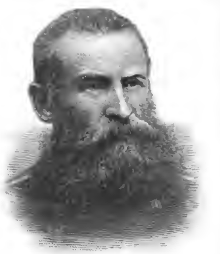
Up to the close of the Franco-Prussian war Bismarck's public life may be said to have occupied itself almost exclusively with managing foreign countries; his personal relations had been principally with government officials and diplomats, when not occupied with his farm servants or peasants. As compared to such men as Cobden, or Lincoln, or Stein even, few men of his position have had such scant intercourse with the people that make up the public opinion of their country. It is difficult in either his conversation or his published writings, voluminous as they are, to meet with any evidence that he understood the people of every day life, or had any sympathy for the manifestation of public sentiment. People he regarded as so many bricks to a house, so many men in a battalion, so many hands on a farm—very good while in their proper place, but absurdities when they began to talk and read the newspapers. His new constitution demanded a semblance of free speech and free press, so he gave it, but the substance he retained. He found means of harassing such public speakers as annoyed him by a timely hint to the local police and officials—a hint that usually proved sufficient. As for the press, he took into his hands the editing of pretty much all those papers that were not hostile to him, and managed to make publishing a very expensive occupation to such as did not like this arrangement.

He is a great man, but his greatness is the product of physical rather than the more subtle force. Denmark displeased him in 1864; he struck her to the ground and crippled her for life. Austria and he disagreed; he forced her into political obscurity. France he has humiliated to a degree she can never forget. So much for outsiders.

His parliament disagreed with him in 1862; he told them to go home and he would do without them. After the French war he tried to control the Germans who did not agree with him in religious matters by force—and failed. He could turn a parliament out of doors, but he could not carry on a war against things spiritual in the same way. Socialism soon commenced to show itself, and in 1877 he passed a law giving the police extraordinary powers in dealing with people who entertained the doctrines of Lassalle. For twelve years the police vigorously broke up meetings, suppressed papers, and locked up Socialists; each year the country being told by Bismarck that no other means would cure this ill. At last, however, the people can stand it no longer, and the Emperor sees that the club of the policeman is not the proper weapon with which to attack a movement essentially intellectual. Every repressive law of Bismarck has been followed by an enormous increase in the number of Socialists; and we may go a step further, and say that every law that he has passed with the object of fostering domestic industry by protective tariffs has been followed by increased cost of living, increased dissatisfaction amongst the classes he pretends to benefit, and crown-



THE LATE MAJOR-GENERAL GEORGE CROOK, U.S.A.

g all, a succession of strikes exceeding in magnitude anything before known in modern Germany.

Fortunately for his country the retirement of the great Chancellor takes place at a time when domestic questions other than foreign ones are uppermost, and after a general election demonstrating with great force that the people do not desire a continuance of the Bismarck system. The Socialists have touched the highest point of political power they are likely to attain, unless their importance should be heightened by further persecution. The force that can dissipate Socialism in Germany resides in the liberal party called *Freisinnige*. This party has greatly added to its strength by the last elections, numbering now sixty-nine seats in the Reichstag. This party seeks the prosperity of the country not in state interference, but in the development of individual energy through laws that apply equally to all. Socialism they never cease to combat, not with bludgeons, but with the finer weapons of sarcasm and healthy reasoning. Protection, the twin-brother of Socialism, is equally odious in their eyes, and for this, if for no other reason, the gentlemen of the *Freisinnige* persuasion have enjoyed the particular malevolence of the head of the state. But in the altered condition of parties to-day, particularly if the government cease their crusade against Socialists, we have reason to hope that this little party will accomplish more in curing Socialists of their heresies than has been accomplished in the last twelve years by the great Bismarck.

Poultney Bigelow.

THE LATE GENERAL CROOK.

Major-General George Crook died suddenly in Chicago, Friday morning, March 21st, of heart disease. He had been in enjoyment of perfect health, and was seized without warning while dressing in the morning, and expired almost immediately. He was born near Dayton, Ohio, September 8, 1828. Graduating from the United States Military Academy in 1852, he was stationed for several years in California with the Fourth Infantry. He was actively engaged in the Rouge River and Pitt River expeditions, and at the beginning of the civil war held the rank of Captain. He came East, and assumed the Colonelcy of the Thirty-sixth Ohio Infantry. He was a brigade commander in the West Virginia campaign until 1862, being wounded at Lewisburg, and was afterward engaged in northern Virginia and Maryland, and was brevetted Lieutenant-Colonel in the United States army for distinguished service at Antietam. During the subsequent two years General Crook played a prominent part in several of the campaigns, being brevetted Brigadier and Major General in the regular army in 1865. In January, 1866, he was mustered out of the Volunteer service, and received the commission of Lieutenant-Colonel of the Twenty-third United States Infantry, being assigned to the district of Boisé, Idaho. Until 1872 he was engaged against the Indians, and having gained a name for himself in that branch of the service, he was sent against the rebellious Indians in the Arizona district, and there achieved signal victories. From that time on he became renowned as a great plains fighter, and gained credit in a number of expeditions which are still fresh in the minds of the public, being no less renowned among the Indians. To the vanquished he was most magnanimous, and earned an enviable reputation in his treatment of the conquered Chiricahuas, although at the time he was subjected to much adverse criticism. In 1888, upon the retirement of General Terry, General Crook was promoted to the rank of Major-General, and was given command of the Department of the Missouri, which he retained until his death.

A NAVAL COURT OF INQUIRY.

Perhaps no naval event of recent years has excited such wide-spread comment as the meeting of the naval court of inquiry ordered by the Secretary to investigate Commander Bowman H. McCalla's administration of affairs on board the United States sloop-of-war *Enterprise*. The charges submitted to the court, which opened with novel ceremonies on the 11th inst., are preferred by eleven complainants, two of them officers, and they relate to alleged acts of cruelty and undue severity in the enforcement of discipline on board the *Enterprise* during her last European cruise. The function of a naval court of inquiry is to investigate all complaints made against an officer, with a view to ascertaining whether they are of sufficient importance to form the basis of formal charges and specifications to be presented before a regular court-martial. At the present stage of the proceedings, which are merely tentative, comment of any sort would be manifestly unfair.

The court meets daily in a room on the third floor of Building No. 7 at the Navy-yard—a modern and commodious structure, whose pleasant piny odor harmonizes well with the sailor-clad figures which for several hours of each day can now be seen quietly flitting about its passages. One is struck at once with the quiet, serious looks of the witnesses as they enter or leave the court-room, as if they, and not their commander, were under investigation. The court-room has a decidedly martial appearance, the walls being completely covered with flags of different nations, while long pennants of red, white, and blue are hung in graceful folds from the four corners of the ceiling to its centre. At a table near the eastern end of the room sit the members of the court—Rear-Admiral Louis A. Kimberly, Commodore W. P. McCann, and Captain Oscar F. Stanton, with Lieutenant Perry Garst as Judge-Advocate—while a table to the left is occupied by Commander McCalla and his counsel, Joseph H. Choate, of New York, and Gustavus Menzies, of Indiana. All the officers are in undress uniform and carry swords, except Commander McCalla and the Judge-Advocate, who are without their swords. As a rule, stenographers are not furnished by the department either to courts of inquiry or courts-martial, unless upon special request, but in this case there were two official stenographers sworn in, whose presence is taken as an earnest that the court intends to do its work thoroughly.

Of the officers composing the court, the president, Admiral Kimberly, is too well known to need detailed notice, his gallantry at Mobile Bay and in other naval engagements being a part of history. He now holds the position of chairman of the Board of Inspection of the navy. Commodore McCann has also a brilliant record, having especially distinguished himself when in command of the steamer *Hunchback* at the battle of Newberne. He is now commandant of the Boston Navy-yard. His recent services as head of the naval committee which proposed the pending extensive additions to our navy are doubtless fresh in the recollections of readers interested in the progress of our navy. Captain Stanton has also had a creditable career. He was present at several engagements during the war, and he was Captain of the United States steam-ship *Tennessee* when Admiral Jouett took the North Atlantic fleet to Colon in 1885, at the outbreak of the rebellion on the Isthmus. He is now at the head of the list of officers of his rank in the navy. Judge-Advocate Garst is connected with the office of the Judge-Advocate-General at Washington. All are mature-looking men with gray hair, and two of them are slightly bald.

Commander McCalla, whose conduct of the cruise is the subject of investigation, has the reputation of being one of the most skilful navigators and capable officers in the navy. He was born in New Jersey, and received his first appointment in November, 1861. He was attached to the Naval Academy from 1861 to 1864, after which he was appointed to the steam-sloop *Susquehanna*, of the Brazil squadron, serving on her for a year. After serving for another year on the steam-sloop *Brooklyn*, the flag-ship of the South Atlantic squadron, he was promoted to master, December, 1866. He served on the steam-sloop *Kearsarge*, of the South Pacific squadron, 1867–8, and was commissioned as lieutenant March 12, 1868. He was attached to the steam-sloop *Tuscarora*, of the same squadron, during 1868–71, and on December 18, 1868, received his commission as lieutenant-commander, being appointed to the *Wabash*, the flag-ship of the European fleet. He was executive officer of the *Wachusett*, a third-rater, of the same fleet, during 1873. From 1875 to 1878 he was attached to the Naval Academy as instructor. Before his appointment to the *Enterprise* as commander, three years ago, he served as assistant to the present Rear-Admiral Walker—now commanding the Squadron of Evolution in European waters—while Walker held the appointment of Chief of the Bureau of Navigation at Washington.

The inquiry is conducted with open doors, and will cover the whole period from October 4, 1887, when the *Enterprise* went into commission, up to the present time, and it will proceed, unless otherwise ordered, until April 15th. Under the system of examination adopted, the officers have been examined by the court first, then the petty officers, and finally the men. On the side of the defendant, Mr. Joseph H. Choate, the commander's senior counsel, caused a sensation during the session of the 13th instant, by conveying the impression that Commander McCalla was the victim of a plot, in which the officers of the Navy Department were aided by officers and men on the *Enterprise* to defame their commander. The main effort of the defence, however, has been to show that the stringent measures used at times on board the *Enterprise* were necessary to inspire proper respect for the officers, and that even the acts of admitted cruelty were justified by extraordinary circumstances.

"The literary form known as a Prose Poem is, like the Song thout Words in music, a peculiar modern invention; I believe is even more recent, and it is even more subtle suggestive. . . . do not know the history of the French Poem in Prose, but I am re that, as we may say in our graphic slang, it has come to stay. is a form which other languages must naturalize; and we can ly hope that criticism will carefully guard the process, and see at it is not vulgarized or coarsened in it. The very life of the em is its aerial delicacy, its soul is that perfume of thought, of otion, which these masters here have never suffered to become argument. Its wonderful refinement, which is almost fragility, happily expressed in the notion of 'Pastels'; and more than ce, forgetting that modern invention has found a way of fixing e chalks, I have felt, in going over these little pieces, that the ghtest rudeness of touch might shake the bloom, the color, from em. As it is, I am certain they must be approached with mpathy by whoever would get all their lovely grace, their charm at comes and goes like the light in beautiful eyes."—*From troduction, by W. D. Howells.*

Published by HARPER & BROTHERS, New York.

HARPER'S BAZAR No. 16 *will celebrate Easter by a superb* STER NUMBER *in a special cover. Among the contributors* contributors HARRIET PRESCOTT SPOFFORD, *whose story, "An ster Bridal," has three illustrations by* ALBERT E. STERNER, *d* KATE UPSON CLARK, *with a clever sketch, entitled "Daffodils."* DR. FELIX OSWALD, FRANCES J. DYER, CHRISTINE ERHUNE HERRICK, MARY GAY HUMPHREYS, ROSAMOND LLETTE, *and others, furnish a most attractive table of contents. The art features are unusually brilliant.* JESSIE RTIS SHEPHERD *conveys the Easter idea in a full-page picture, "When the Morning Stars Sang Together." A striking cture, "The Female Vested Choristers at St. Peter's, Brooklyn, New York," with descriptive text, illustrates a new departure in choral service. Fashion hints and models are given in eat variety.*

The Easter Number of HARPER'S BAZAR *will appear on turday, April 5th.*

CONGRESS AND THE ELECTIONS.

THE reception of the LODGE bill by the press and by such members of Congress as have expressed emselves shows fortunately little disposition to uestion its constitutionality. Objection, however, justly made to its general expediency and to some f its details. The unbroken tradition of usage is e regulation of Congressional elections by the tates, except in regard to the time and manner of ecting Senators. This tradition should be disregarded only in extreme cases, where the end can be ained in no other way. The argument for the ODGE bill is that in certain districts a class of citizens re deprived of their votes not by law nor technically y the State, but either by local terrorism or by ingenious election devices which are approved by pub c opinion. The assumption is that the proposed w will remedy this situation, and enable such citi ens to vote freely and without fear. But is this a ct? Are the colored citizens in the districts contemplated so desirous of voting that because of the ind of protection afforded by this law they will defy ose who are now believed to prevent them from oting?

In other words, do they now abstain from voting ecause they are outwitted, or because they are afraid? o they abstain because they cannot read the labels n the boxes, as in South Carolina, or because they now that they are "spotted," and will be made to uffer? The white voters, as a class, are the more intelligent, masterful, and powerful, and they are the roperty owners. They are convinced that negro scendency would be fatal to society itself, and they ay frankly that while they wish to live at peace with e colored people, and will gladly do what they can r their education and cultivation, and do not object their filling small offices, yet they will resist at ll hazards colored control of the State governments, and generally colored representation in Congress, for reasons which, they allege, would lead Northern communities similarly situated to do precisely the same thing. This is their contention, with the justice of which we are not now concerned. Is not this conviction and determination, which is perfectly well known to the colored people, and which occasionally manifests itself in the most unmistakable manner, and not the inability to read, the real reason of the abstention of the colored vote? It is a moral reason. It is the persuasion of the colored voter in certain districts that he will vote at high cost to himself which keeps him at home; and from this original conviction presently arises an indifference to voting an act which, in any case, he comprehends imperfectly. This is the secret of the suppression of the colored vote.

If now five hundred such voters can procure a United States judge and clerk, inspectors and marshals, to manage the election, will those voters, or any considerable number of their race, for the privilege of voting by allowing an inspector to mark their ballots, be willing to take the risk of incurring the hostility of those who now really prevent their voting? This is the practical question. The LODGE bill assumes that they will, and that the sense of protection at the polls will cause such voters to forget that when the polls are closed the protection ends. This we do not believe. Unless Congress can provide protection for the colored citizen all the time, it does not seem to us probable that protection of his vote, only with the certain result, under the circumstances, of deepening the hostility of race, will greatly increase the colored vote, although it will unquestionably increase difficulties and disorders in the communities affected. These difficulties, including voting, are of a kind which by the nature of the case and of our government is not summarily remediable by law and the marshal's posse. The practical suppression of the votes of lawful voters is unquestionably an immense evil. It is an evil for the local community in which it is tolerated as well as a wrong to the whole country, and that truth should be constantly shown. But it is a wrong which can be remedied only by time, by experience, by agitation, and changes of local feeling and opinion, but not by a law of Congress. In this part of the country also the negro as a man and equal citizen is greatly wronged. But the wrongs are of a kind which laws do not and cannot relieve. The LODGE bill is, we believe, constitutional, but should it become a law it will be futile. It subverts a tradition which has almost the sanction of fundamental law, and does not offer in compensation any reasonable prospect of relieving any wrong or removing any difficulty.

THE CITY.

THE result of the FLACK trial was in strict accordance with public expectation based upon the full narratives of the facts which were published last summer. Yet, remembering BARNARD and CARDOZO, every honest citizen cannot but feel how largely the result is due to the presence on the bench of the magistrate whose services to justice and the public welfare have been many and great—Judge BARRETT. One of the shrewdest schemes of the old Tammany ring was to secure control of the bench, which was meant, in turn, to curb the press by committal for contempt when it exposed the corruption of the judiciary. The present Tammany ring lacks both the ability and the audacity of the TWEED conspiracy. But the revelations of the FLACK trial, involving high public officers, including a judge, and the investigations of the Sheriff's office when it was occupied by the present Mayor, show plainly to the citizens of New York the character and purpose of the city government. The poor trick of expulsion of its agents by Tammany when they were caught in the act was as shallow and futile as TWEED's ostentatious planting of flower beds in the parks and distribution of coal to the poor. It was like a thief buying Bibles with a little of the money he has stolen.

It is stated that the present exposures of Tammany are due to the vengeance of the Republican boss PLATT, who, as the report says, has been betrayed in some of his bargains with Tammany. In the same way, the exposure of the TWEED ring was due to quarrels over plunder. When thieves fall out, says the old proverb, honest folk come by their own. It is Mr. PLATT who was recently reported to have remarked that the Republican party sometimes failed to do right for fear of being misunderstood. He has become boss, let us hope, for the purpose of correcting that weakness. If he be really the author of the investigations, his party in the Legislature has unquestionably done right, and there is no misunderstanding of that fact. The sole hope of uniting good citizens to secure proper government in the city lies in showing precisely what the actual government is. That truth is disclosed at present by the history of the FLACK divorce and the revelations of the Sheriff's office. These proceedings all concern the administration of justice, which is the last resort of outraged liberty and the main defence of individual rights. They emphasize the question whether there shall be BOOKSTAVERS or BARRETTS upon the bench.

One guilt sheriff or judge, however, is comparatively a minor matter. The serious question is the system which produces them and other local officers. In the government of the city of New York ordinary party politics have no more proper place than in the management of a life-insurance company. But each of the great parties insists upon making the management of city affairs—laying out streets, lighting them and cleaning them, and all other municipal duties—party questions, and voters vote simply for their party candidates. So long as this system continues, the very large, intelligent, and substantial body of citizens who are especially interested in good government, and who are Republicans, by supporting distinctive party action in city affairs merely secure the worst government possible. The city is now governed by Tammany Hall, as it was twenty years ago. There is less organized and extensive stealing than then, but the system is the same, and the government is equally corrupt, and in the hands of cleverer men than its present bosses Tammany Hall would be as dangerous a public enemy as in TWEED's day. How is this situation to be changed if the ring continues to nominate its tools for the city offices, and decent Democrats vote for them because they are the regular Democratic candidates, and Republicans vote for hopeless candidates of their own? Whenever Republicans cause it to be understood that the great bulk of the Republican vote would be cast against Tammany Hall for any honest Democrat, not as a Democrat, but as an honest man, there would be hope for the city. There is no hope, however, so long as in city elections every voter runs "wid de machine" of his party.

MR. HALLOWELL UPON THE MUGWUMP.

IN a recent address before the Harvard Historical Society Mr. RICHARD P. HALLOWELL described the mugwump as a person of private virtues, intelligence, and culture, but the most dangerous political figure in the community.

> "He is a standing menace to our free institutions, for refined ignorance when it successfully assumes the air and tone of authority is more demoralizing in its influence upon a community than the more obvious and less plausible ignorance of the uneducated classes."

Mr. HALLOWELL proceeds to say that it is when he leaves economical questions and discusses those of political ethics that the ignorance of the mugwump appears most plainly. We read on, expecting to find some proof or illustration of this refined ethical ignorance of men whom Mr. HALLOWELL describes as virtuous, intelligent, and cultivated. But none whatever is offered or suggested. There is nothing but a reiteration of Mr. HALLOWELL's opinion that

> "when he [the mugwump] drops Greek roots and free-trade, and attempts to discuss national questions involving the rights of the colored man, he enters an unfamiliar field only to display his lack of knowledge and proper training."

That is to say, the mugwump differs from Mr. HALLOWELL upon the better method of securing the rights and promoting the welfare of the colored citizen. But how is he more ignorant than Mr. HALLOWELL?

Let us test the wisdom of Mr. HALLOWELL's assertion by a concrete illustration. Colonel T. W. HIGGINSON is, we believe, a not distant neighbor, and perhaps friend, of Mr. HALLOWELL. Colonel HIGGINSON is an admirable personification of the mugwump as described generally by Mr. HALLOWELL, except in the point of the refined ignorance of the intelligent man. In the case of Colonel HIGGINSON it is refined intelligence. Now how do Mr. HIGGINSON's virtues, intelligence, and culture, his old abolition activity, his service with colored soldiers in the field, the evidence furnished by a lifetime of his exceptional interest in the welfare of the colored man, his exceptional knowledge of his condition and needs, and his practical sacrifices for him—how do all these incapacitate him for a sound ethical view of the question of securing the rights of the colored citizen? How does Mr. HIGGINSON's knowledge of political economy make him careless of human rights? Did similar knowledge affect JOHN BRIGHT in that way? Is there, *a priori*, any reason whatever to suppose that Mr. HIGGINSON, because of his general intelligence and high character and accomplishments, his long and faithful devotion to the interests of the colored race, is unfitted "to discuss the negro question" wisely and humanely, or, indeed, that his convictions upon it are likely to be less earnest, his ignorance greater, or his views less sound, patriotic, and humane, than those of Mr. HALLOWELL?

Mr. HALLOWELL merely repeats, undoubtedly in good faith, the current sneers of a poor kind of politician at men who, although they have strong sympathies with a party, love liberty too well to wear a party collar. The private virtues, intelligence, and culture which Mr. HALLOWELL concedes to the mugwump do not exclude sagacity in dealing with public questions, nor confuse the ethical judgment of public measures. It was the conscience and the courage and the tenacity which characterize the mugwamp from which the Republican party sprang, and to these qualities its achievements and renown are due. Mr. HALLOWELL is of radical antislavery lineage, and his views are doubtless as sincere as they are warmly expressed. But of a lineage not less antislavery than his own is Mr. LLOYD MCKIM GARRISON, the president of the society before which Mr. HALLOWELL spoke. Mr. GARRISON, the grandson of the great abolitionist, is of a younger generation than Mr. HALLOWELL, and he speaks for a great multitude of young and earnest men. When he says, in regard to the question discussed by Mr. HALLOWELL,

> "The great reform has got to come from the South. It has all got to be achieved by public opinion. That opinion has got to be formed not by cowardice or apology or defence or denial of any of the rights of man in any part of this country. But there must be no denunciation. Misrepresentations either of men or motives will not help,"

he speaks with as deep feeling and truthfulness as Mr. HALLOWELL, and exposes the folly and futility of meeting strong convictions and earnest patriotism with mingled sneers at education and ethical ignorance.

GOVERNOR HILL AND THE BALLOT REFORM BILL.

GOVERNOR HILL'S proposition to submit the question of the constitutionality of the ballot reform bill to the Court of Appeals was merely an effort to avoid official responsibility. The Legislature, having passed a bill, sends it to the Governor for his action. The duty of the Governor, if he has doubts of its constitutionality, is to consult competent lawyers, and then sign or veto the bill. If under the bill a legal question arises, it will go before the courts. The first Constitution of New York, adopted in 1777, provided for a Council of Revision, composed of the Chancellor, Judges of the Supreme Court, and Governor, which held a negative upon all laws, unless passed by two-thirds of each House of the Legislature. This negative was afterward given to the Governor alone. In Massachusetts the Supreme Court is authorized, upon the request of the Governor or Legislature, to give an opinion upon the constitutionality of proposed laws. There is, however, no such provision in this State, and the Court of Appeals, as such, could hardly properly give such an opinion as Governor HILL suggests.

Last year he stated that in his judgment the bill was unconstitutional. If that be still his opinion he must veto it upon his responsibility. If he now doubts, he must seek the best advice that he can get. But he cannot invoke the courts to do what they are not empowered to do. If the Court of Appeals should give an opinion in this case, it would be extra-judicial—the opinion of men learned in the law—but it would have no official or binding authority. The proposition to submit the question to them is akin to that of submitting to popular ratification a law already enacted, as was suggested in the case of the civil service reform law. That proposition was a trick of the opponents of the law. The Governor's is an attempt to devolve his own responsibility upon others.

It is very significant as showing the Governor's consciousness of the strength of the public conviction, and his desire to find a means of escaping the consequences of the position he has assumed. His course also necessarily suggests doubt of the strength of his former constitutional scepticism. The Governor is undoubtedly clever at the little game of "hole" politics. But that kind of skill is totally ineffectual in dealing with large public questions. When insight, moral courage, and just appreciation of the real forces in public affairs are required—in other words, when statesmanship is necessary—the clever politician is lost. There is not a sagacious political observer in the country who does not see that the Governor's method of seeking the Democratic nomination in 1892 seriously injures the chances of his party with any candidate by identifying it with reaction and obstruction.

GOOD ROADS.

ROADS are among the first signs and necessities of civilization, and as in many parts of the country the condition of the roads has seemed to indicate a tendency of relapse toward barbarism, it is not surprising that the friends of civilization are now manifesting unusual interest in good road-making. The Farmers' Club of the American Institute lately listened to a paper on the subject by Mr. CRANE, of New Jersey. He treated the influence of bad roads upon farm lands, and stated that seventy-five per cent. of the farms in New Jersey were "plastered with mortgages," and that farm land had depreciated within the past ten years from fifty to seventy-five per cent.

The enormous advantages of what is called "protection" to the farmer seem to have been overborne by bad roads. This view was strongly confirmed by Dr. W. R. WARD, one of the commissioners appointed last year to examine the law and operation of the present road system, who said that the great depression of the farming interest in the State is "undoubtedly due to the villanously bad roads of New Jersey."

In New York the recommendation of a system of State roads which should secure a smooth passage across every county in the State, thus connecting all the counties, so that a man could walk or drive from the city of New York to Jamestown, in Chautauqua county, or Potsdam, in St. Lawrence, upon an admirable road, has led to the formation of an association for the improvement of roads in the State, which recently held a meeting at Utica. The late articles in HARPER'S WEEKLY, by Captain GREENE and Mr. PENNELL, upon roads and road-making and European roads, are an exceedingly valuable contribution to the discussion. A wise system would consist both of county and State roads, and the public money could not be more economically spent than for such a system. There is no greater waste than an immense part of the money now locally expended for roads.

THE POST-OFFICES.

MR. CLARKSON, the First Assistant Postmaster-General, who is reported to have said recently,

> "I have changed 31,000 out of 55,000 fourth-class postmasters, and I expect to change 10,000 more before I finally quit. I expect before the end of the month to see five-sixths of the Presidential postmasters changed. Then I can paraphrase old Simeon, and say, 'Let thy servant depart in peace,'"

now says, in regard to the investigation by the committee of the National Civil Service Reform League, of which Mr. FOULKE, of Indiana, is chairman:

> "The inquiries sent out, in every instance that I have seen, show that the case has been prejudged, and the change made assumed to be wrong. It is evidently an effort to get statements from removed and disappointed officials for political use, and some of the letters show an intention to try to induce the new postmasters to make statements of defence where no defence is needed. The postmasters seem to realize that they have reports to make only to their superior officers. No political capital can be made out of these changes. The President has made no removals except for cause—for delinquency in official duties, inefficiency of service, or violation of law. He has refused to make any changes for partisan reasons. Changes made for cause have been on the reports of inspectors, showing a demand for the change in the interest of the public service."

Mr. CLARKSON is entirely mistaken in supposing the object of the committee to be political. The majority of its members, including Mr. FOULKE, voted for Mr. HARRISON, and they seek only the facts. If the truth in regard to the Presidential post-offices is what Mr. CLARKSON states, that is the very fact which the committee will report, and as nothing could be more creditable to the administration, the committee should receive all assistance possible from Mr. CLARKSON, who, when the committee come to the fourth-class offices, will doubtless hasten to show that he has not discredited the party platform and the administration of which he is part by acting differently from his chief, and made a general sweep of the postal service without cause.

His published interview has the air of a warning to all postmasters to be wary, and not to aid the enemy by answering the inquiries of the committee. But why should a committee of the Reform League, asking solely for the facts in regard to appointments and removals, be assumed to be the enemy of the party which declared that

> "the reform of the civil service, auspiciously begun under Republican administration, should be completed by the further extension of the reformed system already established by law to all the grades of the service to which it is applicable. The spirit and purpose of the reform should be observed in all Executive appointments, and all laws at variance with the object of existing reform legislation should be repealed, to the end that the dangers to free institutions which lurk in the power of official patronage may be wisely and effectually avoided."

If Mr. CLARKSON has been honestly and honorably fulfilling this engagement with the country, why should he attempt to discredit a committee of which the majority helped to bring him into power because they believed the party declaration?

THE CHICAGO FAIR.

THE House, by a vote of 202 to 49, has decided that the World's Fair shall be held in Chicago, opening not later than May 1, 1893, and closing not later than October 1st of the same year. The Representatives from New York voted for Chicago, although some of them expressed the gravest doubts about the financial ability of the Western city to cope with the demands of the enterprise. In the little debate, however, Chicago was not unable to make some suggestive retorts.

The matter is now finally settled. New York has lost the Fair, and in view of the revelations of the character of its municipal officers and government, there is a general sense of relief. It would be rather absurd to invite the whole world to come and see what clever and useful inventions we have made, when the staring fact on exhibition would be the practical failure of popular government properly to manage a great city. We have escaped that disaster, and obviously the city has little self-love to be wounded.

There is no need of a gloomy view, however. If we fall into the hands of thieves, we do not consent to remain in them. The clutch of TWEED and his gang upon the city was very close and firm. But it did not last long. Public opinion "sent them whirling." The more recent rascalities are being thoroughly exposed, and unless the failure is to be permanent, the remedy at last will be applied.

GENERAL CROOK.

GENERAL CROOK deserved all the warm tributes that have been paid to his memory. He was one of the bravest, ablest, and most efficient soldiers of the Union, and one of the most unassuming of men. But his signal distinction was his wisdom in dealing with the Indians. He was an undaunted "Indian fighter," but he was very much more, for he was a courageous and humane friend of the Indians. The cardinal principle of his Indian policy was sincerity. In his view the Indian was not vermin to be exterminated, but a man to be honestly treated. This also was the view of General GRANT.

GRANT said that when a young lieutenant on the frontier he observed that the Americans cheated the Indians and the English did not. The Indians, consequently, trusted the English and distrusted the Americans. They were sure when the Canadian agent promised them a blanket of a certain quality that they would get it. They were not sure of the same result of an American promise. General CROOK, whose military prowess and success had taught the Indians respect and even fear, told them no lies. They felt that he was their friend, and could he have had control of our Indian relations, much of the "dishonor" that has marked them would have disappeared.

It is most fortunate that the better American view held by General CROOK now characterizes the policy of the Indian Bureau. General MORGAN, the present Commissioner, is in full accord with the best and most intelligent friends of the Indian, and his late paper on Indian education, proposing a system of instruction for all accessible Indian youths, is a comprehensive and admirable survey of the situation, and it is in itself a subject of congratulation that it is made by the head of the Indian office. The generous support of General MORGAN'S recommendations by Congress would be a fitting tribute to the memory of the military friend and counsellor of the Indians, General CROOK, whose services will not be forgotten.

PERSONAL.

ALBERT E. STERNER, whose water-colors have lately attracted much attention, has been chosen a member of the Water-color Society. Mr. STERNER is on the eve of his departure for Florence, where he is to spend a few years in study.

—Twenty-five years ago GEORGE PEABODY, the rich banker and philanthropist, set apart $2,500,000 for buying wretched tenements in the London slums, clearing them off, and building in their stead pleasant and healthy homes for the poor. The trustees of the fund have performed their duties wisely and faithfully. They now have eighteen groups of houses scattered over the city, which shelter 20,374 people, and before long they will be able to buy land and build another group. The fund on December 31st amounted to £990,789, and up to that time £1,251,845 had been expended for land and buildings.

—The cloth for President HARRISON'S and Vice-President MORTON'S inaugural suits was, it will be remembered, furnished by JOHN F. PLUMMER, the head of the big woollen firm that has just failed. Mr. PLUMMER is an enthusiastic Republican, and had the cloth made for this especial purpose at a mill in Rockville, Connecticut.

—Baby JOHN ALEXANDER LOGAN, a grandson of the late Senator LOGAN, has been made a Lieutenant in the Fifth Infantry Regiment, or Logan Rifles, Ohio National Guard. The youngster is about six weeks old. His father is a Captain in the regiment.

—A number of rich New-Yorkers are interested in the Church of Our Saviour, or the Sailors' Meeting-house as it is sometimes called, which stands on a float at the foot of Pike Street. The other day when Bishop POTTER confirmed about twenty children there, the sons and daughters of 'longshoremen, seamen, and others living in the vicinity, the little church was filled, and in the audience were Mrs. WILLIAM WALDORF ASTOR and CORNELIUS VANDERBILT.

—Senator BROWN, of Georgia, is a zealous Baptist, and has given largely to the enterprises of his denomination.

—DUDLEY FOSTER, of Billerica, Massachusetts, has been Town Treasurer for forty consecutive years and Town Clerk for thirty-four years, besides holding other local offices.

—The desire of London society to honor HENRY M. STANLEY has taken shape just now in a "Stanley Exhibition." It is devoted entirely to Africa and African products, among the exhibits being relics of LIVINGSTONE and other prominent African explorers, with books, maps, etc., illustrative of their accomplishment. In other departments are shown the results of missionary work and the efforts to suppress the slave-trade.

—Emperor WILLIAM'S animosity toward everything French does not extend to the cooks in the imperial kitchen. They are French, but the bills of fare have to be printed in German.

—There is quite a coterie of literary women in Baltimore, and they have formed a woman's literary club. Among the more prominent members are Mrs. Dr. FABIAN FRANKLIN, of Johns Hopkins University, Mrs. LAWRENCE TURNBULL, Miss HESTER CRAWFORD DORSEY, Mrs. GEORGE WHITELOCK, and Mrs. MARY SPEARS TIERNAN.

—Prime Minister CRISPI, of Italy, among the poorest of the revolutionary exiles from his country thirty years ago, is now a millionaire. Fortunate speculations and investments have given him his wealth.

—Among the curious things offered at a recent auction sale in Norwich, Connecticut, was a queer open-and-shut pulpit, which a century and a half ago was used by Rev. AMOS REED, a pioneer Baptist clergyman, in his ministrations throughout eastern Connecticut. It shuts up in compact shape, and the parson strapped it on his horse's back as he travelled from place to place on his wide circuit.

—MARWOOD, the famous English hangman, died a bankrupt. He was a shoemaker by trade, but speculated considerably, hemp being naturally one of the things he dabbled in. Among his assets is a bill of £25 against the city of Dublin for the hanging of the murderers of BURKE and CAVENDISH.

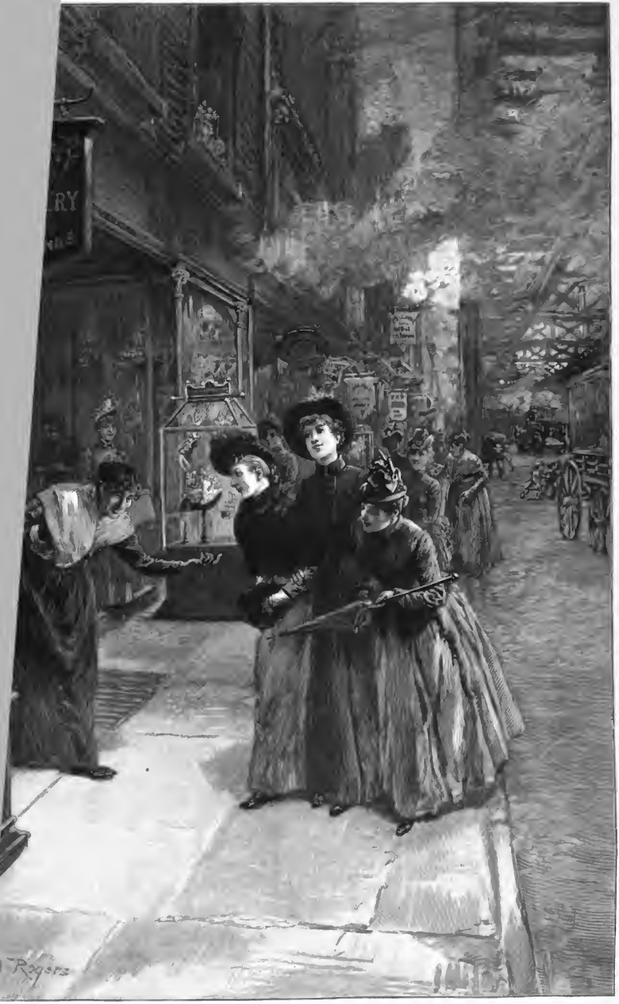
—EDWARD ATKINSON is doing his best to make the Boston city authorities put fire-escapes on the school-houses, and threatens to carry the matter before the Grand Jury.

—Judge THURMAN has been confined quite closely to his house in Columbus, Ohio, by rheumatism this winter, but in other respects his health is very good.

—M. CHAPTELOUP, the well-known brass founder in Canada, has left his fortune of $500,000 to his former employés.

—The wife of Count WALDERSEE, one of the nobles who stand very high in the estimation of Emperor WILLIAM, is the daughter of JAMES LEE, once a prominent New York grocer. She is a beautiful woman, and, while travelling with her father in Europe some years ago, met and married Prince FREDERICK of Schleswig-Holstein, who was about fifty years her senior. He lived but a short time, and later on she was married to her present husband.

Google



NEW YORK SHOP-GIRLS BUYING EASTER BONNETS ON DIVISION STREET.—Drawn by W. A. Rogers.—[See Page 263.]

of its own, and this plot is in almost every instance embellished with trees and shrubbery, and beautified with flowers. The effect upon the visitor who sees none of these things at home, but whose life is mostly spent in the barren streets of New York or Chicago, is indescribably restful and charming. One would, indeed, be justified in saying that the chief glory of Louisville is to be found in the beautiful residence thoroughfares.

In keeping with the natural beauty and social charm of the city is its high intellectual tone, the fame of which is by no means confined to the valley of the Ohio. The people are fully abreast of the mental activity of the times, as any one may learn who sees them at home, and who will take the trouble to visit their various institutions of learning. The public schools are attended by about 20,000 children, and their colleges and seminaries by a large number of students. The educational system is admirably supplemented by the Polytechnic Library, which has 40,000 volumes on its shelves, and which constantly seeks to enlarge its scope of usefulness in every available way. There are thirty-eight charitable institutions, which is claimed to be a larger number than can be found in any city of similar size in the country. The success that has come to the efforts of the people of Louisville to build up their city is a matter of gratification to every one who has been brought in contact with them, and in their new-found task of repairing the ravages of the great storm they will have the hearty good-will of all who know them.

"SEVEN BELLS!—SERVE OUT!"

YEAR in and out at half past eleven in the forenoon watch—seven bells—the ship's cook of a man-o'-war brings to the mainmast for inspection the dinner ration of the day. It is his hour of official triumph. He bears with him what he is pleased to consider a sea masterpiece. He is spick-and-span new in the uniform worn so little; point-device in shining leather and braided knife-lanyard, spotless in blue frock and bell-mouthed trousers, he poses at the break of the quarter-deck with the easy assurance of a *cordon bleu* whose skill fears no affront. He is calm and suggestive, often garrulous. But this is a mere disguise, a society manner, for five minutes later he will be stripped to a perspiring gantline, and be swearing like a Mahonese virago over his stew-pots and his favorite scouse-kettles. He will be damning all the eyes that ever watched a duff grow hard since Benbow's times, and be forgetful of the dignity that once permitted ships' cooks to call themselves his Majesty's officers, to wear brass buttons, blue coats, red waistcoats, kerchiefs, cocked hats, and smallclothes, and to swing at their port legs hangers, which were a little more than skewers, a little less than swords.

In these duller days he ranks with gunners' mates and quartermasters, though his pay is better and his authority less restricted. As an offset, his lot is a wearisome round of bean-baking and slush-saving. He rises early—usually about three in the morning—starts his fire, woos Charley Noble, as his galley smoke-pipe is called, into "drawing" against the back draught of a bellying foresail, growls and is growled at till dewy eve, and then turns in with mind heavy over unsolved problems of beef and pork. His disposition is warped to sourness in so many ways that he has become, as was once said of a certain commodore, the most even-tempered man in the navy, for he is always angry.

At the mast, however, he represses his emotions, smooths his forelock, and presents his pannikin smoking hot. The sea grub steams savorily, and should the beans be done to a turn, and the mess pork be transmuted into melting silver, the officer of the watch is apt to linger over the inspection, and dull with its plunder the edge of sharpened appetite. If everything be right, the order to "serve out" is given; the cook returns briskly to his bailiwick, doffs his garb of ceremony, bawls out to the master-at-arms (Jimmy Legs, in sea parlance) that all is ready, and then with flashing skillet and reeking ladle excavates and lands from his coppers the rations allowed. These are secured by scullions—misnamed berth-deck cooks—who clatter and cackle at his call, and wrangle and harangue over the mysterious, scrimshawed toggles by which, in some occult way, the shares of the messes they represent are differentiated. By-and-by the coppers are emptied, the ovens—those inadequate ovens—are drawn, and a subdued murmur of expectant hospitality buzzes about the decks. There is a promise of festivity in the air, and blue-jackets gather in the gangways or about the hatches when mess cloths and tables are spread, ready to fall to valorously as soon as the bos'n's mates pipe at eight bells to dinner.

And this, so far as rations go, ought to be the best sailor's dinner in the world. The American man-of-war's man is well fed, well clothed, well paid. His food is ample and varied, is the result of intelligent selection, of honest inspection, of kindly intention for his material well-being. In addition to the conventional salt beef, beans, pork, biscuits, "soup and bully," coffee, flour, sugar, dried apples, molasses, and the like, it includes nowadays butter, brawn, canned roast beef and mutton, ham, bacon, canned vegetables, salt fish, cocoa, and articles of a similar character. The possibilities of this ration are very great, but the system under which it is cooked and served is bad. At sea, as on shore, "God still finds the food, and the devil sends the cooks"; and this perversion of the good things of sea life will continue until a radical change is made.

Among many other reforms a proper school of cooking should be established, and every candidate ought to show his master's degree before being sent on shipboard. Modern galleys, stoves of sufficient capacity, should be furnished to every ship afloat, an experienced baker ought to form part of each vessel's complement, the drawing and service of the rations for the whole ship's company should be superintended by one responsible person with competent assistants; and efficient cooks should replace in every mess the ignorant enlisted men who now serve in turn, and, as a rule, unwillingly. The intervals between meals should be greater, and hot coffee ought to be served out once in every night-watch. All these recommendations have been made time and again to Congress and to the Navy Department; and though exhaustive reports have been sent in by commanding officers for the consideration of the various Secretaries, no settled plan has been adopted for "the employment and instruction of cooks in the navy."

In port the sea ration is three or four times in the week replaced by fresh meat and vegetables, and at stated hours each day bumboat women are allowed to sell, under the inspection of the ship's police, a variety of those compounds which run the gamut from unfathomable pies to weird sausages. In some ships the crew is allowed to buy beer, each man being limited to one bottle at dinner and supper time, providing his sobriety and general good conduct warrant the privilege. The spirit ration was abolished during the war, and in lieu of the traditional tot of grog, every person from the admiral to the Jack of the Dust is at sea allowed five cents daily. The total value of a ration is thirty cents per day, and this is so liberal that the allowance for twelve men will easily satisfy fifteen. The rations left undrawn are paid in money to the mess caterer, the commutation being permitted only upon the distinct understanding that it shall be expended for articles of food not provided by the government.

Commuted rations can no longer be used to enhance the wages of cooks or other persons in the navy; and under the new system the crew is not subjected to the exactions of the days when the ship's cook of a frigate would at the cruise's end have received more dollars than the commodore. Wastefulness and deterioration of food are avoided, and, so far as can be arranged, the rations are uniform on all stations, and supplied from a central depot at home. In chemical and physical values the food is amply sufficient for every demand that may be made upon it under varying circumstances, and all needed in our service now is for some maritime Alexis Soyer to rise in his culinary might, keelhaul all the old cooks, and send to every ship afloat trained men who know the difference between other things than salt junk and dried-apple duff, between boiled beans and sea pie.

J. D. JERROLD KELLEY.

MILLINERY LANE.

How many of the army of women who daily frequent the great uptown marts of fashion are aware that within a rifle-shot of the New York City Hall is a thoroughfare which in most part is devoted exclusively to milliners and millinery, which for at least a half-century has been the centre of that industry, and which even to-day turns out more than enough hats, bonnets, and other articles of feminine head-gear to supply the entire population of the Middle States? The thoroughfare is Division Street. It reaches to the northeast from Chatham Square, where the elevated railroads of the east side form a colossal X in iron and steel. It is one of the old streets of the city. It was popular and populous when the Bowery was lined with huge shade trees and fertile kitchen gardens, when Canal Street was practically the city line, and the Five Points were part of a noisome marsh that reached from Baxter Bend to the East River.

Despite its commercial activity it shows all the telltale marks of age. The buildings, though substantial and comfortable, are old-fashioned and queer. The Connecticut brown-stone, which has been used about doors and windows, has scaled and split until the pristine designs are utterly obliterated; the bricks have absorbed so much dirt and dust through the years, and have so long suffered the attacks of mould and fungoid growths, that they have gained the dark, warm tones so familiar in old European cities, and so rare in the new municipalities of the American continent. Even the windows show the wear and tear of time. Not in the store fronts, where cheap plate-glass and gaudy metal are everywhere, but in the upper windows, where the hand of fashion has never come. The sashes are so old and dry as to seem almost gray. Many of the panes have "weathered" until they have become prismatic in appearance, displaying odd circles of red and gold, green and blue, as if they were changing into mother-of-pearl. The pavement is rough and uneven, and the sidewalks, under the attrition of millions of feet, smooth, and even here and there worn through to the soil beneath.

There is a tradition that it was once considered a beautiful thoroughfare. If it was so, things have changed greatly for the worse. Its present traffic consists almost altogether of trucks and drays, hucksters' wagons and peddlers' carts. Through it, never ceasing, surges a vast stream of foreign laborers who have made the east side their home, carrying with it the human flotsam and jetsam of the Fourth and Sixth wards, better known to the reader, perhaps, as the "Bloody Fourth" and the "Bloody Sixth."

Overhead runs the Second Avenue Elevated Railroad, filling the place with noise, darkening the street below into a perpetual twilight, and, in spite of the endeavors of the conscientious corporation by which it is owned, dropping a delicate deluge of oil, hot water, dirt, coal, and iron upon the heads of the luckless passers-by beneath. For almost two long blocks the street is a line of millinery stores. It has been so for more than fifty years, and in its growth has well illustrated the changes of New York life. At first its residents and shopkeepers were Americans, with an occasional representative from England and France.

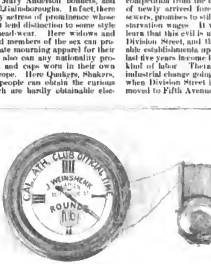
In those days it was a fashionable street for shoppers, and had among its patrons the rich people of the city and visitors from other parts of the land. With the Irish hegira to the New World it began to fall from its lofty estate, and to assume new characteristics. Erelong there were Hibernian milliners and Milesian styles, and Biddy began to drive her mistress to magazines further up town. Germany next stamped its mark upon Division Street, to be followed in quick succession by Austria, Scandinavia, Poland, Russia, and Roumania. Among all these races the thriftiest element has been the Hebrew. He or she—because in the millinery business the two sexes meet on equal footing—has slowly driven the Gentile competitor to the wall, so that the millinery trade of Division Street to-day, whether American, Irish, Teutonic, Slavonic, or Italian, is almost entirely controlled by the shrewd and enterprising Israelite. A majority of the shops keep closed on Saturday, and do business, though through side doors, on Sunday. Everywhere are signs written in Hebrew characters, while now and then are heard the broad vowels, heavy gutturals, Semitic aspirates, and rolled r's of the jargon, language or dialect.

A stroll through the street is of endless interest and information to any one who enjoys the study of human nature. In the fierce rivalry of trade no stone is left unturned to succeed in business. There is hardly a taste, custom, prejudice, or class but what is appealed to by the shops. One tries to gain the custom of the great crowd of women who follow the mode set by Paris. Hardly a design appears upon the boulevards of the French capital but what is duplicated within thirty days thereafter in the show-cases of Division Street. Another tries for the patronage of those afflicted with Anglomania; for, strange to say, this singular social disease is nearly as prevalent among women as among the *jeunesse dorée*. Heavy and substantial wares are offered which suggest at first sight the highest development of cockney art. A third shop caters to the actress, and that large contingent to whom the ordinary thespian is a demi-god or goddess. Here are Fedora hats, Mary Anderson bonnets, and Lillian Russell Gainsboroughs. In fact, there is scarcely any actress of prominence whose name does not lend distinction to some style of woman's head-wear. Here widows and other bereaved members of the sex can procure appropriate mourning apparel for their heads. Here also can any nationality procure the hats and caps worn in their own homes in Europe. Here Quakers, Shakers, and country people can obtain the curious patterns which are hardly obtainable elsewhere. Another noteworthy feature is the utilization of second-hand goods. In some shops these are sold for what they are, without concealment; in others they are cleaned and repaired, and then put upon the counters as "rebuilt," "shop-worn," or "bargains from auction sales." Many a maid of an extravagant mistress here turns an honest penny by selling the masterpieces of Fifth Avenue studios, which have been once or twice worn and then thrown away. Not infrequently actresses and singers, and even wives and maidens, who are temporarily pressed for money, here raise the wind by disposing for a mere song of hats and bonnets bought of famous makers in more prosperous hours.

And everything is cheap; in many cases, too cheap. Imitation goods predominate to a very large extent. Seemingly strong and solid frames are made of the flimsiest materials, and fall to pieces in the first rain-storm. "Genuine silk" ribbons prove to be spurious wares from French and German looms, where counterfeiting is a fine art, and commercial honesty is regarded as a pleasing fiction of an effete past. Yet, to be just, there is but little disguise or concealment made in the premises. The customer, a poor domestic servant, a poorer mechanic's wife, or a still poorer sewing-girl, is bound to have the greatest display for the least money, and the shopkeeper merely gratifies her desire. This love of barbaric and cheap display runs through every show-case. Probably nowhere else in the world can be seen such shocking contrasts in color, such startling shapes and misshapes, and such incongruous combinations of material. Yet these are demanded by a countless throng of girls and women, to whom they represent the highest beauty and the most exquisite fashion.

Nearly every one of these shops is a school of instruction in the milliner's art. In some the scholars receive nominal wages for the work they perform. In others no compensation is made, the tuition being regarded as a just equivalent for the labor and services rendered. While in still others, and especially the more fashionable, or, rather, the more prosperous ones, a regular fee is charged to all who wish to learn. These pupils or apprentices are assiduity itself. They are in their work-rooms as soon as the shutters are taken down in the early morning, and remain until late in the evening, long after the day's business is over. They master their calling in anywhere from three months to a year, and then become clerks in more fashionable establishments uptown, or else open little shops of their own. Many go to other cities, and more particularly to the rapidly growing communities of the West, while but a few make much money. The vast majority earn a handsome livelihood while working in their own behalf.

Behind proprietors and apprentices are the working women. These have steadily gone down in the race of life. They are usually women too poor to do business on their own account, and too old or too troubled with domestic ties to stand any chance of preferment. Their condition is always pitiable, and in some instances heart-rending. Working twelve or fourteen hours a day, they are seldom able to make more than four dollars a week, and in numerous cases three, and even less. The competition of the apprentices on the one hand, and the more terrible competition from the ever-increasing hordes of newly arrived foreign male and female sewers, promises to still further reduce these starvation wages. It will surprise many to learn that this evil is not confined strictly to Division Street, and that the great fashionable establishments uptown have within the last five years become large employers of this kind of labor. There must be a profound industrial change going on in the metropolis when Division Street is being spiritually removed to Fifth Avenue.

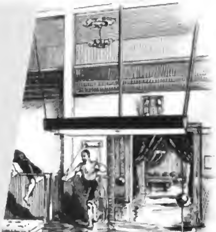


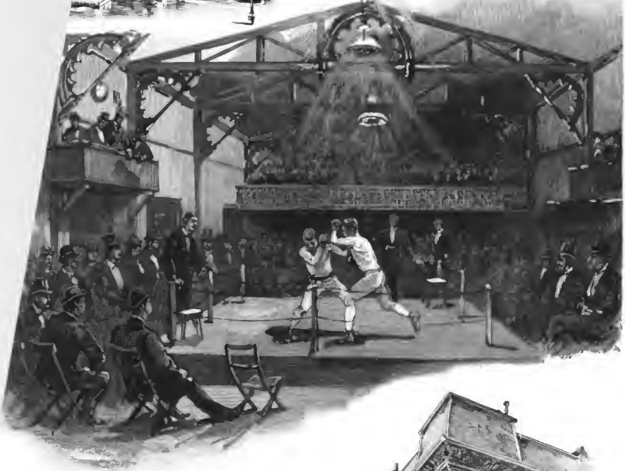
CAL. ATH. CLUB OFFICIAL TIME
J. WEINSHENK
ROUNDS

A REMARKABLE ATHLETIC ORGANIZATION.

THE California Athletic Club, of San Francisco, is conceded to be the richest athletic club in the world. It has a membership of about 1700, comprising the cream of clubbable men on the Pacific slope. The prime object of the club is to promote athletic sports in general, consistent with beneficial results to the members. Boxing is considered more beneficial than any other exercise by the club, and is given most attention. There are three boxing masters engaged by this club to impart the science of the "manly art" to those desirous of becoming proficient in the use of nature's weapons of defence. Each instructor has earned his remunerative position through one or more "finish" or "virtual finish" encounters before this club, defeating almost all the best men of his class. These instructors are Peter Jackson, formerly of Australia, called by some the "Billy Edwards" of his day, Professor McCarthy, whose latest achievement was the defeat of "Denny" Kelleher in twenty rounds, and the other, the invincible middle-weight, Jack Dempsey. Of course Dempsey did receive one set-back at the hands of La Blanche, the "Marine," which he, Dempsey, attributed to his not being in condition.

The California Athletic Club prides itself on having the best equipped gymnasium in





SPARRING MATCH

consistent with accommodations for over 1500 to exercise at the same time.
use is situated on New Montgomery Street, in the city's centre, and within
s of the Palace Hotel. It is three stories high. The ground floor is occupied
The second floor is occupied by the gymnasium, billiard and pool rooms, pri-
ng and sitting rooms, bath rooms, and lockers. The third floor is one large
room, perfectly lighted and ventilated, where many a famous match has been
an end, and championships and fabulous purses won and lost. None but mem-
admitted to these contests. In New York city it would be wellnigh impossible
t to bring off a match of the same proportion, because of a lack of finances and
police interference. At the California Athletic Club it has been authoritatively
at a purse of $25,000 could be raised at any meeting as a prize to be contested for.
the past sixteen months about $50,000 in purses has been paid over to contestants.
is under contract with the California Athletic Club out to appear in any contests
sons excepted) unless sanctioned by the club or under its auspices. The police
ies have never interfered with any contest at this club. The Chief of Police is
ffice and the Sheriff is a regular member of the club. The club pays an annual
to the city authorities of $3000 for which the Board of Supervisors expressly
the privilege of having private contests with the gloves to a finish.
ers are admitted to these contests upon the presentation of membership tickets
where the member is under twenty-one years of age), which are issued to each
the only other spectators, besides, of course, the contestants and their "sec-
or "handlers," are the press representatives. The "stage," or "ring," used at
ntests is of the regulation size, twenty-four feet square, elevated six feet from
r, solidly constructed, and in the centre of the hall or armory, used as occasion
Around this ring are ranged tiers of seats, rising, twenty rows in height, from
almost to the ceiling, thus affording unobstructed views and accommodation for
Immediately over the "ring" is a powerful electric arc light, which makes
ovement of the contestants visible from every part of the room. On one side of
n and near the ring is located the press stand, with telegraph, messenger, and
other requisite conveniences. No one is allowed on the stage, or platform, during a contest except the two principals and referee.

A very essential and convenient innovation is the electric or automatic timing clock, with gong attachment, which stands at one end of the room. When the gong strikes, the "seconds," or "handlers," immediately leave the platform, and take seats in chairs below the contestants' corners until the round is over. The clock registers four minutes—three for work, and one for rest. Two of the directors of the club sit at the corners of the ring, near the contestants, to see that no one gives advice or anything else to combatants from the audience. A member found guilty of this offence forfeits his membership in the club. Great care is taken in choosing competent men to judge the contests. Hiram Cooke, a gentleman lover of boxing, is generally chosen referee by the Board of Directors, and is the only one receiving compensation for his services, he receiving fifty dollars for each contest. William Jordans is generally found officiating in his very fitting capacity of master of ceremonies. The latest notable contest given under the auspices of this club was between Jack McAuliffe, of New York, and Jimmy Carroll, who is in the employ of the California Athletic Club, which occurred on March 21, 1890. McAuliffe was awarded the victory by Hiram Cooke, the referee, which decision carried with it a purse of about $13,000.

The wrestling master of the club is Joe Acton, styled by defeated competitors the "demon wrestler." The officers of the club are L. R. Fulda, president; R. B. Mitchell, vice-president; F. Vernon, secretary; J. D. Gibbs, treasurer; A. Wyman, superintendent; and William Robinson, assistant secretary. The Board of Directors are William R. Vice, George Ross, John Ferguson, Edward Fay, Frank McLaughlin, G. L. Fish, J. F. Coffey, and Colonel A. Andrews.

The members are considering the advisability of building a new club-house at an early date, on a larger scale than the present one.

THE MAN WHO WAS.

BY RUDYARD KIPLING.

LET it be clearly understood that the Rus-
an is a delightful person till he tucks his
irt in. As an Oriental he is charming. It
only when he insists upon being treated as
e most easterly of western peoples, instead
the most westerly of easterns, that he be-
mes a racial anomaly extremely difficult to
ndle. The host never knows which side
his nature is going to turn up next.

Dirkovitch was a Russian—a Russian of
e Russians, as he said—who appeared to
t his bread by serving the Czar as an of-
er in a Cossack regiment, and correspond-
g for a Russian newspaper with a name
at was never twice the same. He was a
ndsome young Oriental, with a taste for
ndering through unexplored portions of
e earth, and he arrived in India from no-
ere in particular. At least no living man
uld ascertain whether it was by way of
lkh, Badakhshan, Chitral, Beloochistan,
epaul, or anywhere else. The Indian Gov-
nment being in an unusually affable mood,
ve orders that he was to be civilly treated,
d shown everything that was to be seen;
he drifted, talking bad English and worse
ench, from one city to another till he for-
thered with her Majesty's White Hussars
the city of Peshawur, which stands at the
uth of that narrow sword-cut in the hills
at men call the Khyber Pass. He was un-
ubtedly an officer, and he was decorated,
er the manner of the Russians, with little
amelled crosses, and he could talk, and
ough this has nothing to do with his mer-
 he had been given up as a hopeless task
case by the Black Tyrones, who, individu-
y and collectively, with hot whiskey and
ney, mulled brandy and mixed spirits of
 kinds, had striven in all hospitality to
ke him drunk. And when the Black Ty-
es, who are exclusively Irish, fail to dis-
b the peace of head of a foreigner, that for-
ner is certain to be a superior man. This
s the argument of the Black Tyrones, but
y were ever an unruly and self-opinion-
d regiment, and they allowed junior sub-
erns of four years' service to choose their
nes. The spirits were always purchased
 the colonel and a committee of majors
d a regiment that would so behave may
 respected but cannot be loved.

The White Hussars were as conscientious
 choosing their wine as in charging the
emy. There was a brandy that had been
rchased by a cultured colonel a few years
er the battle of Waterloo. It has been
turing ever since, and it was a marvellous
ndy at the purchasing. The memory of
t liquor would cause men to weep as they
 dying in the teak forests of upper Bur-
h or the slime of the Irrawaddy. And there
s a port which was notable; and there was
hampagne of an obscure brand, which al-
ys came to mess without any labels, be-
use the White Hussars wished none to
ow where the source of supply might be
nd. The officer on whose head the
ampagne-choosing lay was forbidden the
e of tobacco for six weeks previous to
mpling.

This particularity of detail is necessary to
phasize the fact that that champagne, that
rt, and, above all, that brandy—the green
d yellow and white liqueurs did not count
was placed at the absolute disposition of
rkovitch, and he enjoyed himself hugely—
en more than among the Black Tyrones.

But he remained distressingly European
rough it all. The White Hussars were
My dear true friends," "Fellow-soldiers
orious," and "Brothers inseparable." He
ould unburden himself by the hour on the
rious future that awaited the combined
ms of England and Russia when their
arts and their territories should run side
 side, and the great mission of civilizing
ia should begin. That was unsatisfactory,
cause Asia is not going to be civilized after
e methods of the West. There is too much
ia, and she is too old. You cannot reform
ady of many lovers, and Asia has been in-
iable in her flirtations aforetime. She will
ver attend Sunday-school, or learn to vote
e with swords for tickets.

Dirkovitch knew this as well as any one
e, but it suited him to talk special corre-
ndently and to make himself as genial as
 could. Now and then he volunteered a
tle, a very little, information about his own
tnia of Cossacks, left apparently to look
ter themselves somewhere at the back of
yond. He had done rough work in Cen-
l Asia, and had seen rather more help-
urself fighting than most men of his years.
t he was careful never to betray his su-
riority, and more than careful to praise on
 occasions the appearance, drill, uniform,
d organization of her Majesty's White
ussars. And, indeed, they were a regiment
 be admired. When Mrs. Durgan, widow
 the late Sir John Durgan, arrived in their
ation, and after a short time had been pro-
sed to by every single man at mess, she
t the public sentiment very neatly when
e explained that they were all so nice that
less she could marry them all, including
e colonel and some majors who were al-
ady married, she was not going to content
rself with one of them. Wherefore she
dded a little man in a rifle regiment—be-
g by nature contradictious—and the White
ssars were going to wear crape on their
ms but compromised by attending the
edding in full force, and lining the aisle with unutterable reproach. She had jilted them all—from Basset-Holmer, the senior captain, to Little Mildred, the last subaltern, and he could have given her four thousand a year and a title. He was a viscount, and on his arrival the mess had said he had better go into the Guards, because they were all sons of large grocers and small clothiers in the Hussars, but Mildred begged very hard to be allowed to stay, and behaved so prettily that he was forgiven, and became a man, which is much more important than being any sort of viscount.

The only persons who did not share the general regard for the White Hussars were a few thousand gentlemen of Jewish extraction who lived across the border, and answered to the name of Pathan. They had only met the regiment officially, and for something less than twenty minutes, but the interview, which was complicated with many casualties, had filled them with prejudice. They even called the White Hussars "children of the devil," and sons of persons whom it would be perfectly impossible to meet in decent society. Yet they were not above making their aversion fill their money belts. The regiment possessed carbines, beautiful Martini-Henri carbines, that would cob a bullet into an enemy's camp at one thousand yards, and were even handier than the long rifle. Therefore they were coveted all along the border, and, since demand inevitably breeds supply, they were supplied at the risk of life and limb for exactly their weight in coined silver—seven and one half pounds of rupees, or sixteen pounds and a few shillings each, reckoning the rupee at par. They were stolen at night by snaky haired thieves that crawled on their stomachs under the nose of the sentries, they disappeared mysteriously from arm racks; and in the hot weather, when all the doors and windows were open, they vanished like puffs of their own smoke. The border people desired them first for their own family vendettas, and then for contingencies. But in the long cold nights of the northern Indian winter they were stolen most extensively. The traffic of murder was liveliest among the hills at that season, and prices ruled high. The regimental guards were first doubled and then trebled. A trooper does not much care if he loses a weapon—Government must make it good—but he deeply resents the loss of his sleep. The regiment grew very angry, and one night-thief who managed to limp away bears the visible marks of their anger upon him to this hour. That incident stopped the burglaries for a time, and the guards were reduced accordingly, and the regiment devoted itself to polo with unexpected results, for it beat by two goals to one that very terrible polo corps the Lushkar Light Horse, though the latter had four ponies apiece for a short hour's fight, as well as a native officer who played like a lambent flame across the ground.

Then they gave a dinner to celebrate the event. The Lushkar team came, and Dirkovitch came, in the fullest full uniform of a Cossack officer, which is as full as a dressing-gown, and was introduced to the Lushkars, and opened his eyes as he regarded them. They were lighter men than the Hussars, and they carried themselves with the swing that is the peculiar right of the Punjab frontier force and all irregular horse. Like everything else in the service, it has to be learned; but, unlike many things, it is never forgotten, and remains on the body till death.

The great beam-roofed mess-room of the White Hussars was a sight to be remembered. All the mess plate was on the long table—the same table that had served up the bodies of five dead officers in a forgotten fight long and long ago—the dingy, battered standards faced the door of entrance, clumps of winter roses lay between the silver candlesticks, the portraits of eminent officers deceased looked down on their successors from between the heads of sambhur, nilghai, markhor, and, pride of all the mess, two grinning snow-leopards that had cost Basset-Holmer four months' leave that he might have spent in England instead of on the road to Thibet, and the daily risk of his life on ledge, snow-slide, and glassy grass slope.

The servants, in spotless white muslin and the crest of their regiments on the brow of their turbans, waited behind their masters, who were clad in the scarlet and gold of the White Hussars and the cream and silver of the Lushkar Light Horse. Dirkovitch's dull green uniform was the only dark spot at the board, but his big onyx eyes made up for it. He was fraternizing effusively with the captain of the Lushkar team, who was wondering how many of Dirkovitch's Cossacks his own long lathy down-countrymen could account for in a fair charge. But one does not speak of these things openly.

The talk rose higher and higher, and the regimental band played between the courses, as is the immemorial custom, till all tongues ceased for a moment with the removal of the dinner slips and the First Toast of Obligation, when the colonel rising said, "Mr. Vice, the Queen," and Little Mildred from the bottom of the table answered, "The Queen, God bless her!" and the big spurs clanked as the big men heaved themselves up and drank the Queen, upon whose pay they were falsely supposed to pay their mess bills. That sacrament of the mess never grows old, and never ceases to bring a lump into the throat of the listener wherever he be by land or by sea. Dirkovitch rose with his "brothers glorious," but he could not understand. No one but an officer can understand what the toast means; and the bulk have more sentiment than comprehension. It all comes to the same in the end, as the enemy said when he was wriggling on a lance point. Immediately after the little silence that follows on the ceremony there entered the native officer who had played for the Lushkar team. He could not of course eat with the alien, but he came in at dessert, all six feet of him, with the blue and silver turban atop, and the big black top-boots below. The mess rose joyously as he thrust forward the hilt of his sabre, in token of fealty, for the colonel of the White Hussars to touch, and dropped into a vacant chair amid shouts of "*Rung ho!* Hira Singh!" (which being translated means "Go in and win"). "Did I whack you over the knee, old man?" "Ressaidar Sahib, what the devil made you play that kicking pig of a pony in the last ten minutes?" "Shabash, Ressaidar Sahib!" Then the voice of the colonel, "The health of Ressaidar Hira Singh!"

After the shouting had died away Hira Singh rose to reply, for he was the cadet of a royal house, the son of a king's son, and knew what was due on these occasions. Thus he spoke in the vernacular:

"Colonel Sahib and officers of this regiment, much honor have you done me. This will I remember. We came down from afar to play you; but we were beaten." ("No fault of yours, Ressaidar Sahib. Played on our own ground, y' know. Your ponies were cramped from the railway. Don't apologize.") "Therefore perhaps we will come again if it be so ordained." ("Hear! Hear, Hear, indeed! Bravo! Hsh!"). "Then we will play you afresh" ("Happy to meet you"), "till there are left no feet upon our ponies. Thus far for sport." He dropped one hand on his sword-hilt and his eye wandered to Dirkovitch lolling back in his chair. "But if by the will of God there arises any other game which is not the polo game, then be assured, Colonel Sahib and officers, that we shall play it out side by side, though *they*"—again his eye sought Dirkovitch—"though *they*, I say, have fifty ponies to our one horse." And with a deep-mouthed *Rung ho!* that rang like a musket butt on flag-stones, he sat down amid shoutings.

Dirkovitch, who had devoted himself steadily to the brandy—the terrible brandy aforementioned—did not understand, nor did the expurgated translations offered to him at all convey the point. Decidedly the native officer's was the speech of the evening, and the clamor might have continued to the dawn had it not been broken by the noise of a shot without that sent every man feeling at his defenceless left side. It is notable that Dirkovitch "reached back," after the American fashion—a gesture that set the captain of the Lushkar team wondering how Cossack officers were armed at mess. Then there was a scuffle, and a yell of pain.

"Carbine stealing again!" said the adjutant, calmly sinking back in his chair. "This comes of reducing the guards. I hope the sentries have killed him."

The feet of armed men pounded on the veranda flags, and it sounded as though something was being dragged.

"Why don't they put him in the cells till the morning?" said the colonel, testily. "See if they've damaged him, sergeant."

The mess sergeant fled out into the darkness, and returned with two troopers and a corporal, all very much perplexed.

"Caught a man stealin' carbines, sir," said the corporal. "Leastways 'e was crawlin' towards the barricks, sir, past the main-road sentries, an' the sentry 'e says, sir—"

The limp heap of rags upheld by the three men groaned. Never was seen so destitute and demoralized an Afghan. He was turbanless, shoeless, caked with dirt, and all but dead with rough handling. Hira Singh started slightly at the sound of the man's pain. Dirkovitch took another liqueur glass of brandy.

"*What* does the sentry say?" said the colonel.

"Sez he speaks English, sir," said the corporal.

"So you brought him into mess instead of handing him over to the sergeant! If he spoke all the tongues of the Pentecost you've no business—"

Again the bundle groaned and muttered. Little Mildred had risen from his place to inspect. He jumped back as though he had been shot.

"Perhaps it would be better, sir, to send the men away," said he to the colonel, for he was a much-privileged subaltern. He put his arms round the rag-bound horror as he spoke and dropped him into a chair. It may not have been explained that the littleness of Mildred lay in his being six feet four, and big in proportion. The corporal, seeing that an officer was disposed to look after the capture, and that the colonel's eye was beginning to blaze, promptly removed himself and his men. The mess was left alone with the carbine thief, who laid his head on the table and wept bitterly, hopelessly, and inconsolably, as little children weep.

Hira Singh leaped to his feet with a long drawn vernacular oath. "Colonel Sahib," said he, "that man is no Afghan, for they weep '*Ai! Ai!*' Nor is he of Hindustan, for they weep '*Oh! Ho!*' He weeps after the fashion of the white men, who say '*Ow! Ow!*'"

"Now where the dickens did you get that knowledge, Hira Singh?" said the captain of the Lushkar team.

"Hear him!" said Hira Singh, simply, pointing at the crumpled figure that wept as though it would never cease.

"He said, 'My God!'" said Little Mildred. "I heard him say it."

The colonel and the mess-room looked at the man in silence. It is a horrible thing to hear a man cry. A woman can sob from the top of her palate, or her lips, or anywhere else, but a man cries from his diaphragm, and it rends him to pieces. Also, the exhibition causes the throat of the on-looker to close at the top.

"Poor devil!" said the colonel, coughing tremendously. "We ought to send him to hospital. He's been man handled."

Now the adjutant loved his rifles. They were to him as his grandchildren—the men standing in the first place. He grunted rebelliously: "I can understand an Afghan stealing, because he's made that way. But I can't understand his crying. That makes it worse."

The brandy must have affected Dirkovitch, for he lay back in his chair and stared at the ceiling. There was nothing special in the ceiling beyond a shadow as of a huge black coffin. Owing to some peculiarity in the construction of the mess-room this shadow was always thrown when the candles were lighted. It never disturbed the digestion of the White Hussars. They were, in fact, rather proud of it.

"Is he going to cry all night?" said the colonel, "or are we supposed to sit up with Little Mildred's guest until he feels better?"

The man in the chair threw up his head and stared at the mess. Outside, the wheels of the first of those bidden to the festivities crunched the roadway.

"Oh, my God!" said the man in the chair, and every soul in the mess rose to his feet. Then the Lushkar captain did a deed for which he ought to have been given the Victoria Cross—distinguished gallantry in a fight against overwhelming curiosity. He picked up his team with his eyes as the hostess picks up the ladies at the opportune moment, and pausing only by the colonel's chair to say, "This isn't our affair, you know, sir," led the team into the veranda and the gardens. Hira Singh was the last, and he looked at Dirkovitch as he moved. But Dirkovitch had departed into a brandy paradise of his own. His lips moved without sound, and he was studying the coffin on the ceiling.

"White—white all over," said Basset-Holmer, the adjutant. "What a pernicious renegade he must be! I wonder where he came from?"

The colonel shook the man gently by the arm, and "Who are you?" said he.

There was no answer. The man stared round the mess-room and smiled in the colonel's face. Little Mildred, who was always more of a woman than a man till "Boot and saddle" was sounded, repeated the question in a voice that would have drawn confidences from a geyser. The man only smiled. Dirkovitch, at the far end of the table, slid gently from his chair to the floor. No son of Adam, in this present imperfect world, can mix the Hussars' champagne with the Hussars' brandy by five and eight glasses of each without remembering the pit whence he has been digged and descending thither. The band began to play the tune with which the White Hussars, from the date of their formation, preface all their functions. They would sooner be disbanded than abandon that tune. It is a part of their system. The man straightened himself in his chair and drummed on the table with his fingers.

"I don't see why we should entertain lunatics," said the colonel; "call a guard and send him off to the cells. We'll look into the business in the morning. Give him a glass of wine first, though."

Little Mildred filled a sherry glass with the brandy and thrust it over to the man. He drank, and the tune rose louder, and he straightened himself yet more. Then he put out his long-taloned hands to a piece of plate opposite and fingered it lovingly. There was a mystery connected with that piece of plate in the shape of a spring, which converted what was a seven branched candlestick, three springs each side and one in the middle, into a sort of wheel-spoke candelabrum. He found the spring, pressed it, and laughed weakly. He rose from his chair and inspected a picture on the wall, then moved on to another picture, the mess watching him without a word. When he came to the mantel piece he shook his head and seemed distressed. A piece of plate representing a mounted hussar in full uniform caught his eye. He pointed to it, and then to the mantel-piece, with inquiry in his eyes.

"What is it—oh, what is it?" said Little Mildred. Then, as a mother might speak to a child, "That is a horse—yes, a horse."

Very slowly came the answer, in a thick, passionless guttural: "Yes, I—have seen. But—where is *the* horse?"

You could have heard the hearts of the mess beating as the men drew back to give the stranger full room in his wanderings. There was no question of calling the guard.

Again he spoke, very slowly, "Where is *our* horse?"

There is no saying what happened after that. There is but one horse in the White Hussars, and his portrait hangs outside the door of the mess-room. He is the piebald drum-horse, the king of the regimental band, that served the regiment for seven-and-thirty years, and in the end was shot for old age. Half the mess tore the thing down from its place and thrust it into the man's hands. He placed it above the mantel-piece, it clattered on the ledge, as his poor hands dropped it, and he staggered toward the bottom of the table, falling into Mildred's chair. The band began to play the *River of Years* waltz, and the laughter from the gardens came into the tobacco-scented mess room. But nobody, even the youngest, was thinking of waltzes. They all spoke to one another something after this fashion: "The drum horse hasn't hung over the mantel piece since '67." "How does he know?" "Mildred, go and speak to him again." "Colonel, what are you going to do?" "Oh, dry up and give the poor devil a chance to pull himself together!" "It isn't possible, anyhow. The man's a lunatic."

Little Mildred stood at the colonel's side talking into his ear. "Will you be good enough to take your seats, please, gentlemen?" he said, and the mess dropped into the chairs.

Only Dirkovitch's seat, next to little Mildred's, was blank, and Little Mildred himself had found Hira Singh's place. The wide-eyed mess-sergeant filled the glasses in dead silence. Once more the colonel rose, but his hand shook, and the port spilled on the table as he looked straight at the man in Little Mildred's chair and said, hoarsely, "Mr. Vice, the Queen." There was a little pause, but the man sprung to his feet and answered, without hesitation, "The Queen, God bless her!" and as he emptied the thin glass he snapped the shank between his fingers.

Long and long ago, when the Empress of India was a young woman, and there were no unclean ideals in the land, it was the custom in a few messes to drink the Queen's toast in broken glass, to the huge delight of the mess contractors. The custom is now dead, because there is nothing to break anything for, except now and again the word of a Government, and that has been broken already.

"That settles it," said the colonel, with a gasp. "He's not a sergeant. What in the world is he?"

The entire mess echoed the word, and the volley of questions would have scared any man. Small wonder that the ragged, filthy invader could only smile and shake his head.

From under the table, calm and smiling urbanely, rose Dirkovitch, who had been roused from healthful slumber by feet upon his body. By the side of the man he rose, and the man shrieked and grovelled at his feet. It was a horrible sight, coming so swiftly upon the pride and glory of the toast that had brought the strayed wits together.

Dirkovitch made no offer to raise him, but Little Mildred heaved him up in an instant. It is not good that a gentleman who can answer to the Queen's toast should lie at the feet of a subaltern of Cossacks.

The hasty action tore the wretch's upper clothing nearly to the waist, and his body was seamed with dry black scars. There is only one weapon in the world that cuts in parallel lines, and it is neither the cane nor the cat. Dirkovitch saw the marks, and the pupils of his eyes dilated—also, his face changed. He said something that sounded like "Shto ve takete," and the man, fawning, answered "chetyre."

"What's that?" said everybody together.

"His number. That is number four, you know." Dirkovitch spoke very thickly.

"What has a Queen's officer to do with a qualified number?" said the colonel, and there rose an unpleasant growl round the table.

"How can I tell?" said the affable Oriental, with a sweet smile. "He is a—how you have it?—escape—runaway, from over there." He nodded toward the darkness of the night.

"Speak to him, if he'll answer you, and speak to him gently," said Little Mildred, settling the man in a chair. It seemed most improper to all present that Dirkovitch should sip brandy as he talked in purring, spitting Russian to the creature who answered so feebly and with such evident dread. But since Dirkovitch appeared to understand, no man said a word. They breathed heavily, leaning forward, in the long gaps of the conversation. The next time that they have no engagements on hand the White Hussars intend to go to St. Petersburg and learn Russian.

"He does not know how many years ago," said Dirkovitch, facing the mess, "but he says it was very long ago, in a war. I think that there was an accident. He says he was of this glorious and distinguished regiment in the war."

"The rolls! The rolls! Holmer get the rolls!" said Little Mildred, and the adjutant dashed off bareheaded to the orderly-room where the rolls of the regiment were kept. He returned just in time to hear Dirkovitch conclude, "Therefore I am most sorry to say there was an accident, which would have been reparable if he had apologized to that our colonel, which he had insulted."

Another growl, which the colonel tried to beat down. The mess was in no mood to weigh insults to Russian colonels just then.

"He does not remember, but I think that there was an accident, and so he was not exchanged among the prisoners, but he was sent to another place—how do you say?—the country. So, he says, he came here. He does not know how he came. Eh? He was at Chepany"—the man caught the word, nodded, and shivered—"at Zhigansk and Irkutsk. I cannot understand how he escaped. He says, too, that he was in the forests for many years, but how many years he has forgotten—that with many things. It was an accident; done because he did not apologize to that our colonel. Ah!"

Instead of echoing Dirkovitch's sigh of regret, it is sad to record that the White Hussars livelily exhibited unchristian delight and other emotions, hardly restrained by their sense of hospitality. Holmer flung the frayed and yellow regimental rolls on the table, and the men flung themselves atop of these.

"Steady! Fifty-six—fifty-five—fifty-four," said Holmer. "Here we are. 'Lieutenant Austin Limmason—*missing*.' That was before Sebastopol. What an infernal shame! Insulted one of their colonels and was quietly shipped off. Thirty years of his life wiped out."

"But he never apologized. Said he'd see him —— first," chorussed the mess.

"Poor devil! I suppose he never had the chance afterwards. How did he come here?" said the colonel.

The dingy heap in the chair could give no answer.

"Do you know who you are?"

It laughed weakly.

"Do you know that you are Limmason—Lieutenant Limmason, of the White Hussars?"

Swift as a shot came the answer, in a slightly surprised tone, "Yes, I'm Limmason, of course." The light died out in his eyes, and he collapsed afresh, watching every motion of Dirkovitch with terror. A flight from Siberia may fix a few elementary facts in the mind, but it does not lead to continuity of thought. The man could not explain how, like a homing pigeon, he had found his way to his own old mess again. Of what he had suffered or seen he knew nothing. He cringed before Dirkovitch as instinctively as he had pressed the spring of the candlestick, sought the picture of the drum-horse, and answered to the Queen's toast. The rest was a blank that the dreaded Russian tongue could only in part remove. His head bowed on his breast, and he giggled and cowered alternately.

The devil that lived in the brandy prompted Dirkovitch at this extremely inopportune moment to make a speech. He rose, swaying slightly, gripped the table edge, while his eyes glowed like opals, and began:

"Fellow-soldiers glorious—true friends and hospitables. It was an accident, and deplorable—most deplorable." Here he smiled sweetly all round the mess. "But you will think of this little, little thing. So little, is it not? The Czar! Posh! I slap my fingers—I snap my fingers at him. Do I believe in him? No! But the Slav who has done nothing, *him* I believe. Seventy—how much?—millions that have done nothing—not one thing. Napoleon was an episode." He banged a hand on the table. "Hear you, old peoples, we have done nothing in the world—out here. All our work is to do; and it shall be done, old peoples. Get a-way!" He waved his hand imperiously, and pointed to the man. "You see him. He is not good to see. He was just one little—oh, so little—accident, that no one remembered. Now he is *That*. So will you be, brother soldiers so brave—so will you be. But you will never come back. You will all go where he is gone, or"—he pointed to the great coffin shadow on the ceiling, and muttering, "Seventy millions—get away, you old peoples," fell asleep.

"Sweet, and to the point," said Little Mildred. "What's the use of getting wrath? Let's make the poor devil comfortable."

But that was a matter suddenly and swiftly taken from the loving hands of the White Hussars. The lieutenant had returned only to go away again three days later, when the wail of the "Dead March" and the tramp of the squadrons told the wondering station, that saw no gap in the table, an officer of the regiment had resigned his new-found commission.

And Dirkovitch—bland, supple, and always genial—went away too by a night train. Little Mildred and another saw him off, for he was the guest of the mess, and even had he smitten the colonel with the open hand the law of the mess allowed no relaxation of hospitality.

"Good-by, Dirkovitch, and a pleasant journey," said Little Mildred.

"*Au revoir*, my true friends," said the Russian.

"Indeed! But we thought you were going home?"

"Yes, but I will come again. My friends, is that road shut?" He pointed to where the north star burned over the Khyber Pass.

"By Jove! I forgot. Of course. Happy to meet you, old man, any time you like. Got everything you want—cheroots, ice, bedding? That's all right. Well, *au revoir*, Dirkovitch."

"Um," said the other man, as the tail-lights of the train grew small. "Of—all—the—unmitigated—"

Little Mildred answered nothing, but watched the north star, and hummed a selection from a recent burlesque that had much delighted the White Hussars. It ran:

"I'm sorry for Mister Bluebeard,
I'm sorry to cause him pain;
But a terrible spree there's sure to be
When he comes back again."

A PALIMPSEST.

I gaze along the bare, dim fields, and, lo!
By dint of gazing, or by witchery
Beyond my ken, I sudden seem to see
The Summer, odorous, warm, and all aglow
With bounties of the earth, with skies that grow
In beauty with the day. There floats to me
The tinkle of the sheep-bells on the lea,
The plashing of the brook, the tree-tops' low
And sibilant song. The Winter is effaced,—
That was the writing of a later hand,
A gloomy screed; and now mine eyes have traced
The early, joyous message of the land
When life was rife with roses east and west—
Have read the secret of God's palimpsest.

Richard E. Burton.

CHURCH RECONSTRUCTION UNDER NOVEL CONDITIONS.

Of the Catholic churches in New York city, excepting the cathedral, St. Paul the Apostle, at the corner of Fifty-ninth Street and Ninth Avenue, is the largest. In its style of architecture, with no attempt to be florid, it is impressive as a structure from its vast proportions. As Catholics never build their sanctuaries without due precautions as to the ways and means, their process of church erection is a gradual one. If, then, St. Paul the Apostle is not capped with spire and pinnacles, it may be understood that at some later day "those fingers which point up to God" will be added. Begun in 1875 by Father Hecker, putting all his energies into the work, some years elapsed before regular service was held in the church. The interior was left until recently in an unfinished condition, and the altars were hardly, in size, design, or construction, worthy of their noble surroundings. On entering the church and casting one's eyes overhead, the fine proportions of the structure are better understood. The ceiling, of a dark blue, has the color of the vault of heaven. In it glistens the stars that rolled in space in about the exact position they assumed when St. Paul was born. That dim religious light which is so impressive comes flickering through the two aisles of the church. Large stained-glass windows, imitative of the older method of illumination, give light to the altars.

To-day, and during the whole week, the sharp click of the carver in stone is heard, and workmen are plying their various callings. Scattered about in the church are blocks and slabs of rare Numidian marble, Mexican onyx, and porphyry, now being fashioned for the new altars. Derricks, with their blocks and fall and tackle, are in position where the new altars are to stand. Fronting the Ninth Avenue entrance, a wall of bricks inside of the church is being reared, which partition will form the vestibule. The walls are now being decorated, and slung aloft from their scaffolds, painters are at work giving former bare stuccoed walls their glow of color. Under the wise direction of Mr. John Lafarge, who appreciates fully what is proper for ecclesiastical ornamentation, the work is being rapidly carried out.

A very much admired rule of Catholic churches is that they are never closed, and so despite masons, sculptors, decorators, service at St. Paul the Apostle never ceases. At all times of the day worshippers may be seen. The church is so large that if one portion of it is occupied by workmen, another part of it affords the fullest opportunity for worship. Early mass is held every day, and as on Sunday all work ceases, the devout listen to the sacred words just as if no building ever was going on within the edifice. This remodelling of a church without any sensible embarrassment of service is one of the modern phases of the art of reconstructing buildings. It is believed that by Easter Sunday the fine altars will all be in place, and the entire re-decoration of the church completed. Another generation will see those towers reared which will give additional grandeur to this fine church. All things are encompassed in time. As a first step, however, so far as regards the interior of St. Paul's, the new altars, with the coloring of the walls, will furnish that completeness to the church which has heretofore been wanting.

THE NEW CRUISER "NEWARK."

The U. S. S. *Newark*, launched on March 19th from the Cramps' yard, Philadelphia, is an all-steel, twin-screw, bark-rigged, partially protected cruiser. Her battery is ideal in character for this type of vessel, though its disposition is considered capable of so much definite improvement that a different arrangement has been given to the *San Francisco*, which in hull and construction is a sister ship. The contract for building the *Newark* was awarded in October, 1887, the time limit was fixed at two years, the price agreed upon was $1,248,000, and the machinery accepted was designed by the constructors. In appearance she is a thorough-going modern man-of-war, with ram-shaped bow, elliptical stern, graceful sheer, and military tops at her fore and main mast-heads. The principal dimensions are: length on load water-line, 310 feet; extreme beam, 49 feet 1½ inches, normal draught forward, 17 feet; aft, 20 feet 6 inches; displacement, 4083 tons.

The motive power consists of two sets of horizontal triple expansion engines, which are expected to develop 8500 horse-power, and to give a speed of about 18 knots. The cruising coal allowance is 400 tons, but the bunker capacity is 850, which will enable her to steam with natural draught 3100 miles at full speed, 4977 at a 15.2 rate, and 10 700 at a 10 knot maximum. The protection to stability and to vitals is given by a steel deck, which covers the whole ship, curving longitudinally from the snout of the ram to the round of the stern; the horizontal crown of this deck is about one foot above the water-line, and the sides slope to a fore and aft line about five feet under it. The deck is laid in two courses, the lower one being complete and a half inch thick, and the upper consisting of plates two and a half inches thick on the inclined sides, and one and a half inches on the horizontal plane, except over the steering gear, where its size is increased one-half inch. The plating of the inner bottom is continuous with the ammunition-room, magazine floors, and bow and stern platforms, thus giving throughout a double bottom, which is minutely subdivided; each compartment is supplied with pipes connected with a powerful pump.

The armament will consist of twelve 6-inch, all-steel, breech-loading guns, so mounted as to give direct bow and stern fire from four guns, and beam fire from six guns; the bows and quarters are cut away to furnish this firing section, and the forward and after pairs of guns are mounted on platforms sponsoned slightly from the ship's side. In the *San Francisco* these projections are done away with, and the four guns are mounted, as on the *Philadelphia*, on the forecastle and poop respectively. The neighboring pairs of guns, in both the *Newark* and her sister ship, are sponson-mounted, with such sufficient projection, however, as to let them fire fore and aft without affecting the pieces carried on the extremities of the ship. The two pairs of waist guns are slightly sponsoned in deeply recessed ports, which give a section of lateral train amounting to 140°. All these pieces are fitted with segmental steel shields, and are carried at a mean height of 16 feet 8 inches above the water-line. The secondary battery is composed of four 6-pounder rapid-fire guns, four Hotchkiss revolving cannon, and four Gatlings. The torpedo armament consists of six above-water discharging tubes, three on either side, fore, aft, and amidships, and with an individual train of 90°. Abaft the forecastle, on the forward bridge, is a conning-tower 8 feet 6 inches in diameter, connected with the protective deck by a tube 12 inches in diameter and 2¼ inches thick, through which are carried the steering gear, speaking-tubes, and signal wires.

The speed trials of the *Newark* will take place late in the year, though they do not excite an interest equal to that centred in the *Philadelphia*, because with her the builders hope to exceed the phenomenal performances of the *Baltimore*. A forfeit of $50,000 will, in her case, be exacted for each quarter of a knot below, and a similar bonus will be given for every like movement above, the contract speed. It is for this reason that accurate speed determinations become of such great importance in the official trials, and just now the government is carefully examining three methods, two of which are based upon observations taken from a line running parallel with or between fixed marks, and the other upon relative screw performances. Whatever plan may be selected will have to receive the sanction of the builders, for every mistake of one foot in the total length of the sea knot—6080 feet—will, on the quarter of a knot allowance, make a difference of about $83 to one party or the other. J. D. J. K.

THE INTER-STATE COMMERCE LAW.

The discussion of the inter-State commerce law is rapidly becoming general. The interest in that enactment seems to be greater now than it was when the measure was placed upon the statute-books three years ago, and is rivalled only by consideration of the unprofitableness of farming, especially at the West, and the agitation regarding the currency. The discussion betrays a growing dissatisfaction with the law. As every one knows, the law was aimed against the railroads; at least it was drafted with the view of correcting abuses in the transportation business complained of by its patrons, and was passed at their instance, and in spite of the opposition of the railroads. The last-named are entitled to the credit, however, of having accepted the law in a submissive spirit, and of proceeding to live up to its requirements.

But time has demonstrated that the law is not entirely equitable to the railroads; that is, to the very large part of the population which has put its money into the most important enterprise of the country. Experience has demonstrated, too, that the law is difficult of enforcement, and if enforced rigorously, would work even greater hardships than are now complained of both by the patrons and the managers of the railroads. The loudest complaints against the law come from those for whose special benefit it was enacted, namely, those engaged in agricultural pursuits. Their complaints may not be altogether well-grounded, but that will not carry much weight with those who represent them in Congress, since, as a rule, the Granger politician considers it his duty to cater to his constituents, rather than to educate them.

The railroad interest has, so far as can be learned, made no direct attempt to secure modifications of the law. Certainly it has sent no representatives to Washington, and its dissatisfaction has been expressed only

genious in their reasoning, and all of them are of surpassing interest to the student of commercial affairs. A satisfactory summary of the briefest of them would easily exceed the limits of this article, but we feel at liberty to give the conclusions reached by one of the counsel referred to in his own language. They are as follows:

> 1. When an act of incorporation confers upon a common carrier the right to fix and determine its rates, the question of the reasonableness or unreasonableness of such rates, when so determined, is a question of pure law, and Congress has not lawful power by prescribing or prohibiting amounts to withdraw the question from the judgment of the courts.
>
> 2. If the courts adjudge a given rate to be reasonable, Congress has not lawful power to nullify such decision by either anticipatory or subsequent legislation declaring the charging of such rate to be a crime.
>
> 3. If the right to fix and determine reasonable rates be a vested right and the property of the carrier, Congress has not lawful power to impair such right or to destroy such property, unless by due process of law, and upon securing compensation for the injury.
>
> 4. If the shipper does not otherwise direct on the shipment of his goods, different and competing carriers may lawfully agree, and as the agent of the shipper, to divide the same for transportation between themselves as they may elect, and Congress cannot properly interfere with their so doing.
>
> 5. Moneys paid to a common carrier in satisfaction of his charges are the absolute property of the carrier, and Congress cannot lawfully undertake to control the disposition to be made thereof.

The recent decision of the Supreme Court of the United States overruling that of the Supreme Court of Minnesota in what are known as the "Granger Cases" sustains the first and second of these conclusions, namely, that the determination of fair and reasonable rates must be by judicial proceedings, and that an appeal can be taken from the rulings of railroad commissioners. The decision will doubtless be regarded as applicable to the findings of the inter-State Commerce Commission, and thus open the way to judicial revisions of its acts. In conclusion, it may be noted that the litigation which seems very certain to be started in the near future, involving the constitutionality of parts, and possibly the whole, of the inter-State commerce law, will bring clearly before the public the imperfections of the law as a legal document, and the carelessness of those who prepared it. For example, it can be shown without great difficulty that it delegates to the commission appointed under it powers that are unwarranted by the Constitution, and which, if exercised, would bring it into conflict with all three of the departments of the government established by the Constitution, namely, the Legislative, the Executive, and the Judicial.

Collin Armstrong.

DON'T GO OFF BEFORE YOU ARE READY,
Particularly on a long journey. Be fully prepared. You cannot be, permit us to say, unless you are accompanied with the traveller's and tourist's vade mecum, Hostetter's Stomach Bitters, most genial of appetizers, acclimatizers, and promoters of digestion. Against sea-sickness, malaria, cramps, and colics, begotten of badly cooked or unwholesome food and brackish water, nervousness, increased by travel, chronic biliousness and constipation, the Bitters is a sovereign preventive. It imparts a relish for food not altogether to your taste, and prevents it from disagreeing with you. Never was there such a capital thing for the unfortunate dyspeptic who stands in dread of the best-cooked meal. Stomachic trouble caused by ill-prepared viands aboard ship, on steamboats, and rations hastily bolted at railway restaurants, is soon remedied by the Bitters, which gives a quietus also to rheumatism, kidney troubles, and insomnia.—[*Adv.*]

In buying any sort of goods you want to be *sure* what you will get for your money.

Everybody knows it is so in buying flour or meat, nails or bicycles, oil or glass; why should it be any different with insurance?

It *isn't* any different.

Every uncertainty in price or amount of goods operates in favor of the dealer, not the buyer; if it didn't, he would not sell on such methods.

If a grocer offered to sell you flour at a dollar a barrel above market price, promising to throw in an extra barrel by-and-by if his business paid well enough, you not only would not take the offer, but you would be inclined to go elsewhere for your groceries; you would think he was a slippery customer whom the police had better keep an eye on.

And if you did take it, the result would be merely that you would have paid 10 per cent. more for your flour than you need have done, for you would not get enough extra to anywhere near make up for the extra price.

A straight purchase, so much goods for so much money, is best in every sort of business, and there is nothing about insurance to make it an exception.

The Travelers, of Hartford, does that kind of business; it charges the lowest cash price for its policies, it guarantees *everything* about them—how much will be paid at death, and exactly what will be done in every possible contingency. It offers the best of insurance, at the lowest price; it makes no guesses, and allows its agents to make none, and a man is never deceived or disappointed [*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

IMPERIAL GRANUM
Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

FOR COUGHS, SORE THROAT, ASTHMA,
Catarrh, and diseases of the Bronchial Tubes, no better remedy can be found than "Brown's Bronchial Troches." Sold everywhere, 25 cents.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

Nicholson's Liquid Bread is a refreshing, nourishing, wholesome tonic, that is a popular drink with both the sick and healthy. Its purity is unquestioned. Druggists and grocers keep it.—[*Adv.*]

Burnett's Cocoaine is the best and cheapest Hair Dressing in the world. It kills dandruff, allays irritation, and promotes a healthy growth of the hair.—[*Adv.*]

Angostura Bitters make health, and health makes bright, rosy cheeks and happiness.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits, 25c. a box.—[*Adv.*]

Burnett's Flavoring Extracts are invariably acknowledged the purest and best.—[*Adv.*]

"When the spring-time comes" we usually find ourselves drowsy and exhausted, owing to the impure and sluggish state of the blood. To remedy this trouble, take Ayer's Sarsaparilla, the most powerful, yet safe and economical, blood-purifier in existence.—[*Adv.*]

HARPER & BROTHERS, New York.

UNDER A BUNCH-LIGHT.

BY MINNIE BUCHANAN GOODMAN.—ILLUSTRATED BY ARTHUR JULE GOODMAN.

COURAGE in woman is as glorious as the sunflower, and as incapable of thriving in the dark. I was alone, and it was as dark as tragedy—a palpitating darkness alive with mysterious suggestions. Like Bob Acres in the duel scene, I realized that "valor will come and go"—the situation was more than I had bargained for. From stone steps and hardwood floor I had passed through a little door to where my feet sank into something so warm and soft it might have been alive. It was the velvet rug in the manager's box. Groping boldly, I stumbled and fell into a large, springy embrace, that of a velvet arm-chair. The chill of the brass railing startled me as I leaned on it, and saw as much of the theatre as one may see without a light at half past six in the evening. The artist partner was in a species of tropical dungeon down below, making a study from life of the great tragedian in his dressing-room. Left to my own devices, I had, thanks to my bump of locality, found the most luxurious corner, there to rest unobserved and watch the drama, after the fashion of the nebular hypothesis, evolve from darkness.

The curtain was up, the scenery was gone, and in the vacant stage on one hand and the yawning auditorium on the other the shadows circulated freely. I had expected to feel very much at home, and tried to live up to my expectations. But I thought of Edgar A. Poe's story of "The Pit and the Pendulum," and suddenly the thick, still darkness seemed to be closing in upon me. It was stifling, and yet my feet and hands grew icy cold. I thought I felt something crawling on the floor, and so got back into the big chair, making myself as small as possible, with my feet under me.

"Nonsense!" said I to myself; but the darkness was thick, and the time seemed long. Had I not been afraid of my own ridicule, I would have gone back on the stage to where out of a brick wall came a cheerful side-light, with a wire cage around it. Presently, when hope was at the ebb, a door rattled, and a broad ray of promise shot diagonally across the boards, straight toward me. For an instant I saw the black figure of a man silhouetted against a perfect wealth of golden gas-light. It was one of the finest effects I ever saw on the stage—or at least I thought so at the time.

The door slammed; the glory went out. A small flare of flame came bobbing along, accompanied by a cheerful whistle, and he whom I subsequently discovered to be Joe, the gas-man, lit a big bunch-light at the front of the stage, just where the leader of the orchestra is accustomed to wave his baton. Joe disappeared, and I heard the whistle go underground with him, down to the bottom of the stairs. A cat flew out of my box: my suspicions had not been unfounded.

Reassured by the friendly light, I leaned far out on the box rail. It was like being on a ship at sea. The stage was the middle deck, the bunch-light a big lantern hanging from the main yard arm. Over the side the rows of seats in their linen shrouds looked like a running, foam capped sea that stretched away and lost itself in a black horizon. Above the horizon were pale flying clouds resembling the sea. Up in heaven, the heaven of the gallery gods, the burnished concave of a calcium reflector shone in the blackness like a silver moon. Now and then the bunch-light would flare, and its furthest rays would touch upon gilding, crystal, polished brass, or the surface of a mirror with a glitter like phosphorescence.

Above the deck the sails were clewed up, and a thick net-work of ropes and spars went up and lost itself in the night. Suddenly a familiar creaking sound told that the sailors were pulling on the ropes; in the rigging I felt rather than saw moving spots of something blacker than the darkness—the sailors among the sails. Then there was a soothing silence. The shadows teemed with poetic shapes and suggestions. it was the fascination of being alone on deck, a still, moonlight night. I was just beginning to feel as if I could write poetry, when Joe the gas-man opened, with an irreverent bang, the door that leads from the subterranean regions to the orchestra. As he did so there entered a gust of warm air freighted with the odor of escaping gas, not furnace and oily steam-engine—an odor to make one wake from any dream, and be thankful not to be upon the moving ocean.

One by one, Joe lit the lamps of the musicians and carefully turned them low. Women in cloaks and men in ulsters drifted across the barren stage, like "Mary across the wild moor." One lonely, gloomy-faced tragedian advanced to the bunch light, executed a few racy jig steps, drearily bowed his thanks to an imaginary audience, and solemnly passed on. This broke the ice, and now the action of the piece improves. There is a sharp crackle of electricity, and the lobby lights shine faintly through translucent doors. A man in a very short coat comes down the stage and breaks heavily into the silence.

"Say, Bill, just snake off dem covers on de udder side, will ye? Tommy's got de grip."

A black form from nowhere pops up in the middle of the sea, and is skimming the foam off the imaginary waves, two black forms are removing the imaginary clouds that do not even belong in the heaven of the gallery gods, but consist of linen-swathed seats in the balcony. There is another crackle of electricity, and the side-lights in the auditorium, "half on," show the men staggering off under shoulder loads of white linen, leaving rows of clean-brushed velvet seats ready for use. Joe the gas-man, with his lighter in his hand, bends over as he runs along and lights the footlights. Then, turning off a stopcock in the floor of the stage, he unscrews the bunch-light and carries it off. A rippling swish and a thud, the fire-proof curtain is down; a tremendous crackling of electricity, the lights in the boxes and centre chandelier are ablaze. Correctly dressed ushers stand at the head of each aisle. There is the scuffling of hurrying scene-shifters behind the curtain, and the sound of a violin under the stage. Enter hand in hand an early couple from the country, stumbling bashfully down the aisle, and apologizing profusely to the usher.

"It is barely half past seven," says the artist—at my elbow as if by electricity; "before the time for the curtain to rise, we can put in half an hour at the tragedy up the street."

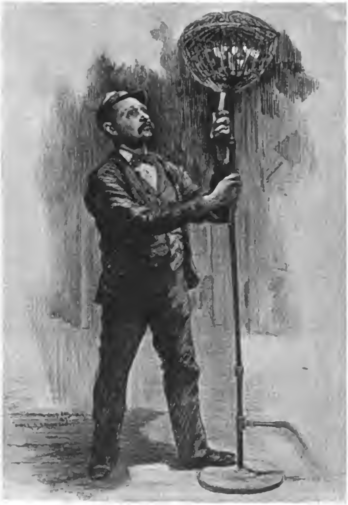
Going out the stage-door, we pass the foreign tragedian's valet, a low-browed Italian, bearing with intensity a cooler containing wine and apollinaris. He shows his teeth in recognition.

"Ze signore no can drink ze wat'," he explains; "eet ees *dangerous!*"

TRAGEDY.

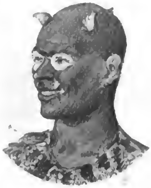
There is an American hustle about the next tragedy. Much is crowded in little space, the whole full of the color and motion of life behind the scenes; the air is hot, hotter, hottest as we go behind the stage-door into its permanent twilight. We fall in the obscurity over two little maroon-clad Jewish girls dressed as pages. They are lolling around like a pair of Italian greyhounds. "B-r-r-r," says one ten-year-old to the other; "rub my legs. They're awful cold in these tights." There is a full head of steam on; the atmosphere is like a Turkish bath with the gas escaping. A door is open between stage and auditorium, and there stands the great American tragedian, a well-built figure in a very heavy ulster of dark plaid. The collar of his coat is turned up, and a fore-and-aft travelling cap is pulled as far as possible over his head. A few stray locks, now gray, but gracefully curling, and a characteristic, unmistakable profile betray his identity. Tenderly he bends over two charming children—little friends who are all excitement, and evidently intend to occupy a stage-box during the performance. The boy regards the tragedian with glowing eyes of admiring expectation; the little girl clings affectionately to his hand. A hasty glance at his watch and he ceases his conversation to kiss them good-by. The door closes. The tragedian glides across the dim stage, soon to reappear in hump and motley, swinging the bauble of *The Fool's Revenge*.

The stage-carpenters and scene-shifters whistle softly as they wander around, setting scenery with the indifference of long custom—an indifference not so hap-hazard as it seems. There is one brilliant point in all the dimness, the spot where all the force of a tall bunch-light seems to concentrate itself upon the abundant gray hair of a young old stage-manager,



UNDER A BUNCH-LIGHT

who stands with his back to the light running his eye over the prompter's book. This same bunch-light, too, brings out the high lights in the gas-man's key-board, which latter consists in a side-wall full of highly polished stopcocks, wheels, and buttons. A single individual playing upon this key-board as upon an instrument controls the gas and electricity throughout the house, making the white light "one green" and the green "one red" at will, and turning night into day or day into night with a movement of his magic finger.



PIERROT.

"You must see Madame," says the stage manager, putting away his book; "she is charming." We hurry through the king's palace across the stage. I have a senseless fear lest the curtain should go up. The door is open, and there stands Madame before the mirror. The large room is neatness itself; the floor, ceiling, and sides are lined with pale blue cambric. There is a great deal of light, and an odor of roses combined with a faint suggestion of dainty cigarettes. In a sweet husky voice Madame repeats the amiable nothings of polite society. Her brown hair looks unusually dark against the pale, highly illumined background; her figure in a long black velvet gown is an inky silhouette, full of gracious fluctuating lines.

It is not all a bed of roses, even for the great ones. The steam-heater in that room is out of order; a stove has been put in, but does not work; Madame is hesitating, as undecided as one of Portia's suitors, between the pleasures of being congealed and those of being asphyxiated.

"Quarter hour," announces the call-boy.

We ascend the stairs, and pass the open door of one of the leading actors. He has taken time by the forelock, and has leisure to spare. Dressed for the performance, he luxuriates in a postprandial paper, sitting in a very modern attitude among wigs, doublets, and general disarray of by gone centuries.

"We have forgotten the property-room," says the stage-manager.

Down the stairs again and into an open door, where in the dimness we see a vast mass of dark confusion, with bits of gilding glittering here and there. By the door sits in an antique chair of state a modern fat man in his shirt sleeves; between his huge knees is a little vase, in which his large fingers laboriously endeavor to arrange some faded artificial flowers. His massive jaws work with rhythmic regularity, and the murky air is heavy with the unmistakable odor of chewing-gum.

"Say, Chippy, ye might as well git out that banquet stuff now."

Chippy, who chews gum too, dives like a swimmer into the obscurity, and splashes around heavily among the family portraits, boats, bird-cages, thrones, garden gates, coal-scuttles, swans, harps, cradles, dragons, sofas, potted plants, cabinets, sceptres, Dresden clocks, and all the rest of it. When he emerges, we follow him as he staggers across the stage, dragging behind him a big noisy bundle wrapped in a red throne-cloth. Without ceremony he dumps his load on a big table, and proceeds to arrange "de banquet"—an almost indestructible feast, though not particularly toothsome. There are aspics, pâtés, and roast fowl of *papier-maché*, fruits carved in composition and hand-painted; the candelabra, goblets, and platters are made of gilded wood, and the superb wine jugs of embossed tin and zinc *repoussé*.

"We use ter take more pains wid 'em 'n we do now," says Chippy, apologizing for the somewhat worn appearance of certain of the viands; "but what's de use? De table sets 'way back anyhow, see? In de las' act de star dances on de banquet, see? 'N' he kicks de whole business galley-west, 'n' breaks somethin' every time, see?"

We leave Chippy to muse on the privileges of a star who can make points at the expense of properties, for our attention is claimed by a weird tableau over in the corner. In that particular spot, shut off by the scenery from any light there might be, it would be dark as Egypt were it not for the rays of one pale candle set upon a table in a stalagmite candlestick of its own drippings. Around the table four men, seated upon the uneasy backs of saw-horses, are quarrelling in obscure gutturals, and making tragic snatches at little squares of white paper. The light reveals three pairs of spectacles, and leaves the fourth to the imagination.

"How effective! Conspirators rehearsing, I suppose. Not in costume yet," I venture.

"Wrong cue," responds the stage manager. "German musicians getting ready for incidental music."

who had lost her ticket,

having retired to consult with her fellows, returns to the attack of the German fortress dismayed, but not discouraged. She makes a lively attempt to pass unnoticed in a crowd. But a large German hand detains her, and a voice that she alone can waken says, "Don'd got a dicket, don'd gome in."

"Now look yeah, boss, you knaw whar I b'long. How's dey gwine ter gib de show if you don't let de ladies 'n' gemmen in? Why, I done played de *Queen er Sheeby* eve'y time dey had it! Why, de derectur knows me. He mus' know me, fo' eve'ybod' knows me. I's numb' seventy-six, sec'nd row ob de cullud ladies, t'ird fum de end."

The assistant stage-manager appears on the inside of the second glass door, in response to the mulatto's frantic appeals in the plantation dialect he sends for the ballet master. As soon as that worried and overworked individual says he "thinks he recognizes seventy-six," the "colored lady" is within the door and out of sight as suddenly as if she had disappeared through an enchanted trap. The procession begins to lose interest. The stage door man in his Teutonic trance once more is as monotonous as he is peculiar.

Through the hallway to the right, then straight ahead again, and you are on the stage. The vast pale auditorium in the half light looks from the stage like a section of the Roman Coliseum. Down in the "bear pit" the musicians are rustling leaves, tuning instruments, and talking in German half-tones. The calcium light men are everywhere, rushing around with huge cylinders, such as are used in soda-water fountains. The stage hands are putting up Solomon's Temple; the carpenters are examining grooves in the floor; supers in all possible and impossible costumes are grouped here and there for the ballet master's inspection. Garlands, fans, wands, torches, harps, banners, tambourines, and other devices are distributed by the property-man's assistants. The Queen's golden palanquin is put in place; the sand storm is looked after. These things are all prepared and rehearsed beforehand, but to put them in the right place at the right time necessitates a new confusion.

It is the half-hour. Down goes the big curtain. The ballet side of the stage is full of life and contrast. You see the romance of tulle skirts and the reality of shirts and stockings to knit. Up on a landing sits little Léontine. She wears dark slippers over her ballet shoes, and a dark jacket protects her neck and shoulders. Now and then she nods her little fifteen-year-old head at the thoughts that come to her as she crochets a tidy of cotton thread. There is a confusion of figures on the stage below her. A performer coming down some set steps passes before a calcium that throws his shadow, huge and grotesque, on the scenery beyond him.

"We all bring work to do whenever we are here," says little Léontine. "Sometimes we are ordered to be dressed for rehearsal at ten in the morning, and our turn does not come until three in the afternoon. We all exchange patterns. Some of the girls have lovely patterns, and know how to knit all kinds of things. Come and see mamma."

Léontine takes us down to where her mother stands. Both belong to the rank and file of the ballet. The mother, a French American, is still pretty, and was young not so very long ago. She loves the little Léontine. There is a worried, mother look in her eyes that makes you forget the painted cheeks, the sketchy skirts, and flesh-colored legs.

"It is so hard to get along," she says, speaking quite freely of what is uppermost. "We must both work, you see, and even then it's hard to save enough for the dull season and for the lessons."

"Yes," adds Léontine, knitting away, "it's the lessons that cost money, and of course I make no progress if I do not study all the time. People who look at dancing from the front think it's all very fine. They have little idea what hard work it is!"

"And the rehearsals, and the long hours," adds the mother. "Last year Léontine was such a little thing her strength was not equal to it; and after the season was over she was ill for months."

"Now don't worry, mamma," says Léontine, coaxing. "I'm ever so much bigger this year, and the doctor thinks I'm stronger too."

The prayer for strength to work, the struggle for bread and butter! Where is the world we read about in books—the world where the income supplies itself, and there is nothing so serious in life as the rise and fall of a love affair?

It is time for the cry of "Orchestra in!" The last preparations are made. The calciums are ready, the lights at side and back are low. Ballet girls, taking a peep at their more fortunate sisters in the boxes, look like pearl-gray silhouettes, just the color of Hamlet's ghost. As we pass out the ballet master is sorting out the wives of Solomon, and has just fined a high-priest who, in elephantine German playfulness, has pulled another priest's beard off.

PANTOMIME.

At seven o'clock it is dark and slippery in the damp back street. The stage door is midway in the block, and to reach it you must pass, if you can, through a solid queue of wrangling, joking, pushing men and lads—a line which begins on the high stoop of a once elegant mansion, extending down the steps and out into the slush of the street. It is the gallery audience waiting for their entrance door to open.

All around and about are scores of poor ragged little boys, who hoot with envy at the gallery swells—rich enough to go to the show. The coupés, carriages, diamonds, and furs at the front entrance of a theatre make the gallery crowd look very much like the extreme of poverty. But in phases of humanity New York is inexhaustible: the gallery auditors are Vanderbilts to the hungry, penniless ragamuffins who enviously admire them. The little beggars are not bad hearted either, provided that in face or manner you show neither dislike nor fear.

"Make way fer de lie dy," says one grimy little fellow, trailing before us in his rags with all the dignity of a French beadle at a cathedral wedding. And, thanks to their good-nature, we are saved the penance of having to wade in the slush, or go back around the block and enter the street from the other side. You must find the stage door by instinct. There are no outward signs or tokens.

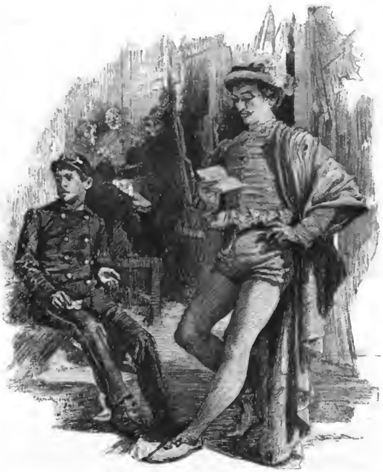
The theatre, one of the genuine old-fashioned kind, is at this hour as roomy and as gloomy as some deserted church.

The stage floor is full of marks, grooves, stars, squares, and triangles, that look in the half-light like the pattern on a faded carpet. On either side of the great stage are serried ranks of scenery, tall and vague. Overhead loose canvases flap softly, like the great black wings of gigantic birds. A Roman arch on the right makes a half-circle of bright light where the massive wall has been pierced, and broad steps of stone lead to rows of small stone dungeons, *i. e.*, dressing rooms, down below. Massive and sinister it all looks, like the subterranean part of some old castle on the Rhine.

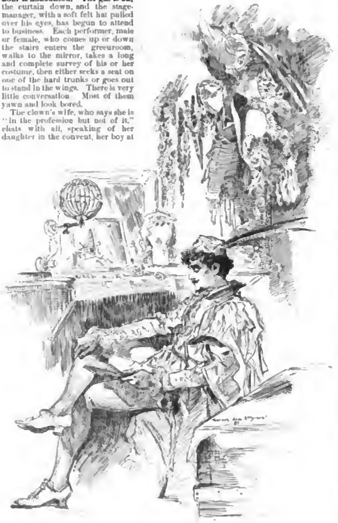
At the left of the stage is the green-room, a room (in books) where distinguished visitors and gifted artists meet to indulge a passion for deep discussion and brilliant repartee. The reality, as we have it here, is a long tunnel-like room with a row of trunks on either side and a pathway down the middle. On one side are some severely simple windows, ornamented from without by the flattened noses of street boys who have climbed a fence somewhere. The extreme end of this dark tunnel is made quite cozy by a bunch-light, a large mirror, and a sewing machine. At the sewing machine sits the clown's wife. They are going to a Masonic ball after the performance, and she is dressed already, in a black evening dress that is decidedly well made and becoming. Her fan and long gloves lie ready on the corner of the machine. She puts in her spare time usefully, sewing red spangles on the devil, white buttons on the clown's collar, repairing a break in the imp's green and red shoulder, and mending the high-priest's blue and yellow sword-belt.

There is the genuine "theatre smell" about the old place. It is composite and permanent. Steam, engine oil, illuminating gas, wood alcohol, the odor of old brick walls, soap, pomade, faded flowers, the musty smell of heterogeneous apparel that has been packed away—these and other ingredients, mixed and remixed, constantly re-enforced and never escaping, make up the sum of that behind-the-scenes odor that is attar of rose to *habitués* and death to all intruders. Bayaderes, demons, priestesses, fairies, skirt dancers, and priests come winding down a spiral stone stairway from above or climbing up from below. The half-hour is announced. The gas is on, the curtain down, and the stage-manager, with a soft felt hat pulled over his eyes, has begun to attend to business. Each performer, male or female, who comes up or down the stairs enters the greenroom, walks to the mirror, takes a long and complete survey of his or her costume, then either seeks a seat on one of the hard trunks or goes out to stand in the wings. There is very little conversation. Most of them yawn and look bored.

The clown's wife, who says she is "in the profession but not of it," chats with all, speaking of her daughter in the convent, her boy at the military academy, and keeps sewing on buttons and spangles with complete impartiality the while. The clown appears in costume. That is, he is a clown from his toes to his collar; but from the collar up he still retains his identity as the author of the piece and one of the proprietors. "If you would like to know how a Pierrot makes up his face," he says, "I know my wife will be very glad to accompany you to the dressing room."



WHERE THE REAL AND THE IDEAL MEET.



"QUARTER HOUR."

The star's dressing-room adjoins the stage and the green-room. He stands in front of a big mirror. The marble slab at the base of the mirror is adorned with a box of white powder and a can of lard. "One, two," says Pierrot; "now see me lose my identity;" and he pulls over his head a tight white skull-cap with apertures for the ears.

"Now a good coating of lard," he says, rubbing thoroughly his neck, face, and ears.

"Leaf-lard, for two reasons—it is harmless, and it helps intensify the white of the powder. The face of a Pierrot, you know, must be a pure bluish white; the yellow of the gas-light counteracts the blue, and the audience sees a perfect white."

Then on goes the powder with a big puff. "I keep on adding powder," he continues, "until I match the white of the skull-cap, and you cannot tell where the cap ends and the face begins; the hardest is to get the ears white, as they are naturally much pinker than the rest of the face."

When he has finished with the powder-puff he bends first on one side and then on the other, clapping his hands in front of the ears and nostrils so that the breeze made by concussion removes all superfluous powder. The artist is enchanted with the transformation. At this stage the head looks like an egg. The lips are covered, the large nose blends into the general whiteness and is hardly noticeable; the nostrils, eyebrows, and eyelashes are white, and the eyes can scarcely be seen. There is something almost supernatural in the effect that can be produced by white. Just as a snow-fall blots out the familiar features of a landscape, masking them to mean something new and strange, so the clown's white powder obliterates the anxious worker and responsible father of a family, making of him a weird, unnatural creature with no more of a soul than Undine, a being light as thistle-down and irresponsible as the butterfly. Whether Pierrot kisses a girl, kills a man, or cracks a nut is all the same to him and to us. We dwell with him in topsy-turvy land—where everything is nothing and nothing is everything—there to be free for a little moment from the limitations and restrictions of moribund mortality. But we are dealing in facts, not fancies.

"Now," continues the star, "this will never do. My face, as you see it now, could not carry an expression strong enough to go across the footlights. I must make it so it will speak loudly, in all languages, and yet without words."

"I often think," Pierrot goes on, putting a stick of black *cosmétique* through the wire of the bunch-light and letting it fry, "what a soft snap most of these actors have. When a man comes on the stage and *says* he does so and so, the audience is very apt to take his word for it. But I, on the other hand, must say nothing; by my actions I must carry the thread of a story, sustain the interest, fix the attention, and make the people laugh at the right time."

The *cosmétique* is cooked, and he lightly outlines each eyebrow, puts a thread-like black line down each side of the nose, a tiny dot of black at each corner of the mouth, daintily traces the curve of the nostril, darkens the eyelashes enough to make them visible, and around each eye at the roots of the lashes traces a line an eighth of an inch wide.

"When I produce my new pantomime," he resumes, "I think I shall fall ill for just one night—a luxury I can't afford at present—and get some stylish society actor or spouting heavy man to play my part. Imagine the condition of the average actor if he were not allowed to speak!"

And so he chats while his wife brushes the powder off his costume, buttons the big ruffled collar around his neck, and Pierrot stands before us—a creature so curious and so devoid of human identity that his voice is an impertinence and his words do not belong to him at all.

"You see I have made no lines that commit my face to any one expression," he explains.

"Quarter hour," interrupts the call boy.

"Up three flights of stairs, that is the way to the room of the English dancers," says the high-priest.

On the first landing the Fairy Queen, standing on one foot, supports her equilibrium by leaning one arm on a cupboard that juts out from the wall. There is a man on his knees before her; but, judging from the back view, he is not

any woman with the
e little Oliver Twist,
"'ome" they love so
ave been bullied from
the cradle, perhaps beaten. An American child of seven has more independence and a greater consciousness of power than the four of these combined. To meet some one who knows London, and will talk with them of "'ome," fills their hearts with joy; and tears spring simultaneously in four pairs of eyes while the tallest, who is speaker, tells, the other three clinging around her waist the while, "'ow verry 'ard and lonely it wos to be so far away fr'm 'ome in such a verry strange kentry all through the 'olidays." You can easily see that the smiles and poses they assume before the foot-lights are merely so many meaningless bits of "business" which they have been taught, like parrots, and execute with mechanical accuracy.

"We're nawt much liked by the Amerricans," says the little speaker. "At first they'd run down Lunnen 'n' the Queen, and try all they could to hurt our feelings. So finally we told them thet treveiling in Amerrica wos nawt arf so comfortable as in England. Oh, you should ev seen them! They said they'd nawt ev it! They were verry mad. So now we just keep to ourselves. We're verry 'appy together. We've made no acquaintances, and sometimes for weeks we speak only to each other."

Four heads nod in concert every time a statement is made. They are anxious to know if their "act" looks well "from the front," and say they want clean costumes, but dare not ask the management lest they give offence. Evidently they have not yet found out they are in America.

The clatter of an electric gong intrudes upon the conversation. It is the signal for "orchestra in." I am very nearly swept upon the stage by a crowd of belated green demons rushing in a dizzy way down the spiral stone staircase. Priestesses and nautch girls ready to go on form long queues in the wings. They stand under tall, old-fashioned bunch-lights that, concealed by the scenery, flood the stage with light. By one of these lights the imp, quite oblivious, is smiling through his make-up as he reads a paper.

"If you will wait until his cue comes," says the stage-manager, "you will see him drop that paper, turn a back somersault through the idol's bosom, and land on the stage."

Away up among the rafters, too high for the stage lights' reach, is a young man. A reflected ray from the calcium he handles illumines his white shirt and shows his face, one cheek distended with chewing tobacco. It is his high mission to emphasize the moral tone of the pantomime by throwing a white light on the just and a red light on the unjust. The rise of the curtain is our signal for departure. The imp is still reading as the stage-door shuts us out from the patter of lively feet and the sound of gay music that begins with a crash.

COMEDY.

"Madame, may I come in?"

"You may, sir."

The maid opens the dressing-room door, and there sits Mrs. Malaprop. It is a scene of sparkling gorgeousness. The blazing lights illumine the jewels, the soft plumes, the lustrous brocade of her costume. She sits like a queen in a common every-day chair, while her train, laid across a second chair, reveals with pardonable indiscretion a dainty petticoat of fine lace and as pretty a foot and ankle as was ever shod in satin and silk. Comes briskly in no less a person than the immortal Bob Acres himself. His eyes are snapping with lively interest; from a precious package he unwinds the tissue-paper, and reveals to the surprised gaze of Mrs. Malaprop a small half-finished plaster statuette of Andromeda against the rock.

"Isn't it beautiful? Isn't it perfectly beautiful?" he queries, cocking his head on one side and holding the statuette at arm's-length.

"Just a sketch, you see, just a sketch, but so dainty and artistic," he continues, still holding the statuette in one hand, and with the other going through an imaginary process of modelling.

"I dare say," replies Mrs. Malaprop, dryly. "I know your artistic tendencies, my good friend. But for me it would be more interesting if Andromeda's features were carried a little further—and her drapery too, for that matter."

"Ah, but my dear Mrs. Malaprop," answers Bob Acres, appealingly, "you wouldn't break those lines, those beautiful lines?"

"If it's beautiful lines you want, that's just the business I've come on," says Sir Lucius O'Trigger, at the half-open door. "I want to show you a letter from my sweetheart," he explains.

"By all means," says Mrs. Malaprop. "Is your sweetheart half-finished and in plaster?"

"No, no, not plaster; but a bit sketchy, a bit sketchy—she's but seven years old, you know."

And he shows a blotted little letter full of childish affection, beginning, "mi deer sir lushus."

"My clothes-wringer! Dear me! I've forgotten to speak to Charles about the clothes-wringer!" and off rushes Bob Acres with Andromeda in his arms.

It might be possible to follow him did not the massive form of Sir Anthony Absolute bar the way.

"No," explains Sir Anthony, "the clothes-wringer does not mean that we have our washing done here. But, as a matter of fact, wherever you find Bob Acres you're pretty sure to find a clothes-wringer."

"You know how thorough an artist that gentleman is," he goes on, after a dramatic pause, during which the imagination vainly tries to solve the mystery of the clothes-wringer. "Well, whenever he has a picture in his mind he cannot get away from, and that is pretty much all the time, he paints it in monotint, working every minute he is not on the stage. While the painting is in the proper condition he lays a clean piece of paper on it, runs the two through the wringing machine, and, presto! has a very excellent copy of it. A clothes wringer, in short, is a Bob Acres printing-press."

The veterans of comedy are leisurely and well-to-do. They dine usually about three P.M., and give digestion an opportunity. About six P.M. they reach the theatre. By a quarter after seven the lengthy and often fatiguing business of dressing and making-up is over, and they enjoy the luxury of three-quarters of an hour to spend in some favorite pursuit. Mrs. Malaprop, who is the queen of her own kingdom, and bears herself accordingly, sits in dignified state, reading, perhaps, or reviewing her mail, or answering business communications or the messages of her children and her friends. Sir Anthony Absolute talks of his farm and his daughters, or writes to his family. Genial and popular Sir Lucius O'Trigger answers letters, or works on a new book of fables. Bob Acres makes notes for his book, signs artist-proof etchings, gloats over some new acquisition in the art line, or works on one of his capital monotints.

There are no favorites like the old favorites. Their destinies are tranquil, their manners proof against the usually disastrous effects of a wandering life. The results of nearly half a century of elimination, they remain a vigorous and vital reminder of the survival of the fittest. They are never idle, they are courteous to all and helpful to many. In such pleasant surroundings no wonder the "quarter hour" has passed unheeded. Much there is in life to make us weep, and some things there are to make us shudder. But to you are many of us indebted for hours of such healthy laughter as satisfies the intellect and rejuvenates the heart. Your lives preach the permanent value of artistic sincerity and the possibilities of sustained endeavor. Long may you all live to keep us young, and may nothing more serious come to part us than the shrill cry now uttered by the call-boy, "*Orchestra in!*"

CITY AND PROTECTION.

rprising statement in regard to the
an Congress is that a scheme of reci-
tical free trade among the American
the chief result of its deliberations.
one important commercial proposition
ation is generally believed, and it has
n the beginning that it would be very
nstrate to the South-American states
rests required them to buy in a dearer
cheaper market. It is plain that the
dom of trade among the States of the
of the rich sources of their prosperity,
lence of similar freedom of exchange of
ng all the states of the Northern and
ts of the continent would result in sim-
benefits. It is, indeed, the natural rela-
t countries. The free supply of hides
America enables our workers in leather,
t and shoe enterprises, to compete pros-
every market. To tax hides as the con-
ir entry is to raise the price of boots and
ry American. The obvious conclusion is
stless because it is so simple.

as the system of tariff obstruction con-
cannot expect our South-American neigh-
ce very seriously our professions of desire
rade relations. The fundamental principle
in the cheapest market cannot be set aside
ing less strong than the offer of some
greater than that which results from the
of that principle. In the existing situation
to parts of the continent no such offer is
le. It is not, therefore, wholly improbable
a scheme of reciprocity has been entertained
ngress. This is made more probable by the
the Pan-American Congress will be regard-
e chief incident in the administration of the
epartment by Mr BLAINE. He is considered
e author of the movement, and a miscarriage
ere subsidence of its deliberations into minor
gative results—indeed any result which is not
e, substantial, and progressive—would be inevi-
njurious to the Secretary's prestige. He under-
this unquestionably better than any one, and
l hardly acquiesce in an abortive and futile
sion of the congress. During his previous
ontrol of the State Department his desire was
strated to enter into closer relations with the
American states, and to establish a continental
which should justify for himself the claim
CANNING made for the King of England. It
arkable, however, that the announcement of
sible scheme of continental reciprocity should
een made simultaneously with the presentation
high tariff of Mr. MCKINLEY, which is the nat-
al necessary result of the election of 1888.

It is never easy to prove the real significance of any general election, but accepting that of 1888 as a fair expression of the popular sentiment upon the question of protection, although the majority fell far below Republican anticipation, it called the Republican party to the control of every branch of the government. A measure embodying the protective principle in its full rigor was therefore fairly to be expected, and there is no doubt that the MCKINLEY bill conforms to that expectation. But Mr. BLAINE, the author and chief figure of the Pan-American Conference, in which apparently a policy of practical continental free-trade is under consideration, is also the leader of the party which is expected to sustain in Congress the rigorous protective tariff of Mr. MCKINLEY, which lays a tax upon South American hides. This situation has naturally attracted universal attention and comment. Not a word, however, has been reported from the Secretary himself, while many surmises and theoretical explanations have been suggested. Is it possible that a Congress which feels itself logically committed to the MCKINLEY tariff could also countenance the reported Pan-American policy? Is it at all probable that the Secretary has so radically and suddenly changed his views—for his article in the *North-American Review* is still fresh in the public mind—that he proposes South-American reciprocity, a policy which is not affected by a name, and if sound is as desirable with foreign European as with foreign American states? Even the rumor, taken with the undisguised demand of Republican New England for free raw material, gives significance to the assertion that serious discontent is brewing within the administration party, and that shrewd Republican leaders apprehend a dangerous reaction against the high tariff policy.

THE NEW SHERIFF.

THE interest in the recent developments of the carelessness, extravagance, and utter contempt of ordinary honesty and business methods with which the government of the city of New York is carried on is by no means local. The whole Union is concerned in the government of its greatest city, while our contribution to the solution of the problem of municipal administration is of interest to every country. Thus far one point is clearly demonstrated, that there is no important city in any country in which more reckless extravagance of administration and less practical advantage to the citizens can be shown than in New York. On the other hand, such energy and efficiency of exposure of the situation by the press, and such prompt investigation by legislative authority, are not to be found elsewhere. But it is undeniable that there will be no confidence in the permanence of relief so long as the causes which have produced the situation, and which have been long familiar, remain undisturbed. If the city government is to be controlled by political parties for their own advantage, the *régime* of TWEED, more or less modified according to the cleverness of the bosses, will also continue.

The most striking and interesting incident, after the recent revelations and the retirement of the Sheriff, is the appointment of General SICKLES to complete the Sheriff's unexpired term. It was wholly unexpected. It was a stroke of the Governor's which justifies the claim made for him by his friends that he is a shrewd politician, and the appointment has been universally greeted with approval. General SICKLES has had much experience of public life, but he was never called to important responsibilities with such general applause. What has been said foolishly of other new officers in the city administration may be said most truly of him—he has a great opportunity. This was not true of the Mayor nor of any of his subordinates. They were merely agents of Tammany Hall, and Tammany Hall is a conspiracy against honest and economical municipal administration. General SICKLES, however, is independent of Tammany. He was not suggested by Tammany, nor was Tammany consulted by the Governor. He is beyond the ordinary sordid temptations of Tammany, and if he has political ambition it is not of a kind that Tammany could make or mar.

Probably, however, General SICKLES had not expected to return to official life, and he enters upon the shrievalty with no pledges or understandings, with none of the usual engagements of any kind whatever, and with the clear perception that the more thoroughly he reforms the abuses in the office, the more strongly he will commend himself to public honor. He may not choose, indeed, to take this position, and he will not be surprised if the public awaits his action before saying more than that he has what other men have not had—a real opportunity. No man could enter an office which has been one of the chief dependencies of Tammany corruption with the determination to cleanse it without finding his task beset with enormous difficulties. The natural hope of good citizens is that General SICKLES's thorough acquaintance with city politics, his strong resolution and courage, and the desire of a man who has been conspicuous in national, civil, and military service to crown his career with signal honor, will induce him to make an office which has long been one of the greatest public scandals a public benefit. It is in that way that he has begun. As he says, he finds the system suitable for a small town still retained in one of the chief cities in the world. By strict observance of the law, which is entirely inadequate to the situation, he will compel a change of the law and abolish every pretence for illegal practices, while the demonstration of the honesty and economy with which the office can be administered will make it at least difficult for any successor to resort to the old prostitution of it.

BALLOT REFORM IN NEW YORK.

THE proposition of Governor HILL to refer the question of the constitutionality of the ballot reform bill to the Court of Appeals showed his consciousness that he was withstanding a very powerful and intelligent public sentiment, and his desire to escape the responsibility of preventing it from becoming law. His veto message shows the same consciousness in his endeavor to demonstrate its unconstitutionality. He lays chief stress upon the official ballot as one not known at the time of the adoption of the Constitution, nor contemplated by it. He says that the word ballot when the Constitution was adopted had a well-understood and popular signification. If he means by this that nothing can be considered a legal ballot except the particular kind of ticket in use forty years ago, he certainly adduces no good reason for his view. The real questions are of a very different kind. Does the law prevent an honest voter from voting for the candidate of his choice? If it does, it is a restriction of the right of suffrage. Does it prevent illiterate voters from voting? Certainly not. They have every right and opportunity which they now have, with an especial security against the ill results of their own illiteracy.

The Governor concludes his message with one of the flourishes of cheap demagogy which are not unfamiliar in his speeches. He will never assent to any bill which is to disfranchise a single honest voter, however humble or unlettered he may be. Yet the very object of the bill is to secure to every honest voter, however humble and unlettered he may be, the chance of honest voting. Corruption and bribery of every kind at elections have become so general and startling that intelligent public opinion everywhere has demanded relief, and the method proposed in the bill which Governor HILL has vetoed has been found to be of the greatest service in protecting the honest voter, whether unlettered or not. It has been strenuously opposed by scheming and professional politicians for the reason that it prevents bribery and corruption, and the frauds that are constantly practised upon the illiterate voter. The character of the opposition to the bill is one of the very strongest arguments for its passage, and, as generally happens, the Governor is in direct opposition to the best sentiment of his own party as well as of the country, and commands the approval of those whose political ascendency would be a public misfortune.

But the Governor is the undoubted choice of his party in New York. Even if it be true that he sold the Presidency for the Governorship, he received the great bulk of his party vote. If the Republican candidate had been elected, the ballot reform bill would now be the law of the State. The Governor's ascendency in his party is undeniably great, and the party at large must be held responsible for him. Some Democratic papers in other States insist that the party is not to be held responsible for Tammany Hall in the city. But if the party should disclaim its chief organization which gives it its victories in New York, and also the Governor whom its Convention nominates and its votes elect, it would discredit the things by which a party is necessarily judged. It is not the protesting and futile minority, it is the dominant majority by which in every State a party must be estimated. It is Democratic votes in New York which baffle ballot reform and license legislation.

REMOVAL OF THE SOUTHERN UTES.

THE question of the removal of the Southern Utes is one that really involves the national good faith toward the Indians. However small their numbers, and however uninteresting they may be to the general public, no public duty is plainer than that of treating them honestly, and with constant regard to their absorption into our civilized community. The annual report of the government agent for the Utes says that, although a few years ago they were leading the original life of savages, they have made great progress toward civilization:

> "The comparatively small assistance they have received from the government has borne good fruit. They have now under cultivation about 600 acres of land, and have raised thereon during the last season about 400,000 pounds of oats, wheat, and barley, besides a large quantity of vegetables and some corn. They have learned in a measure the art of irrigation, and would no doubt become in the near future self-supporting by their agricultural labor if further and more extensive assistance were given them by the government.

work of the New York *Times* building. Somewhat slower is the construction of floors. In a many-storied building the area covered by floors is immense. Some idea of proportions may be gained when the leaf surfaces of a book are compared to the binding. The hollow tile, which from its form makes its own arch, is now entirely in use. Above these floors there is put some three to five inches of solid concrete. This kind of flooring holds and locks together a building as nothing else ever did before. Errors of a hair's-breadth when carried out *in extenso* become in a building dreaded exaggerations. Minute measurements are constant, and the best thumbed of all papers is the working plan of the builder. The plumb-line and spirit level are always in requisition. "Pretty nearly right," is a shambling confession of weakness. "Absolutely correct as to height, width, position," alone suffices. There is a limit of error. Maybe man will never get anything entirely perfect. What latitude is permissible varies with the intelligence of the builder.

A thousand men find active employment, first and last, for the six or seven months on the Madison Square Garden, and that does not comprise all the hands contributing their labor. The builder takes nothing for granted. He holds himself responsible for material, for the placing of it, and must and does look as carefully into those portions of the structure which, once closed up, are never to be seen again as he does into the visible ornamentations of the façade. With the patience of Job, the builder must at the same time differ from the man of Uz in being able to impart the impulse of his enthusiasm to his workmen.

"How does our work compare as to rapidity with that of England or France?" was asked.

"We build very much more rapidly here. I cannot say that it is twice as fast. I do not wish to present my own work, but that of many other American builders. We are forced to keep up with the requirements. We are more likely to be interrupted in winter than they are abroad, that is, in England, France, Germany, and Italy. Hot weather makes no matter to us, but cold weather does."

"Are the workmen, then, more speedy?"

"It looks like it. There are fewer holidays. We count on steady work."

"Then what is it? You employ quite as many foreign workmen as American, do you not?"

"A good workman is of no special nationality to me," was Mr. King's answer. "I have often thought it over. It may be handiness in getting at material, seconds saved here and there, little odd snappy ways of doing things, which count for us as days in the long run. All I know is that the English or Scotch bricklayer working on our wall over there will set more brick than if he was plying his vocation in London or Edinburgh. There is something in the air which quickens a man's senses here, and gets him out of the slow stride. More nervous energy is put into him. I do not speak of myself, but of other builders throughout the whole country, who will, in the eight or ten months, construct a superb structure, which edifice, say in London, would take from two to four years—say three years—to complete. When we begin to hit, we hit heavy, and keep on hitting all the time. I have the very best men I can find. I should be ruined professionally and financially if I did not have the pick of men. I want good men. I find them, and when found I do my best to keep them. Now promptness, the brain guiding the hands, produces careful work. If you slouch over a slow job, you generally turn out wretched work."

Then Mr. King was down the ladder, gave directions to one of his foremen about the foundation of the tower, and a minute afterward was on the Fourth Avenue side, inspecting the excavations there for the steam machinery which was to heat and light the place, run the elevators, and do the thousand and other odd things for which power is to be employed.

In thinking over what the builder of the pedestal of the Bartholdi statue, of the Equitable, and of the *Times* had said in regard to the rapidity of work in the United States, the theory might be advanced that it depended a great deal on temperament. Perhaps Frenchmen in Paris, with their plastic Caen stone, work faster than Englishmen, while the German would be the slowest.

There are very good builders of Bushire, that Persian seaport. They are sure if they are slow. A structure commenced this century will have its roof put on in the next. The deliberation of the Bushire builder is thus explained: "Brother," says the bricklayer to the laborer, "in the name of the Prophet, praise be his name, pass me up a brick." Then the laborer below bows gravely and replies, "Brother, in the name of the Prophet, the Illustrious, the Beneficent, the Pure, the Tower of Strength, to whom all praise is due, the Scourge of the Infidels—may their graves be defiled!—pray accept this brick." At least a Bushire edifice constructed with such pious homily would never when finished have a spick-span appearance. It would be born, so to speak, venerable, for the travail, with the ceremonial, would have been interminable.

The man of the cave period, if he found a ready-made den in the rock, worried himself but little with the trimming of his abode. He is said to have had artistic tendencies, and was probably satisfied with such natural decorations as stalactites, but after we have built our house, endless are our requirements. While the shell has been reared, all the fittings-up for it have been under rapid preparation. Romantic fiction applied to social science has presented uniformity as the drift of the future. When men and women all dress in their exact costumes, and live in houses as much alike as are peaseeds, then house-building will be reduced to a minimum of time. In that happy future a house will be thrown together, in certain parts at least, as rapidly as is brought together the works of a modern watch or the mechanism of a repeating rifle.

More worry and annoyance come now to the builder than when the heavier work was under way. It is an era of the smaller miseries, this putting in place of the infinite number of little things. Painters, floorers, plumbers, cabinet-makers, layers of tiles, electric people, tinners, swarm through the place. It is a Tower of Babel of trades. You cannot paint until things are dry and the dust laid. You cannot wait for your electric communications. They must be applied before the plastering goes on. When you get to laying tiles, or lozenges of marble or hard stones, those are exactly the things that will not be driven. The mosaicist always says, "Manyana."

From the quiet way in which the builder took up the considerations of the whole plan, the idea was conveyed that there really was not so much to do after all in the new Madison Square Garden—only an amphitheatre of immense size, only a theatre as large as Palmer's; besides these, a concert-room and a ballroom of great capacity, and a restaurant, and a hanging garden, and a 300-foot tower, and an arcade all around the block.

Mr. King did not say so, but it struck the writer as if he might have wanted to express himself in this way: "It's all here, so to speak, where I can keep it in touch, let us say, under my hat. Now when I have a half-dozen large buildings going up at the same time in different parts of the city, each one having a problem of its own to solve, that requires some attention. But here it's all together. To you it seems as if it were a complicated thing to do; but I am forced to look at things as wholes. I shall at first put most of my work on the amphitheatre, and get that done, because it may be wanted first. As to the theatre and concert-room, they will crowd on the heels of the circus—no, I mean amphitheatre."

This must be about the drift of what I think Mr. King would have said. Nor can I be so far wrong, for an absolute invitation followed, couched in this guise: "God willing, some time this summer—1890—I hope to invite you to take the elevator in this tower (you will note that my men are now building the foundations of it), and from the top of it we will see quite a collection of buildings, to be known in the future as the Madison Square Gardens."

The architects of the Madison Square Garden, Messrs. McKim, Mead, & White, have altered somewhat the design as it was first presented in a former number of HARPER'S WEEKLY. The tower does not now front on Madison Avenue. The whole structure, imposing from its size, is highly attractive. Architectural effects are, as they should be, assorted to the purpose of the building. It will be the handsomest place of public amusement in this country, and that without false display.

BARNET PHILLIPS.

NOTE.—In New York during the last twelve months plans have been filed for 516 new buildings for business purposes, to be located "on ground previously occupied by other structures, and the estimated value of the proposed new buildings is $30,002,000." In Boston the number of old buildings demolished during the past year "to make room for new structures was 492; new buildings in the place of old ones, 32." Estimated cost of new buildings, "$4,490,000—an increase of $1,992,500." The Mayor of Boston writes that in this statement are included "buildings in the business portion of the city, which have been taken down to make room for the rapid progress of trade." In Philadelphia the same process of reconstruction must be going on, but information having been asked of the proper authorities no response was given. Chicago having been so recently rebuilt, reconstruction will come in the future.

I am indebted to Mr. Scott Thompson for information as to the original owners of the ground now occupied by the Madison Square Garden. See Mr. Scott Thompson's article, "Real Estate in New York," in HARPER'S WEEKLY of October 26, 1889.

COLLEGE THEATRICALS.

IN at least one particular college theatricals take us back to the stage of Shakespeare's time—the female characters are acted by men. It was said of a member of "Master Will's" company of players that he was the prettiest girl in London. A similar compliment can now be paid to one of the prominent actors in the Columbia College Dramatic Club; and there are other members of this association and of the Harvard Hasty Pudding Club who would shine in a contest of beauty. Whoever has attended a performance of college theatricals can read with the fullest appreciation Aldrich's clever story of the youthful scion of a Knickerbocker house, who became desperately enamored of a lovely trapeze performer, and wooed her with fruits and flowers and jewelry only to discover that he had been lavishing his affections and his allowance upon a man. Indeed, a susceptible youth attending a performance of the Columbia College Dramatic Club without a programme for his enlightenment might find himself before the evening was half over smitten with the charms of the club's lovely *prima ballerina*, Mr. Thomas Kelly, a son of Mr. Eugene Kelly, and easily the queen of college theatricals. Changing the locality, one may say of Mr. Kelly what was said of the Shakespearian actor of female rôles—he is the prettiest girl in New York.

We are indebted for our college theatricals to the Hasty Pudding Club, one of the senior societies of Harvard, which gave such successful performances of *Helen and Paris, or the Duke, the Dunce, and the Daisy*, at the Berkeley Lyceum the other day. This club started the ball rolling in 1845 and has kept it merrily going ever since. The particular father of this most diverting class of entertainments was Lemuel Hayward, Harvard, '45, who arranged a performance of *Bombastes Furioso* at the Pudding rooms, he himself playing the title rôle. Mr. Hayward still takes a parental interest in Pudding theatricals. The spirit of fun has been contagious, and there are now at Harvard several other histrionic clubs, the most notable being that of the D. K. E., which is a Sophomore society at Cambridge. The Pudding and D. K. E. performances lead not only at Harvard, but in college theatricals generally; and it is certainly greatly to Harvard's credit that her students besides being prominent in athletic sports are pre-eminent in these sportive entertainments, which at least border upon the intellectual and æsthetic, and certainly require a keen sense of humor and a due familiarity with the terpsichorean graces.

Mr. Lemuel Hayward may be likened to a histrionic Moses, who, smiting the Pudding rock, caused a stream of fun to gush forth. The stream reached New York in January, 1879. There had been Harvard performances in New York before then, but this was on so elaborate a scale, and was such a success, that thereafter college theatricals became a regular feature of the New York social season. The piece in 1879 was *Fair Rosamond*, and it was acted and sung with great *éclat* at the old Union League Club Theatre by a company of Harvard graduates. The performance also introduced the music of *Pinafore* to New York. *Fair Rosamond* was a roaring burlesque, but it was not the only funny feature of the entertainment, for between the acts an amateur orchestra made things hideous, a criticism which will probably not be considered invidious when the writer adds that he himself contributed materially to that nightmare of discord.

The cause of both D. K. E. and Pudding theatricals received great impetus from the class of '82, upon one of whose members, Mr. Evert Jansen Wendell, the mantle of Mr. Hayward may be said to have fallen. Mr. Wendell was Æneas in *Dido and Æneas*, a clever burlesque by Owen Wister, of Philadelphia, a grandson of Fanny Kemble. It was given here in 1882, and is remembered as the greatest hit in college theatricals. As D. K. E.'s, the '82 men had been to New York with *Kenilworth*, *Ivanhoe*, and *Der Freyschütz*, so that there were several familiar faces in *Dido and Æneas*. This burlesque bore the sub-title, *A Revised Version of the Æneid.* Prompted doubtless by their love of the classics, the "Puds" had gone to Virgil for their model. The result was Hasty Pudding, *sauce classique*. There was a certain element of daring in producing a revised version of the Æneid, for at the time it was done revision was not so much of a fad as it is now. Napoleon once expressed his admiration of Virgil in this neat epigram, "Si Homère a fait Virgile, c'est son plus bel ouvrage." No doubt the success of *Dido and Æneas* would have justified the Pudding men in changing the epigram so that it would read, "Si Homère a fait Wister, c'est son plus bel ouvrage." The burlesque literally bubbles over with what may be termed undergraduate fun—a delightfully direct species of wit. Of course the action had the classic story for a basis, but Dido, after ordering a pyre "for one," is obliged to countermand it, as Æneas, having discovered that his ships have become filled with sand, returns to her loving arms. The Trojan weeps so copiously, both before and after his arrival at Carthage, that he has to carry a bucket labelled "Tears" about with him. Whenever a particularly grievous pun is perpetrated, the altar in Dido's palace "blows up." Here are a few choice specimens from the libretto:

Dido. Oh! 'tis a cold hard world, and (*sitting down*) oh! 'tis a cold hard throne. But what of that? We are all thrown into the world except me, and I am wheeled on to the throne. (*The altar blows up.*)

Dido. Carthage must have temples.
Æneas. I don't see why we couldn't get along without temples. You never go to church.
Dido. I admit that. But Carthage must have ruins. Ruins it cannot have if it has not previously had temples. You know it must have ruins; for Marius is to sit in them.

Æneas (*turning to his followers after they have sung five verses of a chorus*). We will omit the next nineteen verses, and sing the twenty-third verse, in which the chorus is earnestly begged to repeat the last four lines.

Besides Mr. Wendell there were in the cast, Mr. Pendleton, a nephew of the late minister to Germany, as Dido; Mr. H. G. Chapin, of Springfield, Massachusetts, as Achates; and Mr. Richard D. Sears, the retired tennis champion, as Puer Ascanius. Mr. Wendell retains his interest in theatricals, and is a leading member of the Amateur Comedy Club, holding his position as much through his ability as through his popularity. He is well known in athletic circles, retaining the amateur record of the world at one hundred yards. Other Hasty Pudding men who made decided hits in college theatricals were Messrs. Philip and Herbert Sears, brothers of Mr. R. D. Sears, the first named being himself the college tennis champion, and Mr. Howard Taylor, the tennis champion.

The ballet made its *début* in college theatricals in *Dido and Æneas*. Dido's costume was a light pink gauze dress, with flesh-colored tights. Doubtless the real Æneas would not have mourned if the real Dido had been thus airily clad. In the burlesque at any rate the costume was a great success, and the ballet has now become a leading feature of college theatricals. It has been especially prominent in the performances of the Columbia College Dramatic Club, which has now been before the public some four years. *Pocahontas*, *Captain Kidd*, *William Penn*, and *Whittington Junior and his Sensation Cat* have been its chief productions, and it now has in rehearsal a burlesque entitled *Lafayette*. Mr. George Morrison is its librettist, and its leading lights are Messrs. Edward Fales Coward, who has deservedly the reputation of being the most brilliant actor on the amateur stage, Thomas Kelly, whose grace and beauty as the *prima ballerina* have already been spoken of, Robert Morrell, and Robert Cutting.

College theatricals are the most enjoyable kind of amateur performances of the present day, because while the amateur clubs are branching out into plays which should never be attempted except on the professional stage instead of confining themselves to bright society farces and comedies, in which amateurs cannot only equal but even surpass professionals, the college men adhere to the burlesque. These burlesques are generally written by a member of the club, who fits his players with congenial parts, and as a result college theatricals are given with a humorous *abandon* which cannot fail to exhilarate the audience.

GUSTAV KOBBÉ.

DAVID DOWS.

A COMPLETE biography of David Dows, who died at his residence in New York city on March 30th, would be largely a history of the economic development of this country during the last half-century. His active business life began before the age of railroads and telegraphs, and he witnessed and had personal experience in the gradual adaptation and practical application of those forces to commerce. His broadness of view, foresight, and courage enabled him to secure a fortune of many millions of dollars by taking prompt advantage of the changing and improving conditions in the revolution in trade brought about by steam and electricity, together with the general material growth of the nation.

He was born in 1814, in Saratoga County, New York, and was the eleventh of twelve children, equally divided as to sex. His father was a farmer who had been a soldier of the Revolution, and was directly descended from the New England Puritans. The first ancestor of the family in America, leaving behind him in England a brother who became a Captain in Cromwell's army, migrated to Massachusetts in 1630, and took part with Governor Winthrop in the founding of Boston. From the New England point of view, Mr. Dows's lineage was of the purest American strain. At the age of fourteen he left his father's farm, with what school instruction the locality afforded, and went to Albany to begin life as a dry-goods clerk. This line of trade seems not to have proved his proper element, as five years later, after some experience at Utica, he came to New York to enter the employ of his brother's firm of Dows & Cary, commission merchants. Here his successful career fairly began. Four years after, in 1837, he was admitted to the firm. In 1844 his brother died, and in 1854 the death of Mr. Cary left him in sole control of the business. He subsequently took his brother Ammi, and in 1860 Alexander E. Orr and V. D. Mairs, as partners, when the now long familiar name of David Dows & Company was adopted.

The main feature of the firm's trade was grain, and its ramifications grew wide and far-reaching. They included offices and elevators in Baltimore, Chicago, St. Paul, and other points, and had necessarily much to do with transportation matters. Mr. Dows was actively interested in the extension of railroads throughout the Northwest, and was officially connected with nearly all the lines in the grain-producing region. He was for many years President of the New York Corn Exchange, out of which grew the Produce Exchange, and contributed greatly toward strengthening New York as a grain mart and point of export. In finding investments for his vast wealth Mr. Dows became associated with many corporations—banks, insurance companies, etc.

During the war for the Union, David Dows & Company rendered valuable aid to the government in the collection and forwarding of supplies. They were important factors in the work of sustaining the armies in the field. When Secretary Chase asked the assistance of New York capitalists in establishing the national banking system, and bringing order out of the chaotic condition of the country's finances at a critical period, Mr. Dows was one of the number who helped essentially to inspire confidence by starting the Fourth National Bank with a $5,000,000 capital.

AN ANTHRACITE IDYL.

"Sure's the pur-rtiest lettle Irish gyur-rl that iver was bur-rn in Amurica," said Tim's grandmother. Tim sat on the steps, and his grandmother sat in the doorway, a white cap with large frills surrounding her face as the petals of a sunflower surround its great seeded centre. She might have been carved out of a hickory-nut, so brown and hard was the texture of her countenance, but big, bright, gray eyes, and wide, smiling lips that could never quite draw together over two enormous separated front teeth, helped, with a nose of true Hibernian pugnacity, to produce an effect of ugliness that was typical, and far from unattractive. In her exquisite cleanliness she contrasted strongly with the black fellow at her feet, who reeked of mine oil, and out of the creases of his boots and trousers scattered fine coal-dust upon her immaculate steps.

She was knitting a coarse sock, and kept the ball under her apron lest it should roll away; never looking at her work, but casting quick glances all around, not to miss whatever of interest might be going on in the neighborhood. Now and then she "shooed" away a cow possessing an undeveloped bump of locality, or a predatory pig whose appearance betokened riotous living, though not wasted substance; and sometimes she shouted, in her rich, deep-throated brogue, at reckless infants who sat in the middle of the road, facing an approaching coal wagon as calmly as if it were the car of Juggernaut, and they its self-destined victims. But with all this care over the outside world, Granny Grant was not oblivious of the nearer and dearer interests within her gates. The mere surface of her mind—her outer senses—took note of pigs and babies; deep below were the real faculties at work, and from out these depths came the sentiment which we have heard her express on the subject of Rosy, eldest daughter of Mrs. Burke, their next-door neighbor but one. Rosy was often granny's text, and Tim had ever been a willing audience, even suggesting new heads to the discourse or developing those he deemed too lightly touched upon; but to-day he hardly seemed to be listening to the oft-repeated panegyrics; he sat with head thrown back against one of the rough supports of the porch, mum, and gazing at nothing in particular.

Granny took up a clay pipe that lay beside her, puffed it vigorously into life, and went on talking through drawn lips. "Yis, Rosy's a pur-rty gyur-rl." Then, in a discriminating tone, twisting her head from side to side, and screwing up her eyes: "Et's not to sa-ay that her *fa-ace* is pur-rty, it's the *look* she has from her fa-ace. An' wheriver ded she acquoire thaht look? Et's not her *pe-rints* as gev et to her. Frank Bour-rke ez as oogly—as oogly as iver I seen a mahn wid a nose on um, an' God knows her mahther ezn't mooch fer shtolle." Which crushing criticism needed no heavenly witness to corroborate, but only a glance at the woman herself as she hung over her gate, with hair first cousin to the fretful porcupine's quills, and attired in a not overclean gown, whose cut displayed mercilessly what granny called "her endeshcroibable shlobbiness."

Mrs. Burke cared little for Granny Grant's opinion, or for public opinion either, which in those parts generally meant the same thing. She cared whether or not her children were run over in the road, and was endlessly screaming to them to "come out o' thaht, or I'll lick ye," to which injunction, with its accompanying threat, they paid little heed, however, "thaht" being present and perennial, while a licking bore the vague, uncertain character of all futurities. She also cared to have her husband's dinner pail well filled in the morning and supper ready for his home-coming at night; but more than aught else did she care to get her washing out before any of her neighbors, and for the sake of indulging this favorite whim would rise while it was yet night, in emulation of that uncomfortably virtuous woman who was King Lemuel's mother's beau-ideal of a daughter-in-law. Moreover, moved thereto by the same ambition, she invested half a week's wages in a washing-machine, to the deep offence of granny, in whom economy joined with conservatism to make her condemn "an expinsive theng that's no good but to kape oop a divilish squ'akin' and wa-aste good sawp, an' diz awa-ay wid the use o' the hands what God A'moighty fur-rnished ye."

One other item closes the brief list of Mrs. Burke's objects of pride, to wit, Rosy's white petticoats, of which that young lady owned more betucked and beruffled specimens than all the other girls together who dwelt in the seventy-four uniform cottages, single and well painted, that made up the aristocratic neighborhood known as Empire Row; and, strange to say, Granny Grant, who could bemoan the waste of good soap in "haythenish" washing machines, and who made herself intolerable at times on the general subject of thrift as *not* practised in the Burke household, found no fault with what she evidently considered indispensable to an Irish girl's wardrobe. Indeed, it is not unlikely that she regarded Rosy's superfluous petticoats as dowry, thinking her the more eligible for Tim in proportion to the number of such articles which she could bring along with her.

But Tim took no interest in the bravery of those rustling ornaments about his sweetheart's feet. He would have kissed the feet, and given away in advance all the neckties he ever expected to own to anybody who could have assured him that Rosy did not look upon him with indifference.

There was a time—not very far back either—when he knew she did not. He had known her all his life; they had sat in the road as infants and thrown coal-dust in each other's faces; they had wallowed in the same ditch, and sailed chips together upon the pond formed by escape water from the nearest mine. If the French proverb be correct, that "who teases, loves," then he must have loved her before the bones in their legs had hardened, for surely Kathleen O'Bawn never suffered more from her ardent Rory's attempts "to plaze" than did poor Rosy when little Tim Grant used to creep over on all-fours to torment her in ways peculiar to himself, such as sticking twigs in between her bare baby toes, poking pebbles and ashes down the neck of her gown, or—and this was the sorest trial—licking her dirty chubby face all over with as little mercy as an old mother cat who thinks bath-time has come shows to her kitten.

When Rosy was able to get up and run away, Tim was obliged to invent new methods of torture, though he still licked her face whenever he got the chance. On being catechised by his grandmother as to why he did so, he replied, "'Cause she allus has 'lasses on her," which was not far from the truth, albeit as a reason for his conduct the statement had no cogency whatever, since Biddy Hart, who lived between the Grants and Burkes, was literally smeared with molasses from morning till night without offering the slightest temptation to Tim's "sweet tooth."

After a while Rosy began to go shod, and to wear her "towsy" light brown hair in broad braids tied with ravishing blue ribbons. Tim, though not a connoisseur in white starched petticoats, had a decided eye for color, which developed itself in an early passion for neckties, and his admiration for Rosy's blue ribbons was so great that he never left one on her hair if it could be gotten off, which deed was sometimes accomplished by fraud, but oftener by force. He himself much preferred the latter method, since the inevitable tussle usually ended by his getting her into his arms, and making her "show her corn"—*corn* being Master Grant's euphemism for *maize*, a term ironically applied by Rosy's father to her white, even teeth. Rosy would resist to the death, but all efforts at keeping her mouth shut only resulted in more bewitching positions of the lips, which to any one understanding English said plainly, "Kiss me, if you dare," and Tim was not without a reasonable amount both of daring and English.

The invariable finale of these ribbon fights was a prolonged shriek from the victim, which displayed every kernel of "corn," from dainty incisors even to the last molar.

Ah, those were blissful times! But all was changed now. Rosy had become a school-teacher, and a school-teacher was in Tim's opinion something truly awful. He had put away such childish things as books at the age of fourteen, and he was now twenty, but it would take a good decade to obliterate from his mind certain impressions received at that hall of learning known as the "Fifth Districk." His ineptitude for study and his readiness for mischief would naturally have placed him among those pupils classified as "troublesome," but that an innate reverence for knowledge *per se*, quite unconnected with any acquisitive thirst, and a reverence amounting to awe for the hired dispenser of knowledge, kept his spirits in check and such mind as he had in a tolerably receptive condition.

But to these admirable motives must be added one not less admirable, namely, a desire to keep up with Rosy Burke. It remained a desire only; for although she was nearly a year his junior, he could never bridge the chasm that yawned between himself, wallowing in the vexations of multiplication, and her whose serene intellect the Rule of Three could not bother, nor practice drive mad.

Through successive promotions Rosy was at length rapt away into the upper heaven of Grammar A—a heaven utterly unattainable for Tim, who withdrew from school soon after entering the B room, and began his own support at slate-picking, only to feel more and more separated from Rosy, as she went winging her flight yet higher, alighting at length upon that top peak—the High School. He could never explain to himself how the separation grew, nor the exact point of time when he was first conscious of it. Who is there that can put his finger on such a point?

There had come a day when Tim actually found himself marching up the school-room steps behind Rosy, yet not daring to so much as tweak her long thick braid, with its delightful "fluff" flowing out beneath the fascinating bow of blue. When had he pulled that braid or stolen that ribbon? It was only yesterday. What had happened between to-day and yesterday? Nothing that Tim knew of. Time had passed; that was all.

After he once began to perceive a difference in Rosy, it was wonderful how many things came to substantiate it in his mind—things unnoticed at the time that now crowded around his bar of judgment, all too eager witnesses to signs of variation and quick change in the mistress of his heart.

Tim was far from being of a jealous disposition, and even had he been so he could have found little cause for jealousy. It was not that Rosy looked at any other boy, but that she did not look at him; that is, not so much as she used to, and when she did in such a queer way. Tim thought there was no sense in a girl's looking that way. Why couldn't she hold her head up, and give a fellow a square eyeshot, the kind he always gave her? But suddenly—or was it gradually, he could not tell—she must take to glancing at him sideways, like an old hen, or after the fashion of granny's tabby-cat, pretending not to see him at all, with a superior air of seeming to say, "I'm here, but you're not there."

But this was not all, nor the strangest part, either. What puzzled Tim most was the occasional thawing out of Rosy's manner. The times she chose for thawing out were very inopportune times for him. If ever he took special pains with his toilet, arraying himself in the full glory of store clothes, boiled shirt, and a cravat the latest and most flagrant marvel of aniline, these seemed only as signals for a certain charming nose to turn up even more than its Celtic origin would warrant, followed by a chin whose soft under fulness had often in bygone days mirrored the dandelion in assurance of its owner's predilection for butter, and which could now hardly express more than the merest shadow of anything so ungentle as scorn.

But let him happen to be in a particularly disreputable mining suit, and black past recognition, then it was that his fair neighbor saw fit to recognize him, and with just enough of the old effusiveness too to make him wild for the sweet revenge of bestowing a good black hug that would leave its mark on her dainty freshness.

Before Tim attained to the advanced position of "outside" mule-driver, Rosy graduated with high honors, and shortly thereafter shadowy rumors began to float about of her having passed a superintendent's examination, and applied for the primary department of Ironbrook School.

These rumors first spread themselves like a thin veil over Tim's sky, casting upon all things that light which is like a certain fearful looking for of change; then suddenly they gathered into a black cloud, which burst with the thunderous news that Rosy had gained the place she sought, and was indeed a teacher.

It would be difficult to describe the exact condition of Tim's mind at this point. His granny, in what was intended for low tones (she was incapable of a whisper), confided to Mrs. Hart, leaning over the fence and knitting the while, that "he was hur-rted in his faylin's to an extint that tuk the varry ta-aste oot o' pay-tates"—an extent of hurt truly alarming to any one who knew of the elective affinity existing between those underground esculents and his palate. Tim himself in the pregnant words "all broke up," perhaps sufficiently expressed the totality of wreck which the view of his inward state would disclose.

Had Rosy been made Empress of all the Russias she could not thereby have acquired a more transcending dignity in his eyes than she now possessed as a "school-marm." His awe of her high office set her apart as upon a throne, and invested her with robe, sceptre, and crown. Rosy was one who knew things! She could explain "sums," and hear lessons without a book! Also she had authority (under the principal, of course), and might thrash—judiciously.

This idea of remoteness was intensified by her boarding at Ironbrook and spending only Saturdays and Sundays at home. Tim did not know which he dreaded most—the dull pain, the "sorrow without torment" of her five days' absence, or the exquisite anguish of seeing her, or at least knowing that she was near, from Friday night until Monday morning. She boarded with Mrs. Hugh Wilson, who represented the top cream of Ironbrook society, and small airy tatters were very busy in carrying word of how Rosy was "making a regular mash of it" over there.

Once, after she had smiled upon him at intervals all day Sunday, Tim plucked up heart and made a pilgrimage to Ironbrook the very next evening, only to call himself a fool for doing so. In the first place, Miss Burke had on her best company manners, of which it might be said that, like her petticoats, they were able to stand alone. Then Tim, who had spent one solid hour in his adorning, and felt himself irreproachably clad, was mortified to the dust to find all the Ironbrook fellows wearing that style of collar which conceals the existence of a larynx, and is called "Piccadilly," while he was still risking assassination from a three-inch "cutthroat." Lastly, he was subject to the horror of encountering two teachers instead of one, for the principal was also making a call at the Wilsons', and talked upon matters connected with the school, to which conversation Miss Burke contributed her share in a way that was appalling. Moreover, she had a private talk outside the door with the principal, who was plainly heard to say: "All right. I'll thrash him for you!"

Now Tim's moral system was at a low ebb, owing to the utter downfall of self-respect caused by his discovery that cutthroats were "out," and these ominous words of the great man made him wince.

What was more likely than that Rosy should enlist a powerful champion as skilled in the manly art of thrashing as Mr. McKenna to rid her of a suitor whose room was evidently preferable to his company?

When she came back smiling, and told Mrs. Wilson that Mr. McKenna was going to settle Jakey Decers for her to-morrow, Tim felt safe in his skin again; but possibly the consciousness of being where you are not wanted is more uncomfortable than the prospect of breaking your enemy's cane by the hardness of your skull. At any rate, Mr. Grant thought best to withdraw before his bodily substance had become so infiltrated by Miss Burke's calcareous smile as to render him valuable to dime museums as "a *bona fide* fossil man."

Once outside, he crumpled his obnoxious collar with both hands, as if that innocent structure of triple linen was solely responsible for every disagreeable incident of his visit; after which he felt somewhat better, and resolved never to go there again, anointing his wounded self all over with the mollifying thought that when Miss Burke should return for her next two days' stay at home, *he* would try *his* hand at the petrification business. He alternately amused and comforted himself for several days with highly-colored mind-pictures illustrating conversations which richly set forth his own skill in sardonic repartee, and cruelly exposed her feebleness of wit.

However, as Friday evening approached, he began to have an unpleasant sensation of being pulled two ways at once, and while still rehearsing his carefully prepared speeches, and practising looks and attitudes expressive of withering contempt, he would have welcomed a water-spout, a cyclone, a general cave-in, or any other casualty that might temporarily release him from the necessity of assuming his new rôle before a public which, being concentrated in a single person, aggravated his self-consciousness, and produced premature stage fright.

It is in such a condition that we find him at the opening of this history, leaning back on the steps, and hearing his grandmother's animated speculations as to the origin of Rosy's "loo-k," as if they were but the whirrings of the fan house, or the rattling of coal down the iron shoots. Granny Grant enjoyed talking for talking's sake, looking not for base rewards in the form of sympathetic response. She talked not as one who is in feverish haste to empty herself of perilous stuff, nor as one merely possessing a morbid desire of communicating something; nor, again, as one who fears that time will not hold out; but rather as if she had all the time there is, and more too, her speech gliding on with a rich serenity, a continuity and copiousness which seemed like so many assurances of faith in a future existence, and in plentiful opportunities throughout all eternity for saying anything that might chance to be left unsaid here below. This made her a delightful companion in case one did not wish to talk one's self. Tim did not wish to talk just now, and his preoccupied air was far from being an annoyance to his grandmother, since it offered no check to the simultaneous flow of ideas and words.

Having passed judgment in the few cutting words recorded above upon the scant claims to personal beauty possessed by the heads of the Burke family, she went on to discourse more at length upon certain domestic and social traits of theirs which many years' propinquity had brought to her notice.

"Thim Bour-rkes, lavin' oot Rosy, ez the foolishest folks iver was anny-wa-ay," said she. "I don't see how the Lor-rd A'moighty cud 'a' ma-ade oop hes moind to ma-ake 'em. He must 'a' been grea-atly shtrook at the toime wid the desoire to crea-ate, widout havin' jist the roight shtoof fer the purpose at hand. Why, they're wuss nor clenkers, 'cause thim ye can pound oop fer roa-ads, but et's a bahd sor-rt o' fittin' or whaylin' ye'd git over sich a wohblin' boddy as Frank Bour-rke. An' as fer Ja-ane, ye cud la-ay her cross-wa-ays on a hill fer to ketch the wagin' whayls an' rist the bastes awhoile; she'd niver wear oot in a hunthered year. She ain't no more fet to breng oop cheldern than a siven-month ba-aby. God knows, she's hed enoof of 'em, but soom pessons niver lear-rns. Why, last wenter was a year, whin Ann an' lettle Mikey was seck wid dipthiry, an' grea-at ulsters doon their troa-ats the wuss sor-rt, what do ye thenk thaht levin' cratur' of a wumman ded? She ded this: she wint to the sur-rcus, an' lift thim youngsthers all be thimselves, only their lettle brathers an' sesthers, an' soom o' the neighborin' cheldern what ketched the ulsters from 'em, an' they all wrapped oop in kerosene rags, an' a-playin' aroun' the foire, an' no wan but the Howly Var-gin a-kapin' 'em from exsh-plodin', an' their mahther awa-ay enj'yin' hersilf en the medst o' howlin' wild bastes an' haythens, what's got more hayer on their heds than dacency anywhere else; an' a-lukkin' at thim in nahthin' but their own skens, lavin' out a bet o' penk or grane selk, what 'ud be as good awa-ay. An' thim a-wokkin' on the saylin', an' a-shtandin' on their heds widout hur-rtin' 'em, 'cause there's nahthin' en 'em to be hur-rted. An' Frank he goes alahng wid 'er shtid o' kapin' to 'is wor-rk, an' whin they coom bahk I'm bilst ef he ain't tepsy, an' thim poor cheldren seck an' sofferin' an' gettin' ento meschief; an' it's me an' Mis' Har-rt as lukked afther 'em, a-runnin' en to gev 'em a dawse o' kerosene noo an' thin. An' I says to um, says I, 'Et's a murtherin' shaame as ye can't kape sthra-aight whan your own cehlds ez a-ailin'.' An' says he, 'Do ye thenk I'm dhrunk?' An' I says, 'Sure, an I don't thenk, ye're bastely sawler.' Nor he wasn't, nayther; an' thin whin lettle Mikey died—wid chokin' to death wid the ulsters on his throat an' the pay nuts an' the pop-corn what his mahther gev um, thin they must have seen a waake as ye niver seen; an' the convent cufant a layin' oot wid candles, an' a white coffin all dicorated wid flowers, an' a white hearse an' white hor-ses to dhraw et, an' a loine o' kerrige wagins what nd maake the sare-cus mor ritified to shew et silf, an' Frank an' Jaane a-wapin' an' a-pukin' oot behind their handkerchiefs to show their grafe—ow ch!" And granny dumped the ashes out of her pipe as if it was one of the seven vials of wrath.

"Noo ther's Rosy," she went on, and her tone softened with her theme. "Ye wudn't thenk she'd a bet o' their shtoof en 'er—wud ye? She's a maate lettle pesson as iver was, *she* ain't wan o' the shlatterin' sor rt. Why, whin she was a wee baaby I usn't to b'lare they got her roightly, though I was at the layin' in mesilf, an' gev her the feest shpankin' she iver got, to maake sure she was aloive; but she growed oop thaht defferent from thim what's about her that I says oftentoimes to Jaane, says I, 'Sure 'n' Rosy's not your own enfant; somebody's wint an' chaanged her.' An' Jaane she got teatin' mahd every toime I told her thaht, an' says she, 'It's yourself as chaanged her, thin.' Howly Saaints! an' me a-countin' on that blissed baaby iver seuce before she come ento the worrld fer me gran'dahter; supposin' she dedn't turrn oot to be a by, what wud I be a-chaanglin' her fer?

"But she was ahlways defferent. I niver seen the exthryordinary waay she tuk to books, an' to luk at her at foive year a-standin' oop, wid her rag baaby en her arrums an' her layer en lettle reng-currls, a resitin verses loike a praste! What's thim verses, noo?

'The by stud on the bur-nin' deck

(an' a leg fool he was, sure), but to see her saay 'em—ow! et was par-rty.

"Ye'd jist know she'd tur-rn oot a school-taycher, an' a foine theng 't ez to be enstructin' cheldern. I wis' ye wudn't taake on about et so. Rosy's jist as fond o' ye as she iver was, an' it's the troot I'm a-saayin'. I seen her last Sunday was a fortni't, a-pukin' oot the windy as shloy's a caht to ketch a soight o' ye all dhressed oop in your new claws, an' whin ye putt your haht on the bahk o' your hid, to wan soide, I jist heerd her saay, 'Ain't he a daaisy fallow?'

"Noo, Tem, ye mustn't be so poor-hear-ted; gyurls ez quare thengs sometoimes. They're jist thaht contrairy ye can ahlways taake 'em to maane what they dedn't saay, an' whin they'll not look at ye, et's themsilves as 'll be a-lahugin' for ye to enquoire the rason."

This shameless "giving away" on granny's part of her own sex was not without its effect upon Tim, whose dull ear had been just awakened by the flattering remark alleged to be Rosy's, but which in truth was only a flower of fancy from the fertile soil of granny's own mind, and then roused into eager attention by an *exposé* of feminine inconsistency finely calculated to act as an alterative upon his relaxed masculinity. For some occult reason—one of those things undiscoverable by any fellow—Rosy was trying to make a fool of him, and he had been tamely consenting to the process. To think of his weakening after all those resolves taken on and since Monday night! But *now* let Miss Burke appear! Let her be rigid with starch and stateliness! Let her—

At this moment was heard a brisk, clattering sound, suggestive of a gentle wind in sails, or the flapping of a sheet stretched out on line to dry and sweeten in the sun and breeze. It was caused by the little boots of Miss Burke tap-tapping against her petticoat as she tripped along the hard coal-ash walk; but for all its gentleness it came with the force of a command to "fire!" and forthwith Tim shot like a ball from a cannon's mouth through the door, right over the head of his grandmother, who calmly adjusted her cap frill, remarking to Rosy that "she'd betther not go about turrifyin' young min thaht waay or she'd have somethin' t' answer fer."

On Saturday morning Tim made an early escape to work, and at three o'clock "shnaked bahk," as granny said, like a runaway slave, felicitating himself upon his successful avoidance of that fair-haired Gorgon who dwelt temporarily at No. 18.

But between three o'clock and bedtime there are a dangerous number of hours and minutes, and while making his toilet Tim resolved to go down to town, a way of spending Saturday afternoon not unusual with him, although of late he had preferred hanging about home, in the hope of catching glimpses and glances which were at once exasperating and delicious. Yes, he would go to town, and come back late, and retire early, and—well, and trust the saints for his future safety.

Passing a drug store he was reminded of the healing property there is in soda-water for a wounded spirit, and straightway walked in upon Mrs. Hugh Wilson and Miss Burke regaling themselves at that fountain of froth and "fizz"; so he betook his wounded spirit to the street again, hoping he had not been seen. Walking aimlessly about, he stumbled no less than thrice upon these two seemingly ubiquitous ladies, who smiled graciously at him, but not with the smile that says, "Won't you join us?" So the disheartened youth strolled homeward, concluding that this world offered no asylum for poor hunted wretches like himself.

Miss Burke attended early mass on Sunday, being not less pious than pretty. Tim was enjoying "forty morning winks" as she went clacking by; but that petticoat music mingled with his dreams in a way that made waking seem a cruel transition from paradise to purgatory. Still he ate a fairly good breakfast, and time somehow wore along. The day of rest performed well what would appear to be its chief function, namely, to enforce the blessedness of that portion of the primal curse which promises no other sauce for bread than the sweat of the brow. "Blue Monday" approached, clad in the rose-colored robe of all to-morrows that hold out the hope of change from present misery.

In April, when the sun shines warmly, four o'clock in the afternoon is not a bad time for a walk. Tim found it much pleasanter in the marshy meadows than remaining a prisoner in his own house, a butt for his grandmother's choicest ridicule. He climbed a grassy hill, and sat down upon the ridge, with his back to the big town lying hazy by its winding river, while before him rose a dark mountain wall stretching from east to farthest south. Throughout the whole length of the narrow valley at his feet was an almost continuous chain of breakers with their attendant culm heaps, jetty in the near foreground, but taking from distance the rich hue and bloom of a purple plum.

A strange spectacle with a charm of its own! But Tim had not climbed that hill for a spectacle; he went there for peace and quiet, and a chance to make his mind up once for all. His mind, however, preferred remaining "in the raw," and utterly refused to submit to the process of manufacture. His attention would not be drawn inward and concentrated; it flitted like a butterfly, alighting at length upon a smiling spot of pink at the foot of the verdant slope. This was a wild crab-tree jubilant with budding promise. No bee ever flew straighter to its favorite honey pot, lured by the color signal, than did Tim fly toward this vast posy.

The tree stood in a corner of the meadow, nearly surrounded by a natural hedge of thorn bushes and sumach. Its few leaves were of the newest green, but their brightness only served as an unobtrusive setting for a million buds, whose form, texture, and ineffable hue have but one counterpart in nature—the little dainty cushions underneath a baby's toes.

Tim gazed at the sight which one might think even a cow could not pass unmoved. He was wondering if he had enough daring left to take home a bunch of these beauties to a certain person, when a singular shaking movement among the branches made him step nearer and look more closely up into the thick blooming mass. Somebody was there, sure. A girl, too, for he saw a glimmer of white.

"Hello!" said Tim, in telephonic greeting; but no responsive hello came from the tree.

"What you doin' up there?" he asked.

A faint voice came down to him. "I'm caught! I can't get loose."

Tim parted the branches. Seated upon a stout limb, with her feet in a crotch, was Miss Burke. At first sight there appeared to be no reason why she should not descend at her will, but he soon discovered that a strong linen lace on her petticoat's hem had fastened itself upon one of the huge thorns of the tree, quite beyond her reach. Both thorn and lace refused to yield, so there she sat, surfeited with sweets, like a cat drowned in her coveted cream.

"Hello!" said Tim again, when he saw who it was. A sudden change had come over him. This was no longer Miss Burke, assistant teacher of Ironbrook school; it was Rosy, and he was Tim the tease, once more.

He felt not in the least hurry to help her down. She could not possibly look prettier anywhere than she did up there, with her sunny brown head against a bewildering background of blossoms, between whose shell-pink clusters tiny odd shapes of tender blue showed themselves. She was safe, too. He had her, so to speak, and he meant to keep her as long as he could. So he leaned against the trunk, comfortably crossing his arms upon a convenient lower branch, and proceeded to make himself agreeable.

"How long you been here, Rosy?" said he. "Ain't you gettin' some tired? Better come down."

Rosy gave a tug at her skirt. "I can't get loose."

"Oh, that's what's ailin', is it? Well, you see the tree ain't content wid bein' as purty as 'twas made, it wants all the more purty it can git," replied Tim, whose progenitors had kissed the Blarney Stone, and transmitted its effects.

"Oh, you!" said Rosy, in a tone that might mean a dozen things, but which Tim construed as meaning one thing, so he went on:

"I *thought* 'twas lookin' mighty smilin' when I seen it up on the hill, so I come down to find out what 'twas smilin' about. Don't blame it, neither. Guess I'd smile too if I was the tree." Here he received a shower of buds full in his upturned face. "I say, don't ye be peltin' me that way with them hard things, 'nough to break a fellow's head. *Look* here! I seen a swarm o' bees when I come down, all flyin' this way. The head one he says, 'Smell a new kind o' flower down yonder, sweeter'n honey; le's go have a sting at it.'"

Just now, in terrible corroboration of Tim's words, a huge bumblebee, with rich premonitory a-zum-m-m, swung heavily in among the flowers right over Rosy's head.

"Oh, Tim, take me down—take me down! Oh! oh! I'll be stung all over. Oh, Tim, *please* take me down!" shrieked Rosy, dodging this way and that, and holding out two entreating arms that would have weakened Tim's heart at once if he had not been so tickled with the thought of having her at his mercy.

"You be easy, now. Bumblebees don't sting." He looked over his shoulder. "That swarm must 'a' got on the wrong track. Don't seem to be a-comin' this way yet. I say, Rosy, you do look awful purty there. Guess I'll climb up and take a kiss."

"No, you shan't," said Rosy, filling her hands anew with blossoms.

"Now you know that can't do me no harm," said the heroic Tim, looking up with unflinching countenance at this would-be engine of destruction preparing to discharge its dainty projectiles. "You jest throw me a kiss instead o' them things, and then *maybe* I'll let you down." The red lips pouted. "There, I see the kiss a-comin'; it's most out. Jest help it along a leetle, won't you?"

"*Oh, Tim!*"—in an exasperated tone—"hold your tongue, and go away."

"I won't hold my tongue, nor I won't go away, nor you don't want me to, neither. How'd you git down if I went away?"

"Well, help me down, then."

"I will if you'll give me a kiss first."

"You don't dare to kiss me."

"*Don't* I?" And Tim began to climb the tree.

Rosy tore off one of the less obstinate thorns and presented arms. Tim paused, seated himself astride of the limb where his elbows had rested, took out his pocket-knife, and cut off the largest thorn he could find, then held it out menacingly in imitation of his fair foe.

Rosy smiled; naturally Tim smiled too. Then Rosy burst into a peal of laughter, and for a while the tree shook with their combined cachinnations. When this timely mirth had subsided, Tim started a fresh subject.

"I say, Rosy, you didn't treat me so very well when I went over to Ironbrook that time. Never seen anything stiffer'n you was."

"I wasn't stiff," said Rosy.

"Wasn't you, though? Then a corpse is limber. Well, you made *me* feel stiff, anyway; kind o' thought I was laid out in my coffin—cold chills all runnin' up and down me. What made you act so, Rosy?" Tim was realizing to the full the advantages of his present position, and waxed bold beyond imagination. "'Tain't a nice way to treat a fellow you've always knowed. What makes you do it?"

Rosy appeared to be tracing out cabalistic figures upon her palm with the whilom threatening thorn; she looked grave, not to say cross. Presently, in her starchiest tone, "How did I treat you?"

"Now look here! I don't want none o' your nonsense. I won't stand it, nor I ain't a-goin' to tell you how you treated me, neither, 'cause you know's well's I can tell you, an' you meant to do it, an' you're meanin' it now." Tim spoke with great severity, for he wanted Rosy to think he was angry, but twinkles twitched at the corners of his mouth and under his eyelids. The latter he managed to conceal by keeping his eyes down, but the feathery red line upon his upper lip left the former cruelly exposed. He *had* been angry, but who could be so now, with little bird in bush and hand at once? He felt perfectly sure of her, but he would not let her know it—not just yet. It isn't every day in the year that you can catch your sweetheart up in a tree like this: the pleasure must be lengthened out. So he was sternness itself as he went on: "I tell you what, Rosy, a girl can play one too many tricks of this sort. A fellow gits kind o' disgusted after a while. He says to himself, '*That* girl ain't no good; she's all slaty; she won't light a fire worth a cent.' So he goes off prospectin' fer a vein what'll pay fer the workin'. Now, if you think I'm a-goin' to marry you—"

"Who's talking of marrying?" snapped out Miss Burke.

"*I'm* talkin' o' marryin'," replied Mr. Grant, calmly. "That's what I come here for."

"Well, *I* didn't."

"What *did* you come fer, anyway?"

"I came to pick flowers, and have a good time all by myself."

"You don't seem to be havin' such a very good time."

"I was having it till you came."

"Oh-h!" said Tim. "I guess I'll quit." And he made as if he were getting down.

"Don't go and leave me. Help me down first," implored Rosy.

Tim relented slightly. "All right, but you've got to promise me something before I do."

"What's that?"

"Promise me you'll marry me."

"I won't no such thing," said Rosy, forgetting her school English in the heat of contest.

"Then I won't let you down." And Tim the tease reseated himself, leaning back, and twirling what he had hopes would one day be a mustache.

The sun was sinking now behind the green hills, but the upper half of the crab-tree yet glowed with its parting beams. Rosy's head was in this more favored portion, and her light frizzled hair formed a misty golden *gloria* around her brows. Tim sat in the shadow with upturned eyes, like an adoring worshipper before a shrine.

Soon the sun disappeared, the glow vanishing with it, and a little shivering breeze went through the tree.

"It's getting cold," said Rosy. "Please help me down."

"Any time you like," replied the amiable Tim, not stirring an inch, nor moving his eyes away from her face. An almost overpowering odor from the myriad buds filled the cool air. "Smells nice here. Guess I'll stay all night." And he folded his arms serenely, closed his eyes, and pretended to snore. The next moment Rosy began to cry, the trunk against which Tim leaned trembled with her sobs, and all the pink buds quivered in sympathy.

Tim was suddenly revealed to himself as an inhuman monster. In an instant his feet were upon the limb where he had been sitting, and his arms were where they had been aching to be for a longer time than he could tell.

"Rosy, Rosy, don't you cry, Rosy! I didn't mean to make you cry. I deserve a lickin', I do. Put your head on my shoulder, Rosy darlin'." But it was already there, the dear little head, with its soft curly hair close against his cheek and neck, the tears falling upon his Sunday suit—happy Sunday suit!

That strong shoulder under its cloth coat was quite the most agreeable place for a good cry that Rosy had ever found, and she did not try very hard to quiet herself, but kept on uttering gentle, hysterical sobs and sniffs, because it was so pleasant to have Tim patting her as if she was a baby, and saying, "Sh-sh!" and, "There, there, don't cry!" But at length she managed to speak.

"Let's get down," she said.

"All right; but I must stick to my word, you know," responded her high-minded lover. "I *said* I wouldn't let you down till you'd kissed me and promised to marry me, an' I won't."

A very wet face was lifted to his, the kiss bestowed being perchance a trifle salt for a critical taste, though Tim seemed wholly satisfied with it.

"Now say you'll marry me—quick," said he, for love's wine was warm in his veins, and the branch had become a rather unsteady footing. Her answer came with all the promptness he could desire:

"Of course I will, Tim dear. Who else would I marry if not you?"

Tim raised himself up to the next notch, reached out a trembling arm, and disengaged the lace from the thorn that held it so obstinately. In a few moments more they had both descended out of their roseate cloud-land, and stood upon common earth again.

Rosy had given her promise, but she made Tim wait a year for its fulfilment. He must be getting better wages, she said, before they could marry, and she herself must teach some more to lay up money toward a trousseau and house-furnishing. Such thrift and moderation delighted granny, who made daily public rejoicing that her grandson was "kaapin' company wid a gyurl what had her wets about her, an' dedn't maane to go floppin' ento widlock loike a hin wid its hid off."

THE LATE VICE-ADMIRAL ROWAN.

VICE-ADMIRAL ROWAN, who died in Washington March 31st, at the ripe age of eighty-five years, had an unusually brilliant and successful career. His record covers a period of sixty years' service in the United States navy, and he was probably the only officer in American naval history who enjoyed the honor of promotion to two ranks on the same day—those of captain and of commodore. He participated in three wars with distinguished honor, the Seminole, the Mexican, and the civil, and in the last his achievements take rank among the greatest of that trying time.

The deceased admiral was born in Ireland, in December, 1805, and coming to this country in early life, he was appointed, in 1826, to the Naval Academy at Annapolis, from Ohio, where he had been for some time a student at Oxford College. He was promoted to passed midshipman in April, 1832, and during the Seminole war he cruised in the sloop of war *Vandalia* on the west coast of Florida, being placed in command of frequent boat expeditions and operations on shore. Commissioned as lieutenant in 1837, he passed several years on coast-survey duty, and then took an active part in the war with Mexico, being present at the capture of Monterey and San Diego, where he landed and hoisted the American flag July 29, 1846. He commanded the naval battalion under Commodore Stockton at the battle of the Mesa, Upper California, in January, 1847; took charge of a landing party that made a successful night attack on a Mexican outpost near Mazatlan; and he was executive officer of the sloop *Cyane* when she bombarded Guaymas, captured twenty Mexican vessels, and destroyed several gun-boats. Later he commanded an expedition into the interior of the country, which defeated a large force of the enemy.

After serving on ordnance duty, 1850-53, he was promoted to commander September, 1855, and appointed to the store-ship *Relief*. In May, 1861, he was appointed to the com-

able option of coining silver for private account before the option was available. In so doing, Congress deprived the people of a reserved power before the occasion for its exercise had arisen, and thus abused the functions of representative government. No man, acting as the agent of another, would dare to make a gratuitous surrender of any of his legal rights; but here the legislative body did so for the community at large, and the community was bound by its act. How a majority was found in Congress for such a measure would pass comprehension, were it not remembered that for ten years the country had been confused in its notions of the dollar by giving the legal tender quality to a government promise to pay.

If the law had been left undisturbed, and in course of time silver had declined so as to make it practicable to bring it to the mint for coinage, one of two results would have 'ollowed. Either the coinage of silver would ave worked well, in which case nothing nore could have been desired, or it would ave worked badly, and the people themlves would have called upon Congress to ange or to repeal the law. Supposing the w actually repealed in this manner, no ound for dissatisfaction could exist. But course adopted was certain to breed dislsfaction, and it did so, with many pracl difficulties in addition. In five years m the time that the silver dollar was pped, it was restored to the list of coins and to full legal tender; but owing to the fall in price in the interval, it was coined only on government account, and to a carefully limited extent. Within a year after this restoration the paper currency of the country was brought to par in gold, and it has been maintained there ever since. Silver, however, has sold lower and lower, causing constant uneasiness as to the amount of silver dollars that could be kept afloat at par with gold, as can be readily understood by the fact that we have now some 364,000,000 of silver dollars, full legal tender, and worth in gold only 75 per cent. of their nominal value. At times this anxiety has been serious; but the large decrease of national bank-notes in recent years has been attended by an increasing need for currency, and this conjuncture of circumstances has happily floated the silver safely.

It is important to consider our silver difficulty with reference to the wants of this country first and chiefly. We are to get over the blunder of our Congress in 1873 in our own way. The situation ceased to be a simple one when the continuity of the provision for silver coinage was broken, and subsequent events have made it very complicated. The difficulties of the subject have been keenly felt by successive Secretaries of the Treasury, and they have made suggestions in consequence; but down to last December their remedy was one which the people would not accept—the stoppage of silver coinage. Instinct and interest alike opposed this remedy, and they form a combination hard to overbear. Experience, too, has removed some of the objections which were made to this coinage. Notably, the old argument against silver dollars, that they are too bulky, and only fit for the poorer nations, is repeated in vain in a community where every man carries the silver certificates in his pocket. None the less, there is a danger in continuing our present system. No one knows when the silver coinage will become too great for stability at par with gold, but every one knows that the day may come, and with it the overthrow of our monetary system.

Secretary Windom, in his report of December, brought forward a plan for utilizing the silver product of our mines and smelters without coining the metal which it sells under its mint valuation in gold. Introduced in Congress and amended in the House, this measure proposes that silver produced or smelted or refined in the United States may be deposited with the government, and Treasury notes be issued against it at the market-price, the notes to be receivable for customs, taxes, and all *public* dues, and to be counted by national banks as part of their lawful reserve. The holder of such notes can get silver bullion for them from the Treasury to the value expressed on them, the price of silver being fixed on the day the notes are presented; or he may demand payment in silver dollars. The government reserves the right to pay them in gold. Market-price of silver is to be determined by the Secretary, and the objection has been raised that he cannot fix the market-price, as such a thing does not really exist outside of London. The objection has no weight. The Treasury has bought, with precisely the same determination of market-price, the silver which has been coined into $364,000,000, and is making purchases from week to week. The idea no doubt is that this system of deposit of bullion and issue of Treasury notes will make the Treasury the preferred buyer for American silver, thus diminishing our export of the metal, and affecting the price favorably in consequence. It is not clear that all this will follow. An advance in the price will stimulate the production of silver both here and in other countries, with what consequent effect upon demand no one can foretell. The metal, like gold, is both merchandise and money, and a low price favors its use as the former, but a high price the latter.

It is, however, to be borne in mind that several other countries are nearly as anxious about silver in its relation to gold as this country is, and Mr. Windom's scheme, which is evidently an improvement over our present system, may commend itself to some of them. If so, so much the better for the future price of silver. In the event of silver reaching our mint price of $1.2929 per ounce fine, or $1 for 371.25 grains fine, it is proposed to throw open the mint on the terms of the old law, for then the blunder of 1873 would be rectified. At present the claims of the measure rest upon the stoppage of coining silver dollars, and these claims should be influential with all who wish to preserve our currency at par with gold. It is better for the Treasury to store bullion than silver dollars, and better that it should cease to make the present ignoble profit from coining dollars which cost only seventy-five cents.

THE ABILITY TO BEAR PAIN

Is the test of fortitude among the Indian tribes. But we defy any Cherokee, Sioux, or Comanche to endure the twinges of rheumatism without wincing. These, indeed, are slight at first, but grow in intensity until they become unbearable. No malady is more obstinate in its maturity than that which gives rise to them. The more need, then, of attacking it at the outset. Foremost among remedies for it is Hostetter's Stomach Bitters, safer and infinitely more effective than colchicum, veratrum, and nux vomica, all remedies which might prove destructive of life in a slightly excessive dose. Mineral depurents, also, when not positively mischievous, are far inferior in remedial power to this salutary botanic medicine. It entirely expels from the blood the acrid impurities which originate the disease, and enriches as well as cleanses it. Constipation, liver complaint, dyspepsia, and other ailments also give way to it.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

HAVE YOU SEEN "CHATTER?" Julian Ralph is conducting a bright weekly called "Chatter," for the home circle, with stories, pictures, and plenty of fun and valuable reading. One dollar a year. R. G. Riggs, publisher, 12 Beekman Street, N. Y. City.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

"The Beverage for Nursing Mothers" is what physicians say of Nicholson's Liquid Bread. It strengthens and invigorates the mother's system. Try it. For sale by all druggists and grocers.—[*Adv.*]

Thomas Roberts, Wholesale Grocer, Philadelphia, says, "Burnett's Cocoaine allays all irritation of the scalp, and will most effectually remove dandruff and prevent the hair from falling out."—[*Adv.*]

Ladies are greatly benefited by the use of Angostura Bitters, the South American tonic.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER. Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

Burnett's Flavoring Extracts are the best, the strongest, and most healthful.—[*Adv.*]

In purchasing medicines, don't try experiments; the first and only consideration should be genuineness. Ayer's Sarsaparilla has stood the test of forty years, and to-day it is in greater demand than ever—a triumphant proof of popular approval.—[*Adv.*]

LOUISVILLE AFTER THE TORNADO.

SUFFICIENT time has elapsed since the appalling descent of the tornado upon the city of Louisville, Kentucky, on the evening of March 27th last, to ascertain definitely the amount of damage to life which it has caused, and approximately the loss of property. Fortunately the calamity, in the light of the latest information, has been discovered to be much lighter than was feared when the first tidings estimated the loss of human life at several hundreds, and the damage to property at many millions. It was natural to form an exaggerated idea of the number of people killed and wounded, for it seemed impossible that such extensive and sudden destruction of buildings in a populous city could be otherwise than attended with great disaster to human life. But it is now known, through the official list of casualties, that not more than seventy-five people were killed by the storm in Louisville. About one hundred others were injured, of whom a great proportion at this date—almost all—are likely to recover. The majority of the deaths and injuries occurred at Falls City Hall, in West Market Street, a three-story building, the ground-floor of which was a market, and on the second floor of which Golden Lodge Knights and Ladies of Honor were in session, and in an adjacent room a dancing class was being taught by Miss Rosa App. In one afternoon following the tornado there were thirty funerals, and the city was one of mourning. An affecting death was that of Rev. Stephen Elliott Barnwell, rector of St. John's Episcopal Church, who, with his little son Dudley, was overwhelmed amid the ruins of the church and parsonage. Father and son were buried in one coffin, their obsequies attended by Bishop Dudley and all the clergy of Louisville.

Circumstances that account for the light loss of life are the width of the streets, the standing of houses in wide lots, the smallness of the houses, and the number of manufactories deserted at the hour of the storm. Main and Market streets, the principal scene of disaster, were largely occupied by tobacco warehouses and small manufactories relating to the tobacco trade.

Fortunately for the contents of roofless buildings in which were vast quantities of unprotected merchandise, the disaster was followed by three days of good weather. The estimates of property losses have been greatly reduced, the last estimates now placing the figure at $2,500,000, and even lower. The stock, which was far more valuable than the warehouses which contained it, received little injury, the main damage being that which shows so obviously in wreckage of buildings. It causes a temporary suspension of business, but the tobacco men are able to take care of all tobacco shipped to this city. The Union Depot was lifted from its foundations and swept to the ground, and twenty-one passenger coaches crushed in its wreck, but trains on the roads leading into the city have been able to leave and receive their passengers at convenient points without much delay. The work of clearing away the débris is actively in progress, and the work of rebuilding commenced. Tobacco sales are now going on regularly, and many of the merchants whose places were destroyed have secured quarters elsewhere, and have resumed their occupations. Much energy in rebuilding is displayed, and the devastation of the tornado will soon be repaired. In Christian, Breckinridge, Webster, Daviess, Allen, Barren, and Hancock counties, in Kentucky, and in parts of Tennessee, Illinois, and Indiana, there was a considerable loss of property and human life.

This tornado, rising in the Southwest, followed the general course of the Ohio River in a northeasterly direction. It first struck Parkland, a beautiful resident suburb in the southwestern part of Louisville, in the course of a rain-storm with wind, and amid thick darkness and with an appalling roar it swept in a minute through the city, and leaving a path of destruction, disappeared across the river. No reliable record could be obtained of its terrific velocity, which was swift beyond the power of instruments to register. It approached the heart of the city in a regularly pursued path, in a course diagonal to the streets, which run east and west and north and south. So confined was the tornado to its comparatively narrow path that most of the people in other parts of the city slept through the night of its occurrence with no intimation of the havoc it had wrought, and they learned of the disaster first in the morning papers. On the day following the storm, the people gathered among the ruins where searchers had been working all night long. As soon as they could get together after the tornado, the Board of Trade met and organized itself into a General Relief Committee. A Committee of Visitation and Inspection was next appointed, and its members instructed to go into the devastated district, and make a thorough examination of damaged houses and names of parties who had suffered loss so as to obtain accurate information of those entitled to assistance. The City Council at once appropriated $20,000 for the immediate relief of the homeless people. The militia organization known as the Louisville Legion entered upon guard service upon the boundaries of the devastated district, armed and equipped for duty by order of the Governor, to guard the property until it could be protected by its owners. The General Relief Committee and the leading newspapers have from the first maintained that Louisville is fully able to meet its losses, and although outside subscriptions have been gratefully accepted, they have not been solicited. It is remembered that Louisville passed through the disasters of the flood of 1883 sustained by her own self reliance and self help. Nevertheless individual residents of New York, Cincinnati, Chicago, St. Louis, Indianapolis, and other large cities, made generous contributions, and generous offers of aid have come from every quarter. The contributions, mainly made in Louisville, include $20,000 raised by the City Council, $30,000 voted by the State government, and nearly $15,000 subscribed by railroad and bridge companies, and now amount to about $150,000. Disbursements were made at first only to those who needed immediate help, but later have been extended to those who lost their furniture and household goods.

A noteworthy and most serious disaster caused by the tornado was the wrecking of the stand pipe tower of the water-works, a structure about 150 feet high. It was cut and twisted sheer off by the wind, about thirty feet from the ground, at the point where the stone-work substructure of the iron and frame work ended. The purpose of this tower was to obtain the necessary pressure to force water into the city reservoir. These reservoirs, three in number, have a storage capacity of 125,000,000 gallons. Unfortunately they were only half filled when the disaster occurred. One million gallons of water daily is the ordinary requirement of the city, and although economy has been exercised in the use of water, the supply is practically exhausted, and were a fire to break out in Louisville at a point away from the river bank there would be no adequate means of repressing it. There is a sufficiency of water for drinking and cooking purposes, for at any point in the level plain upon which the city stands an inexhaustible supply of clear well water is reached at a depth of thirty feet. On every second corner the city maintains a public pump, and from these pumps the drinking water is generally taken when the Ohio River is high and muddy, although the impregnation of this well-water with lime renders it unsuitable for the laundry or for use in boilers, and manufactories of the city which are uninjured by the storm have generally had to shut down for lack of water.

SHERIFF DANIEL E. SICKLES.

THE appointment by Governor Hill of General Sickles to the Shrievalty made vacant by Mr. Flack's resignation was an agreeable surprise to men of all parties. The new Sheriff had achieved a large measure of success as a soldier, politician, and diplomat, and the services he has rendered the country in varied capacities are noteworthy. The possessor of an ample private fortune, and of a reputation associated with large dignities, his acceptance of an office which, however important, could have but little attraction to a man of his calibre should be looked on as a sacrifice for the public good.

Daniel Edgen Sickles is a native of the city of New York, born October 20, 1822, of a respectable old family. His youth, like that of many other notable men, was stormy and intractable, and he left home to become a journeyman printer. He finally, however, entered the University of New York, but did not remain till graduation. He studied law in the office of Benjamin Franklin Butler, then United States District Attorney, and was admitted to the bar in 1843. He passed rapidly into politics, was the editor of a campaign paper in 1844, supporting Polk, became an influential Democratic leader, and in 1847 was elected to the Legislature. The rise of the young aspirant for public honors was now rapid. He served a short time as Corporation Counsel in 1853, and the same year was appointed Secretary of Legation, when James Buchanan was sent to England as Minister. When he returned, two years later, he was elected State Senator, and in 1856 and 1858 he was sent to Congress as Representative on the Democratic ticket. In 1861 his voice sounded in the political din as one of the sturdiest of war Democrats, and his natural instincts as a soldier at once responded to the call of his country. He raised the Excelsior Brigade of New York Volunteers, and was made Brigadier-General. His command, a part of the division of "Fighting Joe Hooker," participated gallantly in all the battles of the Peninsular campaign, afterward in the disastrous battle of Bull Run, and was again with McClellan when the latter turned the tide at Antietam. Elevated to the rank of Major-General, Sickles fought in the terrible battles of Fredericksburg and Chancellorsville, and at Gettysburg, in 1863, commanded the Third Corps, which bore the brunt of the first day's fighting. In this great battle, which determined the final result of the war, General Sickles lost a leg. He continued in active service till the end of the conflict, and in 1866 was appointed a Colonel in the regular army and Major-General by brevet. Three years afterward he was placed on the retired list, with the pay and rank of his brevet appointment. General Sickles commanded the admiration of the army and of the country by his gallantry and ability as a soldier, a career for which nature gave him superior aptitude. No one of our civilian Generals except General Logan was perhaps to be compared with him in this respect.

He had the special confidence of Mr. Lincoln, of whom he became a trusted friend, and in spite of the fact that he was eminently a fighting General, there were but few prominent military men so deep in the interior secrets of the Lincoln administration. He was a supporter of General Grant for the Presidency in 1868 and 1872, and was appointed Minister to Spain in 1869, where he remained for four years, resigning his post in 1873 that he might return again to New York and resume his law practice. Though keenly interested in politics, General Sickles remained aloof from active partisanship till the candidacy of General Hancock in 1880, when he became again closely identified with the Democratic party, and worked for its interests, though he evinced no ambition for office.

When General Sickles accepted the appointment of Civil Service Commissioner from Governor Hill in 1887, he was not a believer in any practically effective system of civil service reform. When he resigned his Presidency of the board in 1889 he announced his conversion to the fullest sympathy with and belief in this great measure, and in his letter to the Governor last year, he emphasized its importance with much earnestness. The succession of so able and experienced a public man to the duties of the Sheriff's office promises a speedy cleansing of that Augean stable, the scandals of which, however suspected, have proved so great as to cause something of a public shock. His executive energy and financial independence will insure an administration which will set an ideal for those that come after him, unless all the precedents of his public life prove at fault. General Sickles has already taken preliminary steps to remove those temptations to maladministration in the office which have made this important legal function one of the worst features of a bad city government. The public will watch the issue with great interest.

Court of Oyer and Terminer, the
anch of the Supreme Court, he
ied at some of the most famous
e last twenty years.
Justice Barrett, in the Court of
Terminer, in which his popular reputation may be said to have been made, were tried the three negroes, Thompson, Ellis, and Weston, accused of killing a Jewish peddler in Lydig's Woods, in the northern part of the city. They were convicted late in October, 1875. During that term Justice Barrett sentenced no less than six convicted murderers to death, and imposed thirty life-sentences.

Justice Barrett's term expired on December 31, 1885. In October, 1885, he was nominated by Tammany Hall (such are the whirligigs of time) to succeed himself. Irving Hall, the County Democracy, and the Republicans endorsed the nomination. The Prohibitionists nominated a candidate and made a valiant fight. The polls stood: Barrett, 197,278; Marshall, 857. Justice Barrett was re-elected.

During his second term, Justice Barrett has presided at the trials of four of the five "boodlers" who have been tried. The "boodlers," it may be well to say, were the Aldermen who in 1884 passed a resolution giving to the Broadway Surface Railroad Company the right to run cars on Broadway below Fourteenth Street. The consideration for that vote, it was popularly believed, was $400,000, distributed among the Aldermen. Henry W. Jaehne and "Honest John" O'Neil were severally tried and convicted before Justice Barrett; Thomas Cleary, the janitor of the Equitable Life-Insurance Company's building, obtained a disagreement of the jury when tried before him. Jacob Sharp, who, more than any one else, was interested in obtaining the franchise for the Broadway road, was tried before Justice Barrett in the summer of 1887. Six weeks were spent in obtaining a jury, and the actual trial lasted two weeks more. It ended in a conviction, which, however, the Court of Appeals set aside.

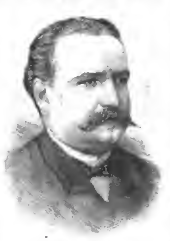
Other important cases tried before Justice Barrett have been the boycotting cases, the Ferdinand Ward case, in which false representations through the telephone were first considered in a court, the Sugar Trust, and most recent of all the Flack conspiracy case.

Although the work required of a Justice of the Supreme Court is heavy, Justice Barrett has found time to devote to various branches of literature, and in December, 1888 produced at Wallack's Theatre (now Palmer's) a comedy entitled *An American Marriage*, which met with some success. Justice Barrett's literary training shows itself in his written opinions; and his remarks in court are models of well-chosen and correct language.

THE SITUATION IN PERU.

The Presidential election in Peru takes place on Sunday, April 13th. Presidential electors and members of Congress are to be chosen, and the policy which is to govern that country for the coming four years will to a great extent be decided upon. As the country of the Incas is only just beginning to recover from the effects of its unfortunate war with Chili, and the result of this election may be to retard if not to completely block its progress, the political events there are naturally clothed with unusual importance just at this time. As a result of the late war, Chili acquired the territory known as the provinces of Tacna and Tarapacá, which were worth, in round numbers, [illegible]. Immense deposits of nitrate of soda made this territory far more productive than if it had been studded with gold mines. Last year the net receipts by the Chilian government in this district from an export duty on the nitrate amounted to $25,000,000. On the other hand, Peru was completely prostrated. Her government was bankrupt. A depreciated paper currency became so poor that it required $1000 in bills to buy a cigar, and for several years the money had been worth only one per cent. on its face value. A national debt of $250,000,000 was left as a legacy of the war, besides $50,000,000, known as the domestic debt, in the hands of Peruvians. President Caceres was inaugurated, after a constitutional election, in August, 1886, and he at once began the work of funding this debt. Within the past three months his efforts have been entirely successful, and by one of the most extraordinary financial transactions recorded in history, Peru has freed herself from her entire foreign debt, and if the agreement be carried out, her railroad system will be at once extended according to the original plans made in the time of Henry Meiggs, involving an expenditure of $40,000,000 to $60,000,000. The entire system of railroads, built originally by the government, is to be transferred to an English syndicate, together with the remaining guano beds and nitrate lands. In addition, Peru is to pay annually for a term of thirty years the sum of £80,000 to the syndicate, which, in turn, guarantees to complete the railroads and to cancel all the outstanding Peruvian bonds.

Such a gigantic scheme requires for its fulfilment a continuous line of policy similar to that inaugurated by the administration of President Caceres. This is one reason why the approaching election is regarded with so much anxiety. By a constitutional prohibition, General Caceres is not eligible for a second term. He favors as his successor Colonel Remigio Morales Bermudez, now First Vice-President of the republic. Colonel Morales Bermudez was born in Pica, in the province of Tarapacá, September 30, 1836. He entered the army as a sub-lieutenant in 1854, at the age of eighteen, and his life has been spent in the army and in the service of the government. He has been Prefect of the Department of Trujillo, and when General Caceres was fighting the Chilians, and afterward in his contest for the Presidency with General Iglesias, Colonel Morales Bermudez was his assistant and one of his chief supporters.



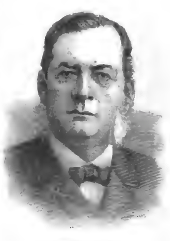
COLONEL MORALES BERMUDEZ

Another candidate for the Presidency, and a conspicuous figure in Peruvian politics, is Dr. Francisco Rosas. This gentleman is a native of Chancay, in the department of Lima, where he was born April 2, 1820. He studied medicine in Lima, and became a professor in one of the medical schools. In 1872 he was made a member of the cabinet of President Pardo, serving as Minister of Government until 1874, when he withdrew, and was elected Alcalde of Lima. In 1875 he was sent as a special commissioner to Europe to negotiate the sale of guano, and on his return, in 1876, he was chosen a Senator from Cajamarca and President of the Senate. The next year he was again sent to Europe as financial agent of the government, and during the war with Chili he was once more commissioned as agent to procure financial aid in Europe, and in 1882 he was appointed Envoy Extraordinary and Minister Plenipotentiary to France, and served in that capacity until the recognition of the Iglesias government in Peru. He returned to his home in Peru after a seven years' absence, and was at once elected a Senator. He is now serving as President of the Senate.

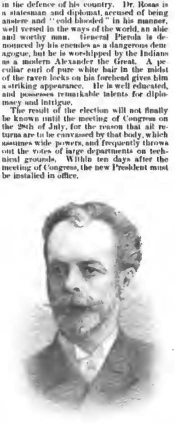
Opposed to these two, and the man with the largest element at his back, is Don Nicolas de Pierola, the candidate of the Democratic party. He was born at Camana, near Arequipa, January 5, 1839. Young Pierola studied law, was called to the bar in 1860, and soon afterward established a review entitled *El Progreso Católico*. In 1864 he became the editor of *El Tiempo*, and soon after, on account of the downfall of President Pezet, he was compelled to fly to Europe. In 1869 President Balta appointed him Minister of Finance and it was during his administration that some of the most expensive public improvements were made and some of the most gigantic loans of money were contracted. From 1872 to 1878 he was continually engaged in conspiracies to overthrow the government, and at the outbreak of the Chilian war he was a refugee, residing in Chili. He tendered his services to the Peruvian government, and was permitted to return to Lima, where, in December, 1879, he headed a small body of revolutionists, who declared him Dictator. The Chilian army was marching on Lima, and the Peruvians could do nothing else than permit him to try his hand. His first act was to telegraph to Rome tendering his submission to the Pope, and asking for the papal benediction on his government. When every resource should have been gathered to resist the invasion of the country by the Chilians, Pierola spent the time of the army in witnessing the public "blessing" of a new cannon, named "The Nicolas Pierola," by the Archbishop of Lima, or in listening to bombastic proclamations, in which he announced that he had completely annihilated the Chilians, when in fact the progress of the invading army was scarcely interrupted, and the government of Pierola at length fell to pieces, and the control of the unhappy country was vested in a provisional government set up by the Chilians themselves. Pierola was compelled to leave the country; and since his return, two or three years since, he has been engaged in preparations for this campaign. His followers are almost entirely among the uneducated and poorer classes, by whom he is regarded as a great hero, and among the priests and monks, who wield a great influence.

Colonel Morales Bermudez is a soldier, courteous and affable, popular with all who know him, and distinguished for his services in the defence of his country. Dr. Rosas is a statesman and diplomat, accused of being austere and "cold-blooded" in his manner, well versed in the ways of the world, an able and worthy man. General Pierola is denounced by his enemies as a dangerous demagogue, but he is worshipped by the Indians as a modern Alexander the Great. A peculiar curl of pure white hair in the midst of the raven locks on his forehead gives him a striking appearance. He is well educated, and possesses remarkable talents for diplomacy and intrigue.

The result of the election will not finally be known until the meeting of Congress on the 28th of July, for the reason that all returns are to be canvassed by that body, which assumes wide powers, and frequently throws out the votes of large departments on technical grounds. Within ten days after the meeting of Congress, the new President must be installed in office.



DR. FRANCISCO ROSAS



DON NICOLAS DE PIEROLA.

through it will remain a puzzle to me to my dying day.

All this while we could hear plainly, through the holes in the wall, the crashing blows which every minute or so were delivered against the grating, together with a shrill roar of shouts and yells, and we knew that before this vigorous assault the grating must give way within a very brief period and let in the whole yelping pack. If I were right in my belief that the Priest Captain alone knew of the secret outlet in the oratory, we still would be safe enough, and could make some preliminary examination of the cave before we closed the way behind us irrevocably by letting the statue fall back into its place; but if I were mistaken, then there was nothing for us but to take the chance of life and death by going on blindly into that black cavern after wedging fast the underside of the statue in such a way that it no longer could be swung open from above.

It was most necessary, therefore, that we should see what course our enemies would take when they came into the oratory and found it empty of us, and the idol broken, and the Priest Captain lying dead there; and, that we might compass this end, Young and I returned into the Treasure Chamber and mounted upon a ledge—that seemed to have been provided for a standing place—whence we had a clear view into the oratory through the slits in the wall. And at the very moment that we thus stationed ourselves there reverberated through those rock-hewn chambers a deafening crash and a jingling clang of metal and a rattle of falling stone; and with this came a yell of triumph and a rush of footsteps—and then, in an instant, the oratory was full of soldiers and priests all yelling together like so many fiends.

But upon this violent hubbub there fell a hush of awe and wonder as those who had thus tumultuously entered the oratory saw the Priest Captain lying dead amidst the fragments of the shattered idol, and perceived that the prisoners who had been shut within these seemingly solid walls had vanished utterly away, and then a sobbing murmur, that presently swelled into moans and cries of terror, arose from the throng, and in a moment more, seized by a common impulse, the whole company bowed downward in suppliant dread of the gods by whom such direful wonders had been wrought.

Young gave a long sigh of relief, and with a most mouth-filling oath whispered in my ear, "They haven't tumbled to it—an' we're all right!"

As we gazed at these terror-stricken creatures a thought occurred to me on which I promptly acted. "Get both of your revolvers pointed through that hole," I whispered to Young. "Point high, so that the balls will not hit anybody; and when I begin to shoot do you shoot also, and as quickly as you can. Mind, you are not to hit anybody," I added; for I saw by the look on Young's face that he longed to fire into the crowd point-blank. For answer he gave me a rather sulky nod of assent; but I saw by the way that he held his pistols that my order was obeyed. "Now," I said, "Fire!"—and as rapidly as self-acting revolvers would do it we poured twenty-four shots through the slits in the wall. No doubt several people were hurt by balls bounding back from the rock, but I am confident that nobody was killed.

When we ceased firing it was impossible to see anything in the oratory because of the dense cloud of sulphurous smoke wherewith it was filled; but such shrieks and yells of soul-racking terror as came from beneath that black canopy I hope I may never hear again. I waited a little, until this wild outburst had somewhat quieted, and then—placing my mouth close to one of the openings and speaking in a voice that I tried to make like that of Fray Antonio—I said in deep and solemn tones: "Behold the vengeance of the strangers' God!"

What effect my words produced I cannot tell. Our firing must have loosened a fragment of rock between the gold plating that lined the oratory and the outer surface of the wall, and even as I spoke this fragment fell. With its fall, the opening was irrevocably closed.

"That was a boss dodge," said Young, as he recharged his revolver. "Those fellows 'll just think hell's broke loose in here, for sure; and I guess after they've onct fairly got outside they'll rather be skinned alive than come back again. But what did you say to 'em? Hearin' you talkin' like th' Padre, that way, gave me a regular jolt. Don't you think, though, maybe it was a little bit risky t' give ourselves away?"

But when I had repeated in English the words which I had spoken, Young very seriously shook hands with me. "Shake!" he said. "I've done you injustice, Professor. Sometimes I've thought that you was too much asleep for your own good, but if anybody ever did anything more wide-awake than that, I'd like t' know *what* he did and who he was. Why, when those fellows tell about all that's been goin' on in here—about their busted idol, an' their dead Priest Captain, an' our skippin', an' this row our shootin' has made, an' then about th' Padre's ghost talkin' to 'em that way—it's bound t' give 'em such a jolt that th' whole outfit 'll slew smack around an' be Christians right off!"

Some such notion as this had been in my own mind as I executed the plan that on the spur of the moment I had formed. And yet, in the end, I could not but regret, for Fray Antonio's sake, my hasty action; for he would have been the very last man to approve of such stringent methods of advancing the Christian faith. If any result came from my demonstration, it certainly came through terror, and the essence of Fray Antonio's doctrine, as it was also of his own nature, was gentleness and love.

[TO BE CONTINUED.]

VISITORS TO THE FLAG-SHIP "CHICAGO."

LIFE on board our new cruisers is not the perpetual holiday pictured in the cable despatches and glowing letters of special correspondents. There have been, and let us hope will be, balls and receptions till the ships come home; but these are the incidents, not the purposes, of the cruise; and they have a definite value as breathing-spaces in the programme of drill, in the denials and limitations of routine, they are most useful as the playtimes which keep maritime Jack from becoming the dull boy of the halting rhymes.

It is the season of merrymaking along the Mediterranean just now, and the Americans of the Riviera are only too glad to visit our vessels; for, after all is said and done, I doubt much if any sight-seeing is half so filled with pleasure as the first glimpse the exiles get of their country's flag fluttering from the peaks or staffs of our war ships rolling gently in the blue waters of Villefranche Bay.

Abroad, as at home, the ships have been crowded by visitors, not only those who look at the surface of things, and are honestly happy with the cleanliness and bright work, but by others who are studying with technical knowledge these first signs of our naval development. So far as official opinions and impressions can be gathered from foreign newspapers, the design, equipment, armament, and *personnel* of the squadron have elicited the warmest encomiums. It is a particular satisfaction to know that the guns have been pronounced equal to any mounted in European vessels of like types, for the armament is American in design and fabrication, and save with one calibre has been built up of American steel. In the re-creation of our navy we have had to develop a theory of ordnance for ourselves, to plan foundries and equip shops, to invent tools, and to educate workmen—and this despite the violent interference of politicians, and the intolerant abuse and wire-pulling of manufacturers wedded to old theories and anchored to old workshops.

The spirited illustration of Mr. De Thulstrup is therefore most timely, because it gives a capital picture of the *Chicago's* all-steel 8-inch breech-loading gun, with its shield, carriage, and sponson mountings. Bigger guns have been designed and finished, but this calibre has a special interest as it is at present the heaviest piece afloat in the new navy. Three higher calibres are provided for in our ordnance policy. Of these the 10-inch has been satisfactorily tested; the 12-inch is fairly under way; and, with the completion of the Bethlehem plant, we are prepared to furnish forgings not only for the 16-inch, but for any other size needed. Surely this is a great stride in less than ten years, for in 1883, when contracts were made to supply the main batteries of the *Atlanta*, *Boston*, and *Chicago*, ingots and forgings for the 5 and 6 inch guns could only be produced at home. With our marvellous development in other material directions, we were then unable to make the average ordnance required by modern theories of defence, and had to buy from English firms, under disadvantageous limitations as to test and inspection, the metal for the 8-inch guns.

Such a policy was of course distasteful to the pretensions of our people, but a dense wall of ignorance surrounded the question, and no technical hammering could batter it down. Finally the indignant insistence of naval officers, and the sledge-hammer though tardy advocacy of the press made a breach in the adamant, and Congress ordered a board to examine into the methods adopted abroad, and to report a plan suited to our necessities.

Nothing but good results has been the outcome of this delayed action. After searching investigation a recommendation was made that the government should establish within its own territory a plant for gun fabrication, and that it should contract with private parties for the forged and tempered material. When Mr Cleveland's administration came in, other decisive steps were taken, first, by refusing to buy abroad either armor or gun steel; next, by allowing the wants of the Navy Department to accumulate until contracts of sufficient magnitude could be offered to the profitable competition of domestic manufacturers; and, finally, by imposing a condition that the successful bidder should erect in this country a plant adequate to the production of armor and steel equal to requirements of the highest standards abroad. The Bethlehem company secured the contract, and went so valorously and honestly to work, that to-day we are independent of alien whims, of foreign control, and can turn out all the war steel necessary to protect our national integrity.

After a successful period of tentative work, the naval gun factory at Washington has been established by law, and is rapidly assembling the ordnance required to arm the new ships, and to replace the obsolete batteries of the wooden cruisers. At the end of the last fiscal year the factory's output included, besides carriages and accessories, two 5-inch, thirty 6-inch, four 8-inch, and three 10-inch guns. To-day the machinery for calibres up to 12-inch is in place, and tools for the 16-inch are being completed. When the entire plant is laid down, the establishment will have a yearly capacity—or the equivalents in working hours—of twenty-five 6-inch and twelve 12-inch breech-loading rifles, with carriages and equipments complete.

This will revolutionize the ordnance afloat, for with the exception of the new steel vessels, the main batteries of our war vessels are still composed of Dahlgren 9-inch smooth-bores and Parrott rifles, all cast-iron and muzzle-loading. These are supplemented with makeshift 8-inch rifles, converted on the Palliser system from smooth-bore, muzzle-loading 11-inch Dahlgrens, and with 60 and 80 pounder breech-loading rifles revamped from old muzzle-loading Parrotts. A series of tables, for which there is no room here, would be required to show the increase of power in the new guns; but it may be sufficient to say that the relative efficiencies of the cast-iron converted 8-inch, and of the 8-inch all-steel rifle shown in the illustration, are in weight of projectiles 180 pounds to 250 pounds; in energy, 2481 foot-tons to 7645 foot-tons, and in penetration of wrought iron at 1000 yards, 10.8 inches to 17.9 inches—all, of course, in favor of the new piece. It may be explained that the term "energy in foot-tons" means that the work developed by the projectile at the muzzle would raise the stated weight in tons to the height of one foot.

Abroad, the energies developed or expected in the greatest calibres are wonderful. Leaving out of question the slightly heavier but not equally efficient Krupp gun, we find the highest tabulated performances in the 16.25-inch English gun. This was built by Armstrong, and is nearly forty-four feet in length; weighs 111 tons; fires a charge of 850 pounds, and a projectile of 1800 pounds; develops a muzzle velocity of 2148 feet per second, and an energy of 57,580 foot-tons, with a penetration of 34.1 inches into wrought-iron at a thousand yards' distance. Whether we will ever need such guns is just now a mooted question, but they mark the wonderful strides of ordnance manufacture. Here, for example, is another comparison between the batteries of the *Atlanta* and *Constitution*, which may be interesting as showing the development in less than a century. The Old Ironsides was the heaviest frigate of her day, and carried a battery of fifty-four guns—thirty-two 24-pounders and twenty-two short 32-pounders—which threw at a single broadside 684 pounds of metal. The *Atlanta* has eight guns—six 6-inch and two 8-inch—and discharges at a single broadside 800 pounds of metal, in every way more destructive.

"With her long 24's," writes Lieutenant Meigs, United States Navy, in the report of the Naval Intelligence Office, "the *Constitution* could probably just about penetrate her own water-line—some 22 inches of oak—at 1000-yards range; to penetrate with the short 32's she would have to approach nearer. The *Constitution* is then completely protected against the fire of her like at ranges greater than 1000 yards.... The *Atlanta's* 6-inch guns can penetrate at 1000 yards a thickness twenty times that of her side at the water-line. And the 8-inch guns can penetrate at the same range about 14 inches of iron. It may be further observed that the five-eighth-inch steel at the *Atlanta's* water-line has just about the same resisting power as the 22-inch oak of the *Constitution*. Thus, while the defensive power at the water-line has remained about the same, the latter ship has a battery power—considered with reference to penetration alone—twenty-five times stronger. As regards the size of the two ships, the *Atlanta* is about one-half larger, but their military duties, their employments in war-time, are identical. They are both, in the military sense of the term, frigates; the duties of both are to accompany and assist the battle ships, to carry them information and stores, to act as lookouts for them, and to attack the enemy's commerce, and guard and convoy our own. Thus the *Atlanta* and all our *protected* ships can penetrate their likes while they are still hull down on the horizon, while battle ships—or *iron-clads*, as they are often called—must approach within from 2000 to 4000 yards before they can hope to make any serious impression."

This extract shows the purposes and uses of the vessels forming the evolutionary squadron, and it is satisfactory to know that in the rough weather encountered on the run from Boston to Lisbon they behaved so admirably as to convince the most exacting critic of their equality to the best of their date and class in any other service. The design proved no less effective than the motive power, for under severe tests the staunchness of construction and steadiness of gun platforms were as pronounced as the low coal consumption and high resultant speed. Save for a mishap to the *Yorktown's* steering gear the voyage was unmarred by accident and the capital seamanship in fair weather and foul showed that, even under novel conditions, our officers are, as of old, equal to any demands made upon them.

At Gibraltar and Toulon they lay at anchor with battle ships of the two greatest navies, and while no comparison of *matériel* could be made between our unarmored ships and the foreign liners, still the association was interesting as illustrating what our development should be in the type which, after all, is a seaboard country's main reliance. America's showing was a brave and picturesque one, but our point-device and trim, well set up cruisers would, in any engagement with these great war machines, have had but scant opportunity.

Owing to unforeseen circumstances a part of the drill programme of the squadron was abandoned at first; but in the end this proved only a temporary respite for the blue-jackets and marines. Admiral Walker believes in hard work, and in the early establishment during this transition period of drills that will satisfy the new conditions. The result of this is to make the squadron a school of intelligent experiment, and pleasant as it may be to show the flag under circumstances which dignify the country, all hands are finding the cruise anything but that "mere holiday junketing between pleasant ports" which the hayseed legislator describes as the main achievement of a naval officer's sea-life.

J. D. JERROLD KELLEY.

JUNIUS S. MORGAN.

WORD was received in New York, April 5th, announcing that Mr. J. S. Morgan, of the London banking-house of J. S. Morgan & Co., had been thrown from his carriage near Monte Carlo and severely injured. He had been driving near that town, when a passing railroad train frightened the horses, and in the excitement of the moment he leaped or fell from the carriage. The horses ran some distance before the coachman could regain control of them, and upon returning to the spot where they started, the driver discovered Mr. Morgan lying near the track in an unconscious condition. He was conveyed to his house, and there found to be suffering from concussion of the brain, added to other serious injuries. From that time he lingered in an insensible state until the following Tuesday, April 8th, when he died.

Junius Spencer Morgan was born in West Springfield, now Holyoke, Massachusetts, on April 14, 1813. He was the son of Joseph Morgan, whose ancestors had been among the early settlers in that district. When four years old his parents removed to Hartford, Connecticut, and he attended school in that town until his sixteenth year. He entered the employ of Alfred Welles, a Boston banker, on April 7, 1829, and at the age of twenty-one he became connected with the banking firm of Morgan, Ketchum, & Co., New York. In the early part of 1836 he returned to Hartford, and entered the firm of Howe, Mather, & Co., dry goods, as junior partner. In 1850, upon the retirement of the senior partner, the firm became Mather, Morgan, & Co. A year later the firm dissolved, and accepting the offer of James M. Beebe, of Boston, to form a copartnership, Mr. Morgan moved to that city. Under the name of J. M. Beebe, Morgan & Co. the firm became celebrated as one of the largest dry-goods commission houses in the country. While in England in 1853 he made the acquaintance of George Peabody, the millionaire philanthropist, and so attracted that gentleman that a partnership in the banking-house of George Peabody & Co. was offered to him, and a year later Mr. Morgan entered the firm. When Mr. Peabody retired in 1864 the firm became J. S. Morgan & Co., under which name it has steadily advanced until it stands in the front rank among the great banking concerns of the world. In 1836, while a resident of Hartford, Mr. Morgan married Juliet, a daughter of the poet John Pierpont. Four children survive him, one of whom is J. Pierpont Morgan, of the New York firm of Drexel, Morgan & Co.

Mr. Morgan was a type of the old school, possessing the highest regard for honor and honesty. Beginning life at the foot of the ladder, as so many other Americans have done, he reached the top, and lived to reap the harvest of success, and enjoy the respect and praise of his fellows. Although a resident of England for many years past, Mr. Morgan has never forgotten the country of his birth. Hartford especially has been dear to him as the place of his early successes in business, and only a short time ago he gave $100,000 toward the establishment of a free library in that city. The Hartford Orphan Asylum has been the recipient of a large sum, which is known as the Sarah Morgan Fund, in memory of his mother, and Trinity College has received many benefits from his bounty. While a resident of Hartford he was an active member of Christ Episcopal Church, and that, together with a number of other institutions, has been substantially remembered. A few years ago a valuable painting by Sir Joshua Reynolds, valued at $50,000, was presented by Mr. Morgan to the Metropolitan Museum of Art. His charity has also extended to several other institutions throughout the country. Among his friends and associates in London and New York Mr. Morgan has been always held in high esteem, and his death will be mourned by a large circle, both in business and society. His son, J. Pierpont Morgan, sailed before the date of the accident, and arrived in Europe after the death of his father.

AG-SHIP "CHICAGO."—Drawn by T. de Thulstrup.—[See Page 299.]

"OWN FOLKS."

BY SOPHIE SWETT.

"PRUDENCE, Prudence, there ain't any spunk in the vinegar!" The voice was querulous and insistent, and made a harsh discord amid the bird songs and soft spring murmurs with which Prudence Favor's soul was half unconsciously thrilled as she hung out her clothes.

"I should like to know what she thinks you're a-goin' to do about it," grumbled Cyrus Larkin, who had chopped some limbs off the dead plum tree, and was now tying one of Prudence's clothes-lines carefully around it.

Prudence took a clothes-pin out of her mouth and called, cheerfully, "I'm a-comin', Laviny!"

Prudence was a large, finely moulded woman, with the head of a Greek goddess and a great mass of auburn hair which Poultney Corner people called red. Forty-five years had made her figure somewhat heavy and her face a little coarse. She was "real good to look at if she wa'n't hansome," her neighbors said, and "real clever" too, which latter adjective signified in Poultney vernacular a mixture of all the smaller virtues.

"You hadn't ought to humor her so, Prudence, you really hadn't ought to," said Cyrus Larkin, as he tied the line in a strong double knot, keeping his eyes fixed upon the operation.

Prudence surveyed his back with evident astonishment, and the color mounted swiftly to her strong cheek-bones. Whispered criticisms of her conduct toward Laviny had reached her ears many times, but no one had ever dared to speak openly to her before. She turned abruptly toward the house; although she was a prudent housewife, she left one end of a sheet dragging upon the ground. Cyrus had turned his head in time to catch a glimpse of her sudden movement and of the fiery red upon her cheeks.

"You ain't put out, be you, Prudence?" he said, anxiously. "I know I hadn't no right to speak so, but I do hate to see you sot on."

She looked at Cyrus's honest, homely face, quivering with agitation. "I ain't one that could be sot on 'thout I was a mind to be," she said.

A minute or two afterward, Cyrus, who had undertaken to finish her task of hanging out the clothes, saw her hurrying out of the house, with her apron over her head and a small pitcher in her hand.

"You ain't a-goin' clear'n over to Mis' Lisa Hughes's after a little vinegar?" he called. "Here, you jest let me take the pitcher! 've got some first-rate cider vinegar, and it's sharp enough for anybody, I'll warrant."

Prudence hesitated for a moment, and then went on. "You're real kind, Cyrus, but I guess I'd better go over to Mis' 'Lisa's. Laviny she'll calc'late that Mis' 'Lisa's vinegar tastes better'n—better'n other folks's."

Cyrus heaved a sigh, and went meekly on with his task, watching Prudence, meanwhile, as she went "across lots," letting down some heavy bars and climbing a stone wall. A Maltese cat, a sleek and dainty creature, washed her face, sitting serenely on the flat stone outside the wash-room door. Cyrus cast a cautious glance toward the vine-shaded window of the great kitchen, where Laviny, he knew, was eating her late breakfast of warmed-over baked beans and cream toast; then he picked up a small stone, and threw it with vigor and an excellent aim at the sleek cat, supplementing the action with a low-toned but forcible "S-sc-at!"

The cat rushed like a small whirlwind, bristling and spitting, and from some unknown regions appeared three other cats, equally plump and sleek, and joined her mad flight. After them came a small terrier, with his hair in his eyes, barking madly.

"Oh dear! what is the matter?" cried Laviny, coming hurriedly out. "Benny, Benny, I shall have to punish you if you chase dear Estella so. I know you don't mean anything, sweet one, but poor dear Estella doesn't understand. Come here, dear kitties, and you shall have a nice piece of meat to pay you for being so frightened."

Laviny was a tall gaunt woman of forty, who looked older than her age. Her blue eyes were faded, and the fair, childishly silken, curling hair was thin above her forehead. On her high cheek-bones—which, by reason of her thinness, were much more prominent than Prudence's—were patches of color which looked curiously like paint, although they were not. She fed her cats with strict impartiality—three more had appeared as if from space—reminding them reproachfully that they had breakfasted, and ought not to expect to be fed because "dear Estella" was being consoled for her fright, and so, with apparent laxity of discipline, she fed the terrier, the supposed cause of "dear Estella's" sufferings.

Cyrus chuckled wickedly as she went into the house. "It don't seem jest the thing to take revenge on poor dumb creturs," he said to himself, "but I've been hankerin' for a long spell to heave something at Laviny's cats, and I declare it done me good."

He had remained in retirement behind the flapping sheets while Laviny was in sight—an easy matter since he was but a little lean man, and his back was somewhat bent.

"I ain't a mite afraid of her," he murmured aloud, feeling that such ignoble conduct required explanation even to himself. "I should enjoy givin' her a piece of my mind. But it would only be spitin' myself. I'm goin' to have hard work enough anyhow to get Prudence to take a stand agin her. Beats all how weak sensible folks can be on some p'ints. You'd think Prudence wa'n't no more'n the dirt under Laviny's feet to see the carryin's on here, and no reason that anybody knows of but jest that Laviny is five years younger, and her hair curled, and she went to the 'cademy, and had a beau that was a minister and went off and left her, and was always kind of sickly and good-for-nothin' even before she got clear'n off her balance about dumb creturs. Mother she was always sayin' that one of them girls would be crazy because their great-uncle Joel Hopkins hung himself. She calc'lated that 'twould be Prudence; she said her red hair showed that she was high-strung. And she said Favors was Favors; they never was nobody, and never would be. I wonder how 'twould have turned out if I'd courted Prudence strong and stiddy, as I begun when we was young, and never listened to mother? Sometimes I don't know but what Prudence has got a grudge agin me for shilly-shallyin' so. It can't jest suit a woman to be courted kind of slack and easy for twenty-five year. And there was spells when mother got kind of wearin', that I never come nigh her at all. But she knew jest how 'twas, Prudence did; she knew 't the farm was left to mother, and I hadn't nothin' but the mill and the medder lot. And mother was a smart woman that had reasons to give for what she wanted you to do. 'Twa'n't nothin' like bein' led 'round by the nose by a foolish cretur like Laviny. What a manager mother was! The farm's worth double what it would have been if I'd run it alone. Prudence could hold up her head with the best in Poultney if she'd only have me instid of workin' herself to death sewin' straw, jest to keep body and soul together, and to buy butcher's meat for Laviny's cats and dogs. Lizy Ann Green that worked there a spell—the time that Prudence sprained her ankle—she said it cost more for them cats, the way Laviny kep' 'em, than for all the rest of the family. Land! how she did flare up at me once jest because I said, 'Laviny, why don't you let them cats be cats?'"

Prudence was coming, out of breath with her haste. She paid no attention to her humble servitor, who was still devoting himself to his self-imposed task of hanging out the clothes. He looked after her with an anxious and distressed face as she passed him in silence. Desperation suddenly seized him. He had felt for a long time that there was one way in which he could win Prudence from her reluctance to marry him, but hitherto his courage had faltered before it.

"If I could only jest convince her that I wa'n't thinkin' a mite of what mother would say! But I never can as long as I be," he had said to himself over and over again in despair.

Perhaps "heaving" a stone at Laviny's cat—a far more doughty deed than the uninitiated could understand—had inspired him to even loftier acts of courage.

"Prudence, are you a-mind to take a ride with me down to the buryin'-ground to-morrer afternoon?" he called after her, in a voice that quavered a little in spite of himself.

"I don' know but what I will, Cyrus," said Prudence, with some hesitation, and a voice lowered so that it should not reach Laviny's ears.

"Here's your vinegar, Laviny," she said, as she set the pitcher down upon the table. "Mis' 'Lisa said she was afraid 'twas some flat, and if you want Cyrus to get you some of his—"

"I don't want Cyrus Larkin's vinegar anyhow, and I don't want anything that belongs to Cyrus Larkin in no way, shape, nor manner. And I expect nothin' but what folks'll say we ain't what we'd ought to be, havin' him here hangin' out clothes."

"He means real well, Cyrus does," said Prudence, apologetically. "I was hackin' away at that old plum-tree to see if I couldn't fix it so'st I could tie a line on to it, and he see me, and—and kind of come over with his sharp hatchet. 'Twa'n't no more'n neighborly," she added, in a more spirited tone. "And when I left the clo's a-draggin', he jest kind of fixed 'em up."

"I wonder if Cyrus Larkin *could* do anything so under-witted that you wouldn't find no excuse for him? And a man that has treated you as he has! Why, you got 'most as far as your weddin' dress once, and then he jest stopped a-comin'. And you a-promisin' to go to ride with him! I expect you're the laughin'-stock of the whole town. A woman of your age! I should 'most think you'd see how ridickerlous it is."

Prudence's face flushed deeply, but she said nothing. She went out into the wash-room and moved about quickly, setting things to rights there. She caught a glimpse through the window of Cyrus going homeward, with his slender bent figure, and with the blue yarn stockings which his mother had always knit for him showing at every step.

"I wonder how many pair of them stockings she has left Cyrus?" thought Prudence, absently.

She wished to stop thinking of Laviny's reproaches. Of course it was ridiculous that she and Cyrus should be in love with each other, she said to herself, but the fact remained. He had been the hero of her young dreams, and the halo of romance still lingered for her around this little homely weak-kneed man, who had been too much afraid of his mother to ask her to marry him. She was even fonder of him now than in her girlhood days. Not only was she one of those steadfast souls who cannot get out of the habit of loving, but now she realized her superior strength, and the element of motherly tenderness had entered into her feeling for him. She had never been able to resent deeply the way in which he had treated her, as people seemed to think she ought to; but perhaps to an unreasonable extent she had disliked Mis' Eunice Larkin, his mother.

When that worthy but masterful old lady had been gathered to her fathers, and Cyrus had straightway returned to his allegiance to her, she had speedily forgotten all bitterness, and, contrary to Cyrus's suspicions, had never been in the least degree troubled about what his mother would think. She had felt as if youth had come back to her, and in the sweet April weather, while she and Cyrus hung out clothes together, the whole world had become paradise. She cared nothing for the giggling girls of Poultney Corner, who were quite overcome at the thought of the stout old maid and her little elderly beau; but with Laviny's complaint about the vinegar—she had not known that Laviny was up—the serpent had entered into paradise.

Laviny "hoped that she had proper pride, and she wa'n't goin' to have anything to say to a man that had treated her sister so," however oblivious of self-respect that sister might become.

"She don't want you to get married jest because she hain't," Cyrus had offended his goddess by saying; and then he had tried to atone by solemnly vowing to "put up with Laviny as peaceable as she did," and even to "pretend that he thought cats and dogs was human creturs, if that would suit Laviny."

Prudence had not yet, however, accepted this generous offer. She thought, while she mopped the wash-room floor, that it was doubtful whether she ever could do so. But at least she would have that drive to the burying ground the next afternoon. And Prudence was conscious of high courage as she made this resolve. Laviny opened the wash-room door. She wore a shawl and a hood, although the April morning was unusually warm.

"I'm goin' out to see if the air won't make me feel a little mite better. I expect it's been kind of hard for you this mornin', my gettin' up so late and all, but I had that 'ketch' in my side again," she said, in a conciliatory tone.

"Oh, I got along well enough," Prudence said. And she was sympathetic about the "ketch," although in her heart she thought lightly of it. Laviny was always full of ailments, and had been so ever since she was threatened with consumption soon after her betrothed, the minister, proved false to her. She treated herself with roots and herbs, which she gathered in the fields and woods, and which were constantly brewing upon the stove. Prudence's disrespect for these messes was always deeply disguised. "They don't hurt her, anyhow, as real doctorin' might, and I expect they do her a sight of good jest because she thinks they're a-goin' to," Prudence had been heard to say, although the mind-cure was as yet unknown to Poultney Corner.

When the next afternoon Prudence was carefully helped into Cyrus's new covered buggy, she had, to use her own expression, "been through consid'able." Laviny had resorted to her strongest weapon, hysterics, to prevent the drive. She felt utterly worn out, and also oppressed with a sense of guilt. Laviny had said her "ketch" was terrible; she knew it was heart-disease, and Prudence might confidently expect to find her a corpse on her return. This prophecy had been weakened by long usage, and Prudence really had no such expectation; but nevertheless she felt a miserable sense of wrong-doing.

"You look all wore out, Prudence," said Cyrus, tenderly.

"I'm afraid I've been dreadful wrong, Cyrus. I'm strong, and I hain't bore the burdens of the weak as I'd ought to."

"I should like to know who has if you hain't," protested Cyrus. "And some folks ain't so weak as they be obstinate and selfish, that's my idea."

"Oh, Cyrus, you hadn't ought to say that! Laviny hain't never been real rugged, and she ain't fit to do for herself; folks that thinks she is, don't understand. I ain't mean and wicked enough to feel that it's hard to do for her, but I can't always feel to give in to her, and I'd ought to, because it works her up so when folks don't. Seems as if I'd ought to be real sanctified, with all the discipline I've had, but I ain't a mite—not a mite."

"Seems as if 'twould be a good plan to let Laviny do some of the givin' in, and get her share of the sanctifyin'," said Cyrus, dryly.

Prudence looked at him in a kind of perplexity through the mist of trouble in her eyes. She had a truly feminine lack of humor, and Cyrus's little vein, as thin and dry as himself, was always wasted upon her.

"Laviny ain't a professor, you know; she don't seem to sense religion like some. Aunt Octav'us she thinks I'd ought to worry about it, but I can't help thinkin' there'll be allowance made for them that ain't like other folks. And—and—there don't nobody know—maybe doin' for the least of these may mean poor dumb creturs as well as folks. There ain't enough thought of 'em, Cyrus, and that's certain. Laviny's a sight better'n other folks about some things."

"For my part give me them that feels for folks first," said Cyrus, stubbornly. "And I can't see as it's agin nater or Scripter for cats to ketch mice."

"Laviny is tryin' about not havin' the fowls killed," admitted Prudence. "We've got a terrible sight of roosters."

"'Pears to me that folks that gets such ideas as them into their heads must be nigh about crazy," said Cyrus. And then he drew himself up suddenly in great alarm. He would not for the world have reminded Prudence of her great-uncle Joel Hopkins, who hung himself. He was relieved to see that she showed not the least sign of disturbance. In fact, if Prudence had not entirely forgotten this unfortunate relative, his memory remained too far in the background of her mind to be easily recalled. And she had never heard of this one of Mis' Eunice Larkin's objections to her as a daughter-in-law.

They had now reached that turn in the road which they must take to reach the cemetery, and Cyrus reined in his horse, and his countenance showed doubt and dejection.

"I don' know but what 'twould be full as pleasant to go 'round by the mill and through the pine grove, after all," he said, hesitatingly.

"Oh, le's do jest as we set out to, Cyrus; I always do like to do as I set out to, and it's consid'able of a spell sence I've been to the buryin' ground," said Prudence.

Cyrus looked at her keenly. "She thinks I hain't got the courage to take her there, but I'll jest let her know that I have," he said to himself. And he chirruped to the horse almost gayly as he turned him into the cemetery road. In fact, Prudence had no suspicion whatever of Cyrus's reluctance to take her to his mother's grave; she was influenced merely by that mild taste for cemeteries which was universal in Poultney. Cyrus hitched his horse at the gate, and they walked through the shaded paths in the afternoon's drowsy stillness. In the peace of the scene and in Cyrus's companionship, Prudence felt so soothed and comforted that she almost forgot Laviny's hysterics.

It was at a large lot, where several generations of Larkins reposed in peace, that they came to a pause. Prudence sat down under the shade of a weeping-willow which drooped over the freshest mound. It looked as if she were sitting unconcernedly upon the grave, as she fanned herself with her hat and asked Cyrus a question about the new fence. Cyrus wiped his forehead as if he was heated, but his face was pale, and he stammered as he tried to answer her.

"Why, Cyrus, how you look!" cried Prudence, suddenly. "I ought to have thought that 'twould be affectin' to you to come here."

It did, in truth, seem to her vaguely surprising that any one should feel a tenderness for the memory of Mis' Eunice Larkin. Her own feelings had been quite softened toward her as she looked at the mound where, after her grim battle of life, in which she had subdued all her kinsfolk to her will, she now lay, heedless of her fallen sceptre. But now that she was dead, she thought very little about her. Laviny, with her active, hysterical objections to the marriage, was much more important.

"I shouldn't wonder if—if 'twas shadier and—and pleasanter over the other side of the buryin'-ground," stammered Cyrus.

"Why, it's real hot and sunny over there, Cyrus. I never did see such a day for April. But—but I'd ought to have remembered that she was your mother. Le's go and set a spell under the pine trees outside the gate."

Once outside the gates, Cyrus was himself again. "I—I hope you don't think 'twas my fetchin' you there, Prudence, that upsot me so," he said. "I hain't been there many times, and she *was* my mother, as you say. And she was a good one, too, and smart. She had great reasonin' faculties, mother had."

"The Bemises was smart folks, I've always heard," said Prudence, magnanimously.

Cyrus gazed at her curiously and tenderly. "Prudence, I b'lieve you be the best woman that ever lived," he said, with intense conviction. "And I ain't a-goin' to let anything stand between you and me no longer, anyhow. It ain't no use talkin' about Laviny's objection, nor hollerin', nor nothin'. She'll be a sight bettern off where there's plenty of everything and nothin' grudged to her, and she'd ought to know it. She hain't no right to regerlate your life anyhow; but if folks are only obstreperous enough—own folks—there's some that 'll give in to 'em jest as if they was slaves. I don't b'lieve in no such doin's myself. I always were of an idee that folks hadn't but one life to live, and they had a right to live it as they was a mind to."

Prudence looked at him a little slyly, remembering what all Poultney knew, that he had been all his life "under his mother's thumb." But he looked so honestly unconscious and courageous that her smile died away in admiration. She had never known Cyrus to seem so manly.

"Laviny 'd ought to know that you can't go on always workin' as hard as you do now, and there ain't goin' to be no chance to sew straw by hand a great while, they're gettin' up machinery that does every mite of the work."

"I don't calc'late but what Laviny and I could always get along with the eggs and the garden sass and all. I ain't thinkin' of marryin' for the sake of gettin' a livin', Cyrus," said Prudence, with a touch of dignity.

"You know I don't mean no such a thing as that, Prudence. I was only jest a-thinkin' how Laviny could be fetched to a better mind. But as true 's you live, Prudence, there ain't but jest one way for us to do, and that's to get married unbeknownst. As long as she hollers you can't stand out agin her, you be so tender-hearted, to say nothin' of its bein' terrible mortifyin' to have the neighbors fetched in that way. But, you see, if I should jest get a license kind of private, and we should kind of step into the minister's next Sunday afternoon after meetin', why, when she found it wa'n't no use, she wouldn't take on a mite. It wouldn't be nothin' strange if she should be real kind of pleased."

Prudence shook her head. Experience forbade her to take this optimistic view of Laviny's probable conduct. But nevertheless, with little more urging, she assented to Cyrus's plan. She knew even better than he that she could not openly "stand out agin Laviny." She resolved with desperate courage that for once she would have her own way, "live her own life," as Cyrus said.

As for Cyrus, he went home so full of triumph that the painful emotions which had overcome him at his mother's grave were almost forgotten. He went about the house that night thinking of changes in the arrangement of the furniture that Prudence might like to make, and feeling a pride in the abundant housewifely stores which were waiting for her.

But that night he dreamed of his mother so vividly that when he awoke he could scarcely believe that it was a dream. She had stood beside his bed, her tall figure and keen old face sharply distinct in the moonlight, and had thrown upon the floor the key of her ancient linen-press. (He had searched high and low for that key, and had not been able to find it.) With this act of surrender she had turned upon him a terrible face, and had said that Prudence Favor was crowding her down into her grave, and that she and Laviny had made a plan to strangle her with her own best table-cloths.

Cyrus awoke with cold drops upon his brow, and he groped about upon the floor for the key before he could persuade himself that it was a dream. The next night he dreamed it all over again, with yet more thrilling effect; and he was so disturbed that he felt it necessary to take a trip to L——, a small city near by, to divert his mind, making the purchase of some agricultural tools the excuse. This weakened the impression made by the dream, and revived his courage, so that he stopped on his way home the next forenoon and obtained the marriage license. When he reached home he found his aunt Cynthy Prouty, his mother's sister, waiting for him. She had keen eyes like his mother's, and as she looked at him, Cyrus felt as if the marriage license in his pocket were clearly visible.

"I come over to fetch you the key of the linen-press, Cyrus, and to tell you the dyin' charge that your mother give me," said Aunt Cynthy, impressively. She drew a key from her pocket and threw it upon the table before Cyrus, who was conscious that his hand trembled as he picked it up. "I don't really s'pose you need to be told what she said, Cyrus, for I expect you know too well what b'longs to your mother's memory to need any warnin', but there is a sight of talk, so I thought I'd jest come over." Aunt Cynthy's tone had become mollified as she looked at her shrinking nephew. "It was the last night I ever watched with her," she continued, having recourse to her handkerchief. "She'd been a little mite wand'rin', and her mind 'peared to run on her best table-cloths. She thought a sight of her table-linen, your mother did, and nobody up this way ever had no nicer. When she drawed that key out from under her piller she was jest as rational and sensible as ever I see her. 'You keep it, Cynthy,' says she, 'for I couldn't rest easy in my grave with them Favors let loose 'mongst my nice things. Like as not they'd use my double damask snow-drop table-cloth and napkins every day; and I expect nothin' but what they'd put the linen sheets onto the hired man's bed.' I said I'd keep the key so's't they couldn't, jest to peaceify her, and I thought she'd kinder dropped off, but pretty soon she began to be restless agin, and, 'Oh dear,' says she, 'my pound-for-pound preserves would be jest as common as apple sarse if them Favor girls should get here. And how could Cyrus with his dyspepsy stan' her saluratus? There never was slack folks like them that didn't use a sight of saluratus.' 'Now don't you take on so, Eunice,' says I, 'for Cyrus won't never do no such a thing.' And whatever folks tells me about walkin' home from prayer-meetin' together, or takin' her to the buryin'-ground, or diggin' up her garden for her, I says the same thing, Cyrus won't never do no such a thing. Now don't you say a word, Cyrus. You jest let me have my say." A quite unnecessary command, since poor Cyrus was overwhelmed with trouble too deep for words. If he had felt a momentary impulse to defend the lady of his love, he had not the spirit to try to arrest the flow of Aunt Cynthy's eloquence. "For my part, I hain't nothin' to say against Prudence Favor," pursued Aunt Cynthy, with an air of great magnanimity. "She's a sister in the church, and I can't say as ever I heard anything against her Christian character. But Favors is Favors; *that* we *all* know. Her father was shif'less, and her mother was poor-sperited and sickly. And them that was brought up slack will be slack. And a man that marries Prudence has got to marry Laviny, so to speak, and her whole menadgery of creturs. I don' know as your mother could be expected to lay still in her grave with them cats and dogs a-layin' round on her stuffed chairs and sofys. But, there! there ain't no need of my sayin' this, and I know there ain't, if folks does talk. But your mother, she wouldn't be peacified when I told her you wouldn't do no such a thing. Says she, 'Prudence Favor 'll get round him when I'm dead and gone, mark my words!'"

Cyrus plucked up a little spirit, in spite of the fact that Aunt Cynthy's dramatic powers were so great that he could almost hear his mother's voice. "Prudence ain't the kind that tries to get round anybody," he said, stoutly.

"I ain't sayin' she is," said Aunt Cynthy, quickly perceiving that she had made a false move. "It ain't neither here nor there what she is, the way I look at it. The p'int is whether your mother hadn't ought to have her say about who she didn't want to have the proputty and the nice house-keepin' things that she'd worked and tit so hard to get. You can't remember your father, Cyrus, but I can. You favor him consid'able. He was as good a man as ever stepped, but he wa'n't smart nor strivin' like some. When he died he didn't have no great propputty; this farm was pretty well run out. Your mother she made it what it is. It's all owin' to her that you're the forehanded man that you be."

"I guess I know it. There ain't no need for anybody to tell me nothin' about that," said Cyrus.

"I was only jest a remindin' you that your mother had ought to have some say about who was to come after her and have the doin's of her nice things that she set so much by."

"I always calc'lated that a man had a right to marry as he was a mind to," said Cyrus, making an effort to assert himself. But he felt that it was a failure, at least in appearance, as he rose limply, and murmuring something about seeing to his horse, beat a hasty retreat.

Aunt Cynthy, as she drew her knitting from her bag and set her needles to clicking, had the air of being mistress of the situation, but inwardly she had her misgivings. "I didn't come none too soon," she said to herself, with profound conviction.

When Cyrus returned from the barn—it was not until after a long interval, during which he had "chewed the cud of bitter fancy" in the retirement of the hay-loft—she announced her intention of remaining for a short visit.

"It's plantin'-time, but own folks is before crops, as I told J'siah, and I'm a goin' to stay a week unless J'siah comes after me. I calc'late that girl of yours, Lonizy Fickett, will bear a little lookin' after. Oh yes! mebbe she does do well; the house 'pears middlin' clean, but I know hired girl capers better'n you do."

Cyrus succumbed to this dispensation of Providence with a sense of helpless misery. He could not order Aunt Cynthy out of the house, he said to himself; still less could he bring Prudence home and present her to Aunt Cynthy as his wife. He saw her at the Friday evening prayer-meeting, but only for a slight greeting, with Aunt Cynthy leaning imperatively upon his arm. In his long and anxious deliberations he had sometimes almost resolved to slip across the field and explain the state of affairs to Prudence. But Prudence seemed to expect a great deal of courage in a man, and it would be embarrassing to tell her of Aunt Cynthy's objections to her. And there was the blessed possibility that J'siah, her son, would come after her. There was much work to be done in planting-time, and Malviny, J'siah's wife, was subject to neuralgia.

When Saturday passed with no summons to Aunt Cynthy, Cyrus rested all his hopes upon a very severe storm the next day. Then Prudence would not expect him to fulfil his engagement. He was afflicted with rheumatism, which made it very imprudent for him to go out in wet weather. There were hopeful signs of a storm. When the Sunday morning dawned fair and bright, Cyrus felt that even nature and Providence had conspired against him. He left Aunt Cynthy to go to church unattended, pleading illness. So unusual an event as his absence from church would be commented upon, and perhaps Prudence would hear that he was ill.

"Prudence Favor was terrible dressed up with a bunch of white flowers on her bonnet this afternoon," said Aunt Cynthy at the supper table that night. "Some folks don't never seem to see that their time has gone by."

Cyrus was cut to the heart. The thought of Prudence, pale and dismayed, in her hard-earned bit of wedding finery was more than he could bear.

"I 'ain't acted the part of a man, and I'm goin' right over and tell her so. And I'll fetch her right home here for all of Aunt Cynthy, if she'll come. And I'd jest as lives tell Aunt Cynthy so to her face," he said to himself, valiantly.

But Aunt Cynthy was deep in a Sunday nap in her chair, and Cyrus thought that, after all, it would not be worth the while to arouse her. In fact he slipped out at the front door, an unusual proceeding, and closed it softly behind him. All of Cyrus's experience in life had tended to convince him that discretion was the better part of valor.

The doctor's carriage was driving away from Prudence's door. As she let the doctor out, Prudence saw Cyrus coming, and waited for him. She had on her every-day dress, and her hair was strained away from her temples, so that the patches of gray showed plainly. Her face was pale, and showed traces of tears.

"I'm an orfle wicked woman, Cyrus," she said. "If I hain't killed my sister it's only by the Lord's mercy. She kind of got wind of what was goin' on. I expect Jo Liscomb told about your gettin' a license. And then I'd got some new fixin's." Prudence flushed all over her pale face. "I expect 'twas silly, but I'd kind of got to feelin' as if I was a girl agin, and I didn't want you to be ashamed of me. She hollered when she see 'em, Laviny did, and I jest went off and left her hollerin'. Seems as if the Lord had hardened my heart, jest like Pharaoh's, lettin' me be all took up with gettin' married."

"Prudence, you'd ought to have more strength of mind than to be drove by her hollerin'," said Cyrus, severely. "She knows she can drive you—"

"I'm surprised at you, Cyrus, to say such a thing. She can't help it. She's jest a poor little cretur, and I've treated her cruel." Cyrus smiled bitterly. The "poor little cretur" was half a head taller than tall Prudence. "When I come home from meetin', she was layin' here alone in a dead faint. I thought much as could be she was dead. When I'd fetched her to a little, I run for the doctor. He says she hain't got no real heart disease, but she's got to be kept quiet, and not crossed the least mite—not the least mite—or she may have. And I never thought nothin' of her ketch! Seems as if I couldn't be thankful enough, Cyrus, that you didn't come. S'posin' I'd got to tell Laviny now that we was married! 'Twould kill her, jest as sure as the world! I felt bad at first, Cyrus, real bad; but I heard 'em say that you was sick, and"—she looked at him with a kind of wondering tenderness—"it would have been real unhandy about your aunt Cynthy. Don't seem as if I should have minded her much. But there! 'twas the Lord's doin's." Cyrus uttered an impatient protest. It seemed to him that the responsibility was entirely Aunt Cynthy's. "It's terrible hard to say it, Cyrus—things has been hard between you and me always—but we can't keep company together no more anyhow, and—and you hadn't better come here at all. Laviny she can't stand it nohow, and I've promised her. Mebbe it's jest as well for you to be mad, Cyrus, for then you won't feel so bad. Seems as if 'twas most too bad; but"—a shrill, persistent call of "Prudence!" resounded through the house—"but mebbe in a better world—"

"If it's a better world, it 'll be one where folks has some chance to do as they're a mind to!" cried Cyrus as Prudence softly shut the door.

SHAD-FISHING ON THE DELAWARE.

THE coming of the first shad is an event the importance of which may be gastronomic or scientific according to the way you have of looking at it. In 1889 the first *Clupea sapidissima* of the North River was caught on the 1st of April. This year the forerunner of the school was some two days later, so for the last two years shad have been fairly punctual. Generally following an old European custom, the first shad caught in the North River is sent to the Mayor of New York for his own private delectation. In this habit may be found a trace of the older time when certain fish, caught no matter when or where, belonged of right to the sovereign; as, for instance, the sturgeon captured in the Thames, which had to be forwarded at once to the King or Queen of England. There is a pretty story having to do with Joan of Arc and the first shad. When the Maid was at her hostelry in Orleans, the first alose, or shad, was bought by the landlord, and he would have prepared it for the maid's breakfast. "No," said the champion of France; "I have other fish to fry. When I have driven the hated English back, which will take place about noon, then I will return, and we will have that shad for dinner." The chronicler informs us that Jean did raise the siege, but we are not told whether the Maid partook of shad for dinner on that eventful day.

In Pennsylvania, according to the careful data kept by the United States Fish Commission, the first shad taken last year in the Delaware was on the 25th of March. For this year the date was some four days earlier. So we see, in the one case, that for the North River the shad this year were somewhat later, and for the Delaware somewhat earlier. Just here comes in scientific inquiry as to the coming of the shad, and following the studies carried out by the present efficient United States Commissioner of Fish and Fisheries, Marshall McDonald, water temperatures have a great deal to do with the first appearances of shad.

For a long time it was supposed that shad were migratory to a great degree, and in the winter moved in bulk to the South, returning *en masse* when warmer weather set in North. This is found not to be the case. There seems to be the strongest evidence that shad, when they descend the rivers in which they were born as small fish, never leave a great distance between them and the mouths of such rivers. There are slight differences in the coloration of the caudal and dorsal fins of Southern Atlantic fish, and such fish are very rarely found in Northern schools. This shows that the fish go back to the particular rivers they belong to. That they do not go very far from the mouths of certain rivers is evident from this fact that in the neighborhood of New York shad are often taken in winter.

It looks as if there was a close relationship between the movements of many kinds of fish and water temperatures. If then the water be too cold, shad do not ascend the rivers, and so far this season in the latitude of New York, though the winter was abnormally warm, just at the end of March and beginning of April there was a sudden lowering of the temperature. It would be entirely unscientific to jump at the conclusion that because there has been an abundance of floating ice this year that that made the sea water colder. Between that part of the ocean where portions of the icebergs are floating and our shores the Gulf Stream runs, which diverts from our coast line the colder water; but what effects on air temperatures the ice may have brought about is difficult to determine. Taking temperatures of water off Sandy Hook for March of 1890, it has always been from two to three degrees higher than in 1889. For instance, on the 30th of this March it was forty-one degrees at high water, the same at low water on the surface, but the bottom water was between forty-five and forty-six. Last year, on the same date, w[illegible] the same water, it was on surface forty-o[illegible] and the same at the bottom. Then the temperatures went rapidly up in 1889.

No phenomenon in natural science can be determined from the experience of one or even ten years. It is only by close observations over extended periods that deductions can be arrived at. The following is, however, the conclusion arrived at in regard to shad, and it is "that shad occupy a hydro-isothermal belt or area limited by the temperature of 60° to 70° F., and that they move with this belt, as the season advances, into and up the rivers." In that beautiful study of natural equilibrium there may be factors that as yet we know nothing about, but which the United States Fish Commission may discover. When the time of perfect adjustment comes, as Mr. Marshall McDonald expresses it, "the fish are brought, by influences of which they are entirely unconscious, into such relations and under such conditions as to make reproduction possible."

Gloucester, on the Delaware River, on the New Jersey side, has always been celebrated for its shad fisheries. Drift nets and gill nets are used, and these are sometimes from 200 to 250 fathoms in length. Deep water is a necessity for a drift net, and at the same time there must be a shelving bank, so that the nets may be readily hauled inshore. The true gill net is stretched on stakes. The illustration shows the hauling of a net, and the fishermen are putting the catch in a small boat, the shad to be at once sent to the market. As to value, the shad fisheries of the Delaware River are of the greatest importance. The epicure in shad is generally inclined to believe that the further north shad is taken, the better it is. In the times of the past, however, when Philadelphia was a smaller city, and the Delaware and Schuylkill flowed unpolluted, the fish caught near that city were deemed the finest. To-day Connecticut shad fetch the highest price.

RUSSIA.

"Russia! Russia! I behold thee from my wondrous beautiful distance."—GOGOL.

SARMATIAN mother! why dost thou devour
Thy offspring, who by loving thee are curst?
Why must they fear thee who would fain be first
To add new glories to thy matchless dower?
Why must they flee before thy cruel power,
That punishes their best as treason's worst—
The treason that despotic chains would burst—
That makes men heroes who in slavery cower?

Upon thy brow the stars of empire burn;
Thy bearing has a majesty sublime.
Thy exiled children ever toward thee yearn;
Nor should their ardent love be deemed a crime.
Oh, mighty mother of men, to mildness turn,
And haste the advent of a happier time!

SIBERIA.

"ALL hope forego, O ye who enter here!"
Here winds are sweet with breath of myriad flowers,
The skies arch blue o'er lands of richest dowers,
And all the fairest gifts of earth appear.
All hope forego? Why, surely hope, not fear,
Should view this land, whose lofting Ural towers
With wealth of gold and precious stones, and pours
Of mighty rivers winding far and near!

Yet look! What mean those melancholy trains
Of desperate men and sad-eyed women, looking back
To bid that awful bourne a last farewell?
O hear those groans, those sighs, those clanking chains,
As on they drag along the hopeless track
That leads, if not to death, to worse than hell!

NATHAN HASKELL DOLE.

to this light rig they unquestionably owe in part their extraordinary capacity to withstand fatigue.

Marching on the Mexican plateau is a severe strain upon both muscles and nerves. Unless some especial purpose is to be served, garrisons are shifted in the dry season, when the roads are ankle-deep with dust, and when the sun beats down, hot and strong, from a relentlessly clear sky, and casts upon everything a blinding glare. It is the way of roads in Mexico, especially in the northern states, to seem interminable. One low ridge of rocky hills is ascended, and from its crest another like ridge is seen half a dozen miles away across an arid valley, over which the waves of heat shimmer and undulate, and in which the only vegetation (if so cheerful a word may be used to describe such brown and yellow bleakness) is thorny cactus, tufts of Spanish-bayonet, and a few distorted and scraggly pita palms—a desolation so complete that it seems unnatural and unreal.

All day long, saving only the hot halt at noon, the march continues through this utter dreariness, oppressed by blighting sunlight, the head of the column (where the officer in command rides with plucky erectness) raising a cloud of dust that grows thicker and heavier with each successive file, until the rear guard literally is lost in its dark density. The smaller streams and many of the larger ones are dried up, and a draught of fresh water by-the-way is a joy impossible; the water in the canteens grows hot in the fiery rays of the sun, and never anywhere is there so much as a hand's-breadth of shade. And yet such is the power of endurance that these wiry Mexican soldiers possess, the men rarely become exhausted by the way; and at night, when a halt is made at some little town, or at some *hacienda* where water can be obtained, and when the cool delicious wind sweeps down refreshingly from the hills, they are as lively, and go at their rations of *frijoles* and *tortillas* with as much zest as though their eight or ten hours of toiling through heat and dust had been no more than a *paseo*—an agreeable stroll.

It should be, and doubtless is, a cause for thankfulness throughout the Mexican army that with the building of the new railroads, by which all the important cities in the republic, excepting Oaxaca, Durango, and the forts on the west coast, have been connected, the arduous marching heretofore attendant upon garrison transfers in great part has been done away with. The increased military strength of the federal government that has come with this change is obvious. Large bodies of troops can now be moved to nearly all important points expeditiously and without waste of strength by the way.

Thomas A. Janvier.

A HUNTER'S "SHACK" IN THE ROCKY MOUNTAINS.

The Eastern visitor to the markets of the cities near the base of the Rocky Mountains is usually much impressed by the abundance of mountain game there displayed. Before the stalls and doorways are rows and heaps of the carcasses of deer and elk, somewhat rarely a mountain sheep, bunches of wild turkeys and grouse, and often hanging from a strong hook, or disposed upon the sidewalk in a life-like attitude, the huge body of the grizzly or cinnamon bear.

The hunters' wagons no longer come into Western cities from the prairie piled high with skins of buffalo and the dried tongues and other choice parts of the animals, for the buffalo has disappeared from the plains. The antelope is rapidly succumbing to the same fate, for these creatures, whose home is the open country, have no place of concealment. But the apparent diminution in numbers of mountain animals, though in part real, is largely caused by their retirement, frightened by the presence of man and discharge of fire-arms, into the region of inaccessible peaks and mountain recesses, beyond the reach of the ordinary hunter. Fortunately the natural features of the Rocky Mountain country do not admit of pursuing deer successfully with dogs, and thus the exterminating effects wrought by this mode of hunting in the deer ranges of Maine, New York, and Michigan cannot be repeated in that region. The hunting methods in the Rocky Mountains partake more of the character of the pursuit of game by Indians, who, in killing such animals as they need, do not exterminate the species nor frighten surviving wild creatures from the region.

Mr. Graham's illustration on the first page represents a hunter's "shack" in the Rocky Mountains. The two occupants have selected a site for their cabin in a locality that combines the general character of a favorable hunting-ground and the specific features of a convenient and pleasant encampment. To follow the deer—the game which they chiefly seek—far up the mountain sides is impracticable in the snowy season; but the hunters know that these shy animals, when the snow is deep, will at some hour of the day descend into the valleys to feed. Their time and mode of doing this vary according to the season of the year, the depth of snow, the extent to which they have been recently hunted in the vicinity, and other circumstances, which are all carefully taken into account by the skilled hunter, who can tell closely the altitude and surroundings in which game of various kinds is likely to be found under given conditions. A heavy fall of snow that sends the deer down to the valleys of the foot-hills will lower the range of the elk only to points midway between the peaks and their bases. The mountain sheep and goats rarely come far below the snow line, and these animals, so difficult to reach, are seldom systematically sought by the "business" hunter, who, of course, is glad to take a shot at them when they are encountered within possible range. A favorite location for the hunter is the vicinity of a salt or alkaline deposit, for such places are very attractive to deer. Sometimes the hunter makes an artificial "lick" by burying a bag of coarse salt in a marshy spot. The gradual dissolving of the salt results in a saline deposit at the surface, which the deer, even when very shy, will take great risks to visit. From behind a "blind," built at an advantageous spot, the hunter shoots the deer as they approach the "lick." Two or three hunters are the usual number in a party, which enables the hunting to be continued while one of the members is taking game to market and returning with supplies.

The "shack," with its walls of upright small logs or splints well chinked with moss, grass, or mud, its roof thatched with evergreens covered it may be, with a foot of earth, and its warm fire within, is a thoroughly comfortable habitation in the sharp frosty air of the mountain heights. Sweeter sleep could hardly be than that which the wearied hunters enjoy upon their couch of pine boughs laid thickly, and smoothly overlapping, on the floor of natural earth. The mountain valley opens upward into a view of the great peak beyond its head; the air is laden with the balsamic odors of spruce, firs, and pine; the stillness is soothingly broken by the splashing gurgle of the mountain brook and the whispering of the wind in the pines, and sometimes is rudely shattered with the shock and thunder of the distant avalanche. By night for companionship not unwelcome to the hunter comes the howling of wolves about the camp, the barking of foxes, the hoot of the owl, and not infrequently the snuffing and grunting of a grizzly bear, drawn to the camp in the hungry season of the year by the odor of the carcasses of venison hung before the door.

THE MISSISSIPPI FLOODS.

An occurrence in the valley of the Mississippi which was recently noticed in the New York daily papers to the extent of some fifteen lines, was vividly illustrative of what most Eastern people literally know nothing about—the perils and the problems of the great Father of Waters. A band of twenty-five men, armed with Winchester rifles, went to the levee at Opossum Fork, and after driving away the guards who were stationed there to protect the levee, they cut a gap through it, letting the water of the swollen river through, and so flooding two counties. This they did, according to the brief despatch which came over the wires, in order to protect their own homes from the danger which threatened them from the pressure on the levee below.

This was as if the people of Jersey City, in order to protect themselves from a threatening danger, should deliberately flood the whole of Staten Island to the depth of twenty or thirty feet. So stupendous an act, if it had happened in the East, would have filled the newspapers of the whole civilized world with comments and detailed description. Happening where it did, it hardly provoked a notice. The local correspondents, learning of it some days after it had happened, sent a bare statement of the fact, without date or detail, and some of the newspaper editors thought it not worth publishing.

Yet the government of the United States spends millions of dollars every year in attempts which have, so far at least, proved totally futile, to confine the great river within its banks, and so avoid the perils which every spring threaten an area larger than all New England and the Middle States.

Two utterances which I heard in the valley of the Mississippi at the time of the great flood of 1882 are fairly expressive of the problem with which the Mississippi River Commission are wrestling. One man said: "I have lived on the river for thirty years, and I have studied it, for it was my business to do so. I have been steam-boating all that time. I am now certain that I don't know anything about it, or about what ought to be done to it."

Another said, "When God put the river into this valley, He told it to go wherever it pleased, and it always has done so, and always will."

The wonderful and often terrible changes that come with the changes of season, and which produce such effects as the artist has shown, are simply inconceivable to one who has not seen them. That a stream so quiet and comparatively small as the Mississippi is at low water, should become a raging torrent of twenty miles average width, and ten feet average depth from shore to shore, throughout the eleven hundred miles from Cairo to the sea, is simply incredible until one has seen it. This river, however, did that in 1882, when the great general overflow occurred. Unnumbered lives were lost that year, and the damage to property was never even estimated. Details were hard to get when communication was so nearly cut off as it then was, and after the floods were over no effort was made to reckon the extent of the disaster.

Since that spring the reports which have come to the East have not indicated any flood equal to the present one, and the only reason why this year has not proved as disastrous as 1882, is that the levees have been strengthened since then. The fact, however, that the levee system has, as a whole, successfully withstood the pressure of the highest water known for many years, is by no means as reassuring as it seems on first consideration, for there is grave reason to believe that the levees themselves serve to increase the very danger against which they are a guard.

The problem is a complex one, and while the plans of the Mississippi River Commission must be accepted as the best practicable, being indorsed as they are by a majority of the best engineers who have studied the subject, there are not wanting capable critics who declare that they are false in theory and essentially dangerous and mischievous in practice.

The main factor in the problem is that which makes news of this article just at the present time. Every spring when the waters of the North are released from their icy bonds, there comes a mighty flood into the valley below. It is not always equally great, of course, and the conditions this year have produced exceptional perils, but the flood comes as certainly as the season does. It may be doubted whether the reports are true that the water is higher this year than it was ever before known to be, but it is unquestionably true that the present flood ranks among the highest.

What to do with this enormous volume of water is the question that baffles the engineers. If it were left unconfined, it would, of course, render vast districts of country uninhabitable, at least for a month or so each year, and even after all the work that has been done, it sometimes happens, as at present, that thousands of people are driven from their homes, and in many cases houses are destroyed, cattle are swept away and drowned, and not a few human lives are lost.

Two principal theories are advanced, one of which is diametrically opposed to the other, and the advocates of each abuse the advocates of the other in unmeasured terms. One is the outlet system. It is argued in favor of this that since the water will come in such quantities as to be dangerous and often destructive, the philosophical thing to do is to provide it with all the outlets possible. Among the many bayous and natural outlets formed by the river near its junction with the sea, it is claimed that a few should be selected and kept clear, so that the surplus water may find its way out as quickly as possible. Such a proposition seems simple, feasible, and rational; but it is not the one which has been followed in the work of the commission, and it is declared by the majority of engineers to be unscientific and radically wrong. The plan that has been adopted is to erect artificial banks (called levees), and to rely upon the "scour" of the water to keep the river bottom free enough to afford a clear passage to the sea. The scour is aided as far as possible by clearing away obstructions where it is desired to maintain a channel, and by placing other obstructions in places where natural shallows have been formed. This is the work carried on by the commission, and is one in theory with that executed by Captain Eads in the South Pass of the Delta. He claimed that if the water flowing through the pass should be confined within comparatively narrow banks, it would scour out the bottom, and so deepen its own bed. The primary result was exactly opposite to this. The water refused to do the work expected of it, and following the law of nature, sought the line of least resistance. Finding the South Pass obstructed, or rather narrowed, much of it turned aside and poured through the Southwest Pass and the Pass à l'Outre, and instead of scouring out the South Pass, scoured the other two to the depth of two feet below where their beds had formerly been. As soon as this was discovered the two passes were partially dammed up, and the water thus forced through the South Pass.

The natural scour has not proved sufficient to maintain the channel that was expected, but powerful dredges have been used supplementarily, and a satisfactory result has been secured. Whether a similar result will be attained throughout the length of the river is a mooted point, but the engineers of the commission are confident of success. Of course the expense is enormous, and it is considered likely that fifty millions will be spent before the work can be considered complete. Even then a considerable sum will have to be spent yearly to keep it in order.

The levees are relied on as the chief aid to the work of the commission, but the commission does not construct them, or even work directly to strengthen them. These levees are nothing more than artificial banks or heaps of soil shovelled up along the line of the natural banks. The commission is working to narrow the wide places in the river, so as to secure a uniform width of three thousand feet. This is done by constructing revetments, consisting principally of mattresses of wire and brush, which are secured by rubble-stone. In other places great quantities of stone are dumped, and various similar means are used to encourage the scour in the shallower parts of the river, and also to prevent the undermining of the natural or artificial banks.

The chief criticism of this plan is based on the fact that the water of the lower Mississippi contains so very much silt in solution. This silt, undoubtedly all brought down by the river from the upper lands, forms the entire surface of the land for many thousands of square miles to an unknown depth—hundreds of feet. As a matter of course, anything that retards the free passage of the water to the sea causes a precipitation of this silt, and it is claimed that the ultimate result of the present system will be to build up the bed of the river so high that the stream will finally forsake its present course entirely, and make a new route for itself. That such a result may follow seems to be a reasonable expectation, though it is likely to take many years in coming—possibly many centuries.

It is asserted, however, that even in the few years that have elapsed since Captain Eads constructed his famous jetties, the bed of the river above has been raised to an appreciable extent. If this be true, the lapse of time may be much less than has been expected before some such catastrophe may occur.

On the other hand, such prophecies are ridiculed by the engineers who endorse the plans of the commission. They assert that the water by being confined in a narrower channel than it would naturally make for itself is really compelled to move on more rapidly, and therefore more forcibly, than it would otherwise do, and consequently, that instead of depositing more silt, it actually deposits less than would be the case if it were unconfined. The complexity of the problem comes from the various attributes, or habits, as they might almost be called, of the great river, and the seeming hopelessness of ever being able to determine which of these attributes is predominant.

In one respect the casual observer is moved to sarcastic reflections. When a flood does come, like the present one, or even one of much less dimensions, the work of the commission is of necessity suspended, and at first sight it seems extremely ridiculous to see engineers waiting for the water to subside before they can place confines many feet below the present surface, which confines are intended, in part at least, for the purpose of preventing similar overflows in the future.

GENERAL N. A. MILES.

On the 5th of April President Harrison nominated Brigadier-General Nelson Appleton Miles to be a Major-General in the army in place of the late General George Crook. The distinguished officer thus selected for promotion has had a career of remarkable brilliancy and success. Born at Westminster, in Massachusetts, August 8, 1839, he was engaged in mercantile life in Boston when the civil war broke out. He joined the Volunteers as First Lieutenant of the Twenty-second Massachusetts Infantry, and the following year, May 31, 1862, was made Lieutenant-Colonel of the Sixty-first New York. With the Army of the Potomac, he took part in all the battles of the Peninsula under McClellan, and then in the Antietam campaign, his regiment being in the Second Corps, then under Sumner. At Fair Oaks he was wounded. In the autumn of that year he became Colonel of his regiment, and in the battle of Fredericksburg commanded a small brigade in Hancock's division of the Second Corps. At Chancellorsville he greatly distinguished himself by checking with his command, consisting then of three regiments and detachments of three others, Jackson's assaults upon Hancock's front, being then in charge of the skirmish line. This service was performed by the intrepid and skilful young officer at a costly price to himself, since he was shot through the body, and carried from the field with what was supposed to be a mortal wound. When the brevets were distributed, his as Brigadier-General in the regular army was "for gallant and meritorious services at Chancellorsville."

During the Virginia campaigns of 1864 and 1865 General Miles added to his reputation as an enterprising officer, and received a commission as Brigadier-General of Volunteers, dated from March 12, 1864, and specifically expressed to be "for distinguished services during the recent battles of the Old Wilderness and Spottsylvania Court House." He also afterward received the brevets of Major-General in the regular army for gallant and meritorious services at Spottsylvania, and of Major-General of Volunteers "for highly meritorious and distinguished conduct throughout the campaign, and particularly for gallantry and valuable services in the battle of Reams Station."

At the close of the war, General Miles received the command of a regiment in the regular army, being commissioned as Colonel of the Fortieth Infantry, July 28, 1866. In March, 1869, he was transferred to the Fifth Infantry, and while commanding this regiment acquired a high renown for Indian campaigning. In 1875 he defeated the Cheyennes and the Kiowas and the Comanches on the borders of the Staked Plains. In 1876 he defeated the hostile Sioux in northern Montana, scattering the bands of Crazy Horse, Spotted Eagle, and other chiefs, and compelling Sitting Bull and his followers to take refuge in Canada. His next great achievement was the defeat and capture of the famous

MR. RANDALL.

Randall, who died in lay, April 13th, was born ctober 10, 1828. His fa- all, a well known lawyer iladelphia. His mother Young Randall did not went into business, and voted himself to mercan- is father, he attended the ion at Cincinnati which ted James Buchanan for a Mr. Randall afterward scious that politics was n business in Philadel- years as a member of the al during 1858–9 served

· Randall had joined the of Philadelphia, and as front with his company attached to the Second y. Later, as Cornet, he oop when it was called casion.

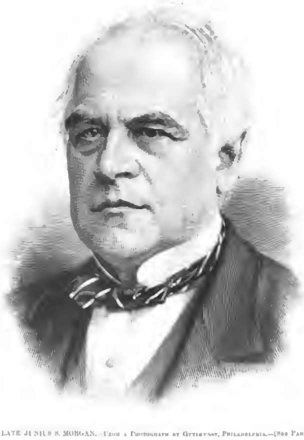
ovember, 1862, he had ves as the Representative vania District. He was t was Republican; but ty won his first election, at the voters of the dis- ity to the Pennsylvania n secured for him thir ons. Mr. Randall took , 1863. In the Thirty- ecame the leader on the ratic minority of thirty

d session of the Forty- hich expired by limita- 75, the Republican ma- te efforts to pass the so-called "Force Bill." The hope of the Democrats lay in delaying it, so that the Senate would not have time to act upon it. The fight lasted for two days and a night in February, 1875. Mr. Randall was on the floor the entire time, eating as he could, sleeping not at all, obstructing all business, until, on February 27th, the bill was passed by a vote of 135 to 114, and sent to the Senate too late for that body to act upon it. This practical victory made him famous.

In December the Democratic majority chose Mr. Kerr as Speaker, and he appointed Mr. Morrison chairman of the Ways and Means Committee, thus recognizing him as the leader of the party. In the succeeding session, however, Mr. Randall was chosen Speaker, and acted as such from December, 1876, to March, 1881, but when the Democrats were again in control, his attitude on the tariff question not commending itself to his party, Mr. Carlisle was chosen in his stead.

Of late years the Democratic party had left Mr. Randall, around whom a small band of protection Democrats had gathered, and he assumed to some extent the rôle of an obstructor. He opposed both the Morrison and the Mills tariff reform bills, and to the latter offered a high-tariff substitute. His advice on parliamentary matters was highly valued, and from his sick bed he directed the Democrats in their recent struggle with Speaker Reed and his rulings.

For nearly twenty years he had occupied the little house in C Street, Washington, in which he died. He leaves a widow—a daughter of General Aaron Ward, of this city—a son, and two daughters, one of whom is unmarried.



THE LATE JUNIUS S. MORGAN.—From a Photograph by Gutekunst, Philadelphia.—[See Page 307.]

THE BLESSING OF STRONG NERVES

Is recoverable, not by the use of mineral sedatives, but by a recourse to effectual tonic treatment. Opiates and the like should only be used as auxiliaries, and then as sparingly as possible. Vigorous nerves are quiet ones, and the most direct way to render them so is to reinforce the vital energies. That sterling invigorant, Hostetter's Stomach Bitters, will be found all-sufficient for this purpose, since it entirely removes impediments to thorough digestion and assimilation of the food, so that the body is insured its due amount of nourishment, and consequently of stamina. Rheumatic tendencies and affections of the kidneys and bladder are also counteracted by the Bitters, which is besides a pleasant medicinal stimulant, infinitely purer than the raw excitants of commerce, which react injuriously upon the nervous system.—[Adv.]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[Adv.]

PUBLIC SPEAKERS AND SINGERS

Can use "Brown's Bronchial Troches" freely, without fear of injury, as they contain nothing injurious. They are invaluable for allaying the hoarseness and irritation incident to vocal exertion, effectually clearing and strengthening the voice. Ask for and obtain "Brown's Bronchial Troches." 25c. a box.—[Adv.]

IMPERIAL GRANUM

Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[Adv.]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[Adv.]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds: all pains. 25 cts. a bottle.—[Adv.]

Nicholson's Liquid Bread is a complete substitute for all alcoholic drinks. Persons of delicate constitutions can take it with impunity, and the most beneficial results. Sold by all druggists and grocers.—[Adv.]

Burnett's Cocoaine allays irritation, removes all tendency to dandruff, and invigorates the action of the capillaries in the highest degree, thus promoting a vigorous and healthy growth of the hair. Its effect upon the glossiness and richness of the hair is such as cannot be surpassed.—[Adv.]

A WONDERFUL OFFER

$700 Piano for $1. Sample copy of Indiana State Sentinel sent free to any address, explaining this offer. Address Sentinel, Indianapolis, Ind.—[Adv.]

Angostura Bitters are the most efficacious stimulant to excite the appetite. Try it.—[Adv.]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[Adv.]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits. 25c. a box.—[Adv.]

Burnett's Flavoring Extracts are invariably acknowledged the purest and best.—[Adv.]

THE MEETING OF STANLEY AND EMIN PASHA.

THE STANLEY-EMIN RELIEF EXPEDITION.

To become an explorer in Africa—at any rate, to make an indelible mark—it would seem as if a previous training were essential. Before setting foot upon African soil, Mr. Stanley had, by a life of adventure, fitted himself in no ordinary manner for his great life's work.

Born at Denbigh, in Wales, in 1841, Stanley appears to have been educated at a school in St. Asaph. He has been described as having possessed as a boy a keen intelligence, high spirit, and determined will. He was, however, unusually sensitive, and did not appreciate chaff or humor; but he was not averse to act as ringleader in many boyish escapades. Geography and arithmetic seem to have been his favorite studies. When about sixteen a roving disposition became manifest, and apparently tiring of school life and a humdrum existence, he left home for Liverpool, and took a passage for New Orleans. There, searching for employment, he found it with one Henry Mortlake Stanley; and on the death of his employer, who adopted him, he took his name, dropping his own patronymic, John Rowlands.

The next event of importance in Stanley's life was his enlisting in the Confederate army, where he saw much service, being taken prisoner, however, at Pittsburg Landing. Here, at any rate, he gave proof of his remarkable courage and daring, for he escaped, under a storm of bullets, by swimming across the river. Some time after he again enlisted, but this time he took service in the Federal navy, and joining the flag-ship *Ticonderoga*, he filled the post of secretary to the Admiral, and remained in the service until the beginning of 1865. He obtained officer's rank for swimming under fire some five hundred yards and making fast a hawser to a Confederate ship, thus enabling her to be towed off a prize. We next hear of Stanley as a newspaper correspondent, and afe seeing some service in the guerilla warfare against the Indians, he obtained the appointment of correspondent for the ew York *Herald*, and accompanied the expedition to Abyssinia, thus entering Africa for the first time, the country here his great achievements were to be accomplished, and here he was to win undying fame. Stanley proved himself to be an intrepid and gallant war correspondent, capable not only of grasping the details of an expedition with remarkable rapidity, but also of forming his own opinions as the tactics employed, and boldly criticising military proceedings. He distanced all other correspondents in telegraphing the results of the Abyssinian war to the New York *Herald*. This expedition, and a subsequent campaign in pain, had proved his metal, and every one knows the story f how, in October, 1869, he was commissioned by Mr. James ordon Bennett to find Livingstone.

It is unnecessary to repeat details, but Stanley had a roundabout route to take in order to reach his starting point, Zanzibar. He had first to describe the opening of the Suez Canal; he then visited Palestine, Constantinople, and the rimea; then on to Tiflis; thence through Armenia to Teheran; and on, *viâ* Ispahan, Shiraz, Bushire, from which place e sailed *viâ* Bombay to Zanzibar, where he arrived on January 6, 1871. This adventurous journey was graphically escribed in a series of letters to his paper.

It is no slight matter to record that during this remarkable tour he had, by exercising extreme caution and tact, succeeded in avoiding all untoward complications. At Zanzibar he had to exert his diplomatic skill. his expedition was remain a profound secret, and yet he had to ascertain here Livingstone might be, and also to distance other proposed expeditions which were being got ready to beat him ther. He had utilized his time at sea by learning how to ke astronomical observations; and so well had he utilized s opportunities, that the observations he afterward made in frica would have done credit to a trained surveyor.

Those who have travelled in Africa know the difficulties f organizing a caravan and fitting it out, yet such was Mr. tanley's energy that by February 5th he was ready to start ith a caravan of two hundred men. He had two European ubordinates—W. L. Farquhar and J. W. Shaw—both of hom had been mates. He also obtained the services of ombay, Uledi, and Mabruki, who had been respectively in peke, Grant, and Burton's expeditions. Selim, an Arab boy, ho had been picked up at Jerusalem, was his interpreter.

We cannot follow Stanley's route from the coast to Ujiji; uffice it to say that on arriving at Unyanyembe he passed a aravan which had been sent to the relief of Livingstone by ir John Kirk. He was compelled to leave here many of is men who were sick, including Shaw. At last, 236 days fter leaving Bagamoyo, he caught sight of Tanganyika, and marched, with flags flying and guns firing, into the town of jiji, shortly after to grasp by the hand the veteran explorer e had come so far to aid. His mission was crowned with uccess and he had achieved a triumph which was to bring is name into the foremost rank of African travellers.

Livingstone undoubtedly exerted a great influence upon tanley, who managed to win his confidence, and he instilled into him a love of exploration which had probably itherto been latent. They were, however, not to part until ey had explored the northern extremity of Tanganyika, nd in so doing came to the conclusion that Tanganyika had o connection with the Nile River system, for they found at the Rusizi River flowed into Tanganyika from the orth, and not out of Tanganyika to the north as had been upposed. This put an end to Dr. Livingstone's theory that anganyika and the Albert Lake might have, in fact, some ommunication.

On December 27th Livingstone and Stanley parted—the one o return to the haunts of civilization, the other to turn once ore to his patient, self-sacrificing work—work which was to e continued with failing strength, uncheered by European ompanionship, and only to be ended when the noble spirit uitted the weakened frame that so long had withstood the ttacks of disease. The iron will which so long had borne e strain was compelled to yield at last, and quietly the reat philanthropist passed away, tended by the faithful ands of his negro followers. After receiving Livingstone's st blessing, Stanley heard from his lips words which must ave rewarded him for what he had undergone: "Well, I ill say this to you, you have done what few men could do -far better than some great travellers I know—and I am rateful to you for what you have done for me. God guide ou safe home and bless you, my friend." No time was ost by Stanley in his return march to the coast. Notwithstanding the flooded state of the country, onward the expedition marched. The elements seemed to fight against them, ey had to battle with storms, to encounter swamps, and ften nearly perished; but yet on May 8, 1872, they arrived the coast, 525 miles having been traversed in thirty-five ays.

Soon the news of Stanley's success reached Europe. At rst it was hardly credited; the anxiety felt concerning Livingstone's safety had been so intense that the news was considered too good to be true; but when Mr. Stanley arrived in ondon with Livingstone's own diaries and letters, doubt as thrown to the winds, and he was received with the applause and gratitude of Livingstone's admiring countrymen. he toils Stanley had undergone had been indeed great. e had aged much; his hair had grown gray. But after a ort rest, occupied in writing his celebrated book, *How I ound Livingstone*, he was again on the way for Africa, this me accompanying the British expedition to Coomassie, arving at Cape Coast Castle in October, 1873. Space only ermits of a brief reference to this expedition. It again dded to Stanley's prestige as a newspaper correspondent, nd on his return to England gave him the opportunity of riting another fascinating book, entitled *Coomassie and agdala*,* which was published in 1874.

THE EXPLORATION OF THE CONGO.

We now turn to what we may call the fourth chapter in tanley's African experiences, and for the first time we shall e him engaged as an African explorer pure and simple. he conception of this new expedition occurred under exceptionally impressive conditions. In Westminster Abbey e remains of the heroic Livingstone, the great missionary nd philanthropist, were consigned to their last resting-place midst the pomp and circumstance of a national mourning. tanley, who had last seen Livingstone at Unyanyembe, ood by the open grave, and, standing there, he formed the esolution to take up the work which Livingstone had been nable to accomplish.

The mystery of Tanganyika remained to be solved. What was the Lualaba River, and whither did it wend its uggish way?

Soon Stanley had made his arrangements, and under the auspices of the New York *Herald* and the London *Daily Telegraph*, he left England on August 5, 1874, and, accompanied by three Europeans and some 350 porters, he left Zanzibar on November 12th to perform one of his greatest feats.

The march to the south end of the Victoria Nyanza was rapidly accomplished, for on February 27, 1875, the lake was reached, and this, notwithstanding the desertion of some of the men, attacks of dysentery and fever, and want of food. Edward Pocock, one of Stanley's three European companions, died at Chiwyu. The natives also attacked the expedition for no less than three days. At Kagehyi, Stanley launched his boat, the *Lady Alice*, in which, accompanied by only eleven men, he circumnavigated the great lake. The voyage to Uganda was not without its dangers, and on several occasions it required the greatest tact and presence of mind to avoid conflicts with the natives. One fight, indeed, did take place near Uvuma, where the *Lady Alice* was surrounded by thirteen great war canoes. Stanley's heavy repeating rifle, however, rendered him good service, and by firing at the water line of the canoes he pierced them through and through, so that to save their canoes from foundering the Wahuma were compelled to withdraw from the contest. At Uganda, Stanley met with a hearty reception from King Mtesa. He was received in great pomp, presents were showered upon him, and he saw for the first time a really great African potentate, who knew well how to insist upon courtly etiquette, whose government was based upon a feudal system, and whose warriors, estimated by Stanley at over a quarter of a million, were well-disciplined, and dreaded by the surrounding tribes. After a short visit, Stanley returned to Kagehyi to bring the whole of his expedition to Uganda. Calling at Bambiri, he and his companions nearly lost their lives, as the natives seized their oars, and then commenced a fierce onslaught. It is difficult to understand how they escaped, but escape they did, and using the boat stretchers as oars, they sped from the inhospitable shore. Arrived at Kagehyi, after exploring more than 1000 miles of coast line, Stanley found his expedition in safety, but Barker, another of his white companions, had died in his absence. After a bad attack of fever, from which Stanley suffered, the whole expedition was transported to Uganda, having administered a severe punishment on the inhabitants of Bambiri.

It would be interesting, were it possible, to relate the stirring incidents which occurred during Stanley's residence with Mtesa. He met Linant de Belefonds, one of Gordon Pasha's officers; he accompanied Mtesa on a warlike expedition to Uvuma, and aided the King by his counsels. He also set himself to work to convert Mtesa, and is said to have translated the whole of St. Luke's Gospel for his benefit, and to have written a synopsis of the Bible. His description of the religious conversations he had with Mtesa is extremely graphic. They ended in Mtesa professing to accept the white man's Book in preference to the Koran, and in Mr. Stanley publishing a letter in the London *Daily Telegraph*, urging that missionaries should be sent to Uganda.

This letter was acted upon by the Church Missionary Society, whose missionaries commenced labor in Uganda in 1877, and have carried on their work there up to the present time, with no inconsiderable success.

With regard to Mr. Stanley's letter, an incident little known may here be mentioned. He had given it to Linant de Belefonds to send home. A few weeks afterward the latter was killed by the Baris, and when his boots were removed, previous to his burial, the letter was found in one of them, and was forwarded, with other letters, to Europe by Gordon Pasha, who related the circumstance.

Stanley utilized to the full his sojourn in Uganda by investigating the habits, customs, and traditions of the people, and he left it to visit, if possible, the Albert Nyanza. Owing, however, either to the treachery of the escort Mtesa had given him, or more probably to private orders given by the King, he was only able to visit a gulf, which he named Beatrice Gulf, and which now proves to be an arm of Lake Albert Edward, the latter draining into the Lake Albert.

Marching to the south, Karagwe was visited, the Alexandra Nile, flowing from the Alexandra Lake into the Victoria, was explored; and thence the expedition pressed onward to Tanganyika, which was likewise explored, Stanley coming across Cameron's route at the Lukuga River, which either flows into or out of Tanganyika on the west. Probably, in seasons when the rains have been great, some of the waters of Tanganyika do flow into the Lualaba, thus constituting Tanganyika as one of the sources of the mighty Congo.

It was soon after this that Stanley decided to follow the Lualaba whither it would lead him; and at this time, too, he met Tippoo Tib, with whom he entered into a contract to provide him with an escort, as many of his own men had died and deserted, thus weakening his effective force considerably. Apparently all was well, but, as Tippoo Tib has more recently proved, his word was unreliable. Soon his men, fatigued by the difficult marches, in which sometimes only six miles could be accomplished in a day, and frightened by reports of the cannibals who lived beyond, refused to proceed. By means of extra bribes and threats and promises, Stanley succeeded in keeping his escort together until reaching Ikondu, where he was obliged to release Tippoo Tib from his agreement, and having obtained twenty-three canoes from the natives, after several desperate battles, the expedition commenced its marvellous descent of the Congo.

It is difficult, indeed, to portray with any attempt at brevity the adventures undergone, the sufferings bravely endured, the attacks of natives heroically withstood, and the constant perils experienced by the expedition through famine or sickness or physical obstacles to their course. Sometimes two and three bodies a day were thrown into the river, and Stanley, writing of these days, once said:

"Frank and I endeavored our utmost to alleviate the misery; but when the long caravan was entering camp, I had many times to turn my face away lest the tears should rise at sight of the miserable victims of disease who reeled and staggered through the streets. Poor creatures! what a life! Wandering, ever wandering in search of graves!"

With regard to the physical obstacles encountered, they had sometimes to shoot the rapids, at others, owing to the passage of the river being impossible, they had to hew a road through almost impenetrable forest and along this road had to drag their canoes, in order to launch them once more on the smoother waters below the falls.

In the Aruwimi district no less than twenty-eight pitched battles were fought on the river between the now diminutive expedition and the fierce natives jealous of the appearance of strangers from afar. To show the tremendous odds against which the expedition had at times to fight, on one occasion near Bungala they were attacked by sixty war canoes, no less than three hundred of the natives being armed with guns, yet, after a five hours' battle, Stanley conquered his foes, and the expedition sailed on in peace. At Massassa Falls, Frank Pocock, who had been of such inestimable value to Stanley, lost his life. He insisted on trying to shoot the falls, but, his boat capsizing, he was swept away and drowned. The mouth of the Congo was reached on August 9, 1877. No less than 7000 miles had been traversed by the expedition in 999 days. The mystery of the Congo was solved; and, after taking the few faithful followers who still remained to him to Zanzibar, Stanley once more returned to England to be loaded with fresh honors, and to be acknowledged as perhaps the greatest explorer of the age.

FOUNDING OF THE CONGO FREE STATE.

After spending 1878 in writing his great book, *Through the Dark Continent*,* we find the intrepid explorer, in January, 1879, again on his way to Africa, but this time under very different auspices, and with a remarkable object in view.

No sooner had Mr. Stanley landed in Marseilles in 1878 than he was met by an embassy sent by the King of the Belgians, Leopold II., inviting him to come direct to Brussels in order to confer as to a new expedition. It was hardly to be expected that a man just returned from such a journey in the heart of Africa, and after enduring all he had undergone, should be ready at a moment's notice, and on first setting foot on European ground, to return to the scene of so much disaster and suffering.

He said to the commissioners, "I am so sick and weary that I cannot think with patience of any suggestion that I should personally conduct it, six months hence perhaps I should view things differently, but at present I cannot think of anything more than a long rest and sleep."

Three weeks in Switzerland in July restored Stanley's jaded energies, and in August he was again approached on behalf of the King. In November he went to Brussels, where a committee was formed, assuming the title of *Comité d'Etude du Haut Congo*. By the 2d of January all was ready for a new enterprise, which was intended to open up the Congo to civilization and to commerce. Stanley was empowered to purchase land, to form settlements, to enter into treaties with the natives, and to place steamers on the navigable parts of the great waterway. Surely at last he had received a reward for his labors, but at the same time a task which few would have had the energy and pluck to undertake. He proved himself, however, equal to any emergency, and we shall now proceed briefly to describe his arduous work during the next six years.

After going to Zanzibar to enlist a number of men, Stanley arrived at the mouth of the Congo on August 14, 1879, almost exactly two years from the time that he had reached it after his memorable descent. On this occasion he had with him eleven assistants, five steamers and launches, two steel lighters, and a whale-boat, immense stores of all descriptions, as well as wooden houses and iron sheds. He commenced his first establishment at Vivi, forty miles above Boma, at the end of Livingstone Falls. It is a rocky spot, and in levelling it for building purposes Stanley gained the name by which he is now so well known on the Congo, that of Bula Matari (Breaker of Rocks). Having erected this station, the next business was to construct a road from Vivi to Isangila, a distance of fifty-two miles—a stupendous undertaking, for it was necessary for it to be a wagon road. A few abbreviated quotations in Stanley's own words will show the difficulties undergone. He had 106 men at his disposal. In making the road through grass-land comparatively little difficulty was experienced. Thus: "At mid-day the pioneers were formed in line, hoes in hand, along the road, and at a signal of uplifting the grass, began. By night there was a clean roadway fifteen feet wide and 2500 feet made." Sometimes, however, "during the progress of the work, the hollows, gullies, depressions, and many irregularities of surface along the roadway had been revealed. Much scrub and many trees, besides large rocks, stood exposed and isolated, but our axes, hoes, crowbars, and sledge-hammers had been distributed, and by the evening of the 2d wagons could roll in safety from the Vivi to the lower river." On March 29th the "temperature averaged eighty degrees Fahr. in the shade. We are carving our roads on both sides of the gorge, digging into the stiff red clay with strong Dutch hoes. The bottom of the gorge is 400 feet below the level of the plateau." Forests were cut through, and at a rocky promontory called Ngoma a causeway had to be built in the river itself for 400 yards. The progress of the road-making at this time averaged forty-two yards a day. No less than 366 days were occupied in making a road fifty-two miles in length. During this time Mr. Stanley had marched himself backward and forward no less than 2352 miles. Referring to the year's exertions, he says: "We must have had an unusual and sacred regard for duty, besides large hope that some day we should be rewarded with positive success after all this strenuous endeavor. That it was not a holiday affair with its diet of beans and goat meat and sodden bananas in the muggy atmosphere of the Congo Cañon, with the fierce heat from the rocks and the chill, bleak winds blowing up the gorge and down from seared grassy plateaus, let the deaths of six Europeans and twenty-two natives and retirement of thirteen invalided wives, only one of whom saw the interior, speak for us. It has been a year dark with trial and unusual toil. Our little band of laborers are proud of the grand work their muscles have accomplished, but are more hopeful of the future, inasmuch as their labors, by means of the steamers, will be greatly lightened."

It must be remembered, too, that during the road-making all the provisions and *impedimenta* had to be carried from Vivi, as well as a steamer and a steam-launch. After completing the road, the station of Leopoldville was built, being finished by April, 1882. Mr. Stanley then went on an exploring expedition up the river, and following the Mfini, he discovered Lake Leopold, but severe fever attacking him, he was compelled to return to Europe for a few months. Four hundred miles of country had, however, been opened up, five stations established, and the boats launched on the navigable Congo above the rapids.

Stanley appears to have been, even from the first, greatly hampered by his assistants. They were continually resigning, suffering from home-sickness, or complaining about their rank, or the work allotted to them. One or two quotations will show Mr. Stanley's experience in this respect. On one occasion he writes: "If my work is to imitate the tourist conductor—to be, as it were, a Cook on the Congo, escorting engineers to make short excursions into the interior—I fear that my interest in the projects of the Comité will be but short-lived."

Referring to the frequent changes in the staff, he says: "I attribute the reason mainly to nostalgia, which requires wearisome repetition of paternal advice and fraternal encouragement. However salutary these may be for a short time, a little biliousness, a slight cold, or a trifle of over indulgence are sure to superinduce periodic attacks of ill-humor and bile of greater virulence, compelling me to again have recourse to the most tender letter writing. When these attacks become chronic, people who, like myself, have rather serious and absorbing duties to perform, are very apt to despise such weak-minded petulance. Chronic home-sickness is held by travellers in much the same estimation as incipient sea-sickness is by sailors. The sailor laughs at the beginning, but pities the long continuance; the traveller is apt to scorn the continuance, but often sympathizes with the first attack." "I . . . deprecate sending many Europeans, as in its present state the expedition is not ready for the reception of people who may become a burden by their never-ceasing demands for luxuries and medicine. Europeans mean more baggage. They have stomachs requiring good food; they are tender, and will require nursing."

---

* *Coomassie and Magdala*. The Story of Two British Campaigns in frica. By Henry M. Stanley. pp. xvi, 510. With Maps and Illustrations. 8vo, Cloth, $3 50. New York: Harper & Brothers.

* *Through the Dark Continent*; or, The Sources of the Nile Around the Great Lakes of Equatorial Africa, and Down the Livingstone River to the Atlantic Ocean. With 149 Illustrations and Colored Maps. By Henry M. Stanley. pp. xxxv, 1008. 2 vols., 8vo, Cloth, $10 00. New York: Harper & Brothers.

Apart from trouble with his European assistants, Stanley had naturally some difficulties with the natives in procuring from them the necessary permission to settle in their country, but patience and tact generally smoothed matters. Sometimes, however, blood brotherhood had to be made.

On Stanley's return to the Congo in the end of 1882, he found that those he had left in charge had let affairs go to rack and ruin, and it took him some time to set matters right. He was soon, however, again on the upper Congo, and by May, 1883, he started with three steamers to establish stations along the river as far as Stanley Falls, a distance of 1413 miles from the river's mouth. By the beginning of 1884 treaties had been made with 450 independent chiefs, and nine fortified stations had been erected, and Stanley, who expected to be relieved by Gordon Pasha on his arrival at Leopoldville, found that the latter had proceeded to Khartoum, and that Colonel Sir Francis De Winton was to take his place.

After all his exertions on the upper river, one can imagine his disappointment when, on arriving at Vivi, he found that once more his subordinates had played him false. Referring to his arrival, Stanley writes:

"I sent myself, glass in hand, to scan what improvements have been made during our long absence in the interior and I confess with regret that I cease from the survey, wishing earnestly that I could sponge out the history of this unhappy place from my tablet of facts. Were it possible to do so, I should be relieved from a burden of knowledge which infects my opinion of the Europeans. . . . But like him who sat and brooded and grieved over the ruins of Carthage, I can only grieve that my memory is haunted by so many shadows of puerile manhood and of figures of youth without substance."

One cannot wonder that Stanley writes bitterly when we read the following:

"On the top of the hill there are two houses less than I built, the garden is a waste, the fence broken down. . . . The houses look squalid, dilapidated, and unpainted. There are about twenty-five whites, most of whom appear as if they did not know how on earth they came or what business they had there. A few bear a truculent scowl on their faces, as though they were laboring under an uncommon load of trouble which they would gladly shuffle off in some manner."

In August, 1884, Stanley was able to report to his Majesty the King of the Belgians that the mission he had given him to perform in the Congo Basin was accomplished with vastly greater success than the most sanguine of those gentlemen who sat at the council held at the Royal Palace in December, 1878, could ever have anticipated. He says: "I have no reason to believe that his Majesty was displeased with the result of these long years of bitter labor."

Stanley had succeeded, after remarkable efforts, in founding a state in Central Africa. He had opened up the Congo Basin, with 5249 miles of navigable river, and country containing an estimated population of 43,000,000, with an area drained by the various rivers of 10,900,000 square miles. It remained for the coping stone to be placed upon his magnificent erection, and in February, 1885, at a conference assembled in Berlin, the Congo Free State was finally recognized by all the great powers, and his Majesty the King of the Belgians was recognized as its monarch.*

CENTRAL AFRICAN SLAVE-TRADE.

In order to rightly understand the events which led up to the Emin Pasha Relief Expedition, organized and led by Mr. H. M. Stanley, it is necessary to refer both to the Central African slave-trade, and also to the annexations carried out on behalf of Egypt in the Nile Valley.

It will probably be remembered that in 1820 Mehemet Ali, the Viceroy of Egypt, arrived at a small fishing village situated at the junction of the Blue and White Niles. At once grasping its strategical importance, he formed a settlement there, which gradually grew to be the important town of Khartoum. This settlement undoubtedly led to a great increase in the slave-trade. Already slave-traders had penetrated toward the south; but it cannot be said that before 1840 the traffic in human beings had been very considerable.

Subsequent to this date, however, ivory-hunters and slave-raiders—for these occupations were always combined—having a firm basis for their operations at Khartoum, extended their sphere of action, and yearly a large fleet of vessels sailed up the White Nile, returning the next year laden with white and *black* ivory. The trade prospered and grew apace—even Europeans became mixed up with it—and finally, about the year 1860, slave-raiders were to be found scattered over Darfur, the Bahr-el-Ghazal, and the equatorial districts of Africa, and some 40,000 slaves a year were brought down the Nile—a number which represented an enormous loss of life. The whole area indicated above was dotted over by the traders' zeribas, occupied by ruffians of the deepest dye, who spent the time between the annual visits of their superiors from Khartoum in collecting ivory and slaves, and committing atrocities upon the inhabitants of the most terrible character.

It will be remembered that in 1863 (it was on the 2d of February) a meeting took place at Gondokoro, on the White Nile, between Speke and Grant, returning from their splendid expedition to the Victoria Lake, and Baker, afterward Sir Samuel, who, being anxious at their long delay, had fitted out an expedition, and, accompanied by his wife, was on his way to find and relieve them. This meeting led to great results. Baker discovered the Albert Lake; but he also saw enough of the slave-trade to fill him with horror and, on his return home, such were the accounts he gave of the scandalous state of matters that a strong public interest was aroused, and pressure was brought to bear upon Ismail, Khedive of Egypt, to do something to stop the inhuman traffic. The result was that Baker was commissioned by the Khedive to fit out an enormous expedition, to place steamers upon the White Nile above the sixth cataract, and, proceeding to the south, he was instructed to annex the country in the name of the Khedive, and to free the natives from the slave-traders' yoke.

Space forbids details of the way in which Baker carried out his expedition. He placed the steamers upon the White Nile; he founded stations at Gondokoro, Fatiko, and Mussodi, and in these districts, it is true, he delivered a mighty blow to the slave-dealers. But the evil was only scotched, not killed. And why? The reason is not far to seek.

The Egyptian officials at Khartoum favored the slave-trade, and Baker was constantly hampered by their action. He had been compelled, too, to limit his operations to the White Nile, leaving untouched the enormous district drained by the Bahr-el-Ghazal and Bahr-el-Arab, lying to the west, and no sooner had he retired from his labors than the trade sprang up again with renewed vigor. It is just possible that at this time interest in the equatorial regions might have flagged had it not been for Schweinfurth, who from 1869 to 1871 had explored the Bahr-el-Ghazal and Monbuttu districts, and who in his travels had come across the great slave king Zebehr, and published a most graphic description of the power possessed by this man, with his hundreds of soldiers, his thousands of slaves, who was living in right regal state in the centre of a densely populated district in the Bahr-el-Ghazal. This interest was not allowed to flag, and in 1874 Gordon Pasha was commissioned by the Khedive to take up Baker's work, to further consolidate the province, and, if possible, to open it to commerce. It would lead us too far from our present purpose were we to follow out in detail Gordon's work.

It is sufficient to say that he placed two steamers on the Albert Lake, that he founded stations throughout the whole of the district, that he entered into friendly relations with the natives, and thoroughly freed the Equatorial Province from the slave-traders. He too, however, saw how useless it was to hope to check the trade by simply confining his attention to a limited though large area, whilst all his endeavors were nullified at Khartoum, and he therefore retired from his post. His work, however, was not yet finished, for in 1877 he returned to Khartoum as Governor-General of the whole Soudan—a district some 1,000,000 square miles in extent. During the preceding ten years the Egyptian Soudan had extended very considerably, for Senaar, Kordofan, Darfur, and the region of the Bahr-el-Ghazal had all come under Egyptian rule. One is tempted to enlarge upon Gordon's work as Governor-General, but a knowledge of his heroic labors should be fresh in the public recollection, and we are compelled to refrain. We now pass on to a subject of more present interest, namely, the reason why Emin Pasha became Governor of the Equatorial Province.

EMIN PASHA.

When, in 1886, letters from Emin Pasha were published in Great Britain, speculation was rife as to who he was, and from that day to this all manner of erroneous accounts of his individuality and apocryphal stories concerning him have been published far and wide. This is hardly to be wondered at, perhaps, as only two or three Englishmen had ever seen him, and he was practically unknown when his first appeal for help arrived. We have no intention of writing his biography, still a few words regarding his origin and the way in which he became Governor of the Equatorial Province will not be out of place.

The following quotation is abbreviated from *Emin Pasha in Central Africa*, a book which was published in 1888, being a collection of his letters and journals: "Edward Schnitzer was born on March 28, 1840, in Oppeln, in the Prussian province of Silesia. He is the son of the late Ludwig Schnitzer and his wife Pauline. His father was a merchant. His family removed in 1842 from Oppeln to Neisse. After being educated in the Gymnasium in Neisse, Edward Schnitzer commenced the study of medicine in 1858 at Breslau University. He completed his medical education in Berlin, where he attended the university during 1863 and 1864 and graduated. A strong desire to travel and a great love for natural history which distinguished him as a boy led the young medical man to look for a sphere of work in a foreign land. He left Berlin at the end of 1864 and went to seek a practice in Turkey. Chance led him to Antivari and Scutari, where he obtained the confidence of the Vali, Mushir Divitji Ismail Hakki Pasha, from whom he received a post on his staff, and whom he accompanied on his official journeys throughout the various provinces of the extensive district under his jurisdiction. In this way Schnitzer became acquainted with Armenia, Syria, and Arabia, and at length arrived in Constantinople, where Hakki Pasha died in 1873. In 1875 Dr. E. Schnitzer paid a visit to his family in Neisse, and remained there for a few months, devoting his leisure hours to the study of natural history. The desire, however, for travel came over him again, and he went to Egypt in 1876, and joined the Egyptian service as Dr. Emin Effendi. He was ordered to join the Governor-General of the Soudan at Khartoum, and from there was sent to act as chief medical officer in the Equatorial Province, of which Gordon Pasha was then Governor."

It has caused considerable discussion and surprise that a German should have an Eastern name. Some people, however, do change their names, although not always for the reason which Emin did. With reference to it he writes in 1871:

"Here in Trebizond, too, my good fortune has not forsaken me, and I have quickly gained a reputation as a doctor. This is due to the fact that I know Turkish and Arabic as few Europeans know them, and that I have so completely adopted the habits and customs of the people that no one believes that an honest German is disguised behind the Turkish name. Don't be afraid; I have only adopted the name, I have not become a Turk."

The name he chose, Emin, "the Faithful One," has turned out to be a very appropriate one, and certainly no one has ever proved himself more worthy of bearing such a name as a description of his character.

Having now shown how Emin and Gordon became acquainted, it is only necessary to mention that Gordon fully appreciated Emin's remarkable powers, and during the two years in which Gordon was near the equator he utilized Emin's abilities by sending him on tours of inspection throughout the country, and he also sent him on three dangerous diplomatic expeditions—two to Uganda, and one to Unyoro.

When Gordon left the Equatorial Province in 1876, it was, as was mentioned above, well organized and peaceful, but it was suffering under a very heavy debt, due to the initial cost of Baker's expedition and its annexation, and it was administered with a deficit of rather over £30,000 a year.

Gordon soon found out that the Governors who had followed him had, with the exception of Mason Bey, who was only Governor for a few months, permitted the province to go to rack and ruin, and he therefore, in 1878, appointed Emin to be its Governor. Most men would have shrunk from undertaking such a position, and to Emin, with his scientific tastes, it was a very uncongenial task.

He took up the work, however, with remarkable energy, and with rare administrative ability, and there is ample testimony to prove that in a remarkably short time he was perfectly successful in bringing his province into a satisfactory condition. Emin's knowledge of men and of languages, and of the habits and customs of the people he had to rule, now stood him in rare stead. He was not compelled, as had been other Governors, to trust to interpreters in his dealings with the natives, for he had already mastered their languages; nor had he to trust to the honesty of his secretaries, for, being able to read Arabic, they were obliged to write what he desired, and not, as had been formerly the case, to receive instructions and to write as they thought fit.

So energetically did he administer his province that a number of useless officials were sent back to Khartoum, stations were rebuilt, and the province peaceably extended both toward the east and to the fertile districts of Makraka on the west. Economy, too, had been introduced in the administration, and instead of a deficit, he had in 1882 a profit of £8000. Apart from this, he had once more cleared the province from the slave-dealers, as likewise the province of Rohl, which was placed under his jurisdiction. It might be supposed, and it has been supposed, that in doing all this work Emin was carrying out a line of policy suggested to him, and that he was upheld in his authority by strong arms at Khartoum. Nothing could be further from the truth. Every one will acknowledge that Emin had learnt much during his contact with Gordon, but critics fail to understand that from the time he was appointed Governor of the Equatorial Province until Gordon's retirement from Khartoum in 1879, only one single steamer went from Khartoum to Lado, conveying instructions, wages, and barter goods. This was owing undoubtedly to the Nile having become blocked in 1878, but in estimating Emin Pasha's work, a fact of such importance ought not to be overlooked, as it enhances tenfold the appreciation which must be given to the work. Again, it has been suggested that so long as Emin could get rid of objectionable officials from his province, so long all went well. It is forgotten that the reverse obtained, and that officials who were obnoxious at Khartoum were sent to the equator for punishment, and it is only too true that in many cases Emin was compelled to utilize the scourings of Khartoum because he had no other material to employ. Subsequent to Gordon's leaving Khartoum in 1879, the officials at Khartoum took no interest in the Equatorial Province whatever; at least the only interest they did take was to send a few steamers conveying prisoners, but no salaries or barter goods, in order to bring down the ivory, India-rubber, ostrich feathers, and what not, which Emin's industry had collected, to swell the coffers at Khartoum, or to speak more accurately, wherewith to feather their own nests.

Apart from all the labors of government, and notwithstanding all the journeys Emin was compelled to take throughout the immense district under his rule, and the jealousy and unsatisfactory characters of the men he was compelled to employ, his scientific labors were still continued. The amount of work he did for science can only be appreciated by scientific men, and as it is only proposed in this article to sketch his position in broad outlines, the interested reader must be referred to his published work, which proves his patience as an observer, his accuracy as a scientific worker, his aptitude as a philologist, and his knowledge of the habits and customs of those among whom his lot was cast. Enough has probably been said to interest readers in Emin's personality. It now remains to be shown how it was that he became isolated and shut off from the world, still retaining the government of his province, and still upholding the torch of civilization until such time as he had fondly hoped he should be relieved, not, be it said, in order to retire, but so that he might continue the work which he had carried on so long unaided and unappreciated save by a few who knew of it.

THE REVOLT IN THE SOUDAN.

Current literature has been so full during the past few years of the Mahdi's rebellion, that it will only be necessary to briefly summarize the events which occurred between 1880 and the fall of Khartoum in January, 1885.

As a matter of fact, few people realize the enormous extent of the Egyptian Soudan in Gordon's time, nor is it appreciated how hampered he was during the last year or two by want of support from Cairo. Ismail Pasha had frankly and honestly upheld him. After his abdication matters wore a different aspect. Difficulties occurred too near home perhaps for Cairo officials to interest themselves much in aught else save their own intrigues, and the actions of the various European nations were not at that time calculated to promote the prosperity of Egypt or its dependencies.

During the time that Gordon had been Governor-General of the Soudan, he had been fighting tooth and nail against the slave-trade and corrupt officials; and although successful in suppressing the one and curbing the other, he had not had time to change the national character, nor to uproot the apathy, corruptness, and greed which inspired so many of his native subordinates.

No sooner had he, then, laid down the reins of government than the state of the Soudan commenced rapidly to relapse into a condition of chaotic misery. Brutal officials recommenced their tyrannical oppression, the people were taxed far above their ability to pay, and injustice reigned supreme. The slave-trade broke out once more; and what wonder that the down-trodden people, who had so recently experienced even-handed justice and the beneficent rule of a great and noble man, were discontented, sullen, and ready at the least provocation to turn upon their oppressors, and to endeavor by force of arms to regain their freedom?

Various revolts had occurred during Gordon's rule—revolts which had been instigated in the interests of the slave-trade by Cairo Pashas, and, not least, by Zebehr, whose power Gordon had broken, and who utilized all means, hoping against hope to recover his pristine power. These revolts had been unsuccessful, partly on account of the energy with which Gordon and his brave subordinate, Gessi, had crushed them; partly, too, because a factor was wanting with which to eliminate the previous blood feuds of the Arab tribes, and to weld them into union.

This power was found when Mohamed Achmed, professing to be the Mahdi, raised the banner of revolt at the island of Abba, preaching a religious war against the oppressors. Success after success followed his arms, until finally, in spite of active British interference and the return of Gordon to Khartoum, the whole of Egypt's power over her dependencies collapsed, with the exception of the province held by Emin Pasha. What, then, had Emin been doing during this time when such events convulsed the Soudan?

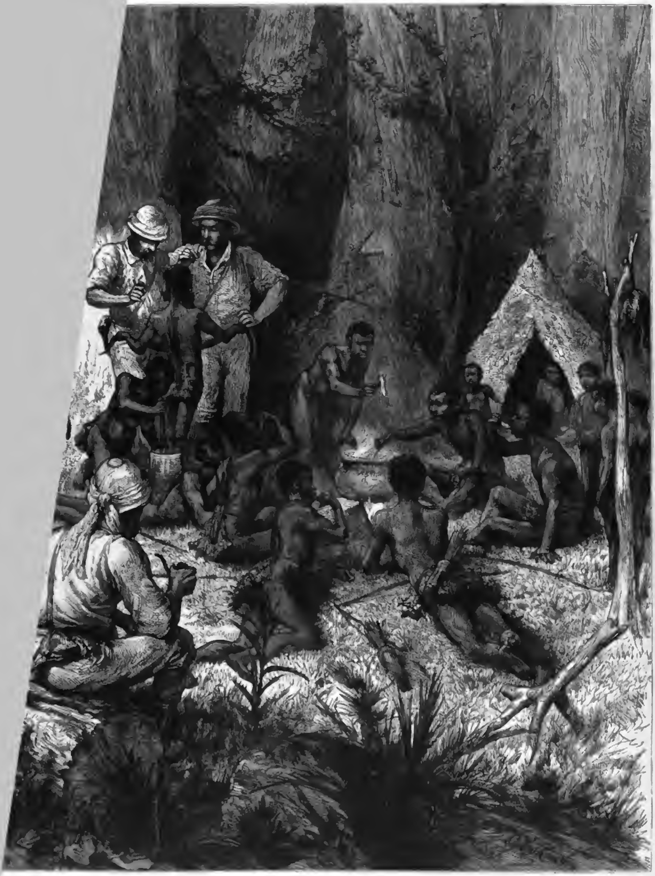
* *The Congo and the Founding of its Free State. A Story of Work and Exploration.* By Henry M. Stanley. pp. xxxviii, 1014. With over One Hundred Full-page and Smaller Illustrations; Colored Maps and Marginal Notes. 2 vols., 8vo, Cloth, $10 00. New York: Harper & Brothers.



FOREST DWARFS EATING SNAKES.*

April, 1882, knowing the grave state of matters, he came hartoum, and tried to impress the officials there with ecessity of prompt action. From Khartoum he wrote: At the present time the situation in the Soudan is grave ed. You will have heard of the so-called Mahdi, the en of God, and of the rebellion he has commenced; you therefore excuse me writing a criticism upon these events, ch must fall out to the disadvantage of all parties. Blind aticism and unnecessary deeds of violence, cowardly de-, and fear and indescribable conceit, insane measures, perfectly intolerable insolence, are the factors which e sufficed to overthrow the mental balance of even the t clear headed for the moment. Under these circumnces I offered to throw the whole of my weight into the les to prevent final collapse; to use my whole influence, position as Turk and at the same time as European, and whole of my knowledge of languages and persons, to rt a calamity."

Emin's advice and assistance were ignored. He was told to mind his own business, to return to his province, to hold it for his government, and to see to it that the Mahdi's influence did not extend to it. He obeyed the order, returned to Lado, and from that time he remained completely shut off from all knowledge of what happened in the Soudan. From April, 1882, when Emin returned to Lado, no steamer went up the Nile until 1889, when the troops steamed up to Rejaf, about thirty miles to the south of Lado.

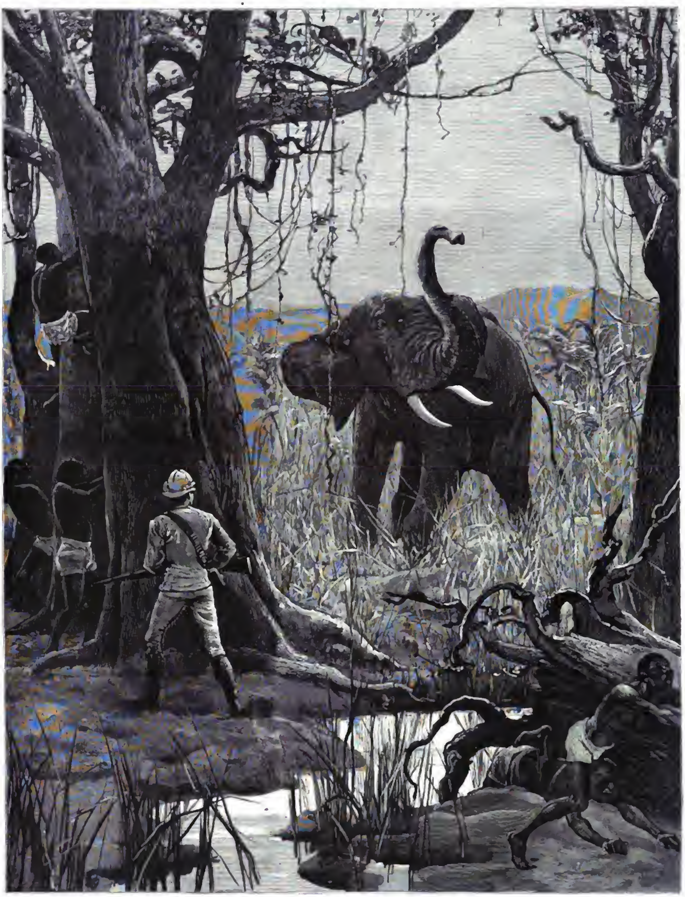
EMIN'S ISOLATION

Month after month Emin expected relief to arrive from Khartoum, and still no rumor even reached him of the tragedy which was being enacted in the Soudan deserts. Supplies ran short, his men had not received pay for years, and yet he held on to his post, striving to do his duty both to his government and his people. All remained at peace until September, 1883, when the Dinkas in the neighboring pro-

---

* These snakes are non-poisonous; they give forth a most savory smell when cooking, and several of the expedition tasted them much to their satisfaction. They have plenty of fat on their bodies (the snakes), and are sometimes from three and a half to four feet in length, and very thick. None of the party were bitten by snakes throughout the whole expedition.

The dwarfs are about four feet in height, and live entirely under the shade of the large forest trees. They are of a rich brown color, and are entirely covered with a soft short down. They were as a rule very treacherous, and their first instinct was to let fly one of their poisoned arrows, of which they generally carried fifteen or twenty (not feathered) at the party; some of them, however, attached themselves to the party as carriers, etc., and one young woman became particularly attached to one of the officers, with whom she acted as carrier, cook, etc., for nearly twelve months. She would speak to no one else, and showed much reluctance in returning to her tribe when the expedition finally left the forest. They are unable to live in the sun, and therefore remain almost entirely in the forest. Their sole garment (male and female) is a narrow belt (a grass rope) under which they insert in front and behind a twig covered with green leaves; when this is worn out it is thrown away and replaced by another. They live almost entirely on roots and vegetables, occasionally indulging in snakes, birds, and monkeys, and are not averse to human flesh when procurable.



LIEUTENANT STAIRS CHARGED BY A WOUNDED ELEPHANT.[*]

vince of the Bahr-el-Ghazal revolted, and Lupton, the brave Governor of that district, was compelled to succumb to treachery on the part of his own men. It may be mentioned here that Lupton's brave defence of the Bahr-el-Ghazal province has passed almost unnoticed by the European press, and yet how heroically he struggled!—in one year alone twenty pitched battles being fought by him against his foes. He was at length carried a prisoner to Khartoum, where he recently died.

It was only in May, 1884, that Emin's real difficulties began, for the rumor of the collapse in the Soudan then reached his province, and in August, 1884, it was attacked by the Mahdi's troops under Kerem Allah.

A few abbreviated quotations from Emin's letters written during the next year will serve to show better than any summary could do the difficulties of his position, and they will at the same time serve to rebut some of his critics, who would have us believe that he was ignorant of his real difficulties, and also of the character of the men with whom he had to deal. In one letter he says:

"Ever since the Arab occupation of the Bahr-el-Ghazal—I will not say its conquest, since everything that has been gained there has been gained by treachery—we have been most vigorously attacked, and I feel that I cannot give you an idea of the admirable devotion of my black troops throughout this long war, in which, for them at least, there can be no advantage. Destitute of the various necessities of life, and with their pay long in arrears, they fought most resolutely, and at last, after nineteen days of hardship and privation, weakened by hunger—the last shred of leather, the last boot having been devoured—they forced a gap in the enemy's ranks and made good their escape. These brave fellows endured all this misery with perfect disinterestedness, without prospect of reward, simply because they were prompted by a sense of duty, and were desirous of exhibiting their bravery to the foe. Whatever doubts I may ever have had of the negro, the history of the siege of Amadi has convinced me that in resolute courage the black race is inferior to none, and in the spirit of self-sacrifice is superior to many. Without any highly skilled officials to direct them or to give them orders, they performed miracles, and it will be difficult for the Egyptian government to give them any worthy proof of its gratitude."

---

[*] The elephant, meeting a warm reception, retired after his first charge, and was no more seen, having been only slightly wounded. Lieutenant Stairs avoided the charge of the elephant by dodging behind a tree, the attendant blacks vanishing in various directions, and being conspicuous by their absence for a considerable time.

Many elephants were at times seen at a distance with large ivories, and had the officers of the expedition had time to devote to the chase, a large amount of ivory might have been obtained.

In a letter written on December 1, 1885, Emin explains fully the difficulties of his position, how he has lost hope, having heard through Kerem Allah of Gordon's death and the fall of Khartoum, which, by-the-way, his people would not believe, and that Dr. Junker (who will be referred to immediately) had decided to try and make his escape through Uganda to Zanzibar, and he describes the necessity of massing his troops together, and retiring gradually to the south. He writes, "If we collect together, it is perhaps possible, with good management and the ammunition we have in hand, to maintain our position for another year, which may be long enough to send letters and men to Egypt and receive an answer. But will Messieurs les Officiers obey orders?"

On March 3, 1886, he writes, referring to an official despatch from Cairo, the first he had received for years: "The Egyptian despatch written in French informs me that the government is unable to assist us, for the Soudan is to be given up, gives me *carte blanche* to take any measure I please till I decide to leave the country. . . . In Egypt and elsewhere they have certainly no notion of the difficulties of my situation. They simply suggest to me the way to Zanzibar, just as they would a walk to Shubra. You will have perceived, from the information contained in the foregoing pages, that I cannot depend with any certainty on my own officers. The greater part of my men, especially the officers, have no desire to leave the country. Most of our soldiers, coming as they do from our own districts (Makraka, Dinka, etc.), and having never seen Egypt, naturally prefer to remain here and live as their fathers did, while the negro soldier sent here from Egypt, whether he be an officer or a private, has forgotten in the lapse of years what strict discipline means. [Emin Pasha was not ubiquitous; he could not be continually visiting all the stations in his large territory, and therefore he was perforce compelled to trust to a great extent to his officers.] Further, he has adapted himself to the country to such a degree that it has quite taken the place of his native land. Each has his family, often a very large one, if all its dependents be counted, and each has his couple of goats or cows.

"Every one knows that the journey is long and the toils great, that many days of hunger and hardship lie before him, and that when he arrives in Egypt the loose bonds of discipline will be tightened again, that he must then say farewell to the 'Mrisa' jug, and that the 'T'a'âl, ya valad' (Come, oh boy) and 'Rhu, ya valad' (Go, oh boy) must come to an end. . . . Then consider how little attention has been shown to our soldiers from Khartoum, and how they have been left without supplies, without clothing, without pay. But enough, you can now understand why the men do not wish to move. Besides, it is quite impossible to make a Soudanese understand why the government has given up the Soudan, and he refuses in so many words to believe that a horde of Danagla is able to crush a well-trained army. Even now it is believed here that the news of General Hicks's defeat in Kordofan is a fiction.

"All my efforts during the last twelve months to concentrate the men in the south have had no other result hitherto than to draw from the First Battalion stationed at Lado and the neighborhood, or at any rate from the officers, a categorical declaration that they would not give up Lado, etc. Now if I send copies of the order from Egypt, written in French, too (was this not almost criminal folly?), it will at least be considered a fabrication—that is, a device of my own—and will not be obeyed. But something worse may happen, for when the people are once convinced of the impotence of the government, universal anarchy may ensue, and the destruction of all the white men may be the result. . . Added to my misgivings about my own men, who may place all kinds of difficulties in my way, not from ill will, but from unfathomable and unconquerable stupidity, I have a foreboding that one of these fine days the Danagla will suddenly come down upon us in steamers. It is certain that they will not leave us in peace, and equally certain that they will occupy these districts again as soon as possible. They have men and weapons enough now, and the resistance of the negroes will soon be broken down if a thousand or two of such scoundrels appear well-armed."

On April 5, 1886, he writes:

"The situation in this country is still a very gloomy one. As I wrote before, the greater part of our people do not wish to retire from here. If I could only get the negroes to let the Egyptians retire, I am quite ready to remain myself."

And in a letter written on April 20th, the same year, he categorically explains that "the men have agreed amongst themselves not to go south, for they maintain that the way to the seat of the government does not run southward, and that no one believes any news coming from the south." He says also, "I am hourly expecting to hear that open rebellion has broken out in Lado."

Only one more quotation need be added to this already long list. It is from a letter written on May 15, 1886.

"We are just as we were; the men will not move, and the few who are inclined to make the journey dare not speak their minds. Moreover, the disagreement between the Soudanese and the Egyptians becomes more marked every day, and hatred of the latter is openly expressed, only a few of them who enjoy a fairly good reputation being spared. This is certainly not undeserved, for the Egyptian gentlemen (?) have always treated the Soudanese *en canaille* in spite of all my warnings; but now the tables are turned. I endeavor to mediate as much as possible, but can this go on long? I have made a fresh attempt to bring the men to reason. If this too fails, I must resign myself to circumstances, and reserve the show of authority which I still possess as long as I can. If the worst comes to the worst, the only thing I can do will be to put the reins into the hands of the oldest Soudanese officer, and withdraw, if possible, to Kabarega's."

The foregoing quotations are from letters which were published as soon as received from Emin Pasha. After reading them, can any one suggest, as has been suggested, that Emin had concealed the state of matters in his province? Surely not. And it is only scant justice to set him right with the public. Any one realizing the difficulties of his position can but marvel that he faced them so long, and was even able to temporize until the long looked for expedition for his relief arrived.

JUNKER AND CASATI IN CENTRAL AFRICA.

Before referring to the way in which news of Emin Pasha's situation arrived in Europe, a few sentences must be written concerning two other Europeans who were in Emin Pasha's province. Dr. Junker, the celebrated Russian traveller, had been exploring the sources of the Welle from 1880. Unable to return to Europe *via* Khartoum, he visited Emin, and decided to try and make his way to Zanzibar *via* Unyoro and Uganda. He had great difficulty in passing through Unyoro. After all the years, however, of patient wandering amongst native tribes, he stuck manfully to his purpose, and at length succeeded in passing through those countries, and in due time, as we shall see, he arrived safely at Zanzibar.

Captain Casati was sent out as a correspondent to the geographical review, *L'Esploratore*, an Italian paper, and from the end of 1879 he had also been exploring the districts of the Djur, Dinka, Makraka, and Mombuttu. In Emin's endeavors to enter into correspondence with Egypt *via* Zanzibar, he had requested Casati to take up his residence with Kabrega, King of Unyoro, and to endeavor to maintain a post-route between the Equatorial Province and Uganda. Casati suffered much at the hands of Kabrega, but he managed to maintain a *modus vivendi*, until, at length, in 1888, Kabrega stripped him naked and drove him into the forest, from whence he managed to make his way to the Albert Lake, where Emin Pasha was fortunate enough to rescue him. Thus it came to pass that Emin and Casati were together on Mr. Stanley's arrival at the Albert Lake.

THE MISSIONARIES IN UGANDA.

Had it not been for the presence of Mr. Mackay, of the Church Missionary Society, who was residing in Uganda, and the self-denying and noble way in which, knowing Emin's difficulties, he exerted himself on his behalf, in all probability a catastrophe like that which happened at Khartoum would have taken place at Wadelai. Mackay, however, with admirable patience and tact, managed to pacify King Mwanga's fears, got him to permit Junker to enter and pass through Uganda, and also enabled Emin's correspondence and a caravan of goods Junker was able to purchase for Emin from the Arabs at Mwanga's court to pass through the country. Emin's gratitude to Mackay has been often expressed, and he richly deserved it, for it was a matter of no little danger to obtain these concessions from such a suspicious and bloodthirsty King.

It will be seen, then, that owing to Mackay's aid, Junker was able to proceed on his way to Zanzibar. Arriving there, he lost no time in publishing to the world Emin's position and Emin's need; and we shall now proceed to describe the response with which it met in Great Britain, and the steps which were immediately taken to send aid to Gordon's last lieutenant, who had been cut off from civilization for so many years, and whose difficulties and dangers have been so briefly sketched above.

ARRIVAL OF NEWS FROM EMIN.

On October 27, 1886, news was received in Great Britain that Emin was still holding his post in central Africa. Emin's letters were written from Wadelai to Dr. Felkin, of Edinburgh, who had visited his province in 1878, and to Mr. Allen, of the Antislavery Society, London, with whom Emin had been in correspondence regarding the slave trade.

Emin's appeal for help was immediately published, and it is curious now to look back on the utter ignorance of the public then concerning the existence of either Emin or the Equatorial Province. Now every one is more or less acquainted with the subject; then hardly a dozen men knew of Emin's work. Dr. Felkin brought the subject under the notice of the Royal Scottish Geographical Society, and the council petitioned her Majesty's government to be permitted to organize an expedition for Emin's assistance. The Antislavery Society, too, petitioned the government to take measures for Emin's relief, and in a very short time his difficulties were realized by the public at large, and the keenest interest was felt both in the man personally and in the steps taken to send him help.

MEASURES FOR EMIN'S RELIEF.

On the 8th of December, 1886, Lord Iddesleigh, her Majesty's Principal Secretary of State for Foreign Affairs, announced that the government itself was unable to take active steps in the matter, but that "some private persons in this country have offered to organize a relief expedition of a pacific character, under the guidance of Mr. H. M. Stanley. The offer has been approved by her Majesty's government, and a sum of money will be given in aid by the Egyptian government."

This announcement served to stimulate interest. All manner of speculations were rife as to who the "private individuals" were, and as to whether Mr. Stanley—who, it was known, was on a lecturing tour in America—would really consent to go; and a discussion as to the character of the expedition and the route it should take to reach Wadelai took place in the daily papers. Opinions seemed to be unanimous that the character of the expedition was to be pacific, and most authorities capable of judging advocated one or other route starting from Zanzibar. It was at first thought, too, that Mr. Stanley himself was in favor of an east coast route.

By the end of December all doubts both as to the nature of the expedition and its leader were set at rest by the arrival of Mr. H. M. Stanley, the redoubtable African explorer, in London. He had thrown himself heart and soul into the project, and was ready to lead the expedition himself. Interest was therefore focussed upon him and all that he said on the subject was seized upon with avidity. The money was readily provided, Sir William Mackinnon most generously guaranteeing the whole sum required. Ten thousand pounds were given toward the expedition by the Egyptian government, £1000 was voted by the Royal Geographical Society of London, another £1000 was subscribed by two members of the Royal Geographical Society of Scotland, and several leading newspapers contributed to the fund on condition that they should be allowed to publish Stanley's letters.

During the next three weeks Mr. Stanley must have had a trying time. No less than five hundred applications were received of every variety from persons wishing to accompany him on his quest. The enormous stores in connection with the expedition had to be provided, including a steel boat in sections and a Maxim gun. Meanwhile, at Zanzibar, Consul Holmwood and Mr. George Mackenzie were engaging porters for the expedition, and in Egypt a company of Soudanese soldiers was being prepared to accompany it. Mr. Stanley had also paid one or two flying visits to Brussels, and by January 20th all was ready for a start, Stanley's chosen companions being Major Barttelot, Captain Nelson, Lieutenant Stairs, Dr. Parke, Mr. Bonny, Mr. Mounteney-Jephson and Mr. Jameson. Mr. Ward and Mr. Rose Troup were also associated with the expedition on the Congo.

START OF THE EXPEDITION.

On January 20, 1887, the *Navarino* left London with Mr. Stanley's staff on board and all his outfit. Two assistants embarked at Liverpool direct for the Congo, being commissioned to engage 680 porters to transport the baggage from Matadi to Stanley Pool, where, as was mentioned in describing Stanley's founding of the Free State, he had constructed a wagon road. Stanley went *via* Brindisi himself, leaving London on January 21st, thus gaining a week in Cairo to consult with the Egyptian government and Drs. Junker and Schweinfurth.

On February 22d Stanley and his staff arrived at Zanzibar, where it was found that the steamer *Madura*, which was to convey the expedition, *via* the Cape, to the mouth of the Congo, had just arrived. On February 23d an event took place which really sealed the fate of the expedition. As soon as it was made known it created consternation, and its advisability was keenly criticised. Stanley, with the aid of Consul Holmwood, entered into a contract with the renowned slave-dealer Tippoo Tib. The reason for this step was somewhat as follows. A disturbance had taken place between the Arabs and the Congo State Station at Stanley Falls. The Arabs had attacked the station and driven out its garrison, and they threatened to descend the Congo and destroy the other stations on that river. Stanley's own account of the affair reads as follows:

"While at Brussels I was consulted by his Majesty the King of the Belgians respecting Tippoo Tib and his designs on the Congo State. I advised that he should be employed as an agent of the Congo State, it being a far cheaper and more humane method to disarm his hostility than the costly method of force, and I was intrusted with the mission to negotiate with him. With the aid of Mr. Holmwood, Tippoo Tib was enlisted as the salaried Governor of Stanley Falls region, whose duty it would be to arrest the advance of the Arabs down the Congo, and to save its rich and populous banks from the devastation which I saw in 1883 had already commenced below the Falls. I also obtained his signature to a formal contract, drawn up by the acting Consul General, that he would furnish me with a contingent of 600 Manyema carriers, to be paid for at the rate of thirty dollars *per capita*, to assist in the porterage of the goods and ammunition for Emin Pasha's force, for which promise I gave him a free passage for himself and ninety-six of his followers from Zanzibar to Stanley Falls, and also free rations."

It will be seen in the sequel how Tippoo Tib kept his promise. It may be mentioned that Tippoo Tib is in verity a nickname for Hamid ben Mohammed, it having been given to him on account of a peculiar movement of his eyes. Lieutenant Becker thus describes him:

"The son of a Zanzibar Arab and a Marima woman, Tippoo Tib has resided for ten years in the Manyema district, where he enjoys an unbounded popularity, not only in his own, but in the adjoining districts, where he is known as a man who would heartily disapprove of any unneighborly acts. From his immense plantations, cultivated by thousands of slaves, all blindly devoted to their master, and from his ivory trade, of which he has the monopoly, he has, in his duplex character of conqueror and trader, succeeded in creating for himself in the heart of Africa a veritable empire, in which, though he is nominally a vassal of the Sultan of Zanzibar, his authority is supreme. Though not of pure Arab blood, the Arab characteristic seems so far predominant in him as to dispose him instinctively to the exercise of patriarchal virtues. His self-command, his indomitable courage, his capacity for business, his far-sightedness, his rapid power of decision, his unfailing success, and a certain chivalrous attractiveness of manner combine to make him, like Mirambo, a kind of hero, celebrated by all the rhapsodists of Oriental Africa."

It is probable that this account of Tippoo Tib is slightly over colored. He broke his contract with Stanley previously, when the latter was on his first descent of the Congo in 1876, as has been mentioned above, and that he is a veteran slave-dealer who has devastated immense districts of country probably his most creditable apologists will not deny. The probability is that the mere fact of choosing the Congo route rendered the co-operation of Tippoo Tib necessary. Indeed, it seems difficult to know what else Stanley could have done, for the Manyemas had taken Stanley Falls, and if the expedition had gone into that territory, armed as it was, it would have been attacked, and probably destroyed, but the fact of Tippoo Tib being with them disarmed—at any rate at first—Arab suspicions.

The expedition sailed from Zanzibar on February 25th, having on board 800 men, all told; and Banana Point, at the mouth of the Congo, was reached on March 18th, after a successful voyage. They had only three deaths, and writing at this time Mr. Stanley says:

"I do not know of any expedition from Zanzibar to the Congo which has had such a wonderful immunity from sickness. Ten per cent. is the usual rate of reduction from the numbers of the physically fit. . . There was a row soon after leaving Zanzibar, the 620 Zanzibaris and ninety of Tippoo Tib's men crowded the Soudanese into a hot and stifling place between-decks. Strangers all round them, and none understanding their guttural Arabic, the poor fellows became frantic, and abused the strangers right and left. This led to blows. Sticks, clubs, and firewood flew in all directions, and the matter looked serious. We lashed in, however, with our sticks, and flourishing them in earnest, the Zanzibari mob was driven back."

The expedition was soon transferred to five river steamers, and sailing past Vivi, they reached Matadi on the evening of the 20th, and landing next day, arrangements were made for marching on. The caravan was divided into seven sections, each under command of a European. A correspondent describes the start of the expedition somewhat as follows: "A shrill and piercing blast from a marine fog-horn, provided with a huge gong worked by a piston, sounded the *réveille*. In a moment every one was astir, the porters all rushing to get their loads and appointed places, shouting and gesticulating, whilst the Europeans rode madly about upon their donkeys trying to bring order out of confusion. In about half an hour, however, all fell into their places. The Soudanese soldiers formed the vanguard, next followed the Somalis and the Zanzibaris with their loads. Tippoo Tib followed, the flags were unfurled, and with another blast from the horn the march commenced."

Mounted on a donkey that had been handsomely caparisoned for the occasion, Stanley took the head of the column. By his side marched one of his boys bearing the Stars and Stripes—an overt demonstration that, notwithstanding his English birth, and in spite of his being in the service of the ruler of the Congo and in command of an Anglo-Egyptian expedition, he does not forget, nor intend it to be forgotten, that he is an adopted citizen of the United States.

It was not to be expected that men fresh from a long sea-voyage would be in good condition for marching, carrying at the same time loads of seventy pounds' weight, yet, nevertheless, the 235 miles from Matadi to Leopoldville, Stanley Pool, was covered by April 21st. But in the march sixty-three men and twenty-eight rifles were lost, three-fourths due to desertion—a peculiarity which characterizes all caravans composed at Zanzibar. Matters do not seem to have been very favorable to the progress of the expedition through the Congo Free State, and on arrival at Stanley Pool Mr. Stanley found, doubtless to his surprise, that fresh difficulties were placed in his way.

At any rate he writes: "The same disposition that we found at Banana Point to obstruct our advance and to glory in our misfortunes was strongly manifest at Stanley Pool. The steamers promised by King Leopold were not ready, and even with the best good-will of the commandant, M. Liebrichts, only the *Stanley*, steamer, was available after a certain amount of repairs. The *En Avant*, steamer, had neither engines nor boilers; the *Royal* was beached on the shore, a hopeless and unseemly wreck; the *A. I. A.*, steamer, was at Bangala Station, 500 miles away. There remained the *Peace*, steamer, of the Baptist Mission, and the *Henry Reed*, steamer, of the Livingstone Inland Mission; but the missionaries were loath to lend their steamers. Meanwhile I had the dissatisfaction of learning that a body of armed men, nearly 800 strong, had been invited by the sovereign of the state to march through a territory which was utterly unable to support its own soldiers, and that they were encamped at the *entrepôt* of the upper Congo without the prospect of being furnished with even one meal from the country itself."

Mr. Stanley had formerly experienced the way in which the Congo Free State was managed in his absence, but, nevertheless, he seems not to have expected the difficulties he would meet with. Fortunately, however, difficulties only stimulate him, and so he was able to bring order out of chaos, and after the utmost exertion the expedition arrived on the 16th of June at Yambuya, on the Aruwimi, after a river voyage of 1050 miles. Stanley had to leave Ward and Bonny's detachment of 131 men at Bolobo, and 600 loads of goods in store at Leopoldville.

Tippoo Tib and his people were sent to Stanley Falls under charge of Major Barttelott, the Arab chief promising that in nine days after his arrival at his station he would set out with 600 porters to join Mr. Stanley, and accompany him to the Albert Nyanza.

The critical point of the expedition had now arrived. Stanley had been utterly deceived as to the condition of the Congo Free State, and the possibilities of transporting so large a force through its territory. He had arrived, as he believed, within a comparatively short distance of the Albert Nyanza, but many of his men and loads could not arrive for some time. It was only natural that he should be most anxious to fulfil his brilliant forecast. This can be seen in all his letters. A gain of two days here is mentioned, a loss of three there, and he knew with what almost breathless anxiety his expedition was being followed by the whole of the civilized world. With his full force, march he could not. What, then, was to be done?

After mature deliberation, and trusting in Tippoo Tib's loyalty, he decided to divide his forces, and to march himself with a body of picked men to the Albert Nyanza, leaving Major Barttelott in command of the camp at Yambuya to follow in his trail as soon as might be. No one can wonder that Stanley came to this decision. He remembered the fall of Khartoum, and the bitter cry of "Too late! too late!" which has resounded ever since that catastrophe took place. He did not wish the same cry to be raised in regard to his own expedition, and therefore to him every day's delay was simply a spur to rapid action. Having seen that a strongly fortified camp was erected at Yambuya, and having given Major Barttelott a letter of instructions how to act, Mr. Stanley collected together an advance column of 389 men, rank and file.

The instructions given to Major Barttelott were explicit: "March after us as soon as you can march, even supposing Tippoo Tib does not send the requisite number of men; it will be your duty to march if you can; and as it is of vital importance that the goods left under your care should reach us in safety and in as great an amount as possible, it will be better for you to make double marches—that is to say, make a short march, deposit your loads, and return for more. We will blaze the trees for you, so that you may have no difficulty in following the route taken by us." It is quite evident that Stanley did not anticipate what subsequently happened, nor did he think he should be away for so many months, because in one sentence of his orders he says: "We may assume that we shall not be longer than a fortnight with him (Emin Pasha) before deciding on our return to this camp along the same route traversed by us when going east." And again, referring to the possibility or otherwise of Barttelott being able to take all his loads with him, he writes: "If you still cannot march, then it would be better to make marches of six miles twice (if you prefer marching to staying for our arrival) than throw too many things away."

Having, as he thought, left everything in a satisfactory condition at Yambuya, Stanley plunged into the forest region on June 28th, and there we will leave him for the present in order to relate what happened to his rear-guard during his absence.

FATE OF THE REAR-GUARD.

Major Barttelott, including the contingent which had been left behind at Bolobo, had 271 men, and an enormous amount of stores under his charge, and this part of the expedition experienced a year of the most disastrous inaction. Barttelott and his companions were daily expecting the arrival of Tippoo Tib and his promised carriers; none, however, arrived. Sickness broke out in the camp, and fever and dysentery decimated the detachment, no less than 112 of the carriers succumbing; Ward and Rose-Troup were invalided home.

In African expeditions it is a well-known fact that inaction breeds disease. It appears, too, that the unfortunate men were not able to get proper provisions. They were also depressed by want of news from Stanley. Only rumors reached them, brought by deserters and Arabs, who related the difficulties Stanley was encountering, and on more than one occasion his death was reported.

It would be painful to dwell upon all the sad incidents which happened until June 11, 1888, for it was only upon that day, eleven months after Mr. Stanley's departure, that Tippoo Tib had provided Barttelott with some of the porters promised. He had made all manner of excuses for the delay in carrying out his contract, and even when the men did arrive he delayed matters as much as possible by various subterfuges.

Barttelott's expedition arrived at Banalya on July 19th, and early the next morning a tragedy took place which brought the rear-guard to an untimely end. Barttelott was shot by a Manuyema named Sanga, in consequence of his ordering the natives to stop singing and tomtoming. As a result, Mr. Bonny was left in charge of the camp, and Mr. Jamieson went back to obtain assistance, but he overtasked his strength, and a violent attack of fever ended his career on August 17th, at Bangala, without his having been able to make the Europeans at the station understand what was the object of his coming.

In referring to this disaster Mr. Stanley writes: "These tragedies and catastrophes, which reduced a completely equipped and well-organized column of 271 men, rank and file, to 102 meagre, starved, and anæmic souls, were due, in the first place, to the breach of contract by Tippoo Tib and to his method of prevarication and dissimulation, to which crooked manners the young officers of the rear column were strangers. They were led on little by little by repeated promises, uttered with fervor and apparent sincerity, to delay their march in the track of the advance column, in the hope that the promised contingent of porters from Tippoo Tib would arrive. They did finally arrive eleven months after date; but in the mean time the rear column, consisting of Zanzibaris and Soudanese, had lost three-fourths of their number in the camp from disease, anæmia, and manioc poison. One hundred graves contained the bodies of 100 faithful fellows who had died within eleven months of idle and useless camp life."

SUSPENSE.

When Mr. Stanley started from Yambuya, it was his intention to march as rapidly as possible in a direct line to Kavalli, a village situated at the southwestern corner of the Albert Lake. The distance in a straight line was about 300 miles, and it was hoped that in two months the goal would be reached. But from the time that this expectation was published, fully fifteen months elapsed before news arrived as to Stanley's whereabouts. He was veritably lost in central Africa. During this time the utmost anxiety was expressed as to his fate and the fate of the little band he led. Surmise was rife, reports as to disease and death decimating the expedition were more or less credited, and on several occasions accounts of Stanley's death were telegraphed both from the east and west coasts of Africa. A most circumstantial account arrived too at Suakin, saying that the Mahdi's emissaries had arrived at Lado, and that Emin and Stanley had been taken prisoners and were in chains.

The report in question was contained in the following letter received by the Governor at Suakin: "In the name of the Great and Merciful God, this letter is written by one of the lowliest servants of Allah to the Chief Kalifa. We advanced with the steamers and reached the town of Lado, where Emin, the Mudir of the Equator, had his quarters. We arrived there on Safar 26th, 1306. We owe our thanks to the officers and soldiers who made our victory easy. Before our arrival, they had captured Emin and a traveller who was with him, and had put them in irons. The officers and men refused to go to Egypt with the Turks. Tewfik sent to Emin a traveller called Stanley. By Stanley he sent a letter to Emin ordering him to go back with Stanley. To the rest of the forces he gave the option of going to Cairo or remaining where they were. They refused to obey the Turkish orders, and received us joyfully. I also send a copy of the letter which was written by Tewfik to Emin, and I send besides the flags which we have taken from the Turks. I understand that another traveller had arrived to join Emin, but he had left again. I am seeking for him, and if he returns, I shall certainly take him prisoner. I have found all the chief officers in residence delighted to receive us. I have taken all the arms and ammunition. I instruct you to send back to me the officers and the head commissioners when you have seen them and given them your directions. They will be of service to me.

"(Signed) Osman Saleh."

The news raised public excitement to the highest pitch. It was very generally discredited; only very few of those who knew the country believed it, and they were laughed at, when at last a telegram was received by Reuter's Agency, and communicated to the House of Commons by Mr. Goschen. It was to the following effect:

"St. Thomas, December 21, 1888.

"Letters from Stanley Falls, dated August 21, 1888, state that on the previous day a letter had been received from Stanley announcing that he was at Banalya, on the Aruwimi; he had left Emin Pasha, eighty-two days previously, in perfect health and well supplied with provisions. He had retraced his steps in order to bring up his rear company and their loads. He had arrived at Banalya on the 17th of August, and expected to start again in two days to rejoin Emin. All the white men belonging to the expedition are well."

Mr. Goschen's communication was received with immense enthusiasm, as it apparently disproved the reported capture of Emin, and it also indicated that Stanley had been successful in his expedition.

WHAT REALLY HAPPENED.

Before proceeding to follow Mr. Stanley's adventurous journey, it may be well in the briefest possible manner to state succinctly the course of events which took place from the time of the advance of the expedition from Yambuya until it left the Albert Lake for the coast with Emin Pasha and Captain Casati in April, 1889.

Stanley marched to the Albert Nyanza, and he arrived there on December 13, 1887. No news was to be obtained of Emin, and as Stanley was unable to procure a boat by means of which to send in search of him, he was compelled to retrace his steps in order to procure his boat which he had been obliged to leave behind some ninety-five miles short of the lake. This he did, then returned for the second time to the lake at the end of April, 1888, and on May 1st Emin and Stanley met. They staid together until May 25th, then, as Mr. Stanley was anxious about the fate of his rear-guard, it was arranged that he should return and seek for it, and in the mean time Emin and Mr. Mounteney-Jephson should proceed to the various stations, read the Khedive's instructions, and collect together all those who wished for Mr. Stanley's escort to the coast. Stanley then left the Albert with his expedition, retraced his steps to the edge of the forest district, made there an intrenched camp, under command of Stairs, Nelson, and Dr. Parke, and then marched to the Aruwimi, collected the remnants of the rear guard, and for the third time marched to the Albert Lake. On his arrival there he learnt that Emin and Jephson had been taken prisoners, but they managed to escape and rejoined him in a few days. They reported that Lado and Redjaf had been captured by the Mahdi's troops, who were subsequently repulsed at Dufli. It turned out then that Osman Saleh's letter was correct in almost every particular.

This brief summary has been given because even now many people do not understand how it was that Stanley arrived three several times at the Albert Lake.

FROM YAMBUYA TO THE ALBERT LAKE.

On June 27, 1887, Stanley broke camp at Yambuya to commence his celebrated march. All were in high spirits, hope and confidence were strong, and the expedition little realized what lay before them. Lieutenant Stairs commanded the advance-guard, a picked company of seventy-five soldiers armed with rifles and hatchets to cut a pathway through the forest for the main body of the expedition. Progress, however, was not to be rapid, for fierce and warlike tribes barred the way, resenting the progress of strangers through their country, and every device which the arts of savage warfare knew was utilized to impede their progress. Cunningly devised pitfalls were constructed to entrap them, and, worse than this, the pathways were guarded by spikes concealed by leaves, which grievously wounded and incapacitated the unwary porters. Many men were placed *hors de combat* by this means, as their lacerated feet festered, and they were unable to march, and had to be left behind. Nature, too, combined with man to obstruct advance. The underwood was dense and interlaced with strong creeping plants; in fact the expedition had to plough its way through one continuous unbroken primeval forest, which maintained the same aspect, density, and character across nearly four and a half degrees of longitude.

From July 5th to the middle of October the expedition clung to the river, and they were able to utilize their boat and some canoes to transport some of their baggage and their wounded and sick men.

"The river retained a noble width—from 500 to 900 yards—with an island here or there, sometimes a group of islets, the resort of oyster fishermen. Such piles of oyster shells! On one island I measured a heap thirty paces long, twelve feet wide at the base, and four feet high. Such a land for flies, insects, and butterflies! The butterflies congregate round me as I write this statement, and flap their wings in approval of this statement. There are clouds of them sailing daily up and across stream, which last four hours."

Describing the forest, Stanley writes: "We were then introduced into the difficulties which more or less would impede our movements and arrest rapid progress. These consisted of creepers, varying from one-eighth of an inch to fifteen inches in diameter, swinging across the path in bow lines or loops, sometimes massed and twisted together, also of a low dense bush, occupying the sites of old clearings, which had to be carved through before a passage was possible. Where years had elapsed since the clearings had been abandoned, we found a young forest, and the spaces between the trees choked with climbing plants, vegetable creepers, and tall plants. This kind had to be tunnelled through before an inch of progress could be made. The primeval forest offered least obstruction, but the atmosphere was close, stagnant, impure, and an eternal gloom reigned there, intensified every other day by the thick black clouds charged with rain, so characteristic of this forest region.... The mornings were generally stern and sombre, the sky covered with lowering and heavy clouds; at other times thick mists buried everything, clearing off about 9 A.M., sometimes not till 11 A.M. Nothing stirs then; insect life is asleep, and the forest is as still as death; the dark river, darkened by the lofty walls of thick forest and vegetation, is silent as a grave. Our heart-throbs seem almost clamorous, and our inmost thoughts loud. If no rain follows this darkness, the sun appears from behind the cloudy masses, the mist disappears, and life wakens up before its brilliancy. Butterflies scurry through the air, a solitary ibis croaks an alarm, a diver flies across the stream, the forest is full of a strange murmur, and somewhere up river booms an alarm drum.

"The quick-sighted natives have seen us; voices vociferate challenges. There is a flash of spears, and hostile passions are aroused.... At Avisibba, about half-way between Panga Falls and the Nepoko, the natives attacked our camp in quite a resolute and determined fashion. Their stores of poisoned arrows they thought gave them every advantage; and, indeed, when the poison is fresh it is most deadly. Lieutenant Stairs and five men were wounded by these. Lieutenant Stairs's wound was from an arrow the poison of which was dry. It must have been put on some days before. After three weeks or so he recovered strength, though the wound was not closed for months. One man received a slight puncture near the wrist; he died from tetanus five days afterward. Another received a puncture near the shoulder, in the muscles of the arm; he died six hours later than the first case of tetanus. One was wounded in the gullet—a slight puncture; he died on the seventh day. I believe one wounded in the side died at night the same day. Tetanus ended the sufferings of all.... These poisons are prepared in the woods; in the depths of the forest the savage makes his fire, and prepares the fatal venom which lays low even the large elephant. It is forbidden to cook it near a village. In the forest he smears his arrows, and having covered the points with fresh leaves, lest he himself might be a victim, he is ready for war. I could write a book almost on the various species of bees found in this forest region, and several books might be written about the multitude of curious insects we have seen. What with the bees of all kinds, the various kinds of ticks, gnats, etc., our lives have been made just as miserable as they could well be. We were prepared to encounter the most ferocious cannibals, but the central African forest, now open for the first time, contains some horrors within its gloomy bosom that we were not prepared for."

Apart from the fighting and the loss of men it entailed, ulcers, famine, and dysentery sapped the strength of a great number of men. "The whole of October, though we had only about fifty miles to travel, was spent in gaining the settlement of Kilonga-Longa's, and sending relief parties back to the survivors of those we had left behind. Fungi and wild fruits sustained us, and those who could not get sufficient of the strange things we lived upon perished, or deserted the starving column to die elsewhere."

One of the reasons why Stanley had taken the Congo route was to avoid the Arabs, but he had the misfortune to meet them in this forest, where they were engaged in their usual occupation of devastating the country, collecting ivory, and killing or enslaving the population. Stanley was compelled to leave fifty-six men at Ugarrowwa and thirty-three more at Kilonga-Longa's.

Referring to this, and to the bad treatment which he and his men received from the Arabs, he writes:

"It was doubtful whether they were any better off in this Moslem settlement than in the uninhabited forest. Yet we had no other option; the ulcers were most rabid; a slight wound or a pimple in the foot or leg would develop in three or four days to the most ghastly sores, several inches in diameter, and penetrating to the bone. It was a terrible sight, and this ulcerous disease raged like an epidemic,

spoons. During all this September and October and November the people were demoralized by their sufferings. Whatever we said to them was disbelieved; they hooted at, jeered at, our assurances that a few energetic marches would take us beyond suffering. It required infinite patience to bear against this wolfish feature of human nature. They might have proceeded to violence, but they did not; considering their sufferings, I call this a virtue. When we finally issued out of the darkness into daylight and bright sunshine, this virtue expanded, and every soul of the 178 men who witnessed the sight joined with us because inflamed with zeal to do the best he could, and we never had any trouble with them afterward.

Almost 100 men had been left in the forest region, and Captain Nelson, who was too ill to move, and Dr. Parke, as well as the boat, had to be left at Kilonga-Longa's. But even now trouble was not at an end, for a fertile and populous country was reached, the inhabitants of which attacked them.

"On the 9th we came to the country of the powerful chief Mazamboni. The villages were scattered over a great extent of country, so thickly that there was no other road except their villages or fields. From a long distance the natives had sighted us, and were prepared. We seized a hill as soon as we arrived, in the centre of a mass of villages,

(Continued on page 334.)

---

* A great part of the journey through the forest was performed along the trunks of fallen trees, owing to the thick undergrowth and mangrove-trees which obstructed the way, and also the marshy ground in the neighborhood of the lakes. The forest dwarfs generally chose the most difficult parts to make their sudden attacks on the party—several of which on these occasions were almost invariably wounded. The dwarfs had no sooner delivered their attack than they disappeared in the most marvellous manner amongst the high reeds and thick forest. The English officers of the expedition took turns to command the advance-guard, which was composed of the sharpest of the natives who were always on the alert for brushes of this description.

Our engraving represents an occasion on which a most determined stand was made by the natives, several of whom were killed and wounded.

The arrows used by the dwarfs were barbed and poisoned, but were never feathered, hence they were never well directed except at close quarters. The blacks attached to the expedition showed great courage and determination, being invariably supported by the English officers.

STANLEY ON THE MARCH.—[See Supplement.]

HARPER'S MAGAZINE.

MAY.

CONTENTS:

SOME MODERN FRENCH PAINTERS.
By Theodore Child. Fifteen illustrations (including frontispiece), from paintings by leading artists and drawings by Paul Renouard and L. O. Merson.
MAKING UNITED STATES BONDS UNDER PRESSURE.
By L. E. Chittenden, Register of the Treasury under President Lincoln. An absolutely unique episode in the history of our national credit.
ROBERT BROWNING.
Sonnet. By Aubrey de Vere.
THE EVOLUTION OF HUMOR.
By Professor S. H. Butcher, LL.D., of Edinburgh University. A difficulty with the Darwinian theory.
OLD NEW YORK TAVERNS.
By John Austin Stevens. With twenty-six illustrations, drawn by Howard Pyle.
A RIDE IN AUSTRALIA.
"Through Bush and Fern." By William Senior. Nine illustrations.
NOW IS THE CHERRY IN BLOSSOM.
Poem. By Mary E. Wilkins.
ENGLISH LYRICS UNDER THE FIRST CHARLES.
By Louise Imogen Guiney. Nine portraits from old prints.
FELINE AMENITIES.
Drawing. By George du Maurier.

FICTION BY FOUR AMERICANS.

BY W. D. HOWELLS.
"The Shadow of a Dream." (Conclusion.)
BY S. B. ELLIOTT.
"An Ex-Brigadier."
BY EDWARD EVERETT HALE.
"Susan's Escort." With three illustrations drawn by W. T. Smedley.
BY R. H. LOCKWOOD.
"Steam from a Samovar."

A TERRIBLE LETTER.

A MORE vigorous political document has not recently appeared than Mr. H. C. LEA'S letter to the President. It has, what all such documents have not, the weight of personal character behind it. There is no private or partisan or selfish object of any kind to be aided by it. It is a public service, arraigning by name public offenders, the writer taking the entire responsibility of the proceeding. The letter recalls the statements made originally in the Pennsylvania Republican press, and lately recapitulated in detail by the New York *World*, concerning the acts of Senator QUAY, of Pennsylvania, the chairman of the Republican National Committee. The charges cover, as Mr. LEA says, a series of "flagrantly dishonest acts, including the temporary abstraction from the State Treasury of $260,000 in one instance, and of $400,000 in another.... If they are true, Senator QUAY ought to be in the penitentiary. If they are false, he is a cruelly libelled man." But although, after two months of the widest publicity and circulation of such charges, Mr. QUAY makes no explanation and seeks no redress, "you," says Mr. LEA, addressing the President, retain your close political connection with him, and "you must share the losses as well as the gains of the venture."

Mr. LEA has an especial right to speak. He was one of the independent Republicans who, withholding his support of the party candidate in 1884, believed the party promises and the pledges of the candidate in 1888, and, like many other honorable men, unwilling to condone what he felt to be the shortcomings of Mr. CLEVELAND in justifying the faith of independents who supported him in 1884, voted for Mr. HARRISON. After thirteen months of an administration which has had every opportunity to win the confidence of the country, Mr. LEA sums up his survey of the President's course:

> "You have thus degraded it [the Republican party] to the lowest level, till it no longer deserves or enjoys the public confidence, and its interest, as well as that of the nation, demands its purification by defeat. You have earned for it the denunciation of the Hebrew prophet: 'The heads thereof judge for reward, and the priests thereof teach for hire, and the prophets thereof divine for money: yet will they lean upon the Lord, and say, Is not the Lord among us? none evil can come upon us. Therefore shall Zion for your sake be ploughed as a field, and Jerusalem shall become heaps.'"

This result Mr. LEA attributes largely to the malign ascendency of Senator QUAY. The only cloud at the opening of the administration was the appointment of a Postmaster-General at Mr. QUAY'S dictation, ostensibly as a reward for certain services performed during the canvass, but really for raising money to be used by a person whom the Republican press had taught the country to distrust. That cloud has now covered the firmament. But three years still remain, says the letter, in which to undo what has been done, and to apply to public duties the high standard which the President applies to his private life. You must remember, however, says Mr. LEA, that evil produces only evil, and that you have on your soul a charge "for which you must reckon to posterity and to God." This appeal to the President at the end of the first year of the administration follows that of Bishop POTTER at its beginning. Both are noble illustrations of civic courage and a high sense of public duty. Both also are indications of the activity of conscience in politics, and of that moral independence of mere party considerations which is the sure hope of the country. Both serve to silence the cry that because there are two parties, a helpless choice must be made between them. It is because party requires of its adherents dumb acquiescence in such courses as Mr. LEA depicts that party allegiance may become fatal to the public welfare, and that party denunciation may become the duty of the highest patriotism. When in Pennsylvania regular Republicanism is represented by QUAY, and in New York by PLATT, honest men will instinctively become as "irregular" as possible.

THE UNION LEAGUE CLUB.

THE Union League Club in New York was formed as a Republican club, and still remains a Republican club. But recent circumstances have constrained it to make a distinct declaration to that effect. When the club was organized, Republicanism meant constitutional opposition to slavery and the unconditional prosecution of the war. After the war ended, the club condemned the conduct of so eminent a Republican as Mr. GREELEY for consenting to sign JEFFERSON DAVIS'S bail-bond. Later, the present president of the club was a State candidate with a Democrat against the regular Republican candidate, and together with the chief Republican editor in the State, and one of the present Republican Senators in Congress, and many other former Republicans, supported the Democratic candidate for the Presidency against General GRANT. The election ended, they held that in voting for Mr. GREELEY they had not left the Republican party. In other words, they held that while friendly in general to Republican ascendency, they were at liberty, for personal or other reasons, to refuse to support a particular candidate. Republicanism, in their opinion, was not inconsistent with individual independence.

The club has now reaffirmed this view. The committee on admissions has admitted members who had exercised precisely the same independence in voting, without adhering to the Democratic party, and the club has now expressed its entire confidence in the committee. It has refused to censure it for admitting as members those who voted for the Democratic candidate at the last national election. The declaration that the club is a Republican club is one which such members would not probably challenge, for as between the two parties they prefer in general Republican ascendency. But they do not therefore acknowledge any kind of obligation to support candidates whom they disapprove. The resolution which was adopted was doubtless drawn as a compromise, under the apprehension that a decided declaration of independence might be adopted by the club. But really, as we have said, it leaves the situation unchanged. This is fortunate, because, had it been otherwise, it would have invited the resignation of a very large and important body of members, and it would have laid down as the principle of the club a proposition which has been steadily denied by original Republicans from the organization of the party, and which is fatal to an honorable party connection, that the test of Republicanism is the unwavering support of regular party action however corrupt or unwise.

This, as one of the members of the club said in the debate, would be the adoption of the fundamental Tammany dogma as the faith of the Union League Club. It would destroy the pride and boast of the Republican party that it is an organization of political freemen and not of slaves. The assertion that our government is one of party, and that practically there are but two parties, and consequently a citizen must belong to one or the other, is an assertion which is not involved in the discussion. Let it be assumed that the club is Republican. Does it follow that if a man buys a Republican nomination to office, or is, in the judgment of the voter, unfit for the office, every member of the club as an honorable Republican is bound to support the corrupt bargain or the unfit nomination? If it does, we should suppose every self-respecting gentleman would hasten to leave the club. If it does not, every member is at liberty to decide for himself in regard to every candidate what his course shall be. The conclusion therefore seems to be wise. The club declares itself to be Republican, and refuses to declare that independent members whom the committee has admitted are not Republicans. No gentleman would desire to join a political club with which he is not generally in sympathy. But no gentleman would wish to join such a club under an express or implied obligation to vote for every candidate who might be nominated by a party convention, or to approve every measure that might be proposed by a party committee.

THE FISH COMMISSION.

A MOVEMENT has been quietly begun at Washington which ought to be effectually frustrated—to enlarge party patronage by making the Commissioner of Fish and Fisheries an officer of the Department of Agriculture, and giving to the head of that department the power of appointing and removing the officers and employés of the Fish Commission. A bill to this effect has been introduced in the Senate by Mr. PADDOCK. But no valid argument has been yet offered for interfering with one of the most efficient branches of the service. The reasons alleged for the change are evidently pretexts. The object is to drag the Commission into politics, and the result can be only mischievous. Fish culture and the intelligent study and care of the fishing-grounds are confessedly the creation of our national Fish Commission. Its work has been accomplished largely under the men who are now engaged in it, and who were trained by Professor BAIRD and one or two others. There is no complaint of ignorance, inefficiency, extravagance, or dishonesty in the management of the Commission. There is no allegation that the work would be more intelligently or economically done under the headship of a Secretary of Agriculture, or that there is any reason for intrusting it to him rather than to the Postmaster-General.

The Fish Commissioner is appointed by the President, by whom he may be removed at will. In both Houses there are committees which supervise the work. The appropriations are based upon careful estimates, and the Commissioner reports annually the expenses in detail, so that injudicious or unlawful expenses may be promptly checked. The chief work of the Commission demands special training in fish culture, fishery methods, and scientific inquiry. This work was organized by Professor BAIRD, and the active force of the Commission has been gradually completed by training and by choice from technical scientific institutions, and this system has made the Commission what it is. Professor BAIRD declined to receive a salary as Commissioner lest the Commission should become political plunder, and thus its usefulness be destroyed. Upon his death Colonel MARSHALL MCDONALD, an acknowledged master of the subject, was indicated by scientific experts and those intelligently interested as the fitting successor of Professor BAIRD. He was appointed, and the work has been prosecuted by him as it was begun. His appointments have been made to keep pace with the enlarging work, and solely for special fitness. The Commission has been kept wholly free of the foreign and disturbing influences of politics.

How could a Secretary of Agriculture, however well fitted for his especial duties, increase the efficiency and usefulness of the Fish Commission? There are no relations between agriculture and the fisheries, except in the figurative sense of TIMOTHY PICKERING'S burst of rhetoric about his maritime constituents, "whose farms are on the ocean, and whose harvests are gathered in every sea." The Commission is concerned not only with fish culture, but with the study of the whole coast line of fisheries. The increase in the appropriation during the last three years is mainly due to the establishment of new hatching stations in accordance with law. Indeed, there is no statement of any kind urged as a reason for a change which is not at once susceptible of simple and satisfactory explanation. It is evident upon so brief a showing as this that no public advantage is to be gained by disturbing the present system. No intelligent person can suppose that the objects of the Commission would be more certainly and adequately secured "by making its officers and employés possible foot-balls of political preferment instead of encouraged and enthusiastic scientists in their life work," as the Gloucester Board of Trade remarks in its resolutions unanimously deprecating the proposed change.

A NECESSARY APPROPRIATION.

THE Civil Service Commission estimates that with the increase of its duties and the proved inadequacy of its force the appropriation for the service should be raised to $53,000, with an addition of five persons to the clerical force. To refuse the increase would be greatly to embarrass the service and to prevent the Commission from the proper discharge of its duties. It would be an indirect and sneaking method of crippling it. We are glad to see, therefore, that Mr. EWART, who is the accepted leader in the House of the opposition to reform, proposes to try to defeat the entire appropriation. This is the course which General GRANT said he should regard as a virtual condemnation of reform, and which the Republican House at that time practically adopted. In President ARTHUR's time it diminished the amount of the appropriation. The action of the present House is uncertain, but a very imposing petition has been presented from Massachusetts in favor of the increased allowance, signed by the Republican Governor and Lieutenant-Governor and most of the chief State officers, the Chief Justice, all the Senators and many of the Representatives, members of the Democratic and Republican State committees, and many eminent citizens of all parties in all parts of the commonwealth.

This is a striking sign both of the general diffusion of the reform sentiment and of the desire of leading Republicans especially to identify the movement with their party. Mr. LODGE's Fourth-class Postmasters bill is another sign, and most important of all is the declaration of Mr CLEVELAND, the probable Democratic candidate, that the reform is of vital necessity. It is well, therefore, that Mr. EWART should join issue upon the main question and compel the House to express its opinion. The ayes and noes will be carefully scanned and distinctly remembered at the autumn election. Congress and the country will both be instructed by the report of the Investigating Committee of the National Civil Service Reform League on the details of Congressional patronage. Reckoning on a basis of twenty-four members well chosen for the purpose, there are about 254 appointments now dependent upon each member. The number of applications is about 1700 to each member, and fully one-third of the time which should be devoted to their legitimate legislative duties is consumed in the distribution of offices.

The result is logical. The committees of the House can consider only a small fraction of the bills submitted to them. Many even of the bills reported do not receive consideration from the House. Many of those that pass are crude and obscurely drawn, and their meaning is determined only by costly litigation. One chief reason of this result is the fact that at least a third of the time which is designed for proper legislation is devoted to business which has no concern whatever with legislation. The abuse springs from the confusion of duties which were intended by the Constitution to be kept carefully separated. Had the union of the legislative and executive functions been thought wise, it would have been provided by the Constitution. But the object of the framers was to separate them. As General GARFIELD said, while yet a member of the House, the junction of such diverse duties "impairs the efficiency of the legislator." But it does much more, because it degrades politics by making them venal, and destroys the function of party by transforming elections into contests for plunder. The report of the committee of the National Civil Service Reform League is of much more service to the cause of reform than the recent resolution of the Union League Club declaring that the efficiency of the National Civil Service Commission, which is universally conceded, is a "fulfilment of the pledges of the party in 1888." The club very properly asks for the increased appropriation. But if the Republican House should refuse it, we suppose the club will console itself by the reflection that the party pledge to extend the area of reform is fulfilled by the excellent character and efficiency of a Commission whose work the Republican Congress would have deliberately paralyzed.

NEW MEXICO.

THE Governor of New Mexico, the Hon. L. BRADFORD PRINCE, in his annual report to the Secretary of the Interior, paints upon the whole a pleasant picture of the condition, resources, and prospects of his realm. The climate he holds to be the most delightful and healthy in the country. The maximum heat of the year in 1889 was 96°, in July; the minimum, 1° below zero, in February. Fruit so flourishes that the whole valley of the Rio Grande will probably become an orchard and vineyard to the exclusion of other agriculture.

The condition of education in the Territory is not wholly satisfactory, but yet encouraging for the future. The population is probably rather less than 200,000. In twelve of the fourteen counties there are 143 schools in which the instruction is in English only, 106 in Spanish only, and 93 in both languages. But as yet there is no school fund, and the illiteracy of the adult native population is general. A university, an agricultural college, and a school of mines are authorized by the Legislature. Land has been ceded, but building depends upon taxation, and support upon donations of land from the national government.

Governor PRINCE holds that in variety and extent of natural resources and advantages New Mexico surpasses any State in the Union. In support of his opinion he adds to his own observation and knowledge citations from earlier authorities, making a very interesting survey. The water supply during the year was scant, and the business of cattle-raising was depressed, while mining was unusually prosperous. But the most striking statement of the Governor's is that concerning the quiet and good order of the Territory. Ten years ago, when he went as Chief Justice, the Territory suffered greatly from the horde of lawless and reckless adventurers that follow the railroad. That has passed on, and there is no more peaceful community in the country. "Crime is more rare than in staid New England," and in one county, embracing an area as large as New Hampshire, Massachusetts, Rhode Island, and Connecticut, together with New Jersey and Delaware, mainly a ranching and mining county, in which the sheriff is very efficient, he found last summer not a single prisoner in the jail. The Governor thinks the refusal to admit New Mexico as a State a great wrong, since no Territory in his opinion was ever so well fitted for admission to the Union.

A FRIEND AT THE POLLS.

THE amendment offered to the SAXTON ballot reform bill, permitting an illiterate voter to have the aid of a friend at the polls, is a provision so certain of abuse as to make it a very serious if not fatal injury to the bill. The reason alleged for its introduction we understand to be that it meets the objection of the Governor. It is one of his objections, undoubtedly, and perhaps the most plausible. But if the Governor finds that his veto leads to a surrender of one of the most important safeguards of the bill, he is not the practical politician that he has shown himself to be if he does not hold out blandly behind his veto until every point to which he objects is conceded.

If the friends of the bill are willing to allow the ballot of every voter who swears that he cannot read to be supervised at the polls by a political agent, it is not a very far cry to the party printing of ballots. The Governor certainly will not yield when he finds his opponents yielding. But a bill amended to meet his approval would not be a reform bill. On the contrary, one more step in the direction of the proposed amendment would be the surrender of the bill. Even the adoption of the amendment and the consequent approval of the bill by the Governor could not be hailed as a triumph of reform.

If it should be said that it would be better than nothing, we should doubt it. If the original bill were in any way extreme or impracticable, a smaller measure might suffice. But it is not so. It is a method which experience has approved, and we may as well continue as we are until we are ready for actual reform. In other words, it is as well to walk as to be carried in a sedan-chair without a bottom. Again, if the object of the amendment be "to put the Governor in a hole," it is useless, because his hostility to reform needs no further demonstration. Ballot reform lies in the public printing and in the secrecy of the ballot. These are interdependent, and either private printing or a supervised ballot is incompatible with reform.

THE RESULT IN RHODE ISLAND.

THE result of the supplementary elections in Rhode Island was a Democratic victory, and the Legislature will elect Democratic State officers. The explanations and the improvement of such an election will be various. It is indeed impossible to interpret such a result precisely and in detail, but the general fact is plain and suggestive enough. As we said last week, it takes Rhode Island out of the Republican "column," and shows serious party changes and readjustments.

Indeed, the whole political situation in New England is worth observing. The Republican secession in Massachusetts includes a large representation of the original and most intelligent and influential Republicans. Some of them have joined the Democrats. Others, and we presume the larger part, like their brethren in New York, maintain a position of independence and observation. They are not affected by the usual taunts of "assistant Democrats," "Molly-coddles," "purists," and "Pharisees," because in general they do not mind that kind of rhetoric, they do not desire office, and of course are not susceptible to the alarms of those who do. Nothing disturbs such men less than the familiar "guying" of party newspapers and the twaddle of professional politicians.

Their constant increase in numbers, and so remarkable a result as that in Rhode Island, which cannot be explained away, indicate a healthful political condition. Among other things, they show that the cry of a high tariff as assuring constant employment, high wages, and protection to American labor is losing its charm. The more that question is discussed, the more it is tested by experience, the less certain is the high tariff of popular approval. If, as the friends of protection assert, it is really the dominant question, the Republican defeat in Rhode Island, with the national government in control of protectionists, and the high tariff just introduced in Congress, means that the protection policy is losing favor. That is as sound and logical an inference as any other of the result in Rhode Island.

EDITORIAL.

WE deeply regret that an article reflecting injuriously upon Mr. JOHN M. FORBES, of Boston, should have appeared in HARPER'S WEEKLY. Mr. FORBES's character is his sure defence against such assault, but as silence might seem to imply the approval and acquiescence of the WEEKLY, we wish in these columns, where alone its opinions are to be found, to express its emphatic disapproval of the tone and entire dissent from the conclusions of the article.

PERSONAL.

AMONG the younger professional men of New York whose futures are full of unusual promise is Professor WILLIAM A. KEENER, who has recently been called from the Harvard Law School to the corresponding department of Columbia College. Mr. KEENER is a native of Augusta, Georgia, and was graduated from the University of Georgia previous to taking the law course at Harvard, which he finished in 1877. Then he formed a law partnership with CLARENCE D. ASHLEY, in this city, the firm being known as ASHLEY & KEENER, but was soon called back to Harvard, where he practically succeeded Judge HOLMES in the STORY professorship. While at Cambridge he successfully developed the course on quasi contracts, and edited a set of [illegible]. Now he is writing a book on the same subject. At Columbia he is to teach equity and real estate. Professor KEENER's proficiency as an instructor is accompanied by a genial dignity of manner which made him very popular with the Harvard students. In his private life Mr KEENER is as happy as he is successful in his professional work, a charming wife and a promising boy being the jewels of his home.

—Senator EDMUNDS's health is so poor that he and his family have left Washington for Virginia Beach, not far from Fortress Monroe, to remain an indefinite length of time.

—Connecticut has only one woman lawyer, Miss MARY HALL, of Hartford. After being graduated from Wesleyan Academy, at Wilbraham, Massachusetts, she taught mathematics for a time in a young ladies' school near Boston, and then began the study of law in the office of JOHN HOOKER, the husband of Mrs. ISABELLA BEECHER HOOKER, at Hartford. In 1882 she was admitted to the bar, Chief Justice PARK, of the State Supreme Court, having decided that as a woman she was eligible. Miss HALL has been quite successful in office practice, to which she tries to confine herself, as she dislikes to appear in court. No other Connecticut women have followed her into the profession, although several are now preparing to do so.

—The artists are practically a unit in praise of Mr. BRIDGMAN's beautiful pictures now on exhibition in the Fifth Avenue Art Galleries. The collection is one of unusual interest, and a marvellous record of the artist's accomplishments.

—The historical house built by the Marquis de Talleyrand on the St. John's River, near Jacksonville, Florida, when, in 1793, France and England both having denied him a home, he found a refuge in the United States, is now the winter home of Mr. and Mrs. RICHARD R. PAULISON. The latter, an accomplished and beautiful woman, is known as the best lady shot in the South. She can cut off a coot's head with a rifle at two hundred yards, or shoot an eagle on the wing, and has performed many other difficult feats of marksmanship.

—Virginia's first woman physician is Mrs. C. L. HAYNES, who has recently been elected assistant physician at the Western Lunatic Asylum after passing a successful examination before the State Medical Board.

—An interesting old mansion of the last century, known as the "Watson Webb house," at Claverack, New York, has been burned. It was built in 1727, and figured in colonial history, and in the events of and succeeding the Revolutionary war. Its rooms and halls were of generous proportions, the interior was finished in the highest style of Dutch art, and a venerable ivy clambered over the capacious porch. General LAFAYETTE visited General SAMUEL WEBB, its owner, after the Revolution, and with his diamond ring etched his name on a window-pane. Of late years the old mansion had been best known as the house where Professor CLEMENT C. MOORE wrote the famous verses beginning, "'Twas the night before Christmas."

—The late Marquis TSENG, the well-known Chinese statesman and diplomat, spoke five European languages, played the piano, and was an expert with the billiard cue, while he had contributed articles to English magazines. As ambassador to the leading capitals of Europe he performed his functions with tact and dignity. The annual revenue from his estates in China is said to have been about $500,000, while his salary as ambassador was $20,000.

—EMIN Pasha, who claims that he was rescued from the wilds of Africa against his will, speaks twenty-seven languages and dialects.

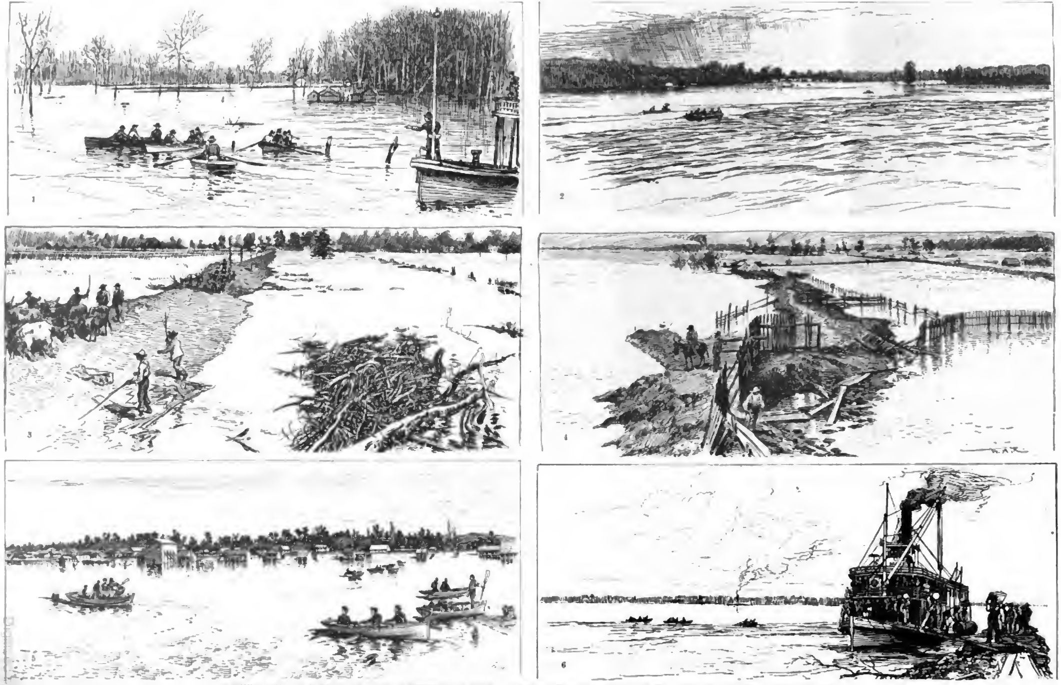
—The Empress of Austria is known as the best royal house-keeper in Europe. She looks after the details of the big imperial kitchen with the same anxious care that an American housewife bestows on the establishment of her lesser world, introduces new-fangled devices for cooking or saving work, and is said to be an adept in planning novel dishes with which to tickle the palates of her royal husband and his guests. The twenty-five men cooks, and as many more women—who make the pastry, and put the finer touches on the elaborate cuisine—with the numberless other attendants of the kitchen and throughout the palace, are marshalled and kept at their work with the skill of a general. And when special preparations are being made for some court festival, every servant, from the pompous head butler to the humblest scullion, has to "hustle."

—Governor CAMPBELL, of Ohio, an old soldier, declines a government pension for the simple but very potent reason that a man in his circumstances does not need one.

—When ROBERT J. BURDETTE was spending several weeks in the Adirondacks during the season of 1884 he temporarily filled the pulpit of the Second Baptist Church in Johnsburg, Warren County. He not only preached acceptably without pay, but he also delivered a lecture, the proceeds of which went to pay off a small debt on the church edifice.

—The last waltz that BISMARCK danced was in 1867, when the King of Prussia visited the Paris Exposition, and a ball was given in his honor. Madame CARETTE invited Prince BISMARCK, who was even then not as slender and as agile as he might have been in his earlier years, to be her partner in the "ladies' tour," and he accepted and waltzed with her, much to the surprise and amusement of those who understood the statesman's aversion for the light fantastic.

—The life-saving crew at Atlantic City, New Jersey, have a millionaire as a volunteer working member. He is JOHN COLLINS LEE, who comes of good old Kentucky stock, and whose father, RICHARD HENRY LEE, was once a well-known Cincinnati editor. The death of his father and a reverse of fortune threw young LEE on his own resources, and he became a New York dry-goods clerk. Later on a rich uncle in Paris died and left him about $2,000,000, and in his search for lost health LEE drifted to Atlantic City, and found it in the hardy life he now leads. He rooms at one of the big hotels, but spends his days at the life-saving station, donning the surfmen's garb and sharing in all their duties, even to taking an oar in the life-boat when it starts out on a mission of rescue. Mr. LEE is very popular with his associates, whose lot is alleviated in many ways by his



SCENES AND INCIDENTS OF THE MISSISSIPPI FLOODS (*Continued*).—FROM PHOTOGRAPHS BY W. A. STANTON, VICKSBURG.—[SEE PAGE 327.]

1. Coming for Mail and Provisions, Butler's, Mississippi. 2. Grand Lake, Arkansas. 3. Shiloh, Mississippi. 4. Henderson, Louisiana, looking Southwest. 5. Leota, Mississippi. 6. Steamer *Sunbeam* at the End of the old Levee near Raleigh, Louisiana.

Tres Palacios alone sat silent. Even when they started up his own well-known guerilla song,

"Casca, el padre de Cascarilla,
Nació, se casó, y murió en la silla!"

he contented himself with mechanically beating time on the deck planks. Seated on his valise, the only thing he had brought with him, he gazed ahead over the bowsprit, looking for the twin towers of old Panamá, which he should see long before they swung round to the north in the harbor of the modern port. Rumors of trouble and actual fighting in the town of Panamá itself had reached Santiago, but to the old outlaw such news seemed natural enough; nor did he begin to understand how they could affect him directly, until the morning of the second day, when a boat put out to meet and warn the captain against landing any passengers.

Tres Palacios thought otherwise; the boat that had brought the news could certainly take him back. So, while the schooner tacked and bore off toward the mouth of the Rio Grande, he was rowed toward the town.

The tide was out, and he landed on the shelf of rocks in front of the fort, where the sailors left him. A few minutes later he had climbed the weathered wall and stood inside the lines, not half a mile from Teresita's house. At this early hour there were usually scores of business men taking their morning walk, but to-day the broad boulevard was silent and deserted. With his bag over his shoulder, Tres Palacios lounged along leisurely, watching out of the corners of his eyes, and more alarmed at the unusual silence than had there been active fighting in the streets. His progress was arrested by a barricade built across the road in front of one of the barracks. Under its shelter fifty or sixty men lay, half asleep, beside their arms. Beyond, the windows of the *Cuartel* seemed deserted; not a musket was seen, nor even the gay color note of a uniform. He crept up to the top of the wall and cautiously looked across; but just as his head emerged from behind the stones a couple of shots fell, he felt a pull at his hair, and a moment later a drop of blood trickled over his forehead, and remained hanging on his heavy eyebrows.

"I wonder on which side I am fighting?" the old man said to himself as he dodged behind the wall. "At any rate, if the fellows can shoot as straight as this, matters cannot yet be very serious." But before he could obtain any information a heavy report rang out beyond; a paving stone shot downward from the coping, and ricochetting, struck him sufficiently hard to knock him off his feet. In a second the old guerillero's blood was up, and he had taken command, for the others soon recognized his superiority and accepted him as their leader. Three times within an hour the barricade was attacked, and three times the old man drove the assailants back, still ignorant of the party for which he was fighting and of the meaning of the flag which had been thrust into his hands. But little, indeed, did he care for the cause of the fight; he was in it, and now, right or wrong, it was too late to draw back.

But the fourth attack was successful. A small field gun had been wheeled into position, and the loosely built barricade rapidly melted before its blows. The bugle sounded a charge, and a few minutes later the defenders were swept back and the street cleared. Tres Palacios was but slightly wounded; but he knew that the fight was over, and that the best thing to do was to lie quiet and wait for a favorable opportunity of escape. Long before the soldiers had reached the wall he had dropped on his face near one side of the street, and lay perfectly motionless, covering his valise with his body, and to all appearances a corpse. They trampled him under foot as they passed, but the old man's limbs merely rolled aside a little, limp and heavy as those of a dead man, and no one paid any further attention to him. Unfortunately the soldiers, finding no enemy to pursue, returned before Tres Palacios had had time to rise, and one of these, a mere child, drunk with his first bloodshed, and boasting of the number of men he had killed, stumbled over the prostrate body, and fell headlong on to the pavement. He picked himself up with an oath, and turning savagely, drove his bayonet with all his strength through the old man's back. But the half-spoken curses died on his lips, for the ghastly crunching of the steel through the resisting bones sickened him, and without waiting to look at the effect of his blow, he dropped the musket and ran away, holding his hands before his face.

It was evening when the old man opened his eyes. Save for a dull, heavy burning somewhere in his body—he could not exactly say where—he felt numb and cold. His mouth was full of blood, and when he breathed it seemed as though some one were fanning red coals in his breast; streams of fire broke away slowly from the central wound and trickled outward to the very tips of his fingers before they passed away, only to be followed by others. He endeavored to remember what had happened, but his agony was so great that he gave a gurgling cry and swooned again.

A few hours later he awoke a second time, suddenly, as from a deep sleep; his mind seemed perfectly clear, and the events of the last twenty-four hours passed rapidly before him, not as they really were, but as he would have had them to be. Below his left arm he felt the hard ridges of the valise that contained the price, or the ransom, of his happiness. Teresa's house was only a few yards away, and now, at last, he should see her. Only a few minutes more to wait! He pictured to himself how he should knock at the great door and ask to see Teresa's maid; how he should send word to her. Should he merely say, "Tres Palacios has come," or should he send up the gold first? No, he could not leave the gold. Some one might steal it, and he shuddered at the thought of what that would mean to him. No, he must take it up himself. Only a few minutes more now; why should he hurry? The mere thought of the great happiness to come made him so happy now that he hesitated to move, and he waited until a bell rang out the hour somewhere in the town.

"Now!" he said, and made an effort to rise; but the paralyzed muscles refused to obey, and with the suddenness of a stroke of lightning the poor old dreamer understood.

This was the end, then—to die miserably in the street alone, like a poisoned cur, a few yards only from his little Teresa, and happiness just beyond his grasp! The gold—*her* gold—what would become of that? Up in the lonely gulches his heart had leaped with joy as he had gathered his treasure grain by grain; he remembered how at one time he would have sold an ounce of his blood for an ounce of the yellow metal, and now that the yellow gold was turned to red, he would have given the whole treasure for a little of the life-blood that stained it.

He groaned aloud. "God, God, it is not right!" and sobbed with wild, impotent rage. "Die! No! he should not, he could not die thus!" With a superhuman effort he raised himself a little from the ground and crawled forward a few inches, gulping down the blood that filled his mouth, and choking the hysterical cries of pain that burst from him in his agony. Hour after hour, with fierce determination, he wrestled with death; and inch by inch he dragged himself nearer to the iron-bound door that to him was the gate of heaven. But as the night waned his struggles became weaker, his swoons became more frequent and lasted longer, and the fever that enabled him to concentrate the remains of his colossal strength burned lower and lower. He alternately hoped he knew not what, and despaired again as his consciousness ebbed away. His mind wandered, and he forgot his surroundings. In a vague, indistinct way he remembered the old days in Santiago, but these blurred pictures were disconnected and meaningless beside the one intense purpose of these last moments.

Through the long hours of the soft tropical night he struggled fiercely, desperately; groaning, gasping, biting the paving stones in his agony, and repeating, in a thick, choked voice, that no longer sounded like anything human, "Teresa, my little one! Teresa, my little daughter!" while, unconscious of his suffering, the girl slept quietly in the great house over the way.

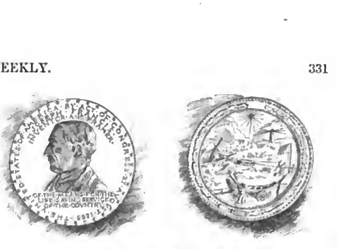
From above, the moon and the stars watched him unmoved, and passed on their way, and the soft blue night light gradually turned to gray. The streets were silent and deserted. In the morning twilight the heavy dews rose slowly from the ground and hung in shreds of mist between the houses, swinging to and fro in the faint sea-breeze, and imperceptibly drifting toward the interior. On the wet pavement, before the door that glistened as if covered with a thin layer of snow, the cramped body of the old negro lay across the narrow street, at the end of an irregular brown line that ran like a loose ribbon toward the débris of the barricade. From the soldiers' quarters the hoarsely shrill tones of the bugle sounded the reveille; a gun boomed in the distance, announcing that it was day once more, and with a sudden spasmodic jerk Tres Palacios raised himself on his side. For a moment he glared around with eyes that could no longer see, and appeared to listen. A few drops of blood trickled down from the corners of his mouth, and under the ghastly smile of his purple lips his teeth glistened, horribly white.

"Te... Teres...!" but the cry died in a gurgle; his head fell forward, and slowly he sank down to the ground. It was the end. And once more the street was silent.

An hour later the door opened, and a young man, stepping out, looked up and down the street. He shuddered slightly as he noticed the corpse, and wondering why it should be lying there, he raised the head with his foot and recognized Tres Palacios. At the other end of the bloody streak that marked the track of his struggle during the night lay a black square valise, and the young man ran toward it. By its weight he guessed the contents, and raising it to his shoulder he ran quickly back to the house, pausing only to kick the passive corpse before his door.

"I was in luck at the club last night," he said to his wife later, as he brought her some of the gold; "and this is for the bracelet I promised you so long ago."

Meantime the American sailors had taken possession of Panamá and cleared the streets. And thus this black Lear of the savanna, poor, unknown, yet loyal to the end, was buried by strangers in the common insurgents' grave. There were none to mourn his death. As the time passed and he never came, Teresa sometimes wondered what had become of Tres Palacios. But who should know what happened in the lonely gorges where the old man hunted for gold?



UNITED STATES OF AMERICA BY ACT OF CONGRESS
INVENTOR AND FRAMER
OF THE MEANS FOR THE LIFE SAVING SERVICE OF THE COUNTRY

THE FRANCIS MEDAL AWARDED BY CONGRESS.

JOSEPH FRANCIS.

If the world crowns with fame and fortune those who invent the destroying appliances of the battle field, what honors should it not award to those whose ingenuity is consecrated to saving the lives of their fellow-men? Such a benefactor is the venerable Joseph Francis, to whom, in his ninetieth year, President Harrison, on the 12th of April, presented a gold medal, provided by Congress, in recognition of his memorable inventions—prominent among which are the metallic life-boat and life-car.

The career of Mr Francis is full of interest. its dates seem to belong to by-gone generations. Born in Boston on March 12, 1801, at the age of eleven he fitted up a boat with cork, making it unsinkable. In a letter dated March 26, 1890, written in a clear and firm hand, he alludes to this specimen of his boyhood's ingenuity, saying that "the first public notice and description of my inventions were published in HARPER'S MAGAZINE, July, 1851, written by Jacob Abbott, thirty-nine years after my first invention in 1812." From 1812 to 1816 he was employed as a page in the Massachusetts Legislature. In 1819, being then only eighteen years old, he received at the Fair of the Massachusetts Mechanics' Institute a premium for a fast row-boat. He had now made the building of boats his business, especially giving his attention to constructing life-boats. Having established himself in New York, he was called upon to build life-boats for two of our war vessels at the Portsmouth Navy-yard, and exhibitions and public trials in New York and Philadelphia of boats which could not be upset brought them wide celebrity. Presently he added to his inventions that of a portable boat, which could be taken apart, and also new and ingenious methods of construction. From the use of wood as his material he passed to iron, then a novelty for that purpose, and between 1838 and 1842 invented a most valuable system of corrugating sheet metal, which he applied first to his famous life-car, with which to land people from wrecks. By 1845 he had perfected his metallic surf-boat. About three years afterward, having meanwhile vainly sought to induce the government to adopt his life-cars, he placed one of them on the New Jersey coast at his own expense. In January, 1850, during a terrible storm, the British ship *Ayrshire* was wrecked on Squan Beach. She had 201 souls on board. When other devices for reaching her had failed, a line was thrown across the ship from a mortar and the life-car pulled out. Back and forth it went on its errand of mercy, until all were rescued, the only person lost being a man who persisted in going on the outside of the car containing his relatives, and so was washed off. At the National Museum in Washington this life car may still be seen.

From that day Mr Francis and his invention became famous, and he was overrun with orders for corrugated metallic life-cars and boats from various nations. And it was not alone in these that his ingenuity found scope. He extended his remarkable system of corrugating sheet metal to various kinds of vessels, and to buoys, floating docks, pontoon wagons, and so on. He furnished appliances alike to our troops on the Western plains and to the Russian on the steppes of Asia. His busy brain also produced the double joint rowlock, the circular yacht, an improvement of the hydraulic press, and, in short, twenty-five patented inventions.

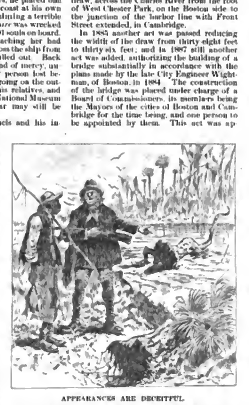
On visiting Europe he was received with distinguished honors. Russia made him a Knight of St. Stanislaus, Napoleon III., after witnessing an exhibition of his car on the Seine, gave him a valuable gold snuff-box studded with diamonds; medals and diplomas came to him from various European societies. Now, at last, a medal from his own country has followed, upon memorials from the American Institute and the New York Chamber of Commerce. Its inscription records that an Act of Congress, dated August 27, 1888, gives the token to Mr. Francis as the "inventor and framer of the means for the Life-saving Service of the country." The same face contains a finely engraved likeness of the recipient. On the other side is engraved a vessel in distress, with the life-car ready to rescue her. The medal is of pure gold, struck at the mint in Philadelphia, and is four inches in diameter and a quarter of an inch thick, exceeding three pounds in troy-weight, the metal having $760 intrinsic value, and the workmanship bringing the cost certainly to over $3000, while some estimates of other items carry the total cost to between $5000 and $6000. At any rate it is the most expensive medal ever struck by the government.

Only a portion is told of the life of Mr Francis in the record of his mechanical devices. His prolonged span of years has been full of beneficence, and his knowledge and skill have freely helped other inventors to success. Well did Congress thank him for his "life-long services to humanity and to his country," and happy must be his reflection at this close of his career that as his inventions have already saved thousands of lives, so they will continue to do in generations to come. His works will live after him.

THE HARVARD BRIDGE.

On September 15, 1887, the work of building the Harvard Bridge across the Charles River at Boston was begun, and the structure was completed during the past winter. For a long time the necessity of a bridge between the Back Bay section of Boston and Cambridge had been frequently urged, and with the increase in the resident population of the fashionable Back Bay quarter and the inception of great street and park improvements in that locality, the need of such a structure continually became more apparent. In 1882 the Massachusetts Legislature passed an act authorizing the cities of Boston and Cambridge to build a bridge, provided with a draw, across the Charles River from the foot of West Chester Park, on the Boston side to the junction of the harbor line with Front Street extended, in Cambridge.

In 1885 another act was passed reducing the width of the draw from thirty-eight feet to thirty-six feet; and in 1887 still another act was added, authorizing the building of a bridge substantially in accordance with the plans made by the late City Engineer Wightman, of Boston, in 1884. The construction of the bridge was placed under charge of a Board of Commissioners, its members being the Mayors of the cities of Boston and Cambridge for the time being, and one person to be appointed by them. This act was ap-



APPEARANCES ARE DECEITFUL.

"See here, my boy, what do you use to kill alligators with down here? I've fired ten shots at that chap, and he wasn't budged."

"'Tain't likes as he will, sah! 'Twould keep yer shootin' fo' de nex' ten yeah ter make a 'pression on dat ole cypress stump, sah."

ved by Governor Ames, May 18, 1887, and on May 20th that year Mayor Hugh O'Brien, of Boston, and Mayor lliam E. Russell, of Cambridge, appointed as third Com sioner Leander Greeley, of Cambridge, who continued serve in that capacity through the different municipal ninistrations until the bridge was completed. The City gineer of Boston, William Jackson, was elected engineer the bridge, and John E. Cheney assistant engineer. ·ious names for the structure were discussed. It was gested that it be called Blaxton (an antique Boston n of spelling "Blackstone"), Longfellow, Chester, and wmut Bridge; but the Commission, taking into consid- lon that the bridge would open a direct avenue to vard College, at last concluded to name it Harvard dge, in honor of Rev. John Harvard, the founder of Har- d College.

'he bridge is 2160 feet in length and 70 feet in width. There are two sidewalks, each 9 feet 6 inches wide, leaving 51 feet of width for the roadway. By the terms of the legislative act the Boards of Aldermen of Boston and Cambridge are empowered to authorize the running of street cars over the bridge, and to set apart a portion of the structure for their use, and the West End Street Railway has obtained the privilege of placing and maintaining two tracks upon the bridge.

The number of spans in the bridge is twenty-four, twenty-three spans being fixed, and one being a draw span. The fixed spans are supported on masonry piers and abutments, and the draw span is carried by a foundation of oak piles. The bed of the river at the bridge is generally composed of clay, overlaid with a considerable depth of mud or other soft material, and the piers, with three exceptions, were built upon piles driven to a firm bearing in the clay. After the piles were driven they were cut off two feet below mean low-water, and a sheathing of plank driven about them to hold the cement concrete with which the spaces between piles were filled for a depth of from two feet to eight feet below the tops of them. Two feet of this concrete was put in above the tops of the piles, and the masonry commenced from that point.

The fixed spans each have four main supporting girders of iron, of the plate girder type, and iron floor beams and brackets for supporting the projecting sidewalks. At the middle depths of the main girders limited advantage was taken of the cantilever system for increasing the lengths of the alternate spans of the bridge, and thereby reducing the number of piers. The lengths of the spans are generally 75 feet and 105 feet alternately, 75 feet of the larger span being supported by 15 feet cantilever extending from the shorter spans. The draw and six spans on each side of it are 19½ feet above mean high water, leaving clear space to a height of 12½ feet beneath them, which will give ample room for the passage of boats. On the Boston side the bridge is reached by a gradual ascent from Beacon Street, and it will be reached from the Cambridge side by an extension, at present uncompleted, of Front Street. On the Boston side this bridge is a continuation of West Chester Park, and it affords a direct driveway from Beacon Street into Cambridge. Harvard Bridge is a well-built and substantial piece of work, and it forms a necessary and additional connecting link between the two cities separated by the Charles River.

THE STANLEY-EMIN RELIEF EXPEDITION.

(Continued from page 330, Supplement.)

about 4 P.M., and occupied it, building a zeriba as fast as billhooks could cut brushwood. The war-cries were terrible from hill to hill. They were sent pealing across the intervening valleys. The people gathered by hundreds from every point. War horns and drums announced that a struggle was about to take place. Such natives as were too bold we checked with but little effort, and a slight skirmish ended in our capturing a cow, the first beef tasted since we left the ocean. The night passed peacefully, both sides preparing for the morrow.

"Our hill stood between a lofty range of hills and a lower range. On one side of us was a narrow valley 250 yards wide; on the other side the valley was three miles wide. East and west of us the valleys broadened into an extensive plain. The higher range of hills was lined with hundreds preparing to descend. The broader valley was already mustering its hundreds. There was no time to lose. A body of forty men was sent under Lieutenant Stairs to attack the broader valley. Mr. Jephson was sent with thirty men east. A choice body of sharp-shooters was sent to test the courage of those descending the slope of the highest range. Stairs pressed on, crossed a deep and narrow river in the face of hundreds of natives, and assaulted the first village, and took it. The sharp-shooters did their work effectually, and drove the descending natives rapidly up the slope, until it became a general flight. Meantime Mr. Jephson was not idle. He marched straight up the valley east, driving the people back, and taking their villages as he went. By 3 P.M. there was not a native visible anywhere, except on one small hill about a mile and a half west of us."

The next morning they resumed their march, but were attacked four times, but they easily got rid of their assailants, and after camping at noon, they marched on again at one. Mr. Stanley's account of the first view of the Albert Lake must be given in his own words:

"I cried out, 'Prepare yourselves for a sight of the Nyanza.' The men murmured and doubted, and said: 'Why does the master continually talk to us in this way? Nyanza, indeed. Is not this a plain, and can we not see mountains at least four days' march ahead of us?' At 1.30 P.M. the Albert Nyanza was below them, and now it was my turn to jeer and scoff at the doubters; but as I was about to ask them what they saw, so many came to kiss my hands and beg my pardon that I could not say a word. That was my reward. . . . Kavalli, the objective point of the expedition, was six miles from us as the crow flies. We were at an altitude 5200 feet above the sea. The Albert Nyanza was over 2900 feet below us."

The next day the lake was reached. The natives appear to have been fairly friendly, but they could give no news of Emin Pasha. This is remarkably strange, as we know he surveyed the south end of the lake, and discovered and surveyed the Semliki River as far as Hamgurko. Indeed, his paper describing this exploration was sent home in October, 1886. Mr. Stanley writes:

"My boat was at Kilonga-Longa's, 1190 miles distant; there was no canoe obtainable, and to seize a canoe without the excuse of a quarrel my conscience would not permit. There was no tree anywhere of a size to make canoes. Wadelai was a terrible distance off for an expedition so reduced as ours. We had used five cases of cartridges in five days of fighting on the plain. A month of such fighting must exhaust our stock. There was no plan suggested which seemed feasible to me except that of returning to Ibwiri, build a fort, send a party back to Kilonga-Longa's for our boat."

And this is what was done. On January 7th Ibwiri was reached, a fort built, and the boat was sent for, and arrived with Dr. Parke and Captain Nelson, and then Mr. Stanley was attacked by gastritis and an abscess on the arm, which required a month's careful nursing by Dr. Parke before he recovered. The expedition had no difficulty in returning to the Nyanza. Food was supplied them in abundance, and they soon received a letter from Emin, who had visited Kavalli during Stanley's absence. The natives were full of stories about "big ships as large as islands filled with men." On arriving at the lake, Stanley's boat was launched, and Mr. Jephson sent to M-swa, Emin's most southern station. On the 29th, in the evening, the steamer *Khedive* arrived at Stanley's camp with Emin Pasha, Captain Casati, and Mr. Jephson on board. At length, then, Stanley and his devoted band were rewarded for their intolerable hardships. They had at last found Emin Pasha, and brought him news from the civilized world. They had, at any rate, now reached the goal of their endeavors.

STANLEY'S REST.

For about three weeks, until May 25th, Stanley and Emin camped together upon the shores of the Albert Lake, and Mr. Stanley had a short but well-earned rest. The one thing which marred his satisfaction was that he had had no news of his rear guard. He and Emin discussed the future, and Mr. Stanley found that Emin was still anxious to retain his post, and to have a route opened to the east coast. There was apparently a good deal of difference of opinion as to the best course to pursue, but Emin appears to have thought that were he provided with sufficient ammunition, he would still be able to maintain his province. Mr. Stanley writes:

"Nor did any one impress us with his eagerness to return to civilization. They all seemed content to remain in the land; they praised it highly for its fertility and agreeable climate. They loved the natives, and were tireless in praises of everything connected with life in that region."

With regard to these points, however, the information published up to the present is vague and insufficient. It may therefore be best to omit further reference to it. It was finally arranged that Emin Pasha and Mr. Jephson should visit the various stations in the province (for it must be remembered that neither Mr. Stanley himself nor his expedition entered the province at all), and tell the people of the chance they had of returning to Egypt under Mr. Stanley's escort, and that all those who wished to go should be brought to the south end of the Albert Lake. After this Emin was to march to Fort Bodo, and bring the stores which Stanley intended to leave there back to the lake, and everything was to be prepared for decision one way or the other on Stanley's return from his search for the rear guard. It will, perhaps, be best to follow Mr. Stanley on his journey, leaving Emin, Jephson, and a few Soudanese soldiers to steam to the north.

STANLEY'S RETURN TO YAMBUYA.

Early in June the advance column returned to Fort Bodo to proceed to the relief of Major Barttelot, or to ascertain the fate of the rear-guard, for, as Mr. Stanley writes, "so anxious had we all become—whites and blacks—respecting the fate of the rear column that throughout each day many an eye was directed to the road leading toward Yambuya, and many an ear was strained to catch the expected signal shots. The people dreamed that the column was approaching, and that they saw the major at the head of quite an army of carriers, and that Mr. Jameson and his friends were also with them, robust and happy. But as the days passed, and no news was heard of the volunteer couriers that had left Fort Bodo on March 16th, we became alarmed. On June 16th having prepared abundant food to cross the dreadful wilderness, which had wellnigh proved fatal to us on our first journey toward the lake, we departed from Fort Bodo on our search for the rear column, leaving Lieutenant Stairs, Captain Nelson, and Surgeon Parke behind, with a garrison of fifty-nine rifles. Twenty-eight days' march from Fort Bodo brought us once more to Ugarrowwa's station, but it was now abandoned. The slave-trader and his hundreds of desperadoes had commenced the return home with 600 tusks of ivory, which had been collected after immense loss of life and native property. People have not the slightest idea what the present fashion of ivory-collecting, as adopted by the Arabs and Zanzibari half-castes west of the lake regions, means. Slave-trading becomes innocence when compared with ivory-raiding. The latter has become literally a most bloody business. Bands consisting of from 200 to 600 Manyuema, armed with Enfield carbines, and officered by Zanzibari Arabs and Suaheli, range over that immense forest-land east of the upper Congo, destroying every district they discover, and driving such natives as escape the sudden fusillades into the deepest recesses of the forest.

"In the midst of a vast circle described by several days' march in every direction, the ivory-raiders select a locality wherein plantations are abundant, prepare a few acres for rice, and while the crop is growing, sally out by twenties or forties to destroy every village within the circle, and to hunt up the miserable natives who have escaped their first secret and sudden onslaughts. They are aware that the forest, though it furnishes recesses of bush impervious to discovery, is a hungry wilderness outside the plantain grove of the clearing, and that to sustain life the women must forage far and near for berries, wild fruit, and fungi. These scattered bands of ivory-hunters find these women and children an easy prey. The startling explosion of heavily loaded guns in the deep woods paralyzes the timid creatures, and before they recover from their deadly fright they are rushed upon and secured.

"By the possession of these captives they impose upon the tribal communities the necessity of surrendering every article of value, ivory or goats, to gain the liberty of their relatives. Thus the land becomes thoroughly denuded of ivory, but, unfortunately, also it becomes a wild waste. The 600 ivory tusks that Ugarrowwa was bearing now to the coast had been acquired by just such bloody work, relentless destruction of human life, and condemnation of the unhappy survivors of the tribal communities to indescribable miseries. What Ugarrowwa had done within his elected circle, Kilonga-Longa had performed with no less skill, but certainly with a far greater disregard to the interests of humanity, within his reserve; and the same cruel, murderous policy was being pursued within dozens of other circles into which the region as far south as Urega, north to the Welle, east to longitude 29° 30′, and west to the Congo was parcelled out."

Through all this devastated land, through the gloomy forest, Stanley made rapid progress, discovering the remnants of the rear column on August 17th. "We witnessed," says Mr. Stanley, "in that crowded pestful village wherein the unfortunate remnant of the rear column was housed enough of the miseries that they had endured. The small-pox was raging; there were six bodies uninterred in the village; the reek of the crowded village was overpowering; dozens of disfigured men passed constantly before our eyes; and if any member of the rear column presented himself to us for recognition, we saw only a living skeleton, a creature stricken with anæmia, or a poor man whose pitiful state of mind and body was most awfully expressed by hollow cheeks, woe-begone face, and eyes brimful of grief or anxiety." Such a discovery as this would have been a crushing blow to almost any man, and every one must heartily sympathize with Stanley on the terrible shock he must have sustained. But his indomitable will bore up against this new strain. He reorganized the remnants of the expedition, and then marched once more for the Albert Lake.

On the whole, the march was rapidly accomplished, but on more than one occasion death from famine stared the whole expedition in the face. At one camp twenty-one persons altogether died from lack of food; and Stanley says that in the whole of his experience it was the nearest approach to absolute starvation he had met with. To show the sufferings endured one need only relate that for several days they existed on broth made of a pot of butter, abundance of water, a pot of condensed milk, and a cupful of flour, this being the total nutriment for 130 people.

On arriving again at Fort Bodo, to Stanley's utmost surprise, he found it still occupied by the garrison he had left in it. No news had been received from either Emin Pasha or Mr. Jephson, and, filled with direful surmisings, the combined expedition now marched to the Albert Lake, where they were soon put into communication with Mr. Jephson, and learnt of the disasters which had taken place in the Equatorial Province during their unfortunate absence.

THE REVOLT IN THE EQUATORIAL PROVINCE.

Space, unfortunately, forbids a detailed account of the stirring times and hardships experienced by Emin and Jephson during the past year. It must, however, be briefly summarized. All appears to have gone well until Laboré was reached on August 12th. Jephson had read the Khedive's letter and Stanley's proclamation at each station, but at Laboré the smouldering fires of discontent broke into flame. Emin and Jephson were flatly told that their mission was not believed; they were charged with having forged the Khedive's orders, and with the intention of evacuating the province only to sell its defenders as slaves at Zanzibar. The ignorant, credulous people refused to believe that marching to the south would ever lead them to Egypt. For years they knew that all communication with Egypt had been by way of the Nile, and with their elementary knowledge of geography it was impossible to convince them that any other way existed. Emin and Jephson were imprisoned and removed to Dufli, where they remained in durance vile until the end of November, never knowing whether or not they would be executed before the close of each several day. Their final escape was due to a curious circumstance already referred to, namely, the attack on Lado and Rejjaf by the Mahdi's troops from Khartoum. At Rejjaf the chief of Emin's enemies were killed, and it was then that his native (negro) soldiers found out that they had been misled by their officers, and insisted upon his reinstalment as Governor.

The Mahdi's troops were grievously repulsed at Dufli, but nevertheless two parties had been formed in the Equatorial Province; the one sided more or less with the Mahdists; the other was inclined to support Emin, on condition, however, that he did not desert them; and, as a matter of fact, it turned out as Emin had so forcibly prognosticated, that few, if any, of his people in reality wished to leave the province. It is only just to say that the revolt was simply due to Egyptian incendiaries working upon the feelings of an ignorant and superstitious people. Matters would have been very different had no thought of retreat to Zanzibar been expressed, but a determination manifested at all odds to maintain the Equatorial Province and to drive back the Mahdists again, as had been done before.

It is all very well to blame these people. Blameworthy they assuredly were, but at the same time considerable allowance must be made for their peculiar characteristics; and it is little to be wondered at that their previous knowledge of the slave-trade and all its horrors rendered them suspicious of a rumored expedition they had never seen, and of a proposed march to Zanzibar, which they knew, at least by repute, as being that place to which thousands of slaves had been transported from countries lying to the south of their own.

In December, 1888, Emin and Jephson, being set at liberty, proceeded to Wadelai, and in February they arrived once more at Mr. Stanley's camp at Kavalli. Stanley was then anxious to march at once for the coast. He was out of patience with people who did not care to be rescued; he was afraid that his expedition might be captured by the Mahdists, and he therefore urged a speedy retreat; but Emin, with sublime patience, urged a little delay, in order to give an opportunity to any who wished to accompany the expedition to the coast to do so. Some of Emin's followers manifested thieving propensities, and the rebels in the north sent letters to others urging them to delay Stanley's march if possible; this being found out, Stanley took prompt action.

He decided to march on the 10th of April, 1889, and march he did, the number of fugitives accompanying being 514. The total number of the expedition at this time was 1500, including some hundreds of porters, who were engaged to carry loads.

THE RETURN TO THE COAST.

The march from the Albert Nyanza to the south end of the Victoria was accomplished with little or no difficulty save one attack by Kabrega's men, who were speedily driven back. The people supplied the expedition with abundance of food; not a bead or a yard of cloth was demanded from them, and in this 400 miles of absolutely new country which was traversed many geographical problems of the greatest importance were solved. The veritable Mountains of the Moon were discovered in Mount Ruwenzori, whose highest peaks were estimated at over 19,000 feet, and from whose slopes some fifty streams feed the Semliki River, which, after a course of 100 miles from Lake Albert Edward Nyanza, empties itself into Lake Albert. The northern shores of Lake Albert Edward were coasted, and numerous hitherto unknown tribes were met with, a description of which will greatly add to our knowledge of the natives of central Africa. More than this, it was found that the great Victoria Lake extended in an unexpected direction toward the southwest, and Stanley was therefore able to estimate that its superficial area was 4500 square miles greater than he had previously believed.

But in traversing this district the expedition suffered much from sudden changes of climate. Mr. Stanley writes: "Since the commencement of our march homeward from our camp at Kavalli we have undergone remarkable vicissitudes of climate. From the temperate and enjoyable climate of the region west of Lake Albert we descended to the hot-house atmosphere of the Semliki Valley, at nearly 3000 feet lower level. Night and day were equally oppressively warm and close, and one or two of us suffered greatly in consequence. The movement from the Semliki Valley to the plains north of Lake Albert brought us to a dry but hot land. The ground was baked hard; the grass was scorched; the sun, but for the everlasting thick haze, would have been intolerable. In addition to which, the water, except that from the Ruwenzori streams, was atrocious, and charged with nitre and organic corruption. The ascent to the eastern plateau was marked by an increase of cold, and many an evil consequence—fevers, colds, catarrhs, dysenteries, and paralysis. Several times we ascended to over 6000 feet above the sea, to be punished with agues, which prostrated black and white by scores. In the early mornings at this altitude hoar-frost was common."

At Msalala the Church Missionary Society's station was reached, and the expedition were the guests of Mr. Mackay for nineteen days. Mackay had been in Africa since 1876, he having been one of the missionaries sent to Uganda on Mr. Stanley's appeal. Stanley speaks very warmly both of his hospitality and of his work, and with justice, for Mackay had been at his post for fourteen years, and had been exceedingly successful in his missionary work. Stanley calls him the modern Livingstone. (A despatch from Zanzibar, April 15, announces the death of Mr. Mackay from fever.)

After leaving the shores of the Victoria Nyanza the expedition marched through Usukuma and Mpwapwa to Bagamoyo. It was, however, attacked by the Wasukuma, who for five days disputed every mile of its advance through their territory. They gathered in immense numbers, and hundreds attacked either flank of the column; but the breech-loaders restrained them from approaching too near the column, and only one man was lost. Near Unyanyembe the expedition was met by a small caravan carrying luxuries with them sent off by the New York *Herald*; and soon after they were welcomed once more to civilization by the German troops under command of Major Wissmann. The march from the Albert Lake had not been accomplished without loss.

The death roll of the expedition may be given in Mr. Stanley's own words:

"According to a muster made at Kavalli on April 5, 1889, 570 refugees from the Equatorial Province had placed themselves under our protection for convoy to the sea. . . . We arrived at Bagamoyo with only 290 souls. The loss *en route* was therefore 280—nearly one-half—during a journey of 1400 miles. Of these 280 missing about 200 have been cared for by various native chiefs through whose territory we passed.

"If the head of a family suffered from a virulent ulcer in a country which furnished no carriers, and he could not possibly travel, there was no option left us but to leave him in some safe place; and as his family and servants preferred to stay with him, we were forced to yield to their entreaty. Probably 80 perished from ulcers, fever, fatigue, and debility; and one old lady, the mother of the Vakeel of the Equatorial Province, from sheer old age; she was nearly eighty years

Google

old. Of the 13 Somalis engaged by Major Barttelott at Aden, only 1 survived the journey; 3 of them were killed by natives while foraging for food, 9 died from fever and debility; of the 60 Soudanese enlisted at Cairo, only 12 returned to the coast, 7 having been already sent home from Yambuya; thus 19 out of 60 leaves a loss of 41, 2 of whom suffered the death penalty for mutiny and murder, and 1 deserted. Of the 620 Zanzibaris, only 225 were returned by us to Zanzibar; 55 were killed in the skirmishes which took place between Yambuya and the Albert Nyanza; 2 suffered capital punishment for selling their rifles and ammunition to our declared enemy; 292 died of starvation, ulcers, dysentery, and exhaustion; the rest deserted."

Of Stanley's European companions, Major Barttelott was murdered, Jamieson died of fever, Ward and Troup returned to Europe *via* the Congo; but Stairs, Nelson, Jephson, Parke, and Bonny survived all perils, and reached the east coast in safety with Mr. Stanley. A warm tribute to their devotion is paid to them by Mr. Stanley, which must reward them for their endurance.

He says, "Words fail to express my deep feelings of thankfulness that it was my fortune to be blessed with such noble companionship. Men of higher intelligence and of superior attainments may enter this darkest zone of that darkest Africa traversed by us, and perform more valuable services to science and humanity, but never, while human nature remains as we know it, will there be four gentlemen so matchless for their constancy, devotion to their work, earnest purpose, and unflinching obedience to honor and duty. In brief, in all that belongs to thorough and noble manliness, these four will stand prominent above all I have met, or ever can hope to meet, within the limits of the African continent." Such generous and noble words from such a leader are praise indeed.

The task of delineating this most remarkable feat of modern times is now concluded. We have followed, although of necessity with the utmost brevity (fuller details are given in the Stanley Letters*), the expedition from its inception to its close; the terrible trials and sufferings undergone in its prosecution have been referred to, and the heroism which alone enabled its accomplishment will be appreciated by all readers. The indomitable will, physical endurance, sagacity, and genius of its leader, H. M. Stanley, have been proved time and again before now, but never has he manifested them in a more remarkable manner than in the expedition now brought to a close. A right royal welcome awaits him when he returns home to rest after his toils, and all classes will unite in heartily according it.

It is impossible to estimate the results of the expedition with regard to the future of Africa. Time alone, that great revealer of secrets, will prove whether or no the trials and losses and disastrous events which have throughout beset the expedition have been suffered in vain. It is fervently to be hoped that such heroism will ultimately result in good for Africa and the Africans.

---

* *The Story of Emin's Rescue as told in Stanley's Letters.* Published by Mr. Stanley's Permission. Edited by J. Scott Keltie, Librarian to the Royal Geographical Society. With Map of the Route. 8vo, Cloth, 50 Cents. New York: Harper & Brothers.

THE SLAVES OF THE "SWEATERS."

THE burden of poverty is a heavy one, and the observer need not go to Hester Street, as the artist has done, to find an exemplification of it. Yet the artist has done wisely, for he has found what may be accepted as the embodiment of the extreme pressure of that burden. Poverty, to those who have studied the problem of it, seems to bear the hardest on those who struggle the most vigorously against it. The burden of it is not great upon the tramp or the idler, who relinquishes the struggle, and, lying down, leaves the community to do for him what he should do for himself. He is like the tropical savage, who simply opens his mouth and waits for the cocoa-nut to drop into it. If it drops, well; if not, well, the game is not worth playing. But to the toiler—to him who accepts the responsibility of carrying his portion of the burden of mankind—there comes always a load as heavy as he can well carry.

In the byways of New York there is an army of such. The student of sociology may not linger on the highways. There the prosperous pass. It is in the meaner streets, along the passageways of the "slums," that one may find the man whom civilization treads under foot. More than that, the man's wife and little ones may be found, as the artist has found them, staggering under the overplus of that burden. Into New York, as the gateway of the New World, flows, year by year, a steady and ever-increasing stream—the "surplus humanity" of Europe. Whoever in human form finds the conditions of life too hard in older civilizations turns to America as the land of promise. It is that. Yet, to the infinite dismay and discouragement of the toiler, the promise is one that may only be fulfilled in the third and fourth generation. Coming from the grinding conditions of labor in the Old World into the broad, generous sunrise of promise in the New, the toiler is at once confronted with the drawbacks of an overcrowded community. No doubt if he could "go West," or if he understood the necessity of doing so, he might find circumstances more favorable; but he cannot or does not. He has reached America. He stops where he is, and no man knows or cares about his necessities enough to guide him. He sits down in such a habitation as he may find, and does such work as he may find to do. It is the story of this man, not seen in the picture, which the artist tells in his picture of what may be seen any day in the streets of New York. He is a tailor; not one who accumulates a fortune by dictating fashions to the votaries of fashion, but the man who has learned to fasten together the garments that clothe the common people. Good honest work he is ready to give in return for a living, but in America he looks for a comfortable living, with a possibility of something more. The tools of his trade are few and simple, and he has them. At once he looks for work, and he finds it. He falls into the hands of the "sweater," and thenceforward, if his life is better than it was in Poland or Hungary—and it is—it is solely because of the larger liberty he has, and because of that bow of promise that is ever before him, and that will, so long as he lives, remain in the distance like an actual rainbow. His son, the little fellow who is tottering along, manfully struggling under his share and more of the family's burden, will grow up a happier and better man than the father ever can be, for he has the better start and larger opportunities; and the father and mother, seeing and knowing this, although vaguely, are content. It takes little to content the hopelessly poor.

And hopelessly poor the parents will remain. The squalor and almost incredible toil endured by the slaves of the "sweaters" can only be realized by those who see and study it. The artist has studied one incident of it in the picture, but it is only an incident. While the father is sewing at home, the mother and children are bringing him more work to do. Toilsome as their progress is through the wretched streets of the poorer quarters, the home must be seen before their poverty can be realized. It is a room—perhaps two rooms—in the top floor of a "rear tenement." Five, six, or eight dollars a month go for bare shelter, for rent buys nothing more than shelter in these places; comforts, conveniences, and cleanliness are not looked for. In these rooms are a table, a stove, a few chairs, a sewing machine, and perhaps a bed. Or, it may be, in lieu of a bed there is a heap of rags in the corner. Besides these things, there is nothing but a few dishes and the family of four.

Week after week, sometimes without even the rest of the weekly Sabbath, and year after year, the toiler struggles on for the enrichment of the "sweater." This creature is not a toiler, not a merchant, not a producer, not even a dealer in anything but human endurance. He is a contractor, and the name "sweater" by which he is commonly called is indicative of the character of his employment and the esteem in which he is commonly held. He is acquainted with some of the large clothing manufacturers, who, under competition, are striving always to lessen the cost of manufacture. They are willing to pay only a trifle for the sewing together of garments, and they contract with the "sweater" for the performance of the work. To him it matters little how small the price of the work is if he can secure enough of it, for he looks out for his own pay first, and pays the workmen whom he employs whatever is left. He serves no purpose whatever in the economy of civilization beyond the mere convenience of the manufacturer, and yet that slender hold is enough for him.

The figures tell the story, or would, if they could be collated accurately and fully. Within a few years a number of the States have established bureaus of labor statistics, and have set their commissioners at work investigating the facts of the daily life of the workers. The field is too large to be covered in a few years, and the reports that are made annually are valuable chiefly as material for the student. The chief criticism to be made so far is that the returns are too scattering. Figures are there, and they are instructive, but they are neither exact enough nor complete enough to be satisfactory. We can learn, however, from Commissioner Peck's report from Albany, that the newly arrived immigrant who goes to work for the "sweater" can make at first about five cents an hour in return for hard work. On this he expects to support his family, and he begins work hopefully. In a little time he finds that he is underpaid, and he begins the struggle, which lasts for the rest of his life, for better wages. He gets them. From the testimony which Mr. Peck has collected we learn that the clothing manufacturer pays as much as a dollar and a half to three dollars for "making," that is, sewing, a dozen pairs of pantaloons, and from fifteen cents to thirty-five cents apiece for making vests. Out of this munificent contract price the "sweater" retains so much that his victim is able to earn about fifty cents for sixteen hours' work. To do this, he has to employ the help of his wife and children. Newspaper reporters who have occasion to visit the homes of the very poor find children from four to six years old—just such infants as the one who toils under the lightest burden in the picture—sitting on the floor, pulling out basting threads. They are earning their quota of the half dollar a day that comes in for the labor of the entire family. Better wages come with more knowledge, but knowledge comes slowly, and the emancipation of the "slaves of the sweaters" is a very gradual process.

"THE MERCHANT OF VENICE."

IT was perhaps an auspicious portent, it certainly is an interesting fact, that the first play that was ever acted in America at a regular theatre and by a regular theatrical company was Shakespeare's comedy of *The Merchant of Venice*. Such at least is the record made by William Dunlap, the first historian of the American theatre, who names Williamsburg, Virginia, as the place, and September 5, 1752, as the date of that production. It ought to be noted, however (so difficult is it to settle upon any fact in this uncertain world), that the learned antiquarian Judge Daly, fortified likewise by Ireland, dissents from Dunlap's statement, and declares that Cibber's alteration of Shakespeare's *Richard the Third* was acted by a regular company in a large room in Nassau Street, New York, at an earlier date, namely, on March 5, 1750. All the same, it appears to have been Shakespeare's mind that started the dramatic movement in America. The American stage has undergone great changes since that time, but both *The Merchant of Venice* and *Richard the Third* are still acted, and in the *Merchant*, if not in *Richard*, the public interest is still vital. In New York, under Edwin Booth's management (at the Winter Garden Theatre, January 28, 1867, and subsequently at Booth's Theatre), and in London, under Henry Irving's management (at the Lyceum Theatre, November 1, 1879), sumptuous productions of the *Merchant* have brilliantly marked the dramatic chronicle of our times. Discussion of the great character of Shylock steadily proceeds, and seems never to weary either the disputants or the audience. The sentiment, the fancy, and the ingenuity of artists are often expended not only upon the austere and picturesque and terrible figure of the vindictive Jew, but upon the chief related characters in the comedy—upon Bassanio and Portia, Gratiano and Nerissa, Lorenzo and Jessica, the princely and pensive Antonio, the august Duke and his stately senators, and the shrewd and humorous Gobbo. More than one painting has depicted the ardent Lorenzo and his fugitive infidel as they might have looked on that delicious summer night at Belmont when they saw "how the floor of heaven is thick inlaid with patines of bright gold," and when the blissful lover, radiant with his own happiness and touched and exalted by the sublime, illimitable, unfathomable spectacle of the star-strewn firmament, murmured to his mistress:

> "There's not the smallest orb, which thou behold'st,
> But in his motion like an angel sings,
> Still quiring to the young-ey'd cherubins:
> Such harmony is in immortal souls;
> But, whilst this muddy vesture of decay
> Doth grossly close it in, we cannot hear it."

It is not to be denied that lovely words are spoken to Jessica, and that almost equally lovely words are spoken by her. Essayists upon the *Merchant* have generally accepted her without a protest—so much do youth and beauty in a woman count in the scale when weighed against duty and integrity. There is no indication that Shylock was ever unjust or unkind to Jessica. Whatever he may have been to others, he seems always to have been good to her; and she was the child of that lost Leah of his youthful devotion whom he passionately loved and whom he mourned to the last. Yet Jessica not only abandoned her father and his religion, but robbed him of his money and his jewels (including the betrothal ring, the turquoise, that her mother had given to him), when she fled with the young Christian who had won her heart. It was a basely cruel act; but probably some of the vilest and cruelest actions that are done in this world are done by persons who are infatuated by the passion of love. Mrs. Jameson, who, in her beautiful essay on Portia, extenuates the conduct of Jessica, would have us believe that Shylock valued his daughter far beneath his wealth, and therefore deserved to be deserted and plundered by her; and she is so illogical as to derive his sentiments on this subject from his delirious outcries of lamentation after he learned of her predatory and ignominious flight. The argument is not a good one. Fine phrases do not make wrong deeds right. It were wiser to take Jessica for the handsome and voluptuous girl that certainly she is, and to leave her rectitude out of the question. Shakespeare in his drawing of her was true to nature, as he always is, but the student who wants to know where Shakespeare's heart was placed when he drew women must look upon creatures very different from Jessica. The women that Shakespeare seems peculiarly to have loved are Imogen, Cordelia, Isabella, Rosalind, and Portia—Rosalind, perhaps, most of all, for although Portia is finer than Rosalind, it is extremely probable that Shakespeare resembled his fellow-men sufficiently to have felt the aspiration which Tom Moore long afterward expressed:

> "Be an angel, my love, in the morning,
> But, oh! be a woman to-night."

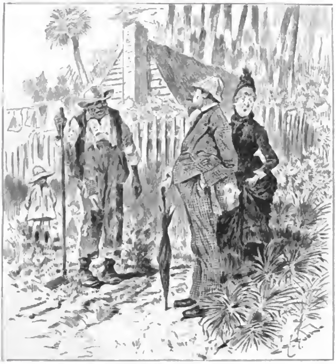
When Ellen Terry embodied Portia—in Henry Irving's magnificent revival of *The Merchant of Venice*—the essential womanhood of that character was for the first time in the modern theatre adequately interpreted and conveyed. Upon many play-going observers indeed the wonderful wealth of beauty that is in the part—its winsome grace, its incessant sparkle, its alluring because piquant as well as luscious sweetness, its impetuous ardor, its enchantment of physical equally with emotional condition, its august morality, its perfect candor, and its noble passion—came like a surprise. Did the great actress find these attributes in the part (they asked themselves), or did she infuse them into it? Previous representatives of Portia had placed the emphasis chiefly, if not exclusively, upon morals and mind. The stage Portia of the past has usually been a didactic lady, self-contained, formal, conventional, and oratorical. Ellen Terry came, and Portia was figured exactly as she lives in the pages of Shakespeare, an imperial and yet enchanting woman, dazzling in her beauty, royal in her dignity, as ardent in temperament as she is fine in brain, and various and splendid in personal peculiarities and feminine charm. After seeing that matchless impersonation it seemed strange that Portia should ever have been represented in any other light, and it was furthermore felt that the inferior, mechanical, utilitarian semblance of her could not again be tolerated. Ellen Terry's achievement was a complete vindication of the high view that Shakespearian study has almost always taken of this character, and it finally discredited the old stage notion that Portia is a type of decorum and declamation.

Aside from Hazlitt, who thought that Portia is affected and pedantic, and who did not like her because he did not happen to appreciate her, the best analytical thinkers about Shakespeare's works have taken the high view of this character. Shakespeare himself certainly took it; for aside from her own charming behavior and delightful words it is to be observed that everybody in the play who speaks of her at all speaks her praise. It is only upon the stage that she has been made artificial and prim and preachy. That misrepresentation of her has, perhaps, been caused, in part, by the practice long prevalent in our theatre of cutting and compressing the play so as to make Shylock the chief figure in it. In this way Portia is shorn of much of her splendor and her meaning. The old theatrical records dwell almost exclusively upon Shylock, but say little if anything about Portia. In Shakespeare's own time, no doubt, *The Merchant of Venice* was acted as it is written, the female persons in it being played by boys, or by men who could "speak small." Alexander Cooke (1588–1614) played the light heroines of Shakespeare while the poet was alive. All students of the subject are aware that Burbage was the first Shylock, and that when he played the part he wore a red wig, a red beard, and a long false nose. No record exists as to the first Portia. The men who were acting female characters upon the London stage when that institution was revived immediately after the Restoration were Kynaston, James Nokes, Angel, William Betterton, Mosely, and Floid. Kynaston, it is said, could act a woman so well that when at length women themselves began to appear as actors, it was for some time doubted whether any one of them could equal him. The account of his life, however, does not mention Portia as one of his characters.

Indeed, the play of *The Merchant of Venice*, after it languished out of sight in that decadence of the stage which ensued upon the growth of the Puritan movement in England, did not again come into use until it was revived in Lord Lansdowne's alteration of it produced at the theatre in Lincoln's Inn Fields in 1701, and even then it was grossly perverted. Forty years later, however, on St. Valentine's Day, 1741, at Drury Lane, when Macklin regenerated the character of Shylock, the original piece was restored to the theatre. Women in the mean time had come upon the stage. The garrulous and delightful Pepys, who had seen Kynaston play a female part, records in his marvellous Diary that he first saw women as actors on January 3, 1661. These were members of Killigrew's company, which preceded that of Davenant by several months, if not by a year, and therefore the common statement in theatrical books that the first woman that ever appeared on the English stage was Mrs. Sanderson, of Davenant's company (at Lincoln's Inn Fields), is erroneous, and indeed the name of the first English actress is as much unknown as the name of the first Portia. When Macklin restored Shakespeare's *Merchant of Venice* to the stage it is not likely that the character of Portia was dwarfed, for its representative then was Kitty Clive, and that actress was a person of strong will. With Clive the long list begins of the Portias of the stage. She was thirty years old when she played the part with Macklin, and it is probable that she played it with dignity, and certain that she played it with sparkling animation and piquant grace. The German Ulrici, whose descriptive epithets for Portia are "roguish and intellectual," would doubtless have found his ideal of the part fulfilled in Clive. The Nerissa that night was Mrs. Pritchard, then also thirty years old, but not so famous as she afterward became.

The greatest actress on the British stage in the eighteenth century undoubtedly was Margaret Woffington (1719-60). Sarah Siddons, to whom the sceptre passed, was only five years old when Woffington died. Both these brilliant names are associated with Portia. Augustin Daly's *Life of Woffington* he best life of her that has been written, l one of the most sumptuous books that e been made in America—contains this erence to her performance of this part: ll her critics agree that her declamation s accurate and her gesture grace and ure combined; but in tragic or even dra- tic speeches her voice probably had its its, and in such scenes, being overtaxed, l against her. As Portia she appeared to at advantage; but when Lorenzo says, als is the voice, or I am much deceived, Portia,' and Portia replies, 'He knows as the blind man knows the cuckoo, by bad voice,' the audience laughed out- it, and Woffington, conscious of her de- ency, with great good-humor joined with m in their merriment." The incident is ntioned in the *Table Talk* (1825) of Rich- llyan, to which book Mr. Daly refers. s. Siddons made her first appearance on the ndon stage as Portia (December 29, 1775), l conspicuously failed in the part on that asion, but she became distinguished in it erward; yet it is probable that Mrs. Sid- ns expressed its nobility more than its ten- ness, and much more than its buoyant l glittering glee, which is so entirely l beautifully given by Ellen Terry. Af- Woffington and before Siddons the st conspicuous Portia was Mrs. Dancer, om Hugh Kelley, in his satirical com- ition of *Thespis*, calls a "moon-eyed d," from which barbarous bludgeon ase the reader derives a hint as to her as- t. Some of the tones of Mrs. Dancer's e were so tender that no one could resist n. Spranger Barry could not, for he ried her, and after his death she became Crawford. Miss Maria Macklin, daugh- of the first true Shylock of the stage, acted Portia, April 13, 1776, with her father. She ecorded as an accomplished woman but titute of genius—in which predicament she bably was not lonesome. On June 11, 1777, tia was acted at the Haymarket by Miss sall, afterward Mrs. Lister, an actress o, since she excelled in such parts as were tomarily taken by Fanny Abington (the inct opposite of Portia-like characters), st have been unsuited for it. The names Miss Younge, Miss Farren, Miss E. Kem- Miss Ryder, Mrs. Pope, Miss De Camp, l Miss Murray are in the record of the stage tias that comes down to 1800. Prob- y the best of all these Portias was Mrs. pe.

he beautiful Mrs Glover played Portia 1809 at the Haymarket Theatre. Mrs. lvie played it, with Macready as Shylock first appearance there in that part), on y 13, 1823. These figures passed and left shadow. Two English actresses of great ie are especially associated with Portia— en Tree, afterward Mrs. Charles Kean, and en Faucit, now Lady Martin; and no doubt ir assumptions of the part should be mark- as exceptions from the hard, didactic, de- matory, perfunctory method that has cus- marily characterized the Portia of the ge. Lady Martin's written analysis of tia is eminently noble in thought and tle and tender in penetration and sym- hy. Charlotte Cushman read the text erbly, but she was much too formidable r to venture on assuming the character.



CHANGE.

TOURIST IN THE SOUTH. "You must have seen lots of change down here the last few years, uncle."

UNCLE. "Dey say dere's been lots, boss, but de mos' I's seen ob it ha' been a dime or a nickle ebery now an' den, explainin' to folks dat it a'n't safe to trabel roun' here 'mong de scrub palmetters, on 'count ob de rattlers an' moccasins."

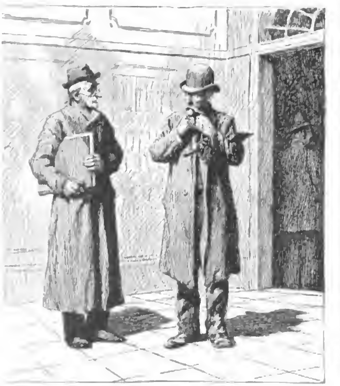
Portia is a woman who deeply loves, and deeply rejoices and exults in her love, and she is never the least ashamed of her passion or of her exultation in it; and she says the finest things about love that are said by any of Shakespeare's women; the finest because, while supremely passionate, the feeling in them is perfectly sane. It is as a lover that Ellen Terry embodies her, and while she makes her a perfect woman, in all the attributes that fascinate, she fails not, in the wonderful trial scene, to invest her with that fine light of celestial anger—that momentary thrill of moral austerity—which properly appertains to the character at the climax of that solemn and almost tragical situation.

On the American stage there have been many notable representatives of the chief characters in *The Merchant of Venice*. In New York, when the comedy was done at the old John Street Theatre in 1773, Hallam was Shylock and Mrs. Morris Portia. Twenty years afterward, at the same house, Shylock was played by John Henry and Portia by Mrs. Henry, while the brilliant Hodgkinson appeared as Gratiano. Cooper (whose life has been so well written by that ripe theatrical scholar Joseph N. Ireland in one of the recent books of the Dunlap Society) assumed Shylock in 1797 at the theatre just then opened in Greenwich Street. The famous Miss Brunton (then Mrs. Merry) was the Portia, and the cast included Moreton as Bassanio, Warren as Antonio, Bernard as Gratiano, and Blissett as Tubal. How far away and how completely lost and forgotten those once distinguished and admired persons are! Yet Cooper in his day was idolized: he had a fame as high, if not as widely spread, as that of Edwin Booth at present. William Creswick—lately dead at an advanced age in London—was seen upon the New York stage as Shylock in 1840; Macready in 1841; Charles Kean in 1845. With the latter, Ellen Tree (his wife), of course, played Portia. Charles W. Couldock enacted Shylock on September 6, 1852, at the Castle Garden Theatre, in a performance given to commemorate the alleged centenary of the introduction of the drama into America. The elder Wallack, the elder Booth, Edwin Forrest, G. V. Brooke, George Vandenhoff, Wyzeman Marshall, and E. L. Davenport are among the old local representatives of the Jew. Madame Ponisi used to play Portia, and so did Mrs. Hoey.

In December, 1858, when *The Merchant of Venice* was finely revived at Wallack's Theatre, with the elder Wallack as Shylock, the cast included Lester Wallack as Bassanio, John Brougham as Gratiano, A. W. Young (a quaintly comic actor, too soon cut off) as Launcelot Gobbo, Mary Gannon—the fascinating, the irresistible—as Nerissa, and handsome Mrs. Sloan as Jessica. The great German actor Davison played Shylock here, in his own language, and many German actors, no one of them comparable with him, have here been seen in it since. Lawrence Barrett has often played it, and with remarkable force and feeling. The triumphs won in it by Edwin Booth are within the remembrance of many play-goers of this generation. When he now acts the Jew, Madame Helena Modjeska is associated with him as Portia. Mr. Booth has customarily ended the piece with the trial scene, omitting the last act; and indeed that was long the stage custom, but with the true Portia of Ellen Terry and a good cast in general the last act goes blithely and with superb effect. The comedy was not written for Shylock alone. He is a tremendous identity, but he is not the chief subject. The central theme is Portia and her love. This theme takes up a large part of the play, which is like a broad summer landscape strewn with many-colored flowers that flash and glitter in the sun, while slowly a muttering thunder-storm gathers and lowers, and presently sweeps overhead, casting one black shadow as it passes, and leaving the fragrant and glistening plain all the brighter and sweeter for the contrast with its defeated menace and vanishing gloom.

WILLIAM WINTER.

NOTE.—An elaborate article on *The Merchant of Venice*—the second of a series on the Comedies of Shakespeare from the graceful pen of Andrew Lang, giving new conceptions of the great characters in these plays—appeared in the April number of HARPER'S MAGAZINE, with superb illustrations by E. A. Abbey.



BETTING ON HIS EGOISM.

"My dear sir," said the lecturer, "I had a very observant listener in you to-night. May I ask the reason? Were you deeply interested?"

"I was, sir—I was. I had a bet that you would use the first personal pronoun once every minute, and, by Jove! I won the bet."

A NECESSITY OF HEALTH.

It is a prime necessity of health that the action of the bowels should be kept regular. But the way to overcome a temporary fit of constipation, or to remedy chronic costiveness, is not to deluge the stomach and drench the bowels with purgatives of violent and painful action. The happy medium between an inoperative and violent cathartic is Hostetter's Stomach Bitters, which acts just sufficiently upon the bowels to relax them, without pain, and which being a wholesome tonic, as well as aperient, has the effect of strengthening both them and the stomach, and promoting the well-being of the whole internal economy. The removal of bile from the blood, increased activity of the liver, usually dormant in cases of costiveness, and sound digestion follows the use of this beneficent medicine, as thorough and genial in its effects as it is safe and pure in composition. Rheumatism, fever and ague, kidney troubles and debility are also remedied by it.—[*Adv.*]

No other Life Policies as liberal cost as little money, no others as cheap give as much for the money, as those of THE TRAVELERS of Hartford, Conn. Best either for Family Protection or Investment of Savings. Non-forfeitable, world-wide, lowest cash rate. Assets, $11,528,648.80; Surplus, $2,365,534.06.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

A SUDDEN CHANGE OF WEATHER
Will often bring on a cough. The irritation which induces coughing is quickly subdued by Brown's Bronchial Troches, a simple and effective cure for all throat troubles. Price, 25 cents per box.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

The medical profession of the large cities endorse and prescribe Nicholson's Liquid Bread, not only as a tonic, but as a pleasant, healthful drink. Have you tried it? Ask your druggist or grocer for it.—[*Adv.*]

PREMATURE Loss of the Hair, which is so common nowadays, may be entirely prevented by the use of BURNETT'S COCOAINE.—[*Adv.*]

NOTHING contributes more towards a sound digestion than the use of ANGOSTURA BITTERS.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

BURNETT'S FLAVORING EXTRACTS are the best, the strongest, and most healthful.—[*Adv.*]

SCROFULA is transmitted from parent to child, and thus becomes a family inheritance for generations. It is, therefore, the duty of every scrofulous person to cleanse his blood by a thorough and persistent course of Ayer's Sarsaparilla.—[*Adv.*]

HARPER & BROTHERS, New York.

discredited—overshadowed Clay's whole political career for a quarter of a century, what ought to be the effect of the charges of pecuniary dishonesty now brought with testimony, and reiterated in detail day after day, against Mr. Quay?

Such accusations cannot be dismissed as beneath the notice of any public man. Disregard of charges like those against Mr. Quay, made as they are made, is a practical admission that they are unanswerable. We do not, indeed, admit the moral right of a newspaper to accuse men of dishonesty, and then with a smirking conceit of candor proclaim that its columns are open for an explanation. If a newspaper alleges forgery against Bishop Potter, or grand larceny against Vice-President Morton, the outrage is not extenuated by the announcement that equal publicity will be given to their denial. Such men will not deny such charges. If their characters do not defend them, their word would be no defence. But this is not Mr. Quay's case. The time, the place, the figures, the methods, of the alleged dishonesty, with corroborative testimony and legal records, are published, and denial of the truth of the charges is defiantly challenged. Under such circumstances, Washington himself would have felt it to be the most imperative public duty to bring the matter to prompt and thorough investigation, that the libellers, if such they were, should be punished like other reckless malefactors.

A perfectly reputable journal makes and repeats what it states to be "a charge supported by evidence, that Mr. Quay took at one time $260,000 from the Pennsylvania State Treasury, and lost it in stock gambling, and at another time took $400,000, when he was State Treasurer, and used it to pay for certain railroad securities which he had purchased, subsequently returning the State's money when he had sold the securities." It cannot be said that Mr. Quay's character defends him against such charges. His standing in the country does not permit him to treat them with scorn. Indeed, he is known to the country only by such unanswered accusations made with proof, and by reports, universally believed, of disreputable pecuniary transactions in the conduct of an election as chairman of the Republican National Committee. Such charges, without evidence, alleged against Senator Edmunds or Senator Hoar would be discredited. But made as they are made against Mr. Quay, both of these Senators would at once challenge legal inquiry. Mr. Quay, through friends, replies only that the accusations are due to the spleen of free-traders and the rage of defeated Democrats. Was the Philadelphia *Press* a splenetic free-trader and defeated Democrat when it said, alluding to these charges when they were first familiar, "Take the lid from off the State Treasury, and uncover secrets before which Republicans would stand dumb"? Is Mr. Lea a disappointed and malignant free-trader? Mr. Quay's indirect rejoinder is not a denial, but rather a confession. It makes his position very much worse. Yet he is still a companion and counsellor of the President, the associate of Senators, and the chairman of the Republican National Committee. Do these facts comport with public decency?

PRACTICAL CHRISTIANITY.

The conference of working-girls' societies or clubs which was recently held in this city was very interesting in many ways, and especially as showing both the admirable way of "putting things" upon the part of the speakers and the parliamentary readiness and ability of the leaders. The interest in the clubs of those who are not working girls is not a mere "fad" of fashionable ennui. It springs from sincere feeling, and is shown by efficient sympathy. Miss Dodge said conclusively, when a question arose which assumed a difference in the membership, that as members there was entire equality. Undoubtedly, as at the conference, those who are not technically working girls will generally take the lead, because they have a greater knowledge of the purposes of the clubs and greater facility in leading. When, for instance, young girls are to be amused in a bright and social way, they will naturally look to those who are peculiarly fitted to be mistresses of the revels, and who can at once lead the sport and keep order.

This system of clubs is of very great value. It supplies a place of agreeable resort for amusement and social intercourse to those whose homes are not attractive, and this alone is an inestimable service. It furnishes opportunities of careful instruction in many forms of self-help and in many methods of earning a livelihood, and, above all, it cultivates the sentiment of human sympathy and friendliness, and destroys the bitterness of class feeling. The advantages also are by no means on one side. Close and constant association with the less fortunate in life tends to correct the selfishness and heartlessness which mere prosperity is apt to produce, and to foster in the truest sense a happy Christian socialism. The interest in these clubs is one of the pleasantest signs of the modern spirit of fraternity, which is merely practical Christianity.

THE "RECOLLECTIONS" OF MR. CHILDS.

To be universally known as constantly doing good, as a rich man who holds his riches in trust for the benefit of others, as the effective friend of every humane enterprise, as the proprietor of one of the great and most prosperous newspapers in the country, conducted strictly upon the principles of courtesy and good sense which regulate the intercourse of gentlemen, and as the friend of the most distinguished persons of his time, is the happy fortune of Mr. George W. Childs, of Philadelphia.

The beginning of his prosperous career is characteristically associated with benefit to a justly famous man. It was the publication of Dr. Kane's journal of his arctic expedition, an undertaking against which Mr. Childs was warned, but which resulted in the payment of $70,000 to Dr. Kane as his share of the profits in the first year of publication. The sagacity which prompted this venture is the gift of nature to Mr. Childs, which explains his prosperous career. The recollections of such a life are necessarily full of interest. They are especially pleasant, because they do not associate narrowness and hardness and meanness and selfish intrigue with success, but, on the contrary, the open hand and the open heart.

Mr. Childs, despite his friendly relations with royalty and the nobility, is too good an American republican to care to quarter his family arms upon any shield. But he could not choose a better motto than such a heart and such a hand. His little volume of *Recollections*, just published by the Lippincott Company, is rich with reminiscences of famous persons and accounts of exceedingly interesting possessions, and of public gifts and delightful occasions, all pervaded with the spirit of the generous giver who is sure to double his generosity by giving quickly. Artists always paint themselves in their pictures, and Mr. Childs has unconsciously given us himself in his book.

A STEALTHY BLOW.

The joint resolution providing for the appointment of thirty additional medical examiners in the Pension Bureau, but exempting them from examination under the civil service rules, is simply an insidious attempt to obtain Congressional countenance for breaking down the rules. The President could suspend the rules in the case if he chose to do so, or thought that the exigency required a suspension. The fact that the suspension is put in the form of a joint resolution shows a desire at once to relieve the President of a disagreeable responsibility, and to obtain the authority of Congress for a blow at reform.

When the joint resolution passed the House it was alleged that the necessity of appointment was so urgent that it would not brook delay. The facts that there was an eligible list from which selections could be made at once, and that the Commission was ready to examine candidates as rapidly as they could be examined elsewhere, were not permitted by the Speaker under the rules to be stated. The urgent necessity, however, has not prevented a delay of some weeks, during which the most complete and satisfactory examinations might have been held. The joint resolution was reported unchanged in the Senate, and Senator Hoar's amendment was adopted providing for such examination as the President may approve.

There is no reason whatever, except the wish to strike at reform, that the thirty examiners should not be appointed exactly as other examiners are appointed. Their duties and emoluments are the same, and the public service cannot be subserved by a different method of selection. The trick of the resolution is plain, and no member of Congress who is friendly to reform can be deceived by it.

MEMORIAL TABLETS IN NEW YORK.

The Holland Society in New York proposes the erection of memorial tablets to mark interesting sites in the city, such as those in Albany which we recently described. The design is admirable, and has been too long delayed. Its execution, also, undoubtedly will be tasteful and satisfactory, except in one point as now proposed. According to the scheme as published, the Holland Society seems to be as intent upon glorifying itself for doing the work as the work itself. The inscription upon every tablet that we have seen proposed begins with the statement, "Erected by the Holland Society," and then proceeds to mention the interest of the site.

This is both amusing and offensive. The society shows unnecessary zeal to advertise itself. The committee should consider the monument erected by Mr. Sapsea to his wife in *Edwin Drood*, which was in effect a glowing panegyric of himself, his virtues, and his business. It is seemly that having mentioned the site of interest, the society should modestly subjoin the fact that the tablet was erected by it. But to preface each inscription with the remark that the society caused the tablet to be erected is to appropriate the first homage of interest, which belongs not to the society but to the site.

Among the spots worthily selected for commemoration are the place where the first houses of white men were built, at Nos. 41-43 Broadway; the site of old Fort Amsterdam; the old Stadt Huys, or City Hall; the Stuyvesant pear tree; the first Exchange; the Middle Dutch Church; Fraunce's Tavern; the Delancey House, later the site of the City Hotel, where the non-importation agreement was signed. This is an excellent beginning, for which the Holland Society is to be heartily thanked. There are many other memorable sites which will doubtless be considered hereafter. Among them is that of the houses in which John Jay and Washington Irving were born.

THE LATE MRS. WESTERVELT.

Mrs. John S. Westervelt, who died a few days ago at New Brighton, Staten Island, in her eighty-seventh year, was a daughter of Vice-President Tompkins, the war Governor of New York in 1812-14. Governor Tompkins is also remembered for his recommendation to the Legislature in 1817 that a day should be fixed for the abolition of slavery in the State, and in accordance with the Governor's suggestion, New York became a free State on the Fourth of July, 1827. His daughter, Mrs. Westervelt, until within a few days of her death retained in a very remarkable degree the vigor and activity of earlier years. Her interest in life was unabated, and her recollections of famous persons and noted events were so vivid that her conversation was at once instructive and delightful. She had outlived her contemporaries, but not her youthfulness of spirit, and her cheerfulness and courtesy were inexhaustible. During a large part of her long life she had lived upon Staten Island, and no resident was more deeply respected. Her husband was for some years Health Officer, and her son, the late Tompkins Westervelt, was County Judge, and an active and public-spirited citizen. The death of Mrs. Westervelt removes one of the few remaining visible links that bind this generation to that of the war in which the State was so active a scene, and her father so conspicuous an actor.

PERSONAL.

While Congressman Randall was a private in the Fifth City Cavalry of Philadelphia in 1861, he used his influence with the War Department so effectively that his Colonel, George H. Thomas, was appointed a Brigadier-General.

—One of the curiosities of Martha's Vineyard, Aunt Nancy Lee, has just died. She raised a number of bantam chickens, and trained them to do tricks. When they died she erected marble tombstones over their graves, and wrote verses to their memory.

—Occasionally some relic-seeking lunatic escapes from his keeper and commits depredations. A person of this class visited Springfield, Illinois, the other day, and mutilated the marble sarcophagus enclosed within the catacomb of the Lincoln monument. Reaching through the iron grating with a heavy cane, he knocked off a piece of the marble, raked it out, and carried it away. As this is only the last of a series of similar acts of vandalism, a stout iron fence is to be put around the monument to protect it.

—Albert F. Heard, who died March 26th, was the author of *The Russian Church and Russian Dissent*, published in 1887 by Messrs. Harper & Brothers. Mr. Heard was formerly Consul-General for Russia at Shanghai, and his work was a careful study, which was well received and highly commended by authorities both in this country and in England, where it was republished. Articles by Mr. Heard also appeared in Harper's Magazine for April, 1887, on "Russia of To-day," and May, 1888, on "Justice and Law in Russia."

—Miss Augusta M. Lowell, organist of the Church of the Incarnation in this city, is considered the leading woman organist in this country. She came to New York from California in 1884, studied with the best teachers, and has won her place by conscientious work. Miss Lowell is also a composer of songs.

—Joseph Catonio, a giant who served King Louis Philippe as porter in 1845, died recently in Rome, and left his huge body to the anatomical museum. His skeleton is to be prepared for exhibition.

—The gift of $30,000 to Rev. Dr. Theodore L. Cuyler, by the members of his late congregation in Brooklyn, was a graceful tribute to the man who had served his church so long and faithfully. Long pastorates are rare in these days of shifting congregations and fickle church associations, and make Dr. Cuyler's thirty years' stay with his people a subject of unusual congratulation.

—The deaths of Congressmen Kelley and Randall still leave a Pennsylvanian "the father of the House." He is Charles O'Neill, of the Second District of that State. O'Neill entered Congress with Randall in 1863, but dropped out for a term a few years later.

—The value placed on the life of the late Miss Brigham, President of Mount Holyoke College, at South Hadley, Massachusetts, by the railroad that killed her, is $4000, that sum having been paid her heirs by the company.

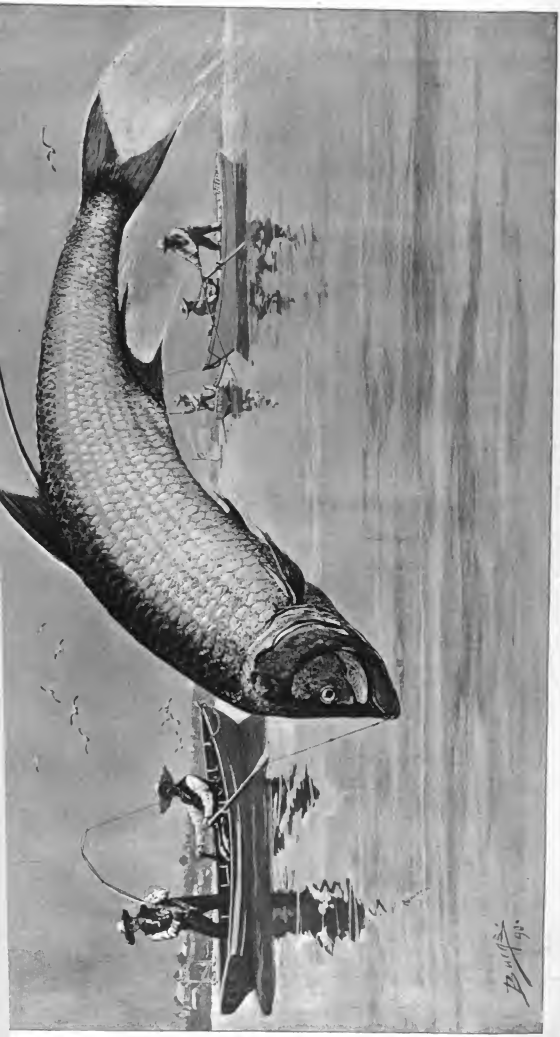
—Frank V. Dumond, at one time connected with the Art Department of Messrs. Harper & Brothers, has been in Paris for the past two years studying art. He has won several medals at the Julian Academy, where he has been a pupil, and his latest work is a picture of the Holy Family at a very scanty meal in Joseph's carpenter shop. The canvas is five by six feet, and contains three figures. It has been received at the Paris Salon with highest honor, and occupies a place on the line.

—The inventor of the Bloomer costume, Mrs. D. C. Bloomer, and her husband, a Council Bluffs (Iowa) lawyer, have just celebrated their golden wedding.

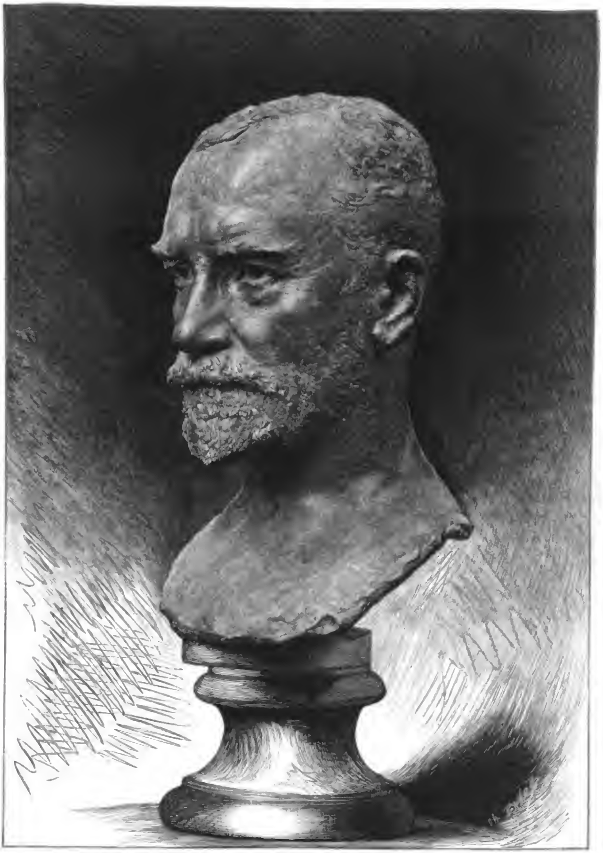
—There is one totally blind member of the British House of Commons. He is a Mr. McDonald, of Ireland, an intense Nationalist, but a man of retiring disposition and not much of an orator. His wife leads him to and from the Parliament House, and the devotion which exists between the couple is touching.

—William Galloway, who ran the first locomotive on the Baltimore and Ohio Railroad, and was called the oldest railroad engineer in the world, died recently in Baltimore, at the age of eighty years. He was retired in 1887 by the Baltimore and Ohio Company, for whom he had worked for over fifty years, never missing a trip or meeting with a serious accident. In all, he ran his engine over 1,500,000 miles.

—Emblems of mourning were recently placed on the public buildings of Athens, by order of the King, in honor of a poor boatman, named Chazes, who had just died at Missolonghi, and a noble funeral was given him at public expense. Chazes was eighty-seven years old, and was one of the few survivors of the Greek war of independence. He figured prominently in the defence of Missolonghi against overwhelming Turkish forces in 1825, and helped lead a sortie, by which one-third of the town's population cut their way through the investing lines and reached the mountains, while the other two-thirds perished. Chazes also became Byron's boatman when the poet made Missolonghi his head-quarters over sixty years ago, and spent many hours in ferrying him about the waters of the Cretohan lagoon. He formed an intense admiration for the poet, and, although not a literary man, at the time of his death he possessed all of Byron's works, and could recite many of his poems.



TARPON-FISHING.—Drawn by M. J. Burns.—[See Page 343.]



BUST OF LÉON BONNAT.—By Paul Dubois, in the Paris Salon (Champs Élysées), 1890. Engraved by Charles Baude.

A BUST OF LÉON BONNAT.

The Salon which opens on May-day will have at least one piece of statuary on which the eyes can rest with satisfaction, however many of a very different sort may stand in the great covered court-yard of the Palais de l'Industrie. This is the bust of the painter Léon-Joseph-Florentin Bonnat in his fifty-eighth year. It is by Paul Dubois, the sculptor of the "Florentine Singer of the Fifteenth Century"—bought, when shown in 1865, by Princess Mathilde Bonaparte—"Military Courage," and other statues for the tomb of General Lamoricière. A bronze copy of the "Military Courage" is in Baltimore, on Mount Vernon Square, where it was placed by Mr. W. T. Walters. Sculptor and sitter are members of the Institute, and both have remained faithful to the Salon instead of joining the seceders on the Champ de Mars. If Monsieur Bonnat has neared sixty, the sculptor has passed that age. We have, therefore, in this work a labor of love, in which one friend of a lifetime seeks to perpetuate the face of another in enduring bronze.

Monsieur Dubois has treated Bonnat as he treated the painter Henner, that is to say, with dignity and self-restraint. The close, scarce hair, the short-cropped beard, the ear fitting well to the head, give him the air of a soldier rather than a painter. Monsieur Bonnat comes from Bayonne, and is half a Spaniard. He passed four years in Rome, and made a great stir as long ago as 1864, when the Empress Eugénie bought his "Pilgrims in St. Peter's, Rome, at the Foot of the Statue of St. Peter." He is known here for portraits which are uncompromising in realism and for Italian genre pictures, small Italian girls, and such things. In Paris, however, the "Christ on the Cross," painted for the Palais de Justice, but now in Saint Nicholas des Champs, is still visited in order to continue the endless dispute whether Bonnat was right to sink the divinity of the Saviour, and portray him merely as a man agonizing in the death of a malefactor. The sculptor has suggested something of that pitilessness with which Bonnat paints every wart on the skin of those he portrays; something, too, of that indifference to the feelings of the religious shown in the tortured, changed face and body of his "Christ on the Cross." Ribera, whom Bonnat has painted, may well have had a good deal of influence on him, so far as subjects and their treatment are concerned.

The engraving of the bust by M. Charles Baude is hardly less happy than the sculpture itself. It is firm and yet supple, rendering particularly well the modelling round the eyes, and the sculptor's treatment of mustache and beard. Thus three artists unite in producing this capital little work of art, which is as severely simple as an antique, and as full of a noble taste for the "just enough." The parallel of careers between sculptor and sitter just alluded to extends to the second-class medals which were decreed to Dubois and Bonnat in 1867, to promotion of both to the Legion of Honor in the same year, and again to their promotion as officers of the Legion in 1874. It is therefore most fitting that the one should take the other—Bonnat painting Dubois, and Dubois modelling Bonnat—though the sculptor has also devoted himself to painting so conscientiously that he is a master in that field too, and might portray his friend in oils as well as clay.

WIND-FLOWERS.

Last night the wind, weary of whispering
Its silvery secrets in the sombre fir,
Found a grass couch upon a moonlit slope,
And drifted off into a pleasant sleep,
Leaving no ripple on the limpid pool.

When morning poured its flood of dancing gold
Upon the earth, the languid wind awoke,
Shook the bright dew-drop from the daffodil,
And wandered through the wood on happy wing.

Then on its couch glistened a rippling sea
Of shy anemones—wind syllables
Turned to starflowers upon April's breast.
When April disappears, they'll melt away,
Give up their flowery embodiment,
And over hill and pasture drift again
The sweet ethereal fancies of the wind.

R. K. MUNKITTRICK.

THE JOURNAL OF A FIRST-CABIN PASSENGER.

BY HARRIET LEWIS BRADLEY.

THE cabin was full of flowers, and one table held nothing but roses—roses in baskets and boxes and roses tied with white satin ribbons. Fastened to each bunch and box and basket was the name of Miss Rosalie Miller. A wandering band of German musicians were playing in the steerage, and from both upper and lower deck hats and handkerchiefs waved in answering good-by to the hats and handkerchiefs waving from one corner of the deck. As the beautiful ocean steamer glided past the light-houses and islands, the first-cabin passengers disappeared, and on the steerage deck the old women took out their knitting, the old men their pipes and packs of cards; the young gentleman in the white straw hat, who for various reasons was travelling in this humble way, unfolded the morning paper; the half-dozen babies dropped asleep in their mothers' arms; and Frieda, the little five-year-old Flemish girl, with a faded pink and blue handkerchief knotted under her chin, smiled a good-morning to Antoine, the deck steward, who leaned idly against the railing above. The first-cabin passengers had disappeared in walking costumes and straw hats and bonnets; they reappeared in ulsters and long cloaks, in soft felt hats and knitted hoods, and each passenger held a novel, with a passenger list tucked in as a book-mark. The different people arranged their steamer chairs into pleasant neighborhoods, and Antoine walked in and out with biscuits and lemonade, a napkin carelessly thrown over his arm, and an obliging smile on his round Flemish face. Antoine needed no passenger list. Being a deck steward of long experience, a glance at the passengers was sufficient to tell him each one's story. He knew to-day which was the commercial traveller, and which was the German count, which was the clergyman going abroad for his health, and which was the Harvard student. He knew that the six pretty young women, with their chairs in a row, were artists going to Munich; that the tall lady in a fur-lined cloak was a woman doctor; and that the lady with a French grammar open in her lap would soon be feeling very sea-sick. He knew also that the young girl who sat near her, and whose eyes still held the shadow of good-by tears, was Miss Rosalie Miller; but any one might have known this by reading the name printed on the back of her steamer chair. The Harvard student had known it at least half an hour, as well as the names of the six young women whose chairs stood in a row. Concerning young Mr. Julian Newton, however, nothing was yet known. He had no steamer chair, and his name only appeared on the passenger list as "and child" in the right-hand column, two lines removed from that of the German count.

Mr. Julian Newton was the youngest of the first-cabin passengers. He was travelling with his paint box, his kite, a portion of his library, and his doll Martha. It was his first voyage, and he was on his way to Paris. Rosalie was four times as old as Julian, who was five, and they met at noon on the fourth day out in the chocolate and rose colored cabin, with its six port-hole windows and its rows of white lilies painted on a background of pale green and gold. The first three days were days of warm breezes and glorious sunsets. The steerage ball had been opened every afternoon by a heavy-bearded man, who looked like an agreeable pirate, and who always danced with a young woman in a sprigged muslin dress. On the upper deck the passengers had become sufficiently acquainted to smile slightly at each other, and the Count, who was musical, played daily on his zither, and spoke German with the Harvard student. On the fourth day there came a change; the waves tossed themselves up into heaps of foam, the ship danced violently over the water, the heavy-bearded man declared that was dancing enough for one day and postponed the afternoon ball, the steerage belle became as limp in her feelings as the frills on her sprigged muslin dress, and those of the first-cabin passengers who were able to be out of their berths covered themselves warmly, talked little, and nibbled hard bread steadily.

Rosalie Miller was in one corner of the deck cabin, and in the opposite corner lay the lady with the French grammar. Now and then she opened her eyes and the book at the same time, and took a hasty look at the page headed "Material for Conversation." She had promised herself to learn six sentences a day, and she intended to learn them whether the sea ran high or low. Rosalie also held a book; it was one of her parting presents, and she had two more exactly like it in her state-room. There was a printed page and a blank page for every day of the voyage, and there was also a chart showing the ship's pathway across the Atlantic.

"How are you feeling now, Aunt Sarah?" said Rosalie to the lady in the corner.

"Worse, if anything," said the lady.

"I think," continued Rosalie, "we shall probably meet with a great storm on the seventh day. We may be shipwrecked. In this book the verse for the seventh day speaks of storms and danger."

The lady said she "didn't care and that the sooner they were shipwrecked the better."

Through the doorway of the cabin one could see the waves and the sky, and now and then a laugh or a snatch of talk floated in through the port-hole windows.

"When we get to Flushing," said the Harvard student to the six pretty young women, whose chairs stood in a row, "we shall take a pilot on board, and his eyes will be black. If they are not black, I will give you each a box of chocolate."

"But we *know* that his eyes will be blue," said the six pretty young women all at once. "We are *sure* of it. If his eyes are not blue, we will each give you a sketch."

In the main cabin below, the Count was playing on his zither, a faint sound of singing came from the distant steerage, and the ship plunged onward through the endless stretch of white-capped waves.

"If the seventh day is to be a storm," said Rosalie, "then on the sixth day we may expect a great calm. Here is the verse for the sixth day:

> "There is a point in the great centre of the cyclone's force,
> A silence at its secret source;
> A little child might slumber undisturbed
> Without the ruffle of one fairy curl
> In that strange central calm amid the mighty whirl.'"

It was at this moment that a bundle of shawls slipped on to the floor from the third corner of the cabin, and young Mr. Julian Newton arose from his noonday nap. Looking gravely around, he said, "Tell me about the water-spout."

"That was the other lady," said Rosalie's aunt, feebly. "I am the lady who tells you about the dish ran away with the spoon."

"I want the water-spout," said Julian.

Now both Rosalie and Rosalie's aunt had not thought of a water-spout for years, not since Rosalie was studying physical geography; and even at that time they had not learned it as well as "the dish ran away with the spoon" a great many years before.

"I will make you a picture," said the girl, taking Julian's slate from the cabin floor. "See, here is New York, where we live. See all the high houses and the cars going by the third-story windows. And here is a very big church, and some queer roofs, and a crooked street; that's Antwerp, where we are going. Now the place between is the ocean. See the waves. And here's the ship, and here is a round-faced little boy in a gray coat with a pointed hood; that is Julian. Isn't this a nice picture?" And Rosalie, putting down the pencil, took the two plump little hands in her own.

"Yes, I think so," said Julian; "it's a nice picture, only it's all wrong. I don't live in New York. I live in Salem, and I'm going to Paris. Tell me about a water-spout."

"You tell me," said Rosalie.

Julian went to the bundle of shawls, out of which he first pulled Martha, and then a book. The doll had broken her neck, and one eye was gone, but the expression of the other one plainly showed that Martha intended to make the best of her misfortunes.

"The water-spout is in here somewhere," said Julian, turning the leaves of the book, which had lost its cover, and was somewhat broken in its binding. "You can read about it if you don't know it."

He had climbed into Rosalie's corner, and one pink cheek rested against the girl's shoulder. "A water-spout is something like the mast of a ship," explained the child, "only it's longer. It comes out of the sea and goes into the sky, and it's all water, and you shoot at it."

"That's when a ship comes too near," said Rosalie, who, having found the picture, was taking a hasty look at the accompanying text. "A water-spout is very dangerous; it could swallow a ship as easily as a pussy-cat could swallow a mouse. That is the reason the sailors shoot at it; a cannon-ball breaks it in the middle."

"I've got a cannon at home," said Julian; "only it is a little one. Are there any pictures in your book?"

"There's a place to make them," said Rosalie, "a place for every day of the voyage, but the book is really meant to keep a journal in. Do you know what that is?"

"My papa takes real flowers and puts them in a book sometimes, and when he takes them out they are flat."

"Yes," said Rosalie, "that is like a journal, only you are not old enough to understand why." The girl placed a pen in the child's hand, and guided the little fingers over the lines and the curves of the letters she had just formed on the title-page.

Sea Journal of Julian Newton.
Outward bound.

"Make the letters nice and black," she said. "Now the book is yours, and every day we will write in it. It is interesting to keep a journal, because you like to read it afterward. Perhaps some day yours will become very valuable. Valuable means that it would sell for lots of money. If you should grow up to be a great man, every one would want to see the sea journal kept by Julian Newton when he was five years old."

"Precious means lots of money too," said Julian. "I call Martha 'my precious.'" And he gave the one-eyed treasure a dangerous hug, considering the state of her neck.

"If you know as much as that," said Rosalie, "I think you can understand why a journal is like a pressed flower. Suppose you and Martha and I were to spend a long, beautiful week in the woods, and every day we should place a flower between the pages of a book, and beneath each flower we should write where it grew; and then, years after, when Martha had lost her head altogether, and you and I had packed a good many new ideas into ours, we should open the book again, wouldn't the dried flowers make us hear the birds sing in the woods we knew so long ago?"

"Yes, I think so," said Julian, gravely. "There are some woods back of my grandmother's house."

"Now, we are on the ocean together," continued Rosalie—"you and Martha and I; we haven't any flowers to press, but every day we will write our thoughts in this book, and then, a good many years from now, we can read what we have written, and each page will make us think of the ocean again and the sailors, and the big red star on the smoke-stack, and the little red star on the cups and saucers."

"And on the soup," said Julian. "I saw it myself."

"And at the end of the voyage," said Rosalie, "when we reach Antwerp, you can send your journal home to your dearest friend. That is what every one does who crosses the Atlantic."

"I shall send mine to Ellen," said Julian. "She's my grandmamma's cook. She came to see me because I was going away, and she felt dreadfully; she cried and cried, and I shall say, 'Dear Ellen, I didn't fall into the water.'"

"Now I am *going* to begin," said Rosalie.

"Dear Ellen, I didn't fall into the water," said Julian. "Write that."

"I will write the first four days my way," said Rosalie; "after that you can tell me what to say."

Rosalie wrote: "Left New York at seven this morning. Sixty cabin passengers, one child. I am the child. A great many people in the steerage."

"The steerage, Julian dear," explained Rosalie's aunt from the corner, "is where you look down and see them dance. They are all poor people, and don't pay as much as we do, and so they are in a different place."

"I know all about the steerage," said Julian. "That's where the man with a straw hat lives. I love that man. He laughs with his eyes. I 'most fell into that place once; I was leaning too hard against the rail."

"I'll write that down," said Rosalie. "'In the steerage is a man with a straw hat. He laughs with his eyes. I love him.'"

"I love the little girl too," said Julian. "I threw her an orange, and she threw me a kiss. First she showed her orange to the steerage man, and he smiled at me a very pleasant smile."

Antoine came in with a tray which he placed on the table by Rosalie's aunt, and he asked if he should bring madame stewed prunes or baked apples.

"Now, it's time to write something about your health," said Rosalie. "People always write whether they feel well, and if they think they are going to be sea-sick, and if they have a good appetite."

"Children always have," said Rosalie's aunt. "I wish I could be a child for the next ten days." She sipped a little of the soup which Antoine had placed before her, said that everything tasted exactly alike, took a hasty look into the French grammar, and closed her eyes not to open them again until the steward reappeared with the baked apples.

"I had pink ice-cream Sunday night," said Julian, "up here on this little table."

Rosalie wrote: "*Second day out.*—Feel well; do not think I shall be sea-sick. Appetite good. Had some strawberry ice-cream. Passed a ship a long way off."

"I'll make the other two days very short," said the girl. "It's so stupid to write about things that are over. For Monday I will write, 'Same as yesterday, only no ice-cream'; and for to-day, 'Met Rosalie, who gave me this book, which is going to be very valuable.' Now I have showed you how to keep a journal, and the rest of the voyage you must keep it yourself, and that will be a great deal better."

"Yes, I think so," said Julian. And this is the way he kept it:

"*Fifth day out.*—I feel very well, and I sleep very well, and I eat very well. A man called me a sweet-potato plant. The waves are covered with white. It looks like a great many white birds on the water. I feel sleepy. Rosalie says it's the sea air. Everybody feels sleepy.

"*Sixth day out.*—The men in the steerage stood up and sang very loud, and the name of the song was, 'When the Swallows Homeward Fly.' The steerage man didn't sang, he reads and writes all the time, and he isn't sea-sick. I feel very well. Rosalie's aunt feels very bad. I say good-night to her in French; she told me how.

"*Seventh day out.*—It is cold. Saw a ship. The man who called me a sweet-potato plant showed it to me. He's a funny man. When it isn't his vacation he goes to a school called Harvard College. Once we were alone at the end of this ship, and the sun made lots of colors in the water, where the waves were white on top. The Harvard man called them rainbows, and he said, 'I am going to drop a gold ring into the sea.' It looked pretty going down. He said the ring was a secret which the sea would never tell, and he was very sad. I like him, but not so much as the steerage man. I asked him if the ring was valuable. He said, 'It was once.' Rosalie says that sometimes happens to rings. She is sorry for him, and so am I.

"*Eighth day out.*—There's going to be a concert. It is for all the passengers; only the steerage people can't go, because they are poor. It costs fifty cents to get in. A lady made a picture of me, on a big piece of paper. My papa bought it. The money is for a sick sailor. I wanted to give it to the steerage man, but my papa thought it would hurt his feelings, and that is a worse hurt than to shut your fingers in the crack of a door.

"*Ninth day out.*—This is Sunday. It is getting monotonous. That is Rosalie's aunt's word. She says it all the time. It means the same as prunes and bread and milk for supper, and never anything else. The ship is all alone in the middle of a great blue sea, and we are going very fast. In the cabin where we eat there is a flag hanging over the piano. They put it there last night for the concert. It is the American flag. Rosalie told me that once there was an American in a foreign country, where they spoke another way from I' way, and they were going to shoot him, because they thought he was bad, and he didn't know how to tell them he wasn't, and just as they were about to shoot, another American came flying on horseback, and threw the American flag around the first man, and said to the people, 'Shoot if you dare!' and nobody dared. This is a true story. Rosalie has a friend who is some relation to the first man. She says it is a beautiful story, and I think so too. She said it was because the Americans were so brave that the other men didn't dare to hurt their flag. I shall be brave because I am an American. To-day we saw a good many sails.

"*Tenth day out.*—Last night I had some pink ice-cream, but no one will have any more because it is all gone. The steward says so. The oranges are 'most gone. Perhaps we shall reach land to-morrow, and then this journal will be all written. That is, the words will be written. Rosalie says that people sometimes write with their thoughts between the lines, and you can't see the writing. I asked her if she had written anything with her thoughts between these lines, and she said she wasn't quite sure."

It was the eleventh day out, and a gray chilly morning. The passengers, first cabin, second cabin, and steerage, were peering eagerly through the mist that they might not lose the first glimpse of land. Soon they saw a dim spot in the distance, then a few lonely islands, then a good piece of land with houses upon it. The blackness of the water changed into a strange green, queer ships were tossing on the waves, and this was the beginning of the English Channel. The passengers hastily finished their steamer letters and repacked their steamer trunks, and at this busy moment Julian Newton quietly dropped his unfinished sea journal on to the steerage deck. No one noticed him, and the book fell exactly where the child intended it should, at the feet of the steerage man.

On either side of the water were long stretches of land, over which hung low-lying clouds, gray clouds showing now and then a touch of rose color through the rifts. Presently the steamer reached Flushing, the first Dutch town, and the pilot-boat came across the water.

"The pilot's eyes are black," said the Harvard student, who was looking through a glass. "I knew they would be."

The six pretty young women laughed and shook their heads, and said blue eyes often looked black at a distance. When the pilot came on board he was found to have eyes of two colors—one black and one blue. On this account the Harvard student gave only three boxes of chocolate, and received in turn only three sketches.

Rows of prim trees grew on the water's edge, rows of red-roofed picture-book houses appeared among the trees; rows of windmills stood up against the sky. The steamer had entered the river Schelde, and at the end of the river a high church tower looked down upon the quaint roofs of Antwerp. The Harvard student grew very merry. He had torn his sea hat into six pieces, one for each of the six pretty young women, who returned this delicate attention by giving him six hairs from their six pretty heads. They little knew how sad the Harvard student could be, and that four days before he had buried a gold ring in the middle of the Atlantic. The pilot with the two-colored eyes brought the steamer safely into port, and the sixty first-cabin passengers sat that night around a flower-decked table, and ate their farewell dinner. Going through the hotel court-yard on her way to this dinner, Rosalie Miller saw Julian seated before a bowl of bread and milk in one of the side rooms.

"I am eating my supper," said the child. "The steerage man was here, and he brought back the book. I gave it to him. I thought he might sell it when it got valuable. He said I was very kind, and he had enjoyed reading it: those were his words. I asked him if he could read between lines, where there wasn't any writing. He said, 'Sometimes,' and his eyes laughed."

The girl's color deepened. She had opened the book, and saw that a page had been added to those from her own hand.

"*Eleventh day out.*—In sight of Antwerp.

"Three of us drifted over the sea,
Into unknown ways that God shall plan.
Two were Julian and Rosalie,
The third was only the steerage man.

"Two of us wrote in a book to keep,
With childlike words and a girlish hand,
Something of days on the waters deep,
As on we sped to a foreign land.

"One of us reading the pages said,
'A wish I have for us happy three:
Forever be we as safely led
As we now come gayly in from sea!'"

The writing was very familiar. In fact, she had in her steamer trunk a seventeen-paged letter from the same hand—a letter which she had torn through the middle on the first day out, pinned together on the second, and read every day since. Some one entered from the little court-yard and took the seat on the other side of Julian, who had fallen half asleep over his bread and milk.

"Two were Julian and Rosalie,
The third was only a steerage man,"

said the new-comer, by way of beginning conversation. But what followed, although interesting in itself, is in no way connected with this journal of a first-cabin passenger.

THE FOOT-PATH.

ALONG the edges of the wood
The foot-path winds an umber streak,
Where oak and beech dropped sylvan food
For squirrel tooth and partridge beak.

The strawberry grew beside the way,
The John's-wort set its star of gold,
The mullein reared its pillar gray,
And laurel leaves their scrolls unrolled.

Cameos of sand the mole threw up,
The woodchuck's cavern yawned beside,
And the streaked honeysuckle's cup
Hung where the stream through pebbles pried.

The path then sought a meadowy dell
Full of soft grass where bird-nests laid,
And a brook tinkled like a bell,
And cedars reared their pyramid.

Dipping and twisting then it went
Along the banks replete with nooks,
Down to the marge, then headlong bent,
Winding as wound the grassy crooks.

Along the borders of the field,
Thence on it ran through hazels dense,
Where their balloons the thistles wheeled,
And the ripe blackberries wreathed the fence.

Through the broad meadow next it went,
Shining with many a spider thread,
Where herds were grouped beneath the tent
The maple cool and breezy spread.

It sought the orchard slope at last,
Where red and golden apples lay;
Over the upland's crest it passed,
And in the woodland died away.

PROFESSOR LANGHORNE'S REFORM.

PROFESSOR LANGHORNE, a very serious philosopher, recently set forth before a distinguished company in this city what he called a new theory or system of platform lectures. His proposition was to make it easy for any lady or gentleman to become a lecturer, not with a view to the good and comfort of society, but for the financial benefit of the aforesaid lady or gentleman. The immediate provocation to this is the alleged fact that lecturers are scarce—there being, it appears, not more than four or five hundred now available, with only two or three European cities to be heard from. It is evident that if the lecturer crop of Europe should fail in the near future, and we should not in the mean time have produced for ourselves an ample supply, the lecture bureaux will be ruined, and the professor desires to avert that calamity.

Herr Langhorne pretends to have derived his new theory from observation. He has heard, he says, a great many lectures, and has been more amused by them than he ever was in his own country even by Schultz and Müller in the comic papers. But after he had listened to forty or fifty a discovery flashed upon his mind, by which he means, we suppose, that a case of unconscious cerebration reached a climax at that moment. He had been, it appears, particularly pleased by the anecdotes that were used to illustrate the different points in the lectures—so much pleased that he laughed boisterously and for a great while entirely failed to observe that the anecdotes did not illustrate in the least the point at which they were brought in, nor, in fact, any other point. As he reasoned upon this, it led up to his discovery. He found, as he says, that a lecturer in this country does not possess himself of a theme, and laboriously and logically elaborate a lecture therefrom, as is done in Teufelsdröckhdom, permitting himself the little relief of an anecdote or a merry tale at the hard points to get the audience easily over these; but, on the contrary, he gets together a dozen or more anecdotes or merry tales, and has a thread of pretended discourse upon which to "work them off" upon his hearers, the merry tales themselves being the substance, and not the ornaments of the lecture.

Herr Langhorne himself worked in a lecture by way of demonstrating his theory. His lecture was upon the art of portrait-painting—a theme suggested by a friend in the audience (with whom he had had a previous understanding). He pointed out that the first portraits were painted on glass—and apparently on looking-glass—the reasons being that looking-glasses afforded the only smooth surfaces produced by nature and accessible to primitive man, and that the subject to be painted had only to place himself in front of the glass, and remain there while the painter made permanent with his colors the reflection that appeared.

This was illustrated by a story of four gentlemen who played poker together. One of them was a gentleman from Kentucky; another was a man with one eye. They had played for an hour or so, and the Kentuckian observed strange conduct on the part of the aces. He watched this for a while in silence, and then he raised his voice in mild and moderate expostulation. He thought some one was cheating, as he was from Kentucky, he did not want to depart from the chivalric standards of his education, and would not make any personal reflections or name names; but if the fellow did it again, he would shoot his other eye out.

The remainder of the history of the art of portrait-painting was developed in about a dozen lines, and was illustrated by a story of a man who was riding around in an ox-cart, when the oxen ran away with him. They went through newly cleared land, and the cart collided with constant stumps at every step, until a worse collision than any other threw the passenger out as from a catapult. Sympathetic people gathered about to know if he was hurt. He said he was not hurt, and that if ever he went to Gehenna, he hoped he might go in an ox-cart, because he should be so glad when he got there.

This is, of course, not the whole lecture on the art of portrait-painting, but is a good outline account of it. It would not be fair to report the whole of it, as the professor perhaps expects to have it copyrighted, and maybe go around the country with it next winter. If he does, his audiences will have their digestion improved, even if at last they do not know much more about portrait-painting than they did at first.

Every person acquainted with the institutions of this country will perceive that the professor has mingled unrelated things a little, and has confounded platform lectures with after-dinner speeches. It is very true that some of our speakers in this sphere indulge largely in illustration by funny stories—so largely that their speeches are often a mere series of illustrations with nothing to illustrate. There are good reasons for this. An orator, indeed, needs an occasion and a theme, and it requires a man with the physical and mental vigor of Daniel Webster to be able to eat one of Delmonico's dinners and make a great speech after it; and if a speech is not great, it appears it must be funny. There is no middle ground. If a speaker cannot charm our ears with fine periods or lift up our souls with great thoughts, he must tickle our fancies with comic conceits till our diaphragms respond with the short convulsions of laughter. If the people cannot have Cicero, they want a buffoon—whose buffoonery must be polite, of course. The after-dinner oratory is, upon the whole, a happy compromise, in which reason is permitted to have its little place, while we insist upon the cap and bells; and whereas the kings of old had their jokers to keep them in heart all through dinner, we take our jokes formally as a separate course at the end.

It may be observed that it is a trifle impertinent for any foreigner to pretend to teach here an art based upon Langhorne's discovery, for is it not obvious that he could not have discovered this art here unless it already existed? And is he not an innocent witness against himself when he says that he heard forty or fifty lectures or speeches before he "caught on"? Does not this alone prove the skill of our orators in this art? We can assure Langhorne that we are not in need of his instruction. We have at least twenty after-dinner orators in this city alone who can make brilliant and delightful after-dinner speeches without any ideas at all—nay, even without what Langhorne calls a thread of pretended discourse, who can simply run together half a dozen stories, and pretty old stories too, and hinging one upon another, make an address that will "set the table on a roar," and keep it so for half an hour, and when the brilliant speaker has taken his seat you cannot recall one sentence of what he has said aside from his stories.

But while the professor cannot teach us this art, the fact that he has found it out is significant for the orators. It implies either that they are growing clumsy in practice or that their oratorical dress has become worn too thin to cover the nakedness of their scheme. Perhaps it will be well for them to brace up and change their style a little, because Langhorne's discovery is in the nature of an exposure, and people may guy a speaker a little when he comes out with the familiar formula, "That reminds me of a story." Indeed, it may prove that Langhorne, reducing things to the absurd point, has unconsciously touched a button which will call up a great reform in after-dinner oratory.

THE KING OF GAME FISH.

TEN years ago the salmon was the acknowledged king of game fish. In the eyes of epicures he may still maintain his pre-eminence, but as a game fish he has been dethroned by the tarpon of the Gulf of Mexico. It would almost seem that nature had in his case devoted herself to the production of a perfect finned athlete. In beauty of shape and color he is matchless. In size he closely approaches the limit of possible capture with rod and line. In strength and agility he easily distances all others of his kind. Even the unimpressionable scientific persons, who usually affix formidable Latin names to members of the animal kingdom without regard to the fitness of things, recognized in the tarpon an unusually meritorious subject. They named him "the large-eyed" (*Megalops atlanticus*), even making an unwonted excursion into the Greek in their enthusiasm, and appropriating a term hitherto sacred to mythological divinities of high Olympus.

Add to these charms of person a desperate kind of pluck that carries him through a two-hours' fight with the most skilful fisherman, and you have a game fish wellnigh ideal in his qualities. His one fault—and it must be admitted that 'tis a serious one—is that he rarely takes the bait.

But before touching upon what may be termed his moral and intellectual qualities, it is well, perhaps, to describe his person a little more in detail. Fancy, if you can, an animated bar of silver some six feet long and fourteen to twenty inches wide; let its gracefully rounded upper edge be almost blue-black, like some shades of oxidized silver; let this shade off into wonderful tints of silvery white, with gold tints here and there on the broadsides. The scales are polygonal, with the angles rounded off somewhat—large horny disks they are, wider than this printed column—and they cover their owner from head to tail, as it were with armor of proof. The eye is as large, seemingly, as that of an ox, and very beautiful as well as fierce when the fish is fighting for his life. The mouth is a huge receptacle, large enough, when wide open, to take in a man's head, and guarded at the sides by large flat shear-like plates, whose cutting powers have been proved by the destruction of many a fisherman's tackle along the Gulf coast of Florida.

Such, in general terms, is this superb inhabitant of our semi-tropical waters. He is found all along the Gulf coast, and under exceptionally favorable circumstances stray specimens have wandered as far north as the coast of New Jersey. He is, however, essentially a tropical fish, and his excursions north of the twenty-sixth parallel of latitude are probably due to inexperience and ignorance of the rapid northward trend of the Gulf Stream. To the westward along the Gulf coast this fish has been known as tarpum, *grande écaille*, silver-king, and by other names peculiar to certain localities. Tarpon is now, however, practically accepted as the popular name, but we believe that its origin has not yet been authoritatively determined.

The tarpon does not often display his glories to human eyes until he feels the prick of spear or hook. The writer once saw a fine specimen chasing flying-fish, with enormous leaps, just off the coast of Florida, but such sights appear to be rare. Generally the dorsal fin is barely raised above the surface, there is a dull gleam of oxidized silver, a huge tail makes whirlpools for an instant, and megalops returns to his feeding-ground on the bottom. Fishermen, indeed, have no love for a jumping fish, for, they say, he seldom takes the bait. Standing on the bow of a sail-boat gliding over the extensive shallows that are the favorite habitat of the tarpon, one may see the great fish by hundreds, or rather one may see the rocket-like cloud of mud that each one stirs up as he takes fright and rushes away into the distance.

Of course such a monster bids defiance to nets, and, until a few years ago, spears or grains were the only known means of capture. At length a fish was accidently taken with a rod, and thereupon Mr. W. H. Wood, of New York, set himself to study the habits of the creature, with a view to adding his name to the list of Florida fishes.

After long experiment he found that, with the exercise of preternatural patience, the fisherman who uses fresh mullet as a bait may hope for occasional bites, with a fair chance of a strike if he keeps cool. It is evident that such a large and powerful fish must have a ravenous appetite, and for this reason it is suspected that the best bait has not yet been discovered. Be this as it may, fresh mullet is the only bait that has thus far been successful.

Tarpons are usually taken in shallow water from an anchored boat. A 10/0 Dublin bend ringed Limerick hook is a favorite size, with about two hundred yards of 15-thread linen line. A rod seven or eight feet long is a good size, and the best snell as yet devised is a rather loosely laid strand of cotton line, stained some dark color, that will not show under water. This is chosen because the bait is likely to be taken by a shark, in which case the snell is promptly bitten apart, and the hook alone is lost; whereas if a chain were used the shark might carry away everything. Moreover, the cotton threads are less likely to alarm the tarpon, who can be securely hooked only when he completely gorges the bait.

It is no uncommon thing for a fisherman to sit for a week or more without a bite, but the chances improve as the season advances, and in May and June fishermen who venture to face the heat may be reasonably sure of better luck. When securely hooked the tarpon displays his remarkable qualities to the full extent. He begins a series of energetic leaps and rushes that test to the uttermost the skill, nerve, and endurance of the angler and the quality of his tackle. The illustration on page 340 shows the exciting moment when the fish, feeling the barbed hook in his gullet, throws himself out of water, and begins a succession of gymnastic feats that last from half an hour to two hours, or more. It is the unwritten law of the tarpon grounds that when a fish is hooked every one must keep out of the way. Our fisherman, accordingly, may count upon a fair field and no favor, and should he succeed in landing his prey his name will be added to the roll of honor that is kept in the queer old hotel at Punta Rasa, the head-quarters for tarpon-fishing on the Gulf Coast.

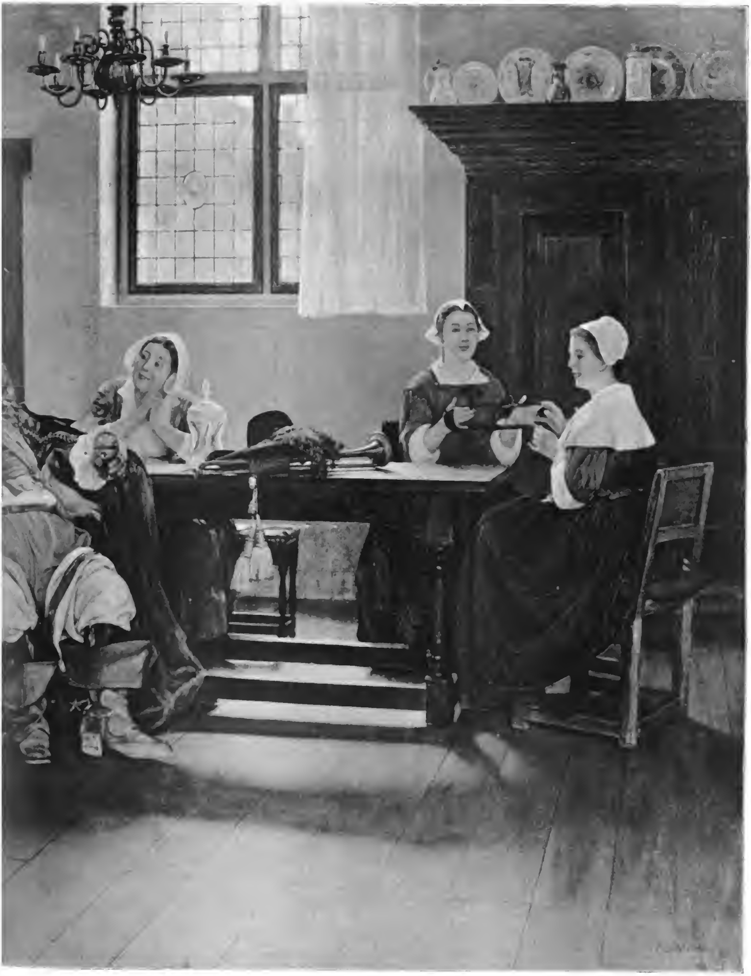
ANTONY VAN CORLEAR, THE TRUMPETER.

Google



-From the Painting by F. D. Millet, N.A.—[See Page 346.]

ANTONY VAN CORLEAR,

THE TRUMPETER OF NEW AMSTERDAM.

Nathaniel Hawthorne as the historiographer of old Puritan life in New England goes hand in hand with Washington Irving as the chronicler of the children of New Amsterdam. Widely different in quality of genius, each suited the types of character and national development which fell to him to portray. Each used fiction as his medium, but the essential color and feeling of truth shone out with a more vivid realism under the creative touch of fancy than can be found in more veracious chronicles.

From the sombre and powerful light of Hawthorne's imagination, one turns with a sense of pleasant rest to the airy and gracious humor of Irving, the historian of New Amsterdam, the minstrel who sings in limpid and musical prose the quaint legends of our American Rhine, and has embalmed them, as in amber, in a medium of mellowness and sunshine. We see rising before the mind's eye the solid and ponderous old Dutch burgher and his no less solid vrouw, with their plump and chubby daughters; the little gabled houses, with their tiled roofs and mighty fireplaces within, the long pipes, the sedate faces, the vast breeches and Brobdingnagian doublets; and a procession of curious and amusing personages, of which Wilhelmus Kieft, the "Testy," Peter Stuyvesant, the "Headstrong," and Antony Van Corlear, the "Trumpeter," are among the most shining exemplars.

Mr Frank Millet, the artist, has made the last-named worthy the subject of a painting now on exhibition at the Academy of Design, which is presented in a double-page drawing in the present issue of the Weekly. The conception of Mr. Millet is so vigorous, unctuous, and genial that it will at once inspire in the spectator a desire to know something more of the character of this personage, as depicted in the pages of his sole biographer, Diedrich Knickerbocker.

"Now it came to pass," narrates our veracious chronicler, "that about this time" (that is to say, in the days of William the Testy) "there lived in the Manhattoes a jolly, robustious trumpeter named Antony Van Corlear, famous for his long wind; and who, as the story goes, could twang so potently upon his instrument that the effect upon all within hearing was like that ascribed to the Scotch bagpipe when it sings right lustily the nose.

"The sounder of brass was, moreover, a usty bachelor, with a pleasant burly visage, long nose, and huge whiskers. He had his ittle *bouwerie*, or retreat in the country, where e led a roistering life, giving dances to the vives and daughters of the burghers of the Manhattoes, insomuch that he became a prodigious favorite with all the women, young and old. He is said to have been the first to collect the famous toll levied on the fair sex it Kissing Bridge, on the highway to Hellgate.

"To this sturdy bachelor the eyes of all he women were turned in this time of darkess and peril as the very man to second and arry out the plans of the Governor. A kind of petticoat council was forthwith held at he Government House, at which the Governor's lady presided; and this lady, as has een hinted, being all-potent with the Governor, the result of these councils was the levation of Antony the Trumpeter to the ost of commandant of windmills and chamion of New Amsterdam.

"The city being thus fortified and garrimed, it would have done one's heart good o see the Governor snapping his fingers and idgeting with delight as the trumpeter strutd up and down the ramparts, twanging deance to the whole Yankee race, as does a odern editor to all the principalities and owers on the other side of the Atlantic. In e hands of Antony Van Corlear this windy strument seemed to him as potent as the rn of the paladin Astolpho, or even the ore classic horn of Alecto; nay, he had alost the temerity to compare it with the ra's horn celebrated in Holy Writ, at the ry sound of which the walls of Jericho fell own."

Of the deeds of the redoubtable Antony e worthy Diedrich Knickerbocker has writn in full—how the voluminous breeches of e burghers quivered with the agitation of e insides thereof when Anthony departed any mission of war or diplomacy, for they ized him much as the comforter of their ives and daughters in time of need; how the days of Peter Stuyvesant he went to ve defiance to the Yankees, "twanging his umpet like a very devil . . . ogling and winkg at the women, and making aerial windills from the end of his nose at their husnds, and stopping occasionally in the vilges to eat pumpkin pies, dance at country lics, and bundle with the Yankee lasses"; d how he did many other things notable the Dutch Had of New Amsterdam.

Mr. Millet has seized Irving's jolly and umous characterization with great spirit d sympathy. Antony the Trumpeter sits a table, pipe and glass in hand, amidst a vy of vrouws old and young. His rubind face is alight with a broad smile of fun l amorousness, as he tells some story of unchausen adventure, or perchance listens the retort of the merry lass who seems to the special object of his admiration. The ghing devil in the trumpeter's eye, and loose, pleasure-loving mouth under the [illegible] tell the whole story. The famous trumpet lies on the table, gayly bedecked with love-tokens, and the rich crimson and yellow slashed doublet and breeches of Antony in their warmth of color contrast with the more subdued tones of the old Dutch apartment. The youthful vrouw who seems to be the trumpeter's special *vis-à-vis* has her back turned to the spectator, but the glimpse of the profile barely shown conveys with irresistible force a spirit of arch and brilliant mockery, which furthermore irradiates every portion of the body in its pose and handling. The other lasses sit or stand with smiling faces, and mamma beams on the scene from the corner of the table. As a foil to all this rollicking merriment *paterfamilias* sits in the corner of the hearth as stolid as a stone, and dreaming amidst the smoke of his long pipe. The artist has heightened the effect of his work by several other subtle contrasts, which will quickly suggest themselves to a keen observer. The picture is so strong, sympathetic, and lusty as a piece of characterization, and relates so closely to the history of New York under the quaintest conditions of its early life, that it should become a public possession. It would sadly belie its true worth to pass into private hands. It is such a canvas as the trustees of the Metropolitan Museum should secure. For, however important it may be to have foreign masterpieces, it is still more needful to hang representative American work, specially when it so charmingly reflects interesting phases of national life or history.

STRAUSS AND VIENNESE DANCE MUSIC.

An amusing story, which has the additional merit of being literally true, is related of an old lady in Vienna, whose greatest joy in life had always been to listen to the waltzes of Strauss as played by his orchestra, and who ordained in her last will and testament that a Strauss waltz should be played at her funeral, for which each member of the orchestra was to receive a ducat. The heirs objected at first, on religious grounds, to carry out this plan, but the provisions of the will were distinct, and could not be violated without endangering their own claims; so Strauss and his musicians were engaged and placed in a circle around the grave, and while the coffin was being lowered they played the favorite waltz of their late lamented admirer.

This story is vouched for by Strauss himself, and it shows most vividly what a firm hold the music of the Strauss family has taken on the Viennese mind. Indeed, it is hardly an exaggeration to say that in the minds of most people Strauss and Vienna are almost synonymous terms. No other city has ever had a hero so thoroughly identified with itself. We can think of Berlin without Bismarck, of London without Dickens, of Paris without Victor Hugo; but I defy any one to think of Vienna without at the same time conjuring up the name of Strauss, by what psychologists call an inseparable association of ideas.

This popularity of the name Strauss in Vienna—and out of Vienna—is by no means of recent growth, for the elder Johann Strauss, who first made the name famous in the annals of dance music, was born in 1804, five years before Mendelssohn and Chopin, and nine years before Wagner. He had the advantage of being for some years a member of the orchestra of Lanner, who is generally considered the originator of the Viennese waltz, although, in truth, the germs of it may be found in the valses of Schubert. Soon, however, Strauss made up an orchestra of his own, and not only took the Viennese by storm, by the inimitable vivacity of his playing and conducting, but conceived the bold and quite novel plan of taking his orchestra and travelling with it throughout Europe, giving everywhere concerts in which Viennese dance music was mingled with classical pieces. Their success was immense, and Strauss soon found himself famous.

But Johann Strauss, Sen., was, after all, only the beginning of the Strauss dynasty, who, great as was his fame and still is, was destined to be eclipsed by his three sons, all of whom have won distinction as composers of dance music.

Of these three sons of Johann Strauss, the oldest—Johann, the "Waltz King"—is the best known, because he has not only composed over five hundred pieces of dance music, but also a series of operettas which are considered by competent judges to be superior, from a musical point of view, to those of Offenbach, Lecocq, Suppe, and Sullivan. The second son, Joseph, also wrote a number of meritorious pieces, and the youngest, Edward, has composed more than two hundred, many of which have enjoyed immense popularity. Johann Strauss, Jun., after his father's death, took his famous orchestra and continued the tours throughout Europe. During the great Gilmore Jubilee he even came to America, but without his orchestra, which will this summer be heard for the first time in America, under the direction of Edward Strauss, who took charge of it about twenty years ago, when Johann began devoting himself to the composition of operettas. It is this orchestra which plays at the court balls in Vienna; which, as we read in the Supplement to Grove's *Dictionary of Music and Musicians*, "created a furor in London" in 1885, and which the Berlin *Boersen Courier* declares to be superior in its own field even to the Philharmonic orchestra of that city. The American tour is to begin in May at Boston, after which various cities East and West will be visited, the orchestra arriving in New York on June 9th, in time for the opening of the new Madison Square Garden.

It must be clearly understood that if the Musical Protective Union should succeed in its threatened determination to keep out the Strauss Orchestra, the American people will miss a rare and unique treat, for which no other band can ever compensate them. We have not a few excellent orchestras and bands in this country, but none of them can play the music of the Viennese school as Strauss and his men play it. Mr. C. F. Tretbar, manager of Steinway Hall, who is as competent a judge of music as any man in the country, remarked pertinently in a recent interview: "I know of no leaders, however great, who can compare with the Strausses themselves in the interpretation of the charming waltz and other dance music of this gifted family. I said this to one of our greatest leaders on the eve of his departure for Europe, and advised him to visit Vienna and confirm my words. He answered with a shrug, but he went, nevertheless, and returned with the acknowledgment that he had enjoyed and learned much." My own experience was similar to that of the leader here referred to.

Previous to my first visit to Vienna I had scorned dance music, and considered it unworthy of the attention of a serious lover of music. But a single hearing of the Strauss Orchestra made me change my mind completely on the subject. I had never learned to dance, but I had not been in Vienna two weeks before I was a regular attendant at a dancing class, and during the carnival of that year I never missed a masked ball at which Strauss played. It was simply impossible to remain indifferent to the rhythmic swing of "those irresistible waltzes, that first catch the ear, and then curl round the heart, till on a sudden they invade and will have the legs," as some one has forcibly expressed it.

But the greatest charm of the Strauss music lies not in the fact that it is the best dance music ever written. It has a higher value, an artistic side, which is largely missed in the ballroom, and can be fully appreciated only in the concert hall. Why is it that Richard Wagner, though he was so chary in his praise of contemporary musicians, frequently expressed his great admiration for the Strauss waltzes? Why does Brahms admire them equally? Why does Mr Theodore Thomas always put a Strauss waltz on the programmes of his popular concerts? Let two of the most distinguished of German critics answer these questions. Dr Hanslick, Professor of Musical History at the University of Vienna, writes: "I do not hesitate to pronounce Strauss and Lanner the most original and fascinating talents in the arid period of Viennese musical life following upon Schubert. They delighted the people and interested the musicians. Supplementing one another, they gave to their small *genre* an unprecedented musical charm and life. It is necessary to examine the older dance music to realize fully what Strauss and Lanner made of it. How astonishingly dry and insignificant are even Mozart's 'German' and Beethoven's 'Country' dances in comparison!"

Herr C. F. Pohl, librarian to the Gesellschaft der Musikfreunde in Vienna, remarks concerning the elder Strauss: "Great masters like Mendelssohn, Meyerbeer, and Cherubini acknowledged his talent. He raised dance music to a higher level than it had ever reached before, and invested his copious melodies with all the charm of brilliant instrumentation. Full of fire, life, and boisterous merriment, they contrasted well with Lanner's softer and more sentimental airs, and must be judged by *a totally different standard from that of mere dance music.*"

Here we have the kernel of the matter. The tendency already shown by the elder Strauss to make the waltz something more than a mere rhythmic accompaniment to the dance has been carried still further by his sons, so that the best Strauss waltzes may be said to be as far above ordinary dance music as are Chopin's valses, or Weber's "Invitation to the Dance." This last-named piece was originally written for the piano, and orchestrated afterward by Berlioz, who ranks with Wagner as one of the two greatest masters of instrumentation the world has ever seen. Yet it is no exaggeration to say that the instrumentation of the best Strauss waltzes is quite on a par with that of Berlioz. Harmonically, too, Strauss is equal to any classical master, and his melodies and rhythms are so original and inspired that their popular character does not in the least detract from their artistic value. Strauss is by turns as tender as Schubert in his lyric songs and as passionate almost as Wagner in his dramas.

As just stated, the artistic beauty of Viennese dance music is fully revealed only in the concert hall, because there the conductor is not obliged to beat time for the dancers with the metronomic regularity of a pendulum, but can follow all the finer *nuances* of time which are inherent in the character of the music, and which give it its poetic charm—its perfume, as it were. This poetic freedom of rhythmic movement in Viennese dance music must be doubtless traced to the influence of Hungarian gypsy music on the Viennese composers, and it is this feature chiefly that raises their music above other dance music. They not only originated the waltz, but they grasped its essence, which lies in its being the dance of love, the dance of lively young people, as compared with the stately minuets and other old-fashioned dances which were danced by the older people in their stiff wigs, while the young people were left in charge of chaperons. The waltz is the dance of the nineteenth century, and symbolizes the emancipation of young people from ceremonious restraint and chaperonage. But being a dance of love, it was necessary that the waltz should be not only lively, but also should give expression to the various moods of love-making—the tender glances, the passionate sighs, the outbursts of jealousy. These feelings are all portrayed in the Strauss waltzes, especially in the introductions, which Strauss has made more and more elaborate and full of tender and passionate amorous feeling.

A few weeks ago the curious information was cabled from Vienna that Strauss in his old days had come to the conclusion that the waltz as he had been writing it all his life was too fast, and that therefore he had begun composing waltzes in a slower time, which would give the dancers time to converse. Strauss was so much pestered with letters on this subject that he wrote to a Viennese paper: "It never occurred to me, and never will occur to me, to reduce the tempo of the waltz to an *andante comodo*, or make it in the least bit slower. My two latest compositions, 'Kaiserwalzer' and 'Rathhausballtänze,' are the most convincing proof of this assertion, as the tempo and character of the waltz are therein the same as they were forty years ago, only I have enlarged the introduction and the coda, and have had occasion to remark to friends that these two parts were perhaps capable of further musical development, which may have given rise to the fable regarding the conversation waltz and the *andante comodo*."

It seemed, indeed, improbable that Strauss would attempt the impossible feat of altering the most characteristic dance of this century, which is simply an expression of the modern spirit, and could not be altered without altering that too. But there is a hint in his last sentence that his successors may carry his reforms, intended for the concert hall, to the ballroom itself, making the dancers no longer whirl around like mechanical wheels or tops, but adapt their motions to all the rhythmic irregularities, the *tempo rubato*, of the musical movement. Were this done, dancing would once more become a fine art. Perhaps our society leaders will study Strauss's interpretations, and decide whether such an innovation would be practicable.

Henry T. Finck.

LA SALLE STREET, CHICAGO.

Columbus gave to Ferdinand and Isabella a new world; La Salle gave Louis le Grand a claim to the heart of a continent. Could La Salle and the Chevalier de Tonty, as they worked their way up the Chicago River on the 4th of January, 1681, have seen in prophetic vision the city which was to spring up along the shore, the sight would have amply recompensed them for their toils, privations, and dangers. They would have seen a city of over a million inhabitants, with 169 square miles of territory, 2000 acres of parks, 614 miles of paved streets, and with 66 railroads binding it by links of steel to every part of the vast domain they were traversing, and in the finest park of the city, looking south down the avenue and street that bears his name, they would have seen a heroic figure in bronze, with this inscription on the granite pedestal, "Robert, Cavelier de la Salle."

La Salle Street, looking south from the entrance of the tunnel to the Board of Trade building, that five or six blocks away abruptly terminates the view, presents an imposing appearance, and gives the casual visitor a good idea of the solidity and business of the central portion of Chicago. Immediately at the mouth of the tunnel, on the east side, is Jackson Hall, recalling the memory of early Chicago, "Long John Wentworth," and associated with the present as the early home of the Chicago *Times*, established more than thirty-five years ago as the organ of Stephen A. Douglas, but afterward, under Story, removed to its present home on Washington Street and Fifth Avenue. On the west side of the street, and a little farther south, between Randolph and Washington, is the location of the Spencer Bank, which many have occasion to remember in connection with the great failure of a decade or more ago. On the whole block bounded by Randolph, Clark, Washington, and La Salle are the City Hall and Cook County Court-house, in reality two buildings, but joined so as to give the effect of a single immense structure, their seventy-five granite columns giving a brighter tint in summer to the background of stone, and on frosty winter mornings they are transformed to columns of Parian marble, rivalling those of "the white wonder" of the Parthenon that crowned the Acropolis of ancient Athens.

South of the City Hall, and fronting on Washington and La Salle, on the site of the old Chamber of Commerce, an office building climbs skyward to the height of thirteen stories, overlooking the City Hall on the north, and the lofty Tacoma building to the south, on the corner of Madison and La Salle. This building is not only the most imposing structure in Chicago in point of height, but in appointments and adaptation to its purpose may be regarded as nearly perfect as modern architecture and science can make it. Some genius, with a taste for the extraordinary, has suggested that its level roof be utilized during the World's Fair, and fitted up as an evening resort, where visitors could enjoy music and refreshments, and see Chicago by gas-light as the leading attraction. On the west side of the street, between Washington and Madison, are the Western Union Telegraph offices, several bank buildings, and the head-quarters of the Western Associated Press, while a little farther south is the Oriental Masonic Hall, one of the oldest in the city.

From Madison Street south to the Board of Trade building is the head-quarters of the insurance business of Chicago. The Nixon building, on the northeast corner of Monroe and La Salle, enjoys the distinction of being the only one that successfully stood the test of the great fire of October 8 and 9, 1871. South from Monroe to the Board of Trade building are some of the finest office buildings in the world. The Board of Trade building, the great agricultural barometer of the West, and the Grand Pacific Hotel, are too well known to need more than mention.

Chicago is justly loyal to the memory of the intrepid explorer of whom Parkman writes, "He stands in history like a statue cast in iron."

H. T. Schmith.

THE HOTCHKISS REVOLVING CANNON.*

The *Royal Prince*, British line-of-battle ship, built in 1610, was armed with quaint ordnance, still more quaintly christened—cannon, petronel, demi-cannon, culverin, demi-culverin, rakers, and swivelling post-pieces—which ran in a destructive gamut from roaring 18's to quiet, small 3-pounders. This "brood of murdering pieces," recalling the breezy tales of buccaneers and the Spanish Main, of *Westward Ho!* and John Oxenford and Salvation Yeo luring the youths of Devon on the weedy steps of Bideford Quay, has long since been consigned to the limbo of artillery scrap heaps, though the tactical principle which governed its mixed employment is in our day restored to its ancient usage.

In the enumeration of the ships we speak now of the primary and the secondary batteries, as they would of old have boasted of their petronels and rakers. The first class includes the stars, from the monster 110-ton guns to the little high-powered 6-inch rifles; and the other, all that lesser battery which makes up the rattling chorus of the new war drama. These smaller pieces have an important rôle to fill, and as the terms, and to a definite degree the conditions, of modern warfare are still unsettled, they are made illogically to play many parts. In the broad generalization adopted we find the secondary battery embraces machine guns, mitrailleuse in type, the revolving cannon shown in M. de Thulstrup's spirited picture, and the rapid-fire pieces, which, beginning with a modest 1-pound projectile, aspired to calibres of six inches and shots weighing seventy pounds, fired ten times a minute. This ambition, however, overleaped itself, and the extreme development has been rejected for a smaller but no less wonderful piece of 4.72 inches, which can hit a target six feet square five times in thirty-one seconds, with a shot weighing forty-five pounds. To finish with the piece at once, it may be added that this gun weighs a little over two tons, and when fired with twelve pounds of Chilworth smokeless powder has yielded a muzzle velocity of 2356 feet a second, and a penetration of 10.5 inches into wrought-iron.

The revolving cannon occupies a place between the single barrelled rapid-fire guns and the machine guns, which consist of a number of breech-loading rifle barrels grouped about an axis or arranged in a horizontal line. Like the latter, it has tubes that are loaded and fired in continuous succession by the action of suitable machinery at the breech; and in common with both it uses fixed ammunition and ejects automatically the empty cartridge shells. The invention created a positive sensation upon its first appearance, and great things were expected of a piece which could fire rapidly and accurately explosive projectiles weighing 1, 2¼, and 3¼ pounds with a velocity of 1400 feet a second. The Hotchkiss Company did not hide its light under a bushel, for I recall vividly the picture of a French battle-ship beset with pestiferous torpedo-boats, and freeing herself just in the nick of time by a murderous discharge of revolving cannons mounted on mathematically exact spots and discharged at the most effective range to complete, as the engraving proved, the destruction by the giant of the over-rash flotilla of "microbes."

From the beginning machine guns have been looked upon as being a most important part of the ship's armament, the possibilities of the rapid-fire gun not having been considered until within the last five years. The Chief of Naval Ordnance reported in 1882 that "it would be necessary to supply our ships of war with a greater number of machine guns, both of large and small calibre. The heavier calibres penetrate the sides of all unarmored vessels, and are capable of piercing about 1.8 inches of steel placed normally near the muzzle. They are also very effective against thin plates placed at quite an acute angle to the line of fire, and at very considerable distances. For this reason they are well adapted for use as a defence against the fast torpedo-boats now in vogue. When these swift little vessels are advancing bows on upon the enemy, the lines they present to the hostile fire are mostly very acute, and unless the projectiles fired against them have high velocity and considerable weight, they glance, and are innocuous. If, however, penetration through the skin plate is once obtained, great residual energy is desirable in order that the projectile may pass through the interior steel bulkheads, and this result is what is aimed at by manufacturers of these classes of guns. In future engagements between ships at sea the effect of such guns will be of great importance, as their powers of destruction and annoyance are quite out of proportion to their size." The revolving cannon of the larger types proved in practice to be somewhat unwieldly, and the final change to the single barrel of increased length, using a heavier powder charge, was logical and in consonance with the growing ballistic power of large guns.

Although the type was invented, developed, and manufactured by an American, the revolving cannon has to be purchased at his foundry near Paris. As this seemed wrong every way, the Navy Department refused, in 1887, to take any more foreign guns, while at the same time it agreed to buy a certain number of these and of the rapid-fire pieces if the Hotchkiss Company would erect at home a plant for their fabrication. The offer has been accepted, and as the proper quality of steel can at last be manufactured here, we are now in a position to purchase our secondary batteries without the possible interference in war times of the limitations imposed by the laws of nations on neutrals or combatants. The calibre generally employed in all services is the thirty-seven millimetre, and the piece can be rapidly served by a crew of five. It is difficult without the solvent of battle experience to assign a definite place to the type, as the great success of the single-barrelled rapid-fire gun has overshadowed it. That its reputation is still good is shown by the fact that in the first-class side-protected cruisers lately authorized for the French navy four of the guns are to be carried in each of the armored tops fitted to the two military masts. We can always have a special pride in it as another evidence of the revolutionizing inventions which this country, the least military of the great powers, has contributed to modern war theories.

NAMES FOR OUR NEW NAVY.

Must we lose the names of the war ships that have once floated the Stars and Stripes in glorious encounter? New ships are building, and old ones are being condemned, by act of Congress, but why cast away the magic name that has once been associated with our glory on the seas? The ships that now carry our blue-jackets and middies about the world should be a reminder of the deeds of their worthy predecessors, and the names they bear should suggest the heroism of our Farraguts, Decaturs, and John Paul Joneses, that the men of this peaceful age may not forget that we too have our heroes.

Our new vessels are bringing new names upon our navy list, and worthy names too; but should we not first exhaust those under which our past heroes fought? Who of us does not feel his cheeks glow with pride when the *Bon Homme Richard* is mentioned, the good ship that carried our Revolutionary arms on to the shores of Great Britain itself? With her were associated many others in the struggle for liberty, almost forgotten now. Let us revive some of them.

There were the *Columbus, Providence, Protector, Defence, Cabot, Hancock, Randolph, Raleigh, Washington, Warren, Trumbull, Congress, Montgomery, Hampden, Lexington, Royal Savage, Liberty, Deane, Gates, Hornet, Surprise*—names picked out at random all ranged under the banner of liberty in the days of '76—many of them those of leaders in that struggle, and all of them at least as appropriate to our modern vessels as such unmelodious nonsense as *Nipsic* or *Tallapoosa*. Who would not prefer fighting on the deck of the *Congress* or *Lexington* rather than on that of the *Sonitaro* or *Quinnebaug*?

Some of the Revolutionary names have survived, as, for instance, *Boston, Enterprise, Alliance, Ranger, Independence, Dolphin, Saratoga*—all ships that helped shape the history of that stirring time. But why should not the rest be also remembered?

In 1800 the war with Algiers and with the French in the West Indies brought our national flag once more upon the high seas in a manner calculated to impress the world with the fact that fighting republics did not die with the last of the Romans. Of the good ships of that period we still are reminded by our present ones to the extent of the *Constitution, Constellation, Essex, Boston, Adams, Portsmouth, Baltimore, Enterprise*; but where do we find now the good ship *United States*, or her sister crafts *Congress, General Greene, George Washington, Ganges, Merrimack, Connecticut, Delaware, Pinckney, Eagle, Warren*?

The war of 1812 fills us with still deeper regret, for that is the last great naval war in which we have been engaged—at least against a foreign power. The Mexican war, we probably all agree, did little to add to our glory at sea, even if it did add to our land possessions.

The war of 1812 made us proud of such ships as the *Decatur, Yankee, Chesapeake, Macedonian, Hornet, Lawrence, Niagara, President, Wasp, Peacock*—names that every school-boy should know all about. Of the others were the *Argus, Siren, Nautilus, Vixen, Ticonderoga, Preble, Oneida, Ontario, Fair American, Somers*, and many more.

The rebellion war is so recent that many a ship that fought then is now in commission; but it is no less to be regretted that so many of the names that suggest naval greatness to us should make room for new ones with no particular historic interest attaching to them. Before naming any more *Atlantas* or *Despatches*, why not revive such names as *San Jacinto, Roanoke, Cumberland, Monitor, St. Lawrence, Oneida, Mississippi*, besides many others that will readily occur to all who have heard of the great rebellion?

If we had no great men, or had fought no great wars, there might be then good reason for naming our boats *Vesuvius, Dynamite*, or corresponding names; but, thank God! we are not reduced to that, and Congress should be made to understand that the ships that reflect American greatness in foreign parts do not require to be branded merely for pleasing effect, like new collars and cuffs, but that each man-of-war that leaves our shores should bear the inheritance of an unbroken record of patriotic deeds upon the high seas; that each veteran craft that reaches the invalid condition should be replaced by another, fresher in paint and spars, to be sure, but manned with the same stuff as fought her predecessor, and animated by the recollection of what was done when the name she bears acted like the magic of Napoleon's eagles.

Let us, then, revive these honorable names, and when these shall have been exhausted, let us draw for the rest, not upon European navies for titles, but upon the names of men great as patriots, and upon those of places connected with deeds of patriotism.

Poultney Bigelow.

THE MERCANTILE LIBRARY.

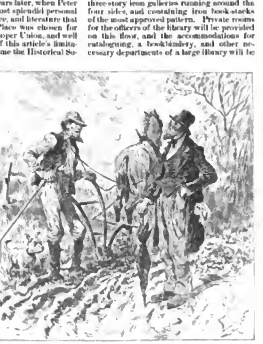
With the passing of another year New York will have one more architectural monument dedicated to science and literature. At the junction of Eighth Street, Astor Place, and Lafayette Place, the site of old Clinton Hall, the Mercantile Library Association is to have a new and magnificent home for its lettered and other treasures. That section of the city abutting upon these corners has come to be firmly established as the rendezvous of its literators. The selection of this location for the Astor Library forty years ago gave to the neighborhood a character, embryotic, it is true, at that time, but of sufficient distinction to determine the American Bible Society to commence the erection of a building close by to be devoted to the production of its manifold religious works, and the proper care of its grand collection of ancient and mediæval tomes and manuscripts pertaining to the Sacred Text. The corner-stone of the Bible House was laid in 1852 at the intersection of Astor Place and Fourth Avenue. Next, in 1854, came the Mercantile Library Association, and arranged its books within the walls of the old Italian Opera-house, then rechristened and since known as Clinton Hall. Three years later, when Peter Cooper had made the most splendid personal endowment to art, science, and literature that history records, Astor Place was chosen for the front elevation of Cooper Union, and well within the boundaries of this article's limitation. About the same time the Historical Society of New York removed its thousands of volumes and documents to a new fire-proof structure at Stuyvesant Street and Second Avenue, hardly more than a stone's-throw distant from its more modern contemporaries.

In the wake of these institutions followed the "old book man," filling up the odd hall-ways, areas, and queer little cubby-holes, in which the old-fashioned buildings thereabouts abounded, with his very miscellaneous collections. The booksellers in turn, many of them, deserted the classic (?) shades of old Nassau Street and settled around the Musean temples of Astor Place and vicinity. Then came the publisher, the printer, and the bookbinder, each with his corps of assistants and artisans, and all aiding to establish a literary democracy that embraces all those who have a hand in the writing, making, or selling of books.

When the demolition of Clinton Hall is begun on May 1st, it will scatter to the winds many pleasant memories of the spot that were gathered in the times when it was known as the Italian Opera-house, and the scene of many an operatic and theatrical triumph. It was the favorite resort of wealthy New-Yorkers, who forty years ago lived mostly within a radius of half a mile of the spot, on Lafayette Place, Second Avenue, Broadway, and Washington Square. It was the scene also of the unfortunate "Astor Place riot," on the 9th of May, 1849, when an ignorant mob, dominated by the spirit of "Know-nothingism" then still rife in the popular mind, sought to prevent the appearance of Macready, the English tragedian, who was announced to play *Macbeth* that night. The details of that disgraceful affair have been so often written that it is unnecessary to enter into the story here. The building of the Academy of Music in 1854 terminated the usefulness of the Italian Opera-house as a place of amusement, and the owners, who had built it by subscription in 1847, were glad to dispose of it for the uses of the Mercantile Library Association.

The picturesque old building, with composite columns of brick and terra-cotta entablatures, has been a familiar landmark for more than a generation, and is in striking contrast with the impressive pile to which it is about to give way. The latter will occupy exactly the same space of ground as the former, measuring 159 feet on Eighth Street, 52 feet on Lafayette Place, 149 feet on Astor Place, and 98 feet on the westerly line, parallel with Broadway. It will rise seven stories above the sidewalk to a height of 115 feet, and when completed will be absolutely fire-proof, according to the declaration of the architect, Mr. George E. Harney, of No 149 Broadway. The walls up to the third story will be of gray Quincy granite, and solid through to the interior; the upper stories to be of dark buff or Holland brick, with supporting buttresses of Belleville or red sandstone, the cornices and trimmings to be also of that stone alternated with terra-cotta; the roof to be flat, entirely of copper and glass, surmounted by an ornate balustrade. The class of architecture will be that of the composite Renaissance.

The interior of the building will be finished entirely in hard-woods of various kinds, the stairways will be of iron with stone treads, and the halls will be paved and wainscoted in variegated marbles. The first story, on the street level, is to be occupied as stores; the second, third, fourth, and fifth floors to be rented out for office purposes; and the sixth and seventh floors to be devoted to the uses of the Mercantile Library Association. The building is to be lighted throughout by electricity as well as gas, and provided with two hydraulic elevators. The sixth story will be sixteen feet in height from floor to ceiling, and will be used for the reference library and reading-room, the fittings, furniture, and decorations to be entirely of oak. The main hall of the circulating library will be on the seventh or topmost floor, with a ceiling twenty-five feet high, and lighted on three sides, as well as by an immense skylight that will occupy nearly two-thirds of the roof space; the whole of the ceiling of this story is to be divided into panels by heavily moulded ceiling ribs, the panels to be highly enriched with suitable designs in wood. The room will be fitted with three-story iron galleries running around the four sides, and containing iron book-stacks of the most approved pattern. Private rooms for the officers of the library will be provided on this floor, and the accommodations for cataloguing, a bookbindery, and other necessary departments of a large library will be



BEANS.

"What's that, Seth—not goin' ter raise any beans this year?"

"Not a bean, deacon; an' I kin jes tell ye that if Congress passes that [illegible] McKinley bill, which taxes beans [illegible] per cent, it won't be long before there ain't a railway rest'rant or a Sunday mornin' breakfast in the hull of New England."

viduals without capital, to establish a library of any influence or extent; and to add to this inconvenience, which, however, was anticipated by its founders, there was another which they had not the least idea of meeting. This was the opposition of a large number of the old school of merchants, who, themselves having mostly been satisfied and successful with an education such as is embraced within the limits of the rudimentary "three R's," fancied that the attention of their clerks to the advantages offered by the new library would interfere with the duties exacted by their employment. This narrow-minded notion gave rise to more or less hostility on the part of these merchants toward the new enterprise, but the practical workings of the institution, and the gradual spreading of more liberal and enlightened views, finally overcame this stupid and ridiculous prejudice.

In the year 1825 special efforts were made to increase the library and extend its usefulness. The first printed catalogue was published in this year, and so prosperously were its affairs progressing that by the next year the library had outgrown the old quarters on Fulton Street, and it was removed to more spacious apartments on Cliff Street, in the building owned and partly occupied by Messrs. Harper & Brothers. Here also a reading-room was first established, supplied with all the principal American periodicals and newspapers, and some foreign ones. This at once became a very popular feature. In 1827 was commenced a series of lectures on popular educational topics, and continued for a long period of years.

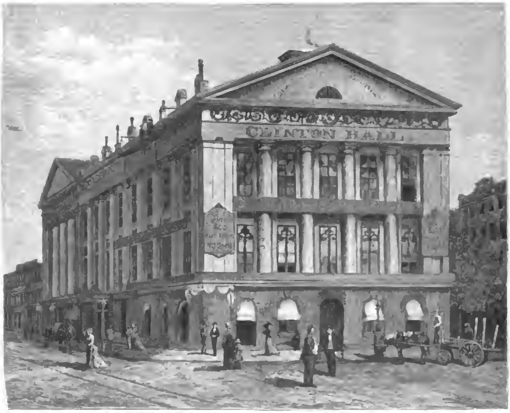
The success of the library as a mutual enterprise had now become assured, and in February, 1828, a number of the broader-minded merchants who felt interested in it met together and agreed to raise by subscription a sum sufficient for the erection of a building suitable for the permanent accommodation of the library. These gentlemen formed themselves into an association, and raised among themselves and friends $88,500 in the course of a year. A plot of ground was purchased at the corner of Beekman and Nassau streets, now the site of Temple Court and the Nassau Bank, and in 1830 a building was erected, and dedicated on the 2d of November that year, with much ceremony, to science and art. The entire cost of the land and building was about $55,000. The building was called Clinton Hall, in honor of Governor De Witt Clinton, who had made the first donation of books that the library received, and who was also the most popular public man of that day.

This new building was held not in the name of the Mercantile Library Association, but in that of the Clinton Hall Association, which was the name adopted by the company of gentlemen who erected it. These conservative old merchants, after raising the amount necessary for the building's erection, came to the conclusion that it would not be wise to intrust the management of so much real property into the hands of the library officials, as they, according to its charter requirements, being all men holding clerical positions, could not be expected to exercise the best of judgment in the disposal of so large a sum of money. In this belief the Clinton Hall Association was formed, and to this day controls the business affairs of the Mercantile Library Association apart from the management of the library itself. The Clinton Association acts in the relation of guardian or trustee of the Library Association's property interests, the latter being assured of a full and perpetual ownership of the property as effectually as though the titles were in its own corporate name.

In the new location the library prospered as fully as its most sanguine friends anticipated, and though it labored under some embarrassments of debt, yet the latter was gradually liquidated until the last payment was made in 1852. By this time the growth of the library had rendered the accommodations at Nassau street too limited. A large number of books could not be properly placed upon the shelves, and the reading-room was entirely inadequate for the demands upon it. Early in 1853 steps were taken for the purchase of a new site, and the Italian Opera-house was bought for $140,000. This building required a further outlay of about $100,000 to adapt it to the purpose of a library, and it was in April, 1854, before the first cart-load of books left the old quarters on Nassau Street. The new hall was inaugurated on the 8th of June following, and addresses were delivered by Hon. Horatio Seymour, J. R. Brodhead, the historian, and Hon. Charles King, President of Columbia College.

After the opening of the library in its present location it rapidly extended its sphere of usefulness, until at the present time its subscription list numbers more than five thousand names. The character of its collections of books has always been governed by the needs of the class of people for whose benefit it was originally founded—the employés or clerks of merchants and other business men. In the new building the architect has provided a very liberal amount of renting space without encroaching upon the requirements of the library, and this space, entirely rented, will provide a most handsome income, all of which, above interest charges, etc., will be wholly devoted to the purchase of new books.

SCOTT THOMPSON.



CLINTON HALL, ASTOR PLACE, NEW YORK—THE OLD BUILDING AS IT STOOD FOR MANY YEARS.

perpetual sea of children, and with the additional discomfort of feeling that she was looked upon as a disappointing failure, she had become a faded, slatternly woman, alternately tearful and snappish, with a weak back and a disastrous liking for a "drop of comfort." She was of no use to Charles in the business. He was obliged to keep the books himself until his eldest son or daughter should be old enough to relieve him of that care. He missed the confidential chats with his mother about their affairs, never realizing until she was gone from him how shrewd and hard-headed the old lady had been. To add to his troubles, business began to fall off, just at the time when he needed every penny. A huge dairy, conducted on "strictly sanitary" principles, with a speciality for asses' milk, was established just round the corner, and tempted away many families with its alluring prospectuses, gorgeous premises, and smart Swiss milkmaids' costumes. The book-keeping grew less and less onerous every month, until at last Charles could have found it in his heart to thank Heaven for having removed his old mother in time.

Something had to be done, so Charles plainly acknowledged to himself. But what? One might as well ask a cedar of Lebanon, rooted for centuries on its lonely mountain, to come down and turn itself into a cocoa-nut palm on the plain as expect a Charles Soutar to abandon his dairy and strike out some new and less hopelessly well-beaten path for himself. He *could* be nothing but a dairyman—there, in the home of his fathers, York Place, South Kensington. After much counsel, taken with a brother of his mother's, who kept a flourishing pork butcher's shop on the Brompton Road, he sadly came to the resolution to put his pride in his pocket—there was, alas! plenty of room for it in his pocket—to sacrifice his best parlor and the bedroom behind it—his "drawing-room floor," in fact—and to take in lodgers.

His wife remonstrated loudly. Her family had never done it; her drawing-room was the one comfort of her life, and little enough she had, goodness knew! Who was going to cook for the lodgers? Who was to wait on them and do for them? But though Charles was gentle, and preferred as a rule to give in, this time he held firm, and the fatal card, framed and glazed, with "Apartments" on it, appeared in the dairy window in close proximity to the golden cow which had stood there for the best part of a century, and which was the most precious heirloom of the Soutar family.

The card had been there some two months, and Charles Soutar was beginning to think that he had better look about him for some other method of mending his fortunes, when one morning in late October, as he was ruefully contemplating his ledger, a lady entered his shop and asked if she could see the apartments. She was a widow, attired in the very deepest mourning, of plain quality, her face being almost invisible beneath the thick crape veil which hung over it.

Charles Soutar sprang to his feet with alacrity, and was just going to call to his wife, when he reflected that Maria Jane was never fit to be seen in the morning, and that a view of her, untidy and dishevelled, might not increase his visitor's enthusiasm for the lodgings. He therefore whispered to Charles the Fifth, who had now reached the useful age of ten, to run and warn his ma to tidy herself a bit, and then to come back and mind the shop while he himself took the lady up stairs.

"There is a private door at the side of the shop, you will notice, madam," he said; "it would not be necessary for you to pass through the shop, although now we can go this way, if you will kindly follow me."

He walked slowly up stairs to the first floor, and threw open the door of the drawing-room. "This is the sitting-room," he observed; "a pleasant, airy room."

The lady gave a quick glance round. "This will do very well," she said. "And the bedroom?"

Mr. Soutar opened the bedroom door, and drew modestly back to allow the lady to enter alone.

She just crossed the threshold, and looked round. "This is all right too," she said, in the same abrupt way. "Your terms?"

Charles Soutar bashfully mentioned his terms.

"Very well; I will take the rooms. I shall come in to-day. I must be perfectly undisturbed and quiet in them. I shall not give much trouble, and if I am comfortable, shall stay for a long time."

Mr. Soutar, who was inwardly trembling with excited pleasure, was heard to murmur something about "references."

"I have just arrived from Australia, and know no one in London," answered the lady, sharply. "I will pay you a month in advance instead."

This arrangement suiting Mr Soutar very well, the lady pulled out her purse and gave him four weeks' rent on the spot—a proceeding which appeared to him eminently satisfactory and promising.

At the door the widow turned and said: "My name is Harrison—Mrs. Harrison. I shall return in about an hour."

"Very good, madam," returned Mr Soutar, and stood at the door a minute or so watching the tall cloaked figure walk away before he ran up stairs, calling, "Maria! Maria!"

His wife appeared at the head of the first flight, buttoning up the body of her dress as she descended. She received the glad tidings with a supercilious air, which, however, somewhat softened down when her husband jingled the money in his pocket and presented her with a sovereign for herself.

"She's sure to be an old cat," she said, gloomily.

"Not at all, my love—not at all," replied the gentle Charles. "She is quite the lady—quite."

"Well, we shall see," said Mrs. Soutar. "I shall go in and tell pa about it."

"Would it not be better to get the rooms ready first, my dear?" her husband suggested. "Mrs. Harrison said she would arrive in about an hour."

"I knew it!" exclaimed Mrs. Soutar, indignantly. "My slavery has begun. Get the rooms ready, indeed! I'm not going to demean myself to no such thing. Bessy can do what's wanted. *I* am going in to see my pa."

Mr Charles retired to his ledger, saying to himself that if this was the way Maria Jane intended to go on, the long time their new lodger had spoken of staying with them would be considerably shortened.

Mrs Harrison arrived in due course with one large trunk and a few smaller packages. When the concealing bonnet and veil were laid aside, she proved to be a middle-aged woman, with black hair plentifully streaked with gray, eyes which seemed to be blue behind a pair of spectacles, strongly marked eyebrows, and a thin-lipped mouth. A woman who had seen trouble, Charles Soutar decided, and also a woman who could take care of herself. She arranged her belongings quickly, with the air of one entirely indifferent to external surroundings, ordered a frugal tea with a boiled egg, and spent the afternoon, so far as the curious Bessy could report to her mistress, sitting in the arm-chair by the window, with a book on her knee.

She turned out to be the very quietest, most easily satisfied of lodgers, paying promptly and without discussion, never complaining of the cooking, which nevertheless left a good deal to be desired, never giving unnecessary trouble. She asked for a latch-key, and went out a good deal at uncertain times, sometimes staying at home for weeks together, at others going out in the daytime or in the evening, and coming home very late.

Mrs. Soutar, as curious as her servant, attempted at first to be what she called "chatty" with her lodger, but her efforts were received so coldly, and with so discouraging a stare of the blue eyes behind the spectacles, that she beat an ignominious retreat, and was obliged to content herself with uttering dark hints to Bessy in the kitchen.

Months changed into years, the ten children grew apace, Charles Soutar became bald, Maria Jane more and more lax in her attire, and still Mrs. Harrison remained an inmate of the little house in York Place. She had not changed in any particular, her smooth hair covered by the widow's cap was not one whit grayer, her mourning was as profound as ever, even to the dismal veil on her bonnet, without which she never stirred abroad.

She might have lived with the Soutars only a week or so for any progress in intimacy she had made with them. They knew just as much, or just as little, about her as on the first day, and she, on her side, never troubled to address a single question to either her landlord, her landlady, or any one of the ten scions of the house. She had arranged to have her provisions purchased for her, and was satisfied with everything.

At first conjecture was rife as to the mystery of this stern-faced widow, who led so lonely a life, who received no letters, and who appeared so absolutely indifferent to everybody and everything; but as time went on, the Soutars' lodger became as much an institution as the Soutars themselves, and people ceased to occupy themselves in so profitless a manner.

Had any one taken the trouble to interest themselves in Mrs. Harrison's movements, they would have been utterly at a loss to understand them.

As soon as Bessy had cleared her breakfast things away every morning, the widow rose and locked the door of her sitting-room. Then she arranged the white curtain of her window so that she could see from it and not be seen herself, and from nine o'clock to her dinner hour at two she sat at the window, her eyes fixed steadily on the opposite side of the street. If there was any movement at the windows of Mr Hartley's house, or if the front door opened to admit or to give exodus to any person, quick as lightning went up a powerful opera-glass which she held ready to her hand. In the afternoon it was the same thing: so long as the light lasted she would sit in the window and watch the house. By and by she acquired a trick of muttering to herself; her own voice perhaps served to keep her company, although at times she would start at its sound and look round furtively, as if to assure herself that she had no listener.

When the little girls who lived opposite, Dolly and Marion Hartley, came out with their nurse or their governess, the woman watching opposite would catch her breath, and with starting eyes would crane her neck to see them as long as possible. Sometimes, but not very often, she would catch up her widow's bonnet and long cloak and hurry after them, keeping at a good distance from them, but occasionally approaching near enough to hear them speak, but never turning round to look in their faces.

In the evenings she would open the window of her sitting-room, and sit there watching for Mr. Hartley to come out. He generally took a hansom, and standing on the splash-board as he got in, would give his directions to the cabman in his full, cheery voice, every word of which could, as a rule, be heard across the quiet street. The cab would drive off, and presently Mrs. Harrison would put on her things, and would make her way, either on foot or by the more humble omnibus, in the direction which the hansom had taken. Arrived there, she would, with untiring patience, wait about, sometimes for hours, until Graham Hartley came out; then she would either follow him, if he went on foot, or get near enough again to his hansom to hear the address of his next destination, to which she would instantly proceed. In this manner she would stalk the unconscious man for many hours; for Graham Hartley had always been essentially a night bird, and had not changed his habits since his wife's sudden disappearance. When, at length, they turn their steps homeward—the gay man of pleasure and the soberly attired widow—Mrs. Harrison was often almost dropping with fatigue. Mr. Hartley in his cab would reach his domicile a long while before his watcher's weary feet could bear her to her humble home opposite. She would slip into the Soutars' house as quietly as a mouse, would glide up stairs, and locking herself into her bedroom, would often throw herself fully dressed upon her bed, and sink almost immediately into the heavy sleep of exhaustion.

There were nights, however, when she allowed Graham Hartley to pursue his giddy course unattended; and then, when she had taken no exercise all day, she found it impossible to sleep at night. As evening came on she would leave her window, and begin to pace up and down her sitting-room, her lips twitching, working, often uttering undistinguishable words, her eyes gleaming, glowing with a strange feverish inward light, looking in the twilight like those of an irritated tigress, her thin hands tightly locked behind her back. One of her favorite occupations at all times was to gaze at herself in the little gilt-framed glass over the mantel-piece; she would stand and gaze—without her spectacles—at her own face, always with the same half-piteous, half-contemptuous expression. Unhappy she certainly was, but no tear ever dimmed her eyes. She was always grim, hard, self-contained.

Although she paid her way with the utmost regularity, she lived with economy. The Soutars were honest, and did not overcharge her. She was a very small eater, so that her weekly bills were far from large, and she was as frugal as possible in her dress. She never went near a bank, and, as has been said, received no letters, so that the money she spent from year to year must have been in her own possession. This, however, the Soutars could not know, for she might easily have gone to draw her dividends when she went out.

So the years rolled on, the motherless girls opposite growing into fair and lovely blossoms, prettier far than their mother had ever been. Mr. Hartley, who was now past middle age, began to sober down a little, and to be proud to take out his two pretty daughters. The widow who lived opposite used to grind her teeth and clinch her hands when she saw them all three setting off together for a ride or drive, the girls chattering with affectionate freedom to their stalwart, still handsome father. Mrs. Harrison did not have to take her night journeys so often now; Mr. Hartley staid at home with his daughters, and sounds of music and singing often floated across the street and reached the ears of the watcher. Mrs. Harrison slept very badly at these times; she was obliged to have almost nightly recourse to a certain small bottle which she kept locked up in her toilet-table drawer.

Then there came a day when the drawing-rooms were shut up, when the doctor's carriage stopped twice daily before the door, and when the footman was kept constantly going to the chemist's. Scarlet-fever, Mrs. Harrison was told it was, when, relaxing for once her usual reticence, she inquired of Bessy's successor if she knew what was the matter in the house opposite.

"The two young ladies and one of the servants has got it bad, they say."

Mrs. Harrison shivered, and went back to her window, which she never left, except to take food, for many days after. At last, one bright sunny morning in June, all the blinds in the house were pulled down, and a day or two later an open hearse drew up at the door, and the widow started from her chair, and, forgetting her usual prudence, pressed her face close to the pane. Presently a coffin, covered from head to foot with wreaths and crosses of flowers, was carried out, and in a few minutes the mournful procession started, Graham Hartley, his face all white and drawn, in the first of the long file of carriages.

Mrs Harrison fell on her knees, and pressed her head into the sofa cushions. "Which? Which?" she muttered. "Dolly or Marion?"

She might have asked the servant, who was sure to know, but she did not. She ate nothing that day nor the next, but kept her watch, her blue eyes staring over the way with a blind look in them, as if they scarcely saw.

For four long weary weeks she sat there, immovable as a statue, and then one morning there was an evident bustle in the house. The victoria drew up to the door, and the eager eyes opposite saw a thin, pale, changed form feebly descend the steps, leaning on Graham Hartley's arm, and enter the carriage.

"Dolly!" murmured Mrs. Harrison. "It was Marion that went."

A week or two afterward the Hartleys went out of town, and the house was shut up. It was always closed during the summer, the family going down to their place in Devonshire. During those months of absence, her occupation gone, Mrs Harrison was in the habit of taking long rambles, walking on and on without ever glancing to the right or left, often muttering to herself in a way that made people as they passed her smile significantly, and sometimes turn their heads to look after her.

In the beginning of November the house was reopened, and Mr. Hartley and his daughter, who, beyond a certain fragility of appearance, retained no trace of her severe illness, came back to town, and the widow re-established herself in her old position. It was not long before her observant eyes noticed that the Hartleys had made a new acquaintance. A young, soldierly looking man of about twenty-eight came constantly to the house. Soon he began to ride and drive with Dolly and her father, and even the crossing sweep at the corner drew the inevitable conclusions, and began to look forward to a wedding and a possible tip for himself.

When she was sure, when she had read it in the beaming eyes of the girl and the tender glances of the young man, Mrs. Harrison forthwith fell into a strange state of excitement. She wandered up and down in her room, muttering, and sometimes letting a hard dry laugh escape from between her parched, thin lips.

"She too," she would murmur—"is she to go the same way too? All joy in life and love, all faith to be crushed out of her too? Is she to be slowly martyred for her money's sake, as her mother was?"

From that day the widow began her nocturnal wanderings again. Only this time it was not Graham Hartley, but young Sir Harry Courtenay that was her object. It was not so easy for her to dog his footsteps, for he lived in chambers in St. James's Street, and was exceedingly erratic in his movements. No sleuth-hound, however, could have shown greater aptitude. She seemed inspired with a patience and *flair* almost amounting to genius. It was not long before she acquired the certainty that the young baronet led as loose a life as his prospective father-in-law had done in those by-gone years before and after he had married an heiress.

Sir Harry's afternoons were given to the courting of the fair, gentle girl who believed him to be the most gallant and chivalrous of gentlemen. Fresh from her innocent kisses, he would go, smiling and serene, to spend the nights in orgies with men who did not know the name of honor, and with women who pressed their painted mouths on the very spot sanctified by his betrothed's pure lips. He was steeped in debt, and only kept his creditors at bay by the prospect of the wealthy marriage he was on the point of making. He was too corrupted, too blasé, for it to be possible for him to feel genuine love for the simple, unaffected little Dolly. His palate craved for caviare and Kümmel, not for strawberries and cream.

All this Mrs. Harrison, with a certain sad experience of her own to guide her, learned and quickly understood. Every day she grew more and more sombre. The fatigue of her detective business told upon her in a startling way; she grew thin to emaciation; her eyes shone large and with a feverish brilliancy in her almost livid face. Tired as she was when she reached home at night, she would sometimes pace her room for a long time, muttering to herself, even occasionally speaking almost audibly. She became, if possible, more reserved than ever, not even now exerting herself to return an answer to any casual remark or question that might be made to her. Mrs. Soutar, prompted by her husband, urged her to see a doctor, as she was sure that she could not be well, but was met by so fierce a refusal that she beat a hasty retreat.

Presently the house opposite began to show preparations for the approaching event. Dress-makers and card-board boxes of all sizes were constantly arriving. Dolly was always going into town on mysterious expeditions, returning with the carriage full of parcels; Mr Hartley went about with a sleek and well-satisfied air. Sir Harry continued to present himself, handsome, smiling, dressed to perfection, without a hint of the tiger's claw hidden beneath the courtly, good-natured exterior; and meanwhile he continued his other life as merrily as ever, taking care that no whisper of his doings ever reached his *fiancée's* father's ears.

Two days before his wedding Sir Harry emerged at three o'clock one morning from a certain house in a shady street well known by him and his compeers. He came out with another man, who said, as they shut the door behind them:

"Well, ta-ta, old chap. I'm off this way. By the bye, I suppose we shall hardly meet again before you are a blissful Benedict. What a good boy you've got to be now, by Jove! Ha! ha!" and he laughed, without any sound of mirth in his voice.

Sir Harry laughed too. "Not a bit of it,"

RECENT DISCOVERIES IN HISTORIC LANDS.

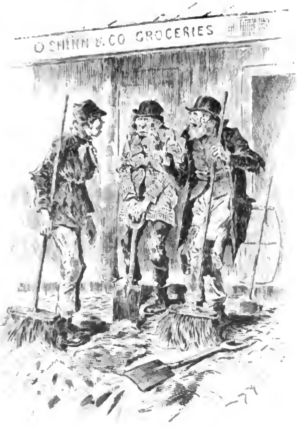
Pick and spade have in the last few decades been furnishing valuable contributions to our knowledge of the history of the Oriental peoples. But never has this been more the case than in the last five or six years. It has always been a source of regret to scholars that not only the native literature of the East, but also so many of the writings of Latin and Greek authors on the classic lands of history have been lost; but now it seems that the buried literary treasures of these countries will more than compensate for the loss. While mourning the destruction of secondary sources of information, the researches of the archæologist are finding primary ones in abundance. The hieroglyphics of Egypt and the cuneiform inscriptions of the Babylonian and Assyrian empire no longer monopolize the attention of historians and investigators. While these remains of earlier civilization are still contributing their full share toward enabling us to understand the ins and outs of these historic nations in their details as accurately as we know the Greeks and Romans from their literature, our own day and date have brought forth such evidences concerning the history of peoples of whose doings all traces appeared to be lost, that these records are a marvel in our eyes.

Prominent among the rediscovered Oriental people are the Hittites, known from biblical and other sources to have been powerful forces in the political ups and downs of western Asia. The discovery of inscriptions in considerable numbers on the site of what proves to be Carchemish, the capital of the Hittite Empire, has solved this enigma of early Eastern history. While the data in regard to this once powerful people are yet meagre, and the questions in reference to them not all settled to the satisfaction of all specialists, so much has been settled, that the Hittites are not a chimera, but a fact of history.

More important yet than this find was that made only about a year and a half ago at Tel-el-Amarna, in Lower Egypt. Here hundreds of tablets were unearthed, covered with cuneiform inscriptions. From these it appeared that at the early date of 1400 B.C. an extensive correspondence by letter—for such the contents of these tablets proved to be—was carried on between Assyria, Babylonia, northern Syria, and Palestine, between such cities as Tyre, Sidon, Askelon, Lachis, Meggiddo, etc., on the one hand, and the Pharaohs of Egypt, Amenophis I. and Amenophis IV. on the other, and this at the time when the Hebrews were settled in Goshen. The contents of these letters are varied in kind and character, touching on affairs public and private in all possible phases. For the first time the evidences are here furnished that in western Asia and northeastern Africa letters and literatures existed at a date much earlier than was generally supposed to be the case, and much earlier than the data furnished by sources hitherto accessible permitted students to accept.

This valuable historical discovery has within recent months received a noteworthy corroboration by the discovery in southern Arabia of a vast number of inscriptions, from which it not only appears that Arabia and western Asia were in possession of a literature four and five hundred years earlier than is stated by the Tel-el-Amarna tablets, but that before the Mohammedan era Christian and Jewish nations, most flourishing in character, with a cultured literature, existed for two thousand years and more in the southern half of the Arabian peninsula. Dr. Edward Glaser, a German savant, made three expeditions to those regions, in quest of new material for scholarly investigation. On these trips, made in 1883, 1885, and 1887, he collected in all no fewer than 1032 inscriptions in countries almost inaccessible to Western travellers. These inscriptions are of both Jewish and Christian origin, and give information in detail of the Minæan and Sabæan kingdoms. The latter was maintained until it was destroyed by the Mohammedans. It is the biblical Sheba, and for many generations its rulers were Jews.

Professor Sayce, who has made a special study of these inscriptions, says that the visit of the Queen of Sheba to Solomon need no longer cause astonishment. Understanding the influence of Solomon's kingdom as we do now, it was almost the most natural thing in the world. Dr. Glaser has found inscriptions which mention Gaza and many others, which show that the influence of the Shebans extended as far as Edom. It was easier in Solomon's day to travel through the length of Arabia than it is to-day. Even of the Minæan kingdom, which preceded that of Sheba, by which it was destroyed, the garrisons and colonies were stationed on the high-road which led past Mecca to the countries of the Mediterranean. Throughout this vast extent of country alphabetic writing was practised in various forms. Hommel, a Munich Orientalist, has discovered that some of these inscriptions date back to almost two thousand years before Christ. Sayce therefore says that the belief that pre-Mohammedan Arabia was a land of illiterate nomads must be abandoned; it was not Islam that introduced writing into it, but the princes and merchants of Main and Thamud, centuries and centuries before—in this way the slave-trading Arab losing his glory in this regard also. The Semitic people all—and undoubtedly the Hebrews form no exception to the rule—in the second chiliad before Christ, throughout the whole region from the Nile to the Euphrates, had advanced to a noteworthy stage of culture, civilization, and literature. This was known to be true in the case of the Babylonians and Assyrians in the east and the Egyptians in the west; but it is the result of recent research and new data furnished by the discoveries in the last half-dozen years that all the region between also partook to a large measure of this civilization. This puts quite a new face on one of the most interesting periods of ancient history.



THE NEOPHYTE.

"P'what's yer name, young feller?"

"Dinnis."

"Ph'well, Dinnis, me boy, it's yersilf has jist begun street swapin', an' it's mesilf has been at it since Tammany invinted swapin', an' it's yersilf as will be discharged if you wurruk as hard as ye have this marnin'. Niver swape up to-day p'what ye kin lave for to-morrer. Take it aisy, Dinnis—take it aisy."

EVERY MEAL IS A TRIAL

To the dyspeptic. Flatulence, heartburn, oppressive fulness of the stomach, are the inevitable sequences of his use of the knife and fork. To say of him that he gratifies the cravings of appetite would be genuine satire. He only appeases them. Is relief attainable? Certainly, and by the use of a pleasant as well as thorough remedy, Hostetter's Stomach Bitters. Will it cure immediately? Certainly not—it does not effect miracles. But it does give prompt and unspeakable relief, and will, if persisted in, produce an ultimate cure. Not only does it impart relish to the food, but promotes its conversion by the stomach into rich health and strength sustaining blood. Supersensitiveness of the nerves, mental depression, and unquiet slumber, produced by interruption of the digestive functions, are also remedied by it. It is the finest preventive and curative of malarial disorders, and relieves constipation, rheumatism, kidney and bladder ailments, and liver complaint.—[Adv.]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[Adv.]

BROWN'S BRONCHIAL TROCHES

Contain ingredients which act specially on the organs of the voice. They have an extraordinary efficacy in all affections of the Throat, caused by cold or over-exertion of the voice. They are recommended to Singers and Public Speakers, and all who, at any time, have a cough or trouble with the throat or lungs.—[Adv.]

IMPERIAL GRANUM

Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[Adv.]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[Adv.]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[Adv.]

The great advantages of Nicholson's Liquid Bread are its low alcoholic constituents, with very high sugar, albuminoid, and cellulose constituents. A desirable table beverage recommended by prominent physicians.—[Adv.]

Burnett's Cocoaine has been sold in every civilized country, and the public have rendered the verdict that it is the cheapest and best Hair Dressing in the world.—[Adv.]

Angostura Bitters, the world-renowned South American appetizer, cures dyspepsia, etc.—[Adv.]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[Adv.]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits, 25c. a box.—[Adv.]

Burnett's Flavoring Extracts are invariably acknowledged the purest and best.—[Adv.]

For the delicate and aged and all in whom the vital current is impoverished and sluggish, Ayer's Sarsaparilla is the very best tonic. It restores the wasted tissues, and imparts to the system surprising elasticity and vigor. Price $1. Worth $5 a bottle.—[Adv.]

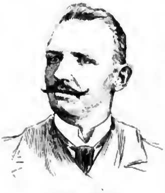
HARPER & BROTHERS, New York.

OPENING OF THE BASE-BALL SEASON OF 1890.

THE LEADING PLAYERS AND THEIR POSITIONS.

BY O. P. CAYLOR.

THE base-ball championship "season" opened on Saturday, April 19th, when two teams of players from Philadelphia appeared at the grounds of the National League and of the Brotherhood in this city. How there came to be two such rival organizations, and what are the prospects of the coming season, will be explained further on.



A. C. ANSON (League).

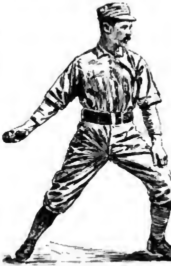
Very recently a syndicate of capitalists made an offer, through the entirely responsible law firm of Tracy, Boardman, & Platt, to pay to the National League of Base-ball Clubs of America $1,000,000 for their franchises. The offer was read to the club owners at their meeting in Cleveland on the 4th of March, and without discussion was laid on the table by a unanimous vote.

Inasmuch as the National League of Base-ball Clubs is but one of a half-dozen or more prominent professional base-ball club organizations in the country, some idea may be had from the above-mentioned business transaction of the immense proportions which the great American sport has attained during the last ten years. The offer of $1,000,000 for the League franchises was considered to be absurdly small, the Boston club alone asserting that they would not sell out for less than that amount. The Boston club, however, own the block of ground upon which their team plays its games, and this plot, with the buildings upon it, is worth probably $250,000. The Philadelphia League club also own their own grounds, and have erected thereon costly permanent grand stands and club-houses. In the other six cities the clubs occupy grounds which are leased, and upon which they have put improvements which cost from $40,000 to $80,000 each.

During the winter which has just passed, a Brotherhood of Base-ball Players, most of whom withdrew from the service of the National League, organized an independent association of clubs, which they call the Players' League. They have rented grounds, and have fitted them up in National League cities, and propose during the season to conduct a competitive business against their former employers. They have secured in each city the moneyed backing of well-known business men, who are promised in return for their financial aid a certain share of the profits of the clubs to which they respectively give encouragement.

A bitter feeling exists between the two organizations. The Brotherhood of Players accuse the League "magnates" of forcing them into a revolt by reason of unfair and un-American modes of oppression in their club rules and regulations. On the other hand, the League officials allege that these rules were as much for the player's benefit as for the club's, and offer in proof thereof the fact that salaries under the workings of these rules more than doubled.

There was in every League player's contract for 1889 an option, called the reserve clause, which specified that if the club should "reserve" the player for 1890, it should be at a salary not less than that of the contract of 1889. The League claimed this to be an option. The Brotherhood players held that it was merely an option as to National Agreement clubs, and that they had a right to ignore it. Several law-suits grew out of the dispute. The New York club went into the courts and attempted to enjoin Ward and Ewing, two of their last season players, from playing with Brotherhood clubs, on the claim that they (the New York club) had a right under this reserve clause to the player's services. In both cases the courts decided against the club. Judge Wallace, in deciding the Ewing case, held that though the reserve clause was a contract morally binding Ewing to *negotiate* with the New York club for 1890, it was not such a contract that the club could enforce.



JOHN G. CLARKSON (League).
From a Photograph by Conly, Boston.

It is admitted on both sides that the war between the two leagues will be a bitter one —a fight to the finish—and that the result will be the survival, possibly not of the fittest, but of the most enduring. The people who simply love the sport, and care nothing for the dispute between the old magnates and the new, will watch the games with considerable interest.

Besides the National League and the Players' or Brotherhood League there are three other combinations or circuits of clubs, including the principal cities in the eastern or central part of the country.

The National League holds franchises and has established clubs in Boston, New York, Brooklyn, Philadelphia, Pittsburgh, Cincinnati, Chicago, and Cleveland.

The Brotherhood clubs are located in Boston, New York, Brooklyn, Philadelphia, Chicago, Pittsburgh, Cleveland, and Buffalo. Thus it will appear that in only one National League city and one Brotherhood city the two organizations do not conflict.

Then there is the American Association of Base-ball Clubs, which is comprised of clubs in Brooklyn, Philadelphia, Rochester, Syracuse, Columbus, Toledo, Louisville, and St. Louis.

The Atlantic Association embraces a circuit composed of clubs in the cities of Baltimore, Wilmington (Delaware), Hartford, Newark, Jersey City, New Haven, Washington, and Worcester.

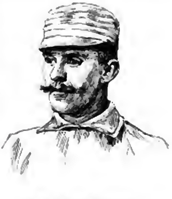
The Western Association has clubs in Minneapolis, St. Paul, Sioux City, Des Moines, Omaha, Kansas City, Denver, and St. Joseph.

There are also minor professional organizations, such as the Texas League of Clubs, in the larger cities of Texas, the California League, the Tri-State League, the International Association, and a number of others of lesser interest.

The reader will notice that, with the exception of the antagonism between the Brotherhood League and the National League, these various organizations do not conflict in territory except in the instances of Brooklyn and Philadelphia, where the National League and American Association occupy common territory by agreement.

It was this comity in business which of recent years made base-ball so profitable not only to clubs, but to professional players. The whole system is controlled and governed by a set of common base-ball laws, called the National Agreement, to which every professional base-ball organization of clubs in the country has subscribed, and is held bound except the Brotherhood League.

The supreme court to which all appeals are made in disputes between clubs of different organizations under the government of this National Agreement Confederation is a Board of Arbitration, consisting of three delegates from the National League and three from the American Association. The other leagues and associations enjoying the protection of this base-ball Magna Charta are qualified members, and while they are entitled to representation in the board, their representatives have no vote. The board has legislative as well as judicial powers. It has sole right to amend the National Agreement, repeal any part of it, and make changes or additions from time to time. The writer of this article had the honor of being a member of the original committee which formulated the tripartite agreement, and was secretary of the first Board of Arbitration. To Mr. A. G. Mills, of New York, base-ball owes the conception of that great instrument which has done so much for the game.



JOHN M. WARD (Brotherhood).
From a Photograph by J. Hall, Brooklyn.

Before the National Agreement was formed for the confederation of leagues and associations, clubs preyed upon each other's players, and the least show of financial success made by a club in any city would at once call out rival or competitive clubs, until all were bankrupt, and the result would be a suspension of the game at that particular point for years. In this state of affairs there was no permanent value to a club's interests, and capital was very shy when asked to back up the game as a financial speculation.

Thus we see that the famous Red Stocking Club, of Cincinnati, in 1870 was completely thrown out of business and disrupted by the Boston and Washington clubs taking their favorite players for 1871. Instead of continuing to have the champion team of the United States, Cincinnati had no club at all in 1871, and no team. Neither was there another club organized in that city until late in 1875.

So, too, in Boston. When in 1875 the Chicago club took from the Boston club four of their famous players in the middle of the season, the pride was taken out of Boston patrons, and the club's business declined for several years, during which time instead of making money, it fell away to a total loss of nearly fifty thousand dollars.

Another evil from this unrestrained competition was the constant changing of players from team to team. And as it requires

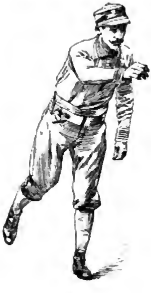
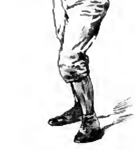
fourfold, and the number of players in the same proportion, but it has increased base-ball players' salaries from a maximum of $2500 to $6000 for seven months' service, and increased them *on an average* 200 per cent. As instances, note these cases: Ewing, the catcher, came to the New York club in 1883 for $3000, and last year received $5000, with a bonus of $1000 additional. Ward, the shortstop, played his first month in New York in 1883 for $75 a month, and last year drew $600 a month from the same club. Carpenter, the third base-man, went to Cincinnati to play in 1882 at a salary of $800, and this year he was engaged for $2300. These men play no better now than they did in 1882, but the prosperity of their clubs in business has been their prosperity as well.

Notwithstanding all this advancement in their salaried interests, many players of the National League began to chafe at some of the rules which the club officials made to control them. There was really no well-defined objection to the reserve rule, for the thinking players believed it benefited the profession generally for the reasons above given. But they objected to the practice of clubs selling their releases to other clubs; to the classification of the players into grades, to which certain set salaries attached; to the article in their contracts which permitted the club to discharge them after ten days' notice. A Brotherhood had been formed among the players, including all the National League players but about ten or twelve. Last summer, some time in June, when the championship season was at its height, the leaders of the Brotherhood drew up a bill of their grievances to be presented to the League. A committee of the Brotherhood called upon A. G. Spalding, of the Chicago Club, who was chairman of the League Standing Committee on Conference, and presenting their case, asked for an immediate answer, looking toward a correction of the aforesaid wrongs before the season of 1889 should close. Mr. Spalding, for the League, refused to break through that organization's established custom by "swapping horses while crossing a stream." He, however, assured the committee of players that as soon as the championship season was ended their request would be respectfully considered, equitably adjusted, and everything made satisfactory to the Brotherhood before contracts for 1890 were presented for signatures.

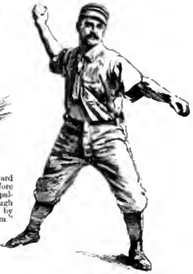


A. WEYHING (Brotherhood).



JOHN A. McPHEE (League).

rhood).



E. N. CRANE (Brotherhood).

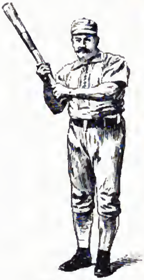
The leaders of the players, however, were not satisfied, and the most radical of them urged a general strike the day before July 4th—the big day of the year in base-ball financially. The cooler-headed men, however, prevented this proposed action. On July 14th a meeting of Brotherhood delegates was held at the Fifth Avenue Hotel, in New York city, and it was then and there resolved to cut loose from the League at the end of the season. Members from each chapter were delegated to secretly look up "financial backers" in the various cities, and report later on.

The consequence was that on the seventh day of September, and a few days about that period, the members of each chapter of the Brotherhood (or most of the members) signed an agreement to "strike" in November following, as soon as the championship season ended. Meanwhile financial backers in each League city were carefully selected, secured, and, together with the players, sworn to secrecy. The secret was so well guarded that though the plan was laid and perfected nearly three months before their contracts with the League terminated, there was no word of suspicion uttered to warn the club-owners until about October 1st. Even then the players, one and all, vehemently denied that there was an agreement to capture the business of the League.

The plan only partly succeeded. The belief of the leaders had been that they could take every player with them, and thus compel the dismantled League clubs to go out of business. But about one-third of the best players refused to desert their clubs, declaring that they understood, when they signed the agreement in September, that no revolt was to occur unless the clubs should refuse to grant certain requests, which they had been given no chance to consider.

This defection from the ranks of the Brotherhood players not only weakened their plan, but it left the National League clubs a nucleus around which to fortify and fight for the maintenance of their business interests. They proceeded to buy the releases of promising young players from contract with clubs of minor organizations under the National Agreement, and at the same time secured the membership of the American Association clubs in Brooklyn and Cincinnati, with their complement of fine players. The

Indianapolis and Washington clubs, members of last year's League, were bought out, and the latter fine team transferred for the most part to New York city. Thus the old clubs will enter the season as well equipped with stellar attractions as the Brotherhood clubs, and better prepared financially for the fight. The Brotherhood in the start challenged the League to a fight to the finish. The latter accepted it, and there is no "possible, probable shadow of doubt" but that one of the two organizations will in time have to surrender. Some of the cities occupied by both cannot possibly support two clubs, and an unbroken circuit of eight cities is always absolutely necessary in a financial sense.



DAVID ORR (Brotherhood).

It therefore follows that the season just opening will be the most exciting and the most important in the history of the national game.

Herewith is a full list of the players who constitute the teams of the various clubs of the League and the Brotherhood at the time this is written:

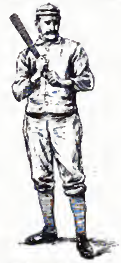
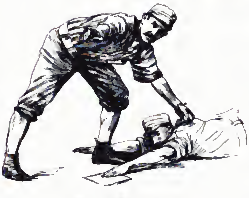
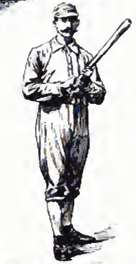
A DIVE FOR SECOND BASE.



JOSEPH MULVEY (Brotherhood).



THOMAS E. BURNS (League).



S. L. THOMPSON (League).

The desertion of so many of the old players from the National League teams has opened the way for the advancement of a considerable number of younger experts who have hitherto lacked the opportunities to advance themselves to the front in professional ball playing. The season of 1890 will then be the more interesting because these new candidates for popular favor are to have a chance to win their laurels on the ball fields in the large cities.

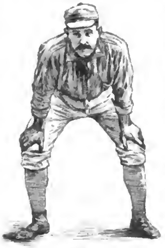
Among the new players are quite a number of college men. The New York club has three of them in its team—young men who respectively have been students of Harvard and Hamilton colleges, and Brown's University. Of the older players, Hutchinson and Bassett are the most notable as college graduates.

Probably no other player at this

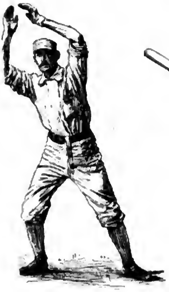
mirers who know him professionally are scarcely less numerous than his friends who know him socially. What Ross Barnes was to base-ball in 1876 John A. McPhee is to it to-day.

Jeremiah Denny, of the New York club, has no rival as a third-base-man. He is a Californian, but has lived so long in the East as a professional that the Pacific coast can hardly claim him. Denny, besides being able to play his base—the most difficult of all on the in-field—more skilfully than any of his rivals, is a heavy, sure batter, and a fair base-runner.

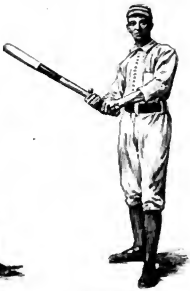
John W. Glasscock, of the same club, is acknowledged to be without a successful rival as a short-stop. His wonderful stops, "pick-ups," and quick throwing to bases are considered among the marvels of base-ball playing. By trade Mr. Glasscock is a ship-carpenter, and the fact that he receives twenty dollars a day for playing ball during the summer does not prevent him from earning more moderate sum in wages during the winter by working at his trade.



ROGER CONNER (Brotherhood).



JOHN G. REILLY (League).



D. L. FOUTZ (League).

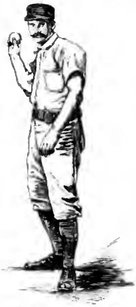
in skill to Glasscock as a short-stop
Montgomery Ward, leader of the
ood, and captain of the Brooklyn
ood club. Mr. Ward is called a
layer, whose quick wit and ready
t have served him well in play. He
a fine base-runner.
the out-fielders such men as Tier-
mpson, Corkhill, O'Brien, Wilmot,
lliday, Hanlon, and O'Neil are no-
rers. All with the exception of
re also good batters.

The championship season of the National League began on the nineteenth day of April, and will close on the fourth day of October. In the Brotherhood the season opened also April 19th, and closes October 4th. The rules of the National Agreement prohibit any of its clubs from playing a game with the Brotherhood clubs, because the latter contain players who have become ineligible by reason of having signed National Agreement contracts, and repudiated their alleged obligations under them. There will consequently be no test of strength between the winners of the two championships. But next fall the champion club of the National League and the champion club of the American Association will play a series of games for the "championship of the world," as has been the practice for four years.

In concluding, it might not be amiss to note the tremendous strides professional base-ball has taken during the last fifteen years, until it has become an established business all over the United States. There are at this time about one hundred professional clubs banded together under the National Agreement. These one hundred clubs give employment to about fifteen hundred players, whose average salary is perhaps $1000 a season, making a total amount paid in salaries of $1,500,000. Besides the National Agreement clubs there are the eight Brotherhood clubs, embracing about one hundred and twenty players, whose salaries will aggregate $250,000, swelling the grand total to 1620 players and $1,750,000 in salaries.

These clubs during the season will travel about 450,000 miles by rail. Each club will carry from twelve to sixteen men in their journeying around, which means railroad tickets representing 6,300,000 miles. At an average of 2½ cents a mile, the cost of travel alone, not including sleeping-car accommodation, will be found to amount to something like $157,500—quite a neat drop in the earnings of the American railroads.

There is another class of business which profits from this base-ball playing—the hotels.



JOHN W. GLASSCOCK (League).

During one-half of the playing season, about eighty days of each year, every club has its team on the circuit, and the players are for the most part quartered at the very best hotels. Not less than $200,000 is spent in this way among the various hotels in cities which support base-ball clubs. Probably $100,000 would be a small estimate of the rents paid by the clubs for their grounds, and certainly $200,000 would not more than pay the miscellaneous expenses, such as sleeping-car fares, carriage hire, advertising, salaries of ground employés, treasurers, and gate-keepers, and the purchase of supplies.

Add it all together, and you will have nearly two and a half-million of dollars paid out by professional base-ball clubs each year. It is not unlikely that these figures are too small to be correct, nor is it a hazardous guess to say that the profits of the whole season among all the clubs, over and above expenses, will reach a quarter of a million of dollars. Then we find the American people paying each season $2,750,000 for their amusement in base-ball. Three spectators, on an average, will represent a dollar. So that we have a total attendance during the season of about eight millions of people. Divide this up into one hundred and thirty playing days, and you will arrive at the conclusion that the average daily attendance in America on base-ball games where admission fees are charged is over fifty thousand. This season, I believe, it will exceed sixty thousand.

It is not an unreasonable estimate to say that every day during this summer five million Americans will examine the columns of their favorite newspapers to see the result of the professional base-ball games of the previous day.

NEARLY READY.

THE CAPTAIN OF THE JANIZARIES. A Tale of the Time of Scanderbeg and the Fall of Constantinople. By James M. Ludlow. pp. iv, 404. 16mo, Cloth, $1 50. (*New Edition.*)

Stirs the blood in our veins.—Rev. Henry M. Field, D.D.

This book is a masterpiece.... It will run a good race with "Ben-Hur."—The late Rev. Daniel Curry, D.D.

A straightforward romance, written almost in the great manner of Scott. As a story, it is absorbingly interesting from first page to last.... It is full of the warm-blooded, healthful life of the age of deeds—a quality which cannot be too highly prized in any age of words.—*Dial*, Chicago.

YOUMA. The Story of a West-Indian Slave. By Lafcadio Hearn. pp. vi, 193. Illustration by Howard Pyle. Post 8vo, Cloth, Ornamental, $1 00.

There are wonderful descriptive passages, with all those weird touches characteristic of the author, who says things as no one else is able to say them, and the studies of human life are no less skilful. Where all is so good it is impossible to point out that which is best, whether it be that vivid, dramatic scene where Youma stands with her heel upon the serpent's neck, or the charming prattle between the *da* and her nursling concerning those marvellous stories of "Dame Kélément," of the proud girl who married a goblin, and of the Zombi bird whose feathers were colored "with the colors of other days." But there is a certain monotony in commenting upon Mr. Hearn's writings. One finds nothing to utter but words of praise.—*New Orleans Times-Democrat.*

NEWSPAPER LEADERSHIP.

MR. CLARKSON, the Assistant Postmaster-General, said in his late speech at Pittsburgh that in our political contests the intellectual discussions of the press are superseding the mere spectacular demonstrations of red lights and rockets and processions, and that the campaign of 1892 will be largely a newspaper campaign, which has already begun. He proceeded to speak of "the marvellous manner" in which the Democratic party has been strengthening its lines in the newspapers and the magazines:

> "In the large cities of the East they have captured nearly all the magazines and illustrated papers. All the mercenaries of the press and literature have been lured into their service. The reinforced Democratic press is a startling thing for the Republican party to face, and it must face it with courage and wisdom. In New York city 1,400,000 copies of daily newspapers are printed daily. Less than 200,000 of them are Republican. This means that two-fifths of the Republicans of New York city and environments are reading Democratic papers, taking the Democratic version of things, and the young people of the households being educated unconsciously against the party of their father. I would not abridge the latitude of discussion or reading, but it is important that young people should at least read their own side as well as the other. In Boston the papers of greatest circulation are also Democratic. New England has largely gone from the faith of the days of the war in its newspapers. The same is true of nearly every large city in the country.
>
> "Democracy has also pressed its conquests to the agricultural press, and in the last three or four years many of the farmers' papers in the West have become advocates of free-trade. It was largely through this line and that of the Farmers' Alliances that the Democrats first based their claim that the Northwest was for free-trade and changing to the Democratic party. Even as good an organization as that of the farmers was utilized, and Farmers' Alliances established systematically, with all the Democrats and all the weak-kneed Republicans in the neighborhood gathered into its folds. Then they were supplied with free-trade literature secretly and constantly. Such a propaganda has never been known in America as that of the Democrats in their hunt in secret, and through a changing press, in behalf of free-trade in the West to-day, and I submit to you as Republicans that it is time for our party to take notice of what the opposition party is doing by increasing and strengthening its press."

This is a striking and suggestive statement, and in substance it is undoubtedly true. But Mr. Clarkson is not quite accurate in calling the change Democratic in a partisan sense. It is not that, and the fact that it is not is as important as any that Mr. Clarkson mentions. The significant phenomenon is not the increase of the Democratic press, but the rise of the independent press. Thus in New England the three powerful papers of the day are the Boston *Herald*, the Providence *Journal*, and the Springfield *Republican*. They are all representative of the tendencies of New England sentiment since the war, and their influence is commensurate with their ability. But they are not Democratic papers. They do not advocate tariff reform and ballot reform and civil service reform because those measures are Democratic measures, or because the papers themselves are Democratic partisans. They advocate them solely upon their merits, and they are as willing to credit the progress of those reforms to one party as to another. Moreover, they criticise the acts of parties and the conduct of politicians without regard to party names or to any party preferences of their own. Not one of them will be governed in its support of a Presidential candidate in 1892 by the mere fact that he is nominated by the Democrats or by the Republicans. They will support the candidate of their choice solely because his success will seem to them to be the surest guarantee of the adoption of the policy which they approve. But in that decision personal character and various probabilities would be essential elements, and they would say with Mr. Charles J. Bonaparte, "I shall always vote against a party professing my views as to the tariff if I believe that in so doing I shall, on the whole, promote the cause of honest government and pure politics."

All this, which is both undeniable and in character and extent unprecedented in our politics, suggests something which Mr. Clarkson did not mention, and which probably he has not considered. The position and prosperity of these three representative papers in New England, each in a different community, implies a corresponding public sentiment which supports them. It means an immense independent public opinion in accord with them, and as the regular party majorities in the neighborhood of these papers are small, it means a balance of power. This is the happiest sign of the times, because it is a balance held in exceedingly intelligent and honest hands, and the necessary consequence is moderation in party action. Party organs and orators are very fond of insisting upon the necessity of parties, and are very profuse of sneers at jayhawkers and skirmishers between the lines. But every sensible man must feel that it would be much worse for the country if New England were all divided strictly into two parties, with no check upon the excesses of either. As long as identification with a party means support of every measure or candidate approved by a party caucus or convention, the host of independent citizens who will decline to bear a party name will constantly multiply. The favorite shibboleth of strong partisans, "Reform within the party," is unmeaning, because reform is possible only by opposing to the last the thing to be reformed. Effectual reform lies in defeat of the measure that ought not to be adopted and of the candidate who ought not to be elected. This is the spirit of independence in politics which Mr. Clarkson sees to be rapidly extending, and which, because it is often arrayed against the excesses of the Republican party, he supposes to be a new birth of the Democratic party.

A FIELD-DAY.

Civil service reform is greatly indebted to Mr. Cummings, of New York, and Mr. Houck, of Tennessee, for bringing the House of Representatives to book upon the question. The result was, on one side, a defense of the spoils system, which was equally remarkable for the amusing and threadbare feebleness of the argument and the absence of leading men from the group of advocates; and, on the other, for the surprisingly unreserved and positive adhesion to reform of the real leaders of the House, and a vote in favor of the appropriation of 120 to 61. If, as Speaker Reed said at Pittsburgh, politicians are only eleventh-hour men, who vote as they are admonished by public opinion, and, as is constantly alleged by the spoilsmen in Congress, if members voted as they wished they would repeal the law, the orators and the vote in the House are conclusive of the belief of members in the general approval of reform.

When Mr. Jenckes, a Rhode Island Republican, first began the agitation in the same House twenty years ago, the proposition was too airy and incredible to provoke much serious debate. It was a question wholly new to the country and subversive of the accepted customs and what were held to be the vital conditions of party efficiency. It was evaded and bowed aside, and after some polite deference to General Grant's recommendations, he said that if Congress refused the appropriation he should interpret it as a verdict against reform, and Congress took him at his word. Again, in the summer of 1882, there was great Republican sport over the measure in the House. The admonishing thunder of the Congressional elections of that year followed, and, with that sound in its ears, upon its reassembling Congress could hardly wait to pass the reform bill, which became a law on the 16th of January, 1883. The fight of the spoilsmen then began. In every possible way they have sought to discredit, to evade, to stultify, and to repeal the law. They felt especially confident that the favorable moment had now arrived. They wound the bugle call of assault. But after a most sorry array of recruits and display of wooden guns, the Republican leader of the House, supported by other Republican and Democratic chiefs, said

> "that if the Republican party was pledged to one single thing more than another, it was the maintenance of the civil service law. Every national platform of the Republican party for the last twelve years had declared for the continuance and enlargement of the merit system. It was not only according to the tenets of the Republican party, but according to its best sentiments. Ay, more, it was sustained by the best sentiment of the whole country, Republicans and Democrats alike; and there was not a man on the floor who did not know that there was not a party in the country, Democratic or Republican, that had the courage to repeal the law. The Republican party must take no backward step. The merit system was here, and here to stay."

Such are the revenges of time. Mr. McKinley's personal character and his position in his party give the greatest weight to these words. His colleague Mr. Butterworth; Mr. Cutcheon, of Michigan; Mr. Moore, of New Hampshire; Mr. McComas, of Maryland; Mr. Lodge and Mr. Greenhalge, of Massachusetts; Mr. Hopkins and Mr. Hitt, of Illinois; Mr. Henderson, of Iowa; Mr. Lehlbach, of New Jersey—all spoke strongly for reform. The result was a ludicrous rout of the spoilsmen. The appropriation was adopted by 120 votes to 61, and although it was not all which the Commission asked, it was an increase of $8000 over the present grant, and an addition of five clerks to the force. That public opinion would have justified the $53,000 asked for we have no doubt, and that the action of the House will be approved is unquestionable. The moral effect of the result will be most salutary. It assures the country that the law will stand, and more definitely than ever it commits the Republican party to the reform as a party measure. The remarks of Mr. McKinley and those who spoke with him were in effect a stern rebuke of the administration, and almost while the Republican leader was saying in Congress that reform was sustained by the best sentiment of the whole country, and that the Republican party was pledged to it, the Republican Assistant Postmaster-General was saying in Pittsburgh that the people did not believe in it, and that it had no American sympathy. Yet if anything may be called truly American it is the fair play for all comers which the spoils system of Mr. Clarkson absolutely denies, and which the reform secures. Members of Congress may not like it, but they know that the country does like it, and they vote accordingly.

BOODLE.

The profound interest in the story lately told by McCann under oath to the legislative investigating committee in New York was due to the fact that it put into definite and detailed statement the corrupt methods which are believed largely to control our politics. The story, in effect, was that Richard Croker showed McCann in 1884 a sum of $180,000 which had been subscribed to buy of the Aldermen Hugh J. Grant's confirmation as Commissioner of Public Works, Grant himself contributing $80,000; and also that, under the form of gifts to Croker's daughter, Grant gave $25,000 to Croker as a share of the fees of the Sheriff's office, and when the investigation was coming and Croker left the country, that an effort was made by Grant to persuade his wife, who knew a great deal of the transactions, to follow him. Mayor Grant instantly denounced the story as a lie, and Mr. Croker telegraphed from Europe his denial in similar terms. But instead of demanding immediate investigation by the committee, the Mayor accused it of practical complicity with McCann, and asked the Senate for another committee, which is both an insult to the Senate and a sign of fear of cross-examination. Whether true or false, the fact that such evidence was given involving the chief magistrate of this city, and that it was not instantly and indignantly repudiated by the press and public opinion as false and impossible, and that the revelations in regard to the dishonesty of the Sheriff's office when occupied by Mayor Grant were of a character so startling, is most humiliating.

Even if the testimony of McCann shall be discredited and shown to be false in the specific case, there is no doubt that it describes the methods of city politics. There is no question that Aldermen were bought in the Broadway boodle cases, and if anybody supposes that Tammany would hesitate to do what McCann charges, he differs from public sentiment in general. Nor is the corruption limited to city politics or Tammany Hall. That there were large corruption funds raised and expended during the last general election is well known, and that there is no more radical and threatening danger to free institutions is also a familiar fact. The situation becomes more menacing when the chairman of the National Committee of the party of administration, which claims especially to be the party of honest politics, is published through the country, with details of evidence, as a man who was pecuniarily dishonest in office, and who is defied to bring a suit for libel in the courts. The matter becomes still more serious when the organs of his party are generally silent or attempt a feeble denial, and party committees without explanation extol him as blameless. This is a kind of offence of which public opinion in this country is not long tolerant, and if the situation remain as it now is, and the Republican party go into the Congressional elections of the autumn with the charges against Mr. Quay unexplained, there will be a national reckoning similar to that of 1882.

It is pleasant, in the midst of the public disgrace of the revelations in the city of New York and the Quay scandals, to remark the courage and plain speech of the independent press, and of such eminent citizens as Mr. Henry C. Lea, and the swift and steady growth of the demand for ballot reform and reform in the civil service. They are both practical measures of relief from the peril of which every intelligent citizen is conscious. Their enemies are the very adepts and beneficiaries of corruption who are now being exposed. The whole Tammany system, to which the Quay scandal also belongs, is a conspiracy against popular government and the nursery of dishonest politics. It is absurd for Republicans to denounce Tammany and to be dumb over the Quay accusations, or for Democrats to shrug regretfully at the Tammany disclosures and to inveigh loudly at the corruption of Quay. Rascality on one side does not condone knavery on the other, and when the practical choice is between a thief and a forger, honest men will choose neither. The disclosures now made public will be of the highest service.

THE POSTMASTER-GENERAL'S CIRCULAR.

The Postmaster General has issued a circular to the postmasters and employés of the Department, in which he cites in full the letter of President Cleveland, dated July 14, 1886, against the political activity of postmasters. Mr. Wanamaker adopts the suggestions of the letter as his own, and exhorts the postal employés to diligence and courtesy and entire non-partisanship in the discharge of their duties, and forbids the postmaster from installing himself as "the manipulator of the political affairs of his own party."

This is what the postmaster has been in the larger part of the smaller offices, and this is what he has been appointed to be. One of the shrewdest politicians in New York frankly owned, what was known to be the fact, that the country post-offices were the local party head-quarters; and all that many communities which had voted for Mr. Cleveland asked after his election was that the postmasters who had been the most obnoxious of partisans, handing out Democratic newspapers to their subscribers with sneering comments, and in every way making themselves repulsive to party opponents, should be dismissed.

But while the Postmaster General issues this circular he might wisely reflect that it is his Assistant who makes it necessary. When men are made postmasters because they are the local manipulators of the political affairs of their own party, they are not likely to stop the service for which they have been rewarded. Mr. Cleveland's warning was made necessary by the fact that postmasters were appointed even under his administration because they were obnoxious—that is, positive and aggressive partisans. That is Mr. Clarkson's rule of selection. But if postmasters were appointed only when there was an honest vacancy by death, resignation, inefficiency, or dishonesty, and only because they were fitted for the place and likely to treat everybody courteously, there would be no need of such circulars.

BALLOT REFORM IN NEW YORK.

The ballot reform bill, as passed unanimously by the Legislature of New York and signed by the Governor, is not the complete bill that was anticipated, but it is a great advance upon the present system of voting. The new law provides the official ballot, removes the excuse for assessments, and secures the secrecy of the vote. Pasters may be taken into the booth and used. But there is no method of knowing whether they have been used. This provision may be doubtless abused. But if it does not prevent bribery and coercion altogether, it makes them much more difficult.

A very important result secured by the bill is the facility with which independent nominations can be made. Five hundred voters can obtain a supply of tickets for State officers upon whom they agree, and fifty for municipal candidates, except in New York and Brooklyn, where three hundred can have them placed upon the ballots. This removes at once the enormous labor and expense which have prevented movements to withstand the party machines, and enables honest citizens to combine easily and successfully against professional politicians.

The adoption of such a plan of voting shows the determination to deal with the political corruption which is now being exposed, and which our present election system fosters and protects. The approval of the bill by the Governor would show the force of public opinion, for, however imperfect the law may be, it will work unquestionably a reform which the Governor does not like, and which is naturally repugnant to his school of politicians. Happily it is one which the most intelligent and patriotic citizens everywhere desire.

"LABOR'S" MAY-DAY.

Bismarck seems to have been correct—that trouble which is carefully announced in advance is not to be apprehended. The universal expectation of great trouble in all the chief cities in Europe on May-day was not fulfilled, although there was some bloodshed in Paris and Pesth. It may have been due to the military preparations which were known to have been made, and which would not have been made in vain had occasion arisen. The peaceful result may be explained also by the fact that the actual design was much less comprehensive and definite than was stated, and also to the vague and unreasoning anticipation which always attends a very obscure situation.

The movement of "labor" is complicated with various degrees and kinds of Socialism, from nationalism to anarchy, and it is always exposed to the incursions of mere criminal rioters and agitators. The organization of men who live by wages is instinctive, and its immense extension is a fact to be dealt with, not denied. There are great honesty of purpose and perfectly lawful intentions in such organizations, but they are liable to be overpowered by visionary and unscrupulous leaders.

In the old French cry of liberty, equality, and fraternity it was the equality rather than the liberty which was desired; and yet American equality, or what we know as equality before the law, and an equal right of independent individual choice, is the only possible equality. Equality of condition, which is the Socialistic aim, is no more possible than equality of ability or physical endowments. So far as the movements of "labor" fall under the control of this kind of Socialism, they cannot succeed, for the same reason that a man cannot lift himself by his waistband. But when they involve a measure which the government has approved, like the eight-hour day, it proposes an arrangement about which there can be argument and amicable deliberation.

CONGRESSIONAL ELECTIONS.

Speaker Reed's speech at Pittsburgh, with the bill of Senator Hoar and that of Mr. Lodge, shows the purpose of the dominant party to assume national control of Congressional elections. There is no doubt of the constitutional power to do this. But the speech of the Speaker shows the motive of its proposed exercise to be wholly partisan. The local control of elections, which is peculiarly agreeable to our whole political system, and which has become a cherished tradition, is to be overthrown in order to secure a partisan advantage.

The argument is that the Democratic party suppresses the Republican vote in certain States. The remedy offered is to secure a Republican majority by the power of the national government, acting through the courts of law. The result will probably be as much doubt as now as to the honest result of the elections, and the destruction of confidence in the courts. Already that confidence is shaken by the occurrences in Florida and the statements of the letter of the editor of the Jacksonville *Times-Union* to the President. The President virtually proclaims certain counties as obstructing the process of the courts. The editor replies with a statement of facts which, *mutatis mutandis*, recalls the situation in New England before the Revolution.

It would be very singular if the people in communities in which officers of the courts publicly announce their partisan character should retain respect for the courts or confidence in them. As we said in speaking of the Lodge bill, United States judges may be assumed to be as trustworthy as elected officers. But if the statements of the editor of the *Times-Union* are not disproved, that assumption fails in Florida. To intrust the control of elections to such court officers as the editor describes would be presumptive evidence of a partisan purpose, and the party which authorized it would have to reckon with the intelligence of every part of the country.

THE EIGHT-HOUR DAY UNDER GOVERNMENT.

The eight-hour movement is extending widely. Congress has decreed it for certain branches of the national service, and other branches naturally demand it. The post-office clerks wish to know why some of their associates should enjoy a day of eight hours' labor while they are compelled to hard and longer toil. Of course there is no other answer than that it would take a great deal of money to gratify their wishes if the compensation is to remain the same.

There is an annual deficit now in the postal service, and a day of eight hours with the present wages and a larger force would greatly increase it. The presumption is fair that the employés relieved from overwork would work more efficiently, and that the larger appropriation would result in better service. This is a rule which is as applicable in the post-office as elsewhere, and Congress can hardly logically refuse the request. There should be no favoritism in the public service, and if the day of one employé is eight hours, either that of others should be the same, or they should be paid for the over-time.

The adoption of the rule would largely increase the numbers of the service as well as the cost. But if the public is willing to concede to its employés a working day of eight hours, it is reasonable to suppose that the individuals of whom the public is composed will not refuse to do likewise. There is no doubt that many postal clerks, mail-carriers, and others are overworked. But they are aware that the government has no money except that which is taken from individuals in taxes, and the question which their request raises is one of very wide and general consequences.

THREE GREAT NAMES.

There is evidently no disposition to allow the birthdays of Lincoln and Grant to be forgotten, and, fortunately, unlike Jefferson's, they are celebrated in a patriotic rather than partisan spirit. In his speech at the observance of Grant's birthday in Brooklyn, General Woodford expressed the universal feeling which gratefully associates the three names Washington, Lincoln, and Grant. It is very remarkable that within a century a country should have had three such men to honor, and it is very doubtful whether any country within the same period can point to three such sons.

Washington and Lincoln were men of greater grasp and of more historic stature than Grant. But he had with them in an extreme national exigency a perfectly unselfish patriotism and the greatest magnanimity. It has seemed so natural to us that our chief leaders in great emergencies should be patriots that the fact does not occur to us as their praise. But history does not often repeat the story.

Washington lived to complete his work, and his public career is the most symmetrical known to us. To secure by arms the independence of a nation and fully to organize a wholly new national government is his distinctive glory. What influence Lincoln might have had upon the reconstruction of the Union we may surmise but cannot know. Grant's part in the work was perplexed by politics, but it was humane and generous. The commemoration of such men calls a truce to petty passions, and lifts us into the realm of the noblest patriotism.

PERSONAL.

Mrs. E. B. Custer, who has for the past two years made her home in what she calls that delightful old quarter of New York not far from Washington Square, has left the city for the summer already, and betaken herself to her country home at Stroudsburg, Pennsylvania, in the vicinity of the Delaware Water Gap. Here Mrs. Custer finds she can best do her literary work, uninterrupted by the many social calls that she cannot evade while in town. She tells with delight of the amount she manages to accomplish in her rural seclusion, and expresses her preference for such quiet to the charms of a more fashionable resort.

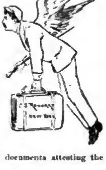
—The late Professor Mather, of Amherst College, will not only be greatly missed in the educational institution with which he was so long connected, but also in many towns and cities of western and central Massachusetts, where he frequently filled prominent pulpits on Sunday. A dozen years ago Professor Mather became greatly interested in the fine arts, and being made lecturer on sculpture, devoted much time and energy to gathering plaster casts for the college museum, which, under his care, became the most complete in the country outside of Boston.

—Mrs. James A. Garfield, who has been spending a few days with her daughter, Mrs. J. Stanley Brown, at Washington, called on the present occupants of the White House, the visit being the first she has made there since President Garfield's death.

—The seditious sentiments formed by Sergius E. Shevitch, the Socialist leader and editor of this city, and which were originally the cause of his leaving Russia, do not seem to have impaired the political standing of his brothers at home, one of whom is a member of the Senate at St. Petersburg, while another is Russian Minister to Japan. Family reasons have recently made it desirable for Mr. Shevitch to visit Russia, and the autocratic government of that country has given him leave to do so. It remains to be seen whether he will care to go.

—Charles Theodore, the Bavarian Duke, is a true philanthropist. He not only gives free surgical treatment to thousands of poor people, but spends $50,000 a year in maintaining his free dispensaries and hospitals.

—The Paris correspondent of the New York *Herald* telegraphs, under date of May 1st, the following interesting item: "Mr. C. S. Reinhart replied to the inquiry: 'I have nothing in the Salon, because I am en *route* to New York. My studio is packed, and I am on the wing,' sent with accompanying sketch."



—Bruno Gansel, of Chicago, has the sleigh in which Napoleon made his flight from Russia in 1812. It is an ancient and worm-eaten affair, little care having been bestowed on it of late years, and attached to it are three little silver bells. Napoleon rode in this vehicle to a little Silesian town, where he exchanged it with Gansel's father for a light travelling coach. Gansel has documents attesting the genuineness of the sleigh.

—Major Serpa Pinto has been appointed aide-de-camp to the King of Portugal, the zeal without backing which made a fiasco of his attempts at central African conquest not being regarded at home with the marked displeasure which the British lion seemed to think it should.

—In republican America it does not seem strange that Viscount Hampden, ex-Speaker of the British House of Commons, should have gone into the retail provision trade, but few would probably appreciate the privilege of buying goods stamped with a coronet. Eggs may become addled and butter attain strength even under so pretentious a trade-mark.

—*A Cyclopædia of the Manufactures and Products of the United States*, just published by the Seeger & Guernsey Company, of this city, furnishes a very impressive reminder of the rapidly growing desire to bring the country into closer relations with the republics of South America. The book is primarily intended for the convenience of buyers of American goods in Mexico, and Central and South America. It has received the warm endorsement of delegates to the late International Conference, and of President Diaz, of Mexico as a valuable aid to the formation of closer commercial relations between the United States and its neighbors to the south. Every article of any consequence manufactured in the country has a place in its columns, accompanied by the names and addresses of the leading firms engaged in making it. The method of arrangement and classification leaves nothing to be desired, and it is probably the most complete vade-mecum for buyers, home or foreign, yet issued in the United States. It will be revised from year to year with each annual issue.

THE GRIDIRON JUMP, AN EPISODE OF SPORT IN BRITISH INDIA.—[See Page 367.]

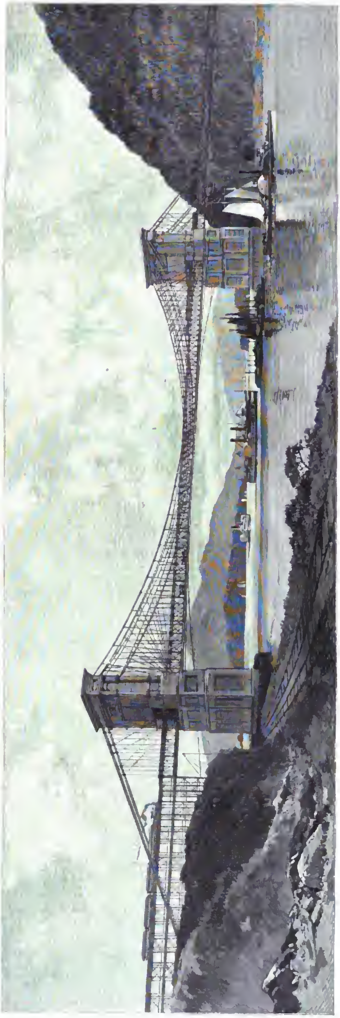
THE HUDSON SUSPENSION BRIDGE.

A SUSPENSION BRIDGE across the Hudson River is now in course of construction just above Peekskill. The locality is a historical one, the eastern end of the bridge being at Anthony's Nose, and the western end resting on the site of old Fort Clinton, which was the scene of many encounters during the Revolution. The bridge will span the river without piers, abutments, or obstructions of any kind in the waterway, and will offer no impediment to navigation. The records of the Navy Department show that the highest mast that ever passed Fort Clinton measured 113 feet above the water, and by reason of the elevation of the ground on either side the bridge will exceed the height fixed by law, and will afford a clear headway of 163 feet above high tide. One span, 1620 feet in length, will cross the river, and the towers, 327 feet high, will have a base of granite masonry standing upon the solid rock on either side. The towers will have the appearance of granite, but in reality they are made of steel in skeleton form, and are incased in the manner of an iron house front. A girder thirty feet in height and forty feet in width will extend from tower to tower, and passing through will connect with the hill-sides at either end—a total length of 2850 feet. The girder will be held by twelve cables, composed of 954 strands; 61 wires—each wire 0.160 of an inch in diameter—making a strand. Two hundred and twenty-five thousand pounds to the square inch of metal will be the tension resistance. Thirty thousand miles of wire will be used in the construction, the wire being particularly strong and of great toughness. Twelve cables will extend from the towers on either side, eight of which will be parallel to and over and on each side of the trusses of the girder, and their curves will be in four vertical planes. The remaining four cables are to be two and two in the same plane, this plane to be so inclined to the horizon that while they are but 40 feet apart in the centre of the bridge, at the tops of the towers the distance between them will be 124 feet. They will not only help to carry the weight, but will act as a horizontal bracket or cantilever to prevent lateral motion. Technically this is called cradling the cables. From the saddles near the tops of the towers, the backstays, which help to carry the land spans of the great girder, will run to the anchors at such angles as to make the lines of force vertical, and directly through the central plane of the towers.

The engineers have profited by observing the defects in other bridges, and in that way have made many new and improved features which will add greatly to the stability of the bridge. A system of wind-gauges, independent of the cables, is to be provided with apparatus to compensate temperature strains. Double-track railways of standard gauge will occupy the upper deck, and the lower one will have a roadway and foot paths for local traffic.

Every piece of metal, however small, used in the construction will be so placed that it can be inspected and painted at any time, and removed and renewed if necessary. This is a feature possessed by no other bridge, but which in this case allows the substitution of anything of metal, even to the little wires in the strand, without disturbing in any way the traffic of the bridge. A safe working load for the river span will be 6500 tons, while for the whole bridge 10,970 tons will be within the limit of safety. From the western end of the bridge the railroad tracks will extend to Turner's Station on the Erie road in one direction, and southward to New Jersey. From the eastern terminus the railway line will extend to the Connecticut State line by way of Somerstown, from whence the New York and New England Railroad will carry the line to Brewster's. The western extension necessitates the construction of a tunnel about 5000 feet in length through what is known as Bull Hill, by which the grade is reduced to thirty-seven feet to the mile. The tunnel in itself is a large undertaking, and a great force of men are at work upon it and the bridge towers, under the direction of General Edward W. Serrell, the chief engineer. The entire work will be finished within two years, and the completion will inaugurate a new departure in railroad affairs. The New England railway system will be brought into direct connection with the trunk lines of the West and North and Southwest, and will open a new all-rail route to the coal fields. A number of traffic contracts covering a period of fifty years have been made with the great railroad companies, who are in favor of the bridge scheme, and recognize its advantages.

At the present time the towers are in course of erection, and all the steel-work which is being prepared in the shop will be received by the engineers in such shape as to be immediately placed in position.



THE HUDSON SUSPENSION BRIDGE IN COURSE OF CONSTRUCTION NEAR PEEKSKILL, NEW YORK.—DRAWN BY CHARLES GRAHAM.

KIT.

BY JENNY L. HOPKINS.

JERRY HUNTLEY'S grimy old clock, with the Father of his Country in a scarlet waistcoat and mouse-colored knee-breeches for a frontispiece, had just lazily chimed the hour of five. The aforesaid old gentleman was considerably the worse for wear, having received in the course of his long and useful career a gaping wound, which had nearly proved fatal, and through which could be distinctly traced the workings of his interior mechanism. The little children who came to the Cross Roads store with buckets of butter and baskets of eggs used to wonder vaguely at the internal arrangements of General George Washington, which consisted apparently of two brass weights and several tiny cog-wheels. It was the only portrait of Washington in the neighborhood, and it never occurred to them that that gaping wound had not been designed by art instead of having been inflicted by the handle of a pitchfork, as it really had been by Dick Bowser, Jerry's clumsy clerk, who invariably brandished a rake, a hoe, or a pitchfork precisely as if it were an implement of war.

The clock, which had gone into business with Jerry nearly half a century before, had always occupied a position of honor on the shelf next to the top one, where the dignity of General Washington was upheld by a rough cleat, the fastenings in which were of such a spike-like variety that one might easily have fancied the dear old man in the light of a martyr nailed to the stake. A miscellaneous assortment of agricultural implements occupied the top shelf, and it was while occupied in storing away the annual supply of these homely utensils, nearly a dozen years before, that Bowser had broken General Washington's leg and cruelly exposed his interior structure to the world. Jerry Huntley often said that nothing in the store was ever safe when Bowser was around. His very presence seemed to inspire a general insurrection among the motley array of goods with which the store was packed from floor to ceiling. Molasses and coal oil, butter and gin, codfish and onion sets, mingled their vociferous odors in clamorous unison when Bowser was there to mislay stoppers and leave off covers.

Regularly on the first of every month, when Jerry paid him his salary, his employer never failed to tell the awkward fellow that he had broken as much crockery within the last four weeks as his wages amounted to; but, for all that, Bowser had been at the store for over twenty years, and was likely to remain there twenty years longer.

"Dick Bowser's no airthly 'count in the store," the old man used to say, as he sat smoking his pipe with a few choice neighborhood spirits of an evening, "but he 'ain't got his beat in this country for hucksterin'. Why, the wimmen save up all their truck fur him fur twenty mile roun'. Ye couldn't git 'em to sell it to nobody else. Jim Lane, him that keeps store over to Weepin' Willer, he tries sendin' out a waggin every spring, but, law, 'tain't no use. Ye see, Bowser's got the inside track with the wimmen. I dun'no' how he gits it. The Lord knows he's little 'nough 'count roun' here."

Now, between you and me, the truth was that Dick Bowser had a very kind heart, and that was one great reason, perhaps—Jerry Huntley having another—that the latter had kept him so long. On the afternoon in question, a midsummer afternoon it was, the clock having just struck five, Jerry Huntley, having nothing else to do, was sitting on a bench that ran along a platform in front of his store. He was a big, fleshy man, whose ample girth and smoothly shaven face made him a conspicuous figure among the farmers of the settlement, most of whom were heavily bearded, and more or less meagre in point of flesh, the vigorous exercise in which they indulged being rather more conducive to taking flesh off their bones than to putting it on. Moreover, Jerry was bald, and his eyes, which were small and dark as sloes, had a way of shining like black diamonds when he was amused or interested. His attire consisted simply of two garments, a blue gingham shirt, and a pair of wide, baggy linen pantaloons supported by a pair of white knitted suspenders.

Jerry had been one of the first settlers at the Cross Roads, and was accounted a rich man, although there were certainly no external evidences of that enviable condition about the store, nor yet about Jerry's house, a low, rambling, one-story building, which stood in a wide, unkept door-yard a few feet in the rear. The store itself was a small, low structure adorned with quaint windows, which peered out upon the flat sweep of meadow and woodland lying beyond like so many small, curious little eyes. The hand of man never having been called into requisition, Nature had painted the Cross-Roads store in her own way, the result being those indescribable woody browns and grays to which imitative art has never attained. The shutters, which were an after-thought, still retained their original piny hue, and the door had Jerry Huntley's name marked across it in red kiel, which the storms of twenty winters had been unable to efface. Dick Bowser was responsible for that bit of ornate chirography. The first thrashing Huntley ever gave him—he had come to the store when but a small lad—had been for that same transgression; but the kiel Dick had used was of the variety known as "hard," and had scratched so deeply that it would never "out."

Inside, the store was grimy with the grime of years. Every time Dick Bowser swept and sprinkled, he only laid another stratum of hilly earth on the boards which composed the floor. The narrow shelves bulged with their weight of cheap dry-goods. Boxes and barrels were everywhere. A display of boots and shoes was artistically flanked on one side by a box of odoriferous codfish, and by an aggressive-looking mass of dried apples on the other. There was everything to be had at the Cross-Roads store. Even the mail came there once a week, and was obligingly dumped into a wash-tub, from which the inhabitants were at perfect liberty to fish out their own. The fact that they never helped themselves to anybody else's was due to an unwritten code of honor which was never transgressed.

It may readily be supposed that Jerry Huntley was not forced to spend the close of the long summer afternoon alone. The most infrequent visitor at any country store could tell you better than that. There probably had not been a day nor an hour for more than forty years that at least one horse had not been hitched at the long rack which stood at the side of the road, and oftener there were several. As for Solomon Perkins—old Sol Perkins, the neighbors called him, without meaning the slightest disrespect; in fact this was rather a term of endearment than otherwise—it had got so of late years, they said, that he never left the store except at meal-time, and then not always, for Jerry, whose table was presided over by a buxom hired girl—one Jemima Lovely by name—frequently invited him to remain. But Sol Perkins was not the only companion Jerry had that summer afternoon, for it was Saturday, and the Cross-Roads farmers had knocked off work early, as was their wont on the last day of the week. Sam Black was there—a monstrous fellow of prodigious height, who looked as if he might easily have kicked Jerry's little store over, and carried it home in his pockets to his "young uns," as he called them, for a plaything—and Eli Bronson, an eccentric Lilliput, whose head would not have reached to Jerry's waist by actual measurement, and who had long since come to be known by common consent as the Little Giant. Then there was William Lovely, Jemima's brother, a smart young man, who had been two winters at school at Weeping Willow, but who occasionally condescended to bestow an hour or two of his interesting company upon the habitués of the store. These and half a dozen others, who lounged about the platform in various attitudes, made up an assembly which amused itself by chewing tobacco and aimlessly whittling at small bits of wood—refuse of dry-goods boxes—with which the ground in front of the store was always thickly strewn.

Occasionally a man would lazily inform Jerry that "the old woman wanted a pound of coffee or tea for Sunday," but for the most part the visitors had not so much as the ghost of an excuse for tarrying. They came to the store from force of habit, and remained simply because they were too indolent to move on. The air was close and stifling, and notwithstanding the repeated efforts of Mr. William Lovely, who considered himself quite at home on any subject, conversation flagged. Suddenly a cloud of thick yellow dust appeared in the distance. It made the atmosphere even more oppressive, but it roused dormant interest. Sam Black hazarded the opinion that he "s'posed it was Tim Foley haulin' the school-house coal."

Jerry Huntley laughed. "Not much," he said, good-naturedly. "Thet's Bowser, ez sure ez it's a livin' man. Thar's summat abaout his drivin' thet I kin tell every time."

"Bet yer the chaws all roun' thet 'tain't," said the Little Giant, who, like most small men, always liked to be on the opposite side of a question.

"Better git out yer plug, then," Jerry responded, "for thar's ole Gray's head naow. I kin tell it a mile off."

The four roads from which the neighborhood derived its name met and forked in different directions at the corner of Jerry Huntley's field, half a mile away, and it was not long before the shapes of man, horses, and wagon emerged dimly from out the cloud of dust at the further end of the lane. As Dick Bowser drove slowly into view and stopped at the store, an amused grunt went up at the expense of the Little Giant, who felt obliged to pay the penalty of his wager, and did so sheepishly; but this incident was of small importance when compared with the arrival of Jerry's huckster wagon. The latter was, in fact, always the event of the day. On these occasions Bowser became a hero by mere force of circumstances—a state of things which was not of long duration, but which that personage enjoyed to the utmost while it lasted; and the broad grin which illuminated his freckled countenance on that memorable day, when his jaded horses came slowly homeward, indicated that the day's rounds had been productive of even more than their usual amount of entertainment and profit. The wagon was an old rickety affair covered with dirty canvas, half detached from the bows, and its bed was so closely packed with boxes, barrels, and chicken-coops that Bowser had been obliged to dispense with the seat, and had made the return trip astride of a barrel. There was a big lot of "truck," as it was known at the Cross-Roads, to unload, and Jerry hastened at once to Bowser's assistance, accompanied by Perkins, Black, and one or two others.

The picture Dick Bowser presented seated astride that old barrel would have provoked the risibilities of almost anybody outside of the settlement. Huntley's team consisted of a small mule and a large horse, the effect being incongruous in the extreme, and the harness was patched in several places with bits of rope, for whatever else the old man did with his money, he certainly did not believe in sacrificing it to mere external appearances. The general *ensemble*, including Bowser, who was a small, shrivelled specimen, with freckles and a shock of thick, matted, corn-colored hair, would have taken the premium at a show of eccentrics.

"Hullo, Dick! hed a good day, I reckon?" Jerry said, as he stepped around to the foot of the wagon, took out the end board, and with the assistance of Black and Perkins began rolling boxes and barrels out on the platform. "Here, Solomon, give us a lift with the coops, will ye? Easy, boys, easy. Gewhilikens, Bowser, what's thet?" For Jerry, in the course of his excavations, suddenly ran foul of a small basket, the contents of which instantly set up a faint moaning cry.

"Gosh, Jerry!" ejaculated Sol Perkins, "Dick must 'a brought ye a puppy, knowin' ye'd like it almost ez well ez ye would a pet hornet;" and chuckling to himself over his friend's anticipated discomfiture, the old man reached into the wagon for the basket, giving it a careless wrench as he did so, which made the presumably canine occupant send out fresh moans as of pain.

"Easy thar, durn ye!" cried Sam Black's big voice, angrily. "Sol Perkins, don't ye s'pose a puppy's got no feelin'? Stand back, will ye?" and thrusting his great body between the men and the wagon, the big fellow lifted out the basket as tenderly as a woman would have done. Swinging it lightly before him, the others following curiously behind, he stepped carefully upon the platform, removed the shackly cover, and revealed—"Why, durn my skin, Jerry," he exclaimed, "if Bowser 'ain't gone an' brung ye a baby!"

And that it was a baby was too plain to be mistaken, for taking the small creature out of the basket, Sam lifted it up gently, and held it on his big broad shoulder for the men to see; a wee, six-weeks old baby, with a little pale, pinched face, two great, staring black eyes, and a pair of skinny little hands, that reminded one of the claws of an eaglet.

By this time Bowser, who had gone on mechanically with the work of unloading, had begun to turn all the colors of the rainbow, and Jerry, who was utterly dumfounded, simply stared at his eccentric employé in open-mouthed amazement, as if he wondered what would happen next. Sam Black, who had a houseful of little ones at home, gently seesawed from side to side, making a strong cradle of his arms, and vainly trying to hush the feeble cries of the babe, which were those of hunger. The men had gathered about him in a little group, their faces wearing an expression of the blankest astonishment.

Jerry Huntley was first to break the silence. "Willum," he said to young Lovely, "run inter the haouse an' tell Jemime to come out here. Sol Perkins, I wish ye'd jump on yer horse an' go over after Mari'. Jemime she don't know nothin' about babies; no more don't I," this with a faint blush, which might have been more reasonably expected from a boy of eighteen than from a man well up in the fifties. Unquestionably the circumstances were decidedly embarrassing to the Cross-Roads store-keeper, who had always been a bachelor, and who the gossips said always would be.

Dick Bowser had just poised a chicken-coop on his back, and was making off for the barn with it, when Jerry stopped him with his sharp, "Hi, thar, Bowser!" a word of command with which the younger man was too well acquainted to delay long in answering. Bowser's brown face turned a shade lighter, and the chicken-coop trembled visibly on his shoulders as he replied, meekly, "Yas, Mr. Huntley," for Jerry was known to be a violent man at times, and Bowser dreaded an explosion of his wrath as he would have dreaded an earthquake.

"Look ye here, Dick Bowser, I'll 'Yas, Mr. Huntley' ye, if ye ain't keerful. What in thunder do ye mean, anyhaow, bringin' me a baby—me, of all men—jest ez if 'twas a part o' the reg'lar chicken business. Where'd it come from, I say, an' what d'ye bring it here fur? Tell the truth, naow, or ye'll pack afore night."

At this juncture there ensued a moment of breathless suspense. Even the baby herself seemed interested in the coming disclosure, for she stopped crying, and nestled comfortably down on Sam Black's big shoulder, while the men instinctively drew a little nearer, and stood with their mouths wide open, as if they expected those organs to assist generously in the process of hearing. The chicken-coop, with its load of fluttering roosters and pullets, had grown very heavy by this time, but it never occurred to Dick Bowser to put it down. On the contrary, he clutched it more firmly than before, and the perspiration broke out on his face in great globules, from the combined effects of heat, exertion, and fear.

"Found it half a mile this side o' Riley's Ford, in the Big Woods, under a clump o' hickories. It was cryin' in the basket, an' I got out an' took it in. After thet I stopped to every haouse along the road 'twixt here an' thar an' axed the wimmen folks to take it, but they all 'lowed as haow they hed more young uns naow than they knowed what to do with, so I *hed* to bring it along."

"I believe yer lyin'," muttered Jerry; "ye alwus wuz sich a confounded queer cuss I never could make out head nor tail to ye. Waal, git along with yer chicken-coop, an' we'll see what the wimmen kin do fur the chile. Here, Jemime, take it. 'Tain't goin' to bite ye, I reckon. Acts ez if 'twas hungry ez a wolf. What 'll we give it fur supper, Sam? Bacon an' 'taters?"

"'Night's milk," replied Sam, out of the depths of his superior paternal wisdom; "fresh from the keow. Then put it to sleep, an' it 'll be bright ez a dollar in the mornin'."

But Maria Perkins, who arrived a few minutes later, riding on a bit of blanket spread behind her husband's saddle, said the baby was very sick. "Dick Bowser he picked the poor little critter up jest in time," she added. "Ef he hadn't, it would 'a' been dead afore mornin'."

And so it came about that Jerry Huntley's spare bedroom—the one with the new red and yellow rag carpet, and the old yellow four-poster covered with a startling pink and blue bedquilt, done after a design known to the women of the Cross-Roads as "The Rising Sun"—was turned into a nursery that very night, in which Maria Perkins and Jemima Lovely flitted to and fro all night, like kindly shadows, striving with might and main to keep the poor little lamp of life alight. When morning came, Maria, who set out for home soon after daybreak to look after the wants of her household, ran across Jerry walking slowly up and down the platform, with both hands in his pockets and an old straw hat pulled well down over his eyes.

"Waal, Mari'," he asked, anxiously, "haow's the child?"

The woman looked at him in surprise. "It'll live," she said, briefly, hurrying on, and leaving the Cross-Roads store-keeper to think his own solitary thoughts.

Ten years later on, another midsummer evening, Jerry Huntley and Dick Bowser were sitting down to supper together just as they had done for the last thirty years. The lapse of time had wrought but little change in the two men. Jerry's few remaining hairs had grown a little grayer, and Dick's corn-colored locks a little darker—that was all. There were two vacant seats at the table, and when Jemima Lovely came in, carrying the smoking coffee-pot, behind which she soon ensconced herself at the head of the board, Jerry, looking up interrogatively, asked where Kit was. Now Kit, as any one might have supposed, was none other than the baby whom Bowser had found in the basket "half a mile this side o' Riley's Ford, in the Big Woods," ten years before. That is, she had been that baby, but nobody would ever have known her as such now, because she had grown into such a provokingly pretty, olive-skinned child, with great, burning black eyes, and a mop of tangled black curly hair, which Jemima could never do anything with, try as she would, and because, whereas the baby, being a puny little thing, was a marvel of patience and sweetness, the Kit into which it had grown was as perverse and wilful as she was full of health and spirits. This state of things may have been due to her rearing, Jerry Huntley and Jemima Lovely having but the crudest ideas of how to bring up a child, but notwithstanding her perverseness she loved them well, including Bowser—who had bowed down and worshipped her from the beginning—and had ruled them with a rod of iron ever since she was old enough to talk.

As the meal progressed and the child did not make her appearance, Jerry began to grumble, as he always did when his ward was out of sight. "Can't you keep her in the house long 'nough to eat her meals, Jemime?" he asked, gruffly. "'Pears to me that chile's growin' up jest like a weed, anyhow. She's off with Tom, Dick, an' Harry all the time, a-runnin' an' a-climbin' like mad. I swan, I dun'no' what to do with her. Why, thar she is naow!" For the latch of the garden gate clicked just then, and Kit came in, drenched to the skin, her short calico dress, which just came to her knees, clinging to her little round plump form, her hair a dripping mass, and her sun-bonnet crushed in her wet hand, like a sponge. As she neared the house she caught sight of the trio in the kitchen, and coolly ignoring the door, sprang lightly in at the open window, crossed the room, dropping a stream of muddy water on the white floor, and walking straight up to Jerry's chair, perched herself on his knee, and began greedily eating her supper from his plate.

"What mischief hev ye been inter naow?" asked the old man, taking her wet hair in his hands and wringing it over the back of his chair. "Ye're wet through an' through. G'long with ye. I don't want no sich tomboy."

"Oh yes, ye do, daddy!" cried the child—she had always called him daddy; it was the first word her lips had ever uttered—"yes ye do, 'cause—'cause ye don't know I come nearly drowndin' this afternoon, do ye? An' ye'd 'a' wanted me bad to-night if I'd 'a' come home drownded—say, naow, daddy, wouldn't ye?"

She had a weird way of defending herself when reproved—one that seldom failed of the mark in Jerry Huntley's household—but her guardian looked at her more sternly perhaps than he ever had done before, when she made this startling announcement.

"Who saved ye?" he asked, in a tone that Bowser and Jemima knew to be husky and broken, although a stranger would never have suspected it.

"Willum Lovely, Jemime's brother. He was drivin' over t' his daddy's from Weepin' Willer, an' he seen me go under the water—I was swimmin' in the creek, ye know—an' he had his clothes off an' got me out o' the water quicker 'n ye kin say Jack Robinson. Gimme me some more corn-bread, Jemime."

The old man grasped the child's shoulders so fiercely that she cried out with pain. "I tell ye what it is, Kit," he said, "thar's no use talkin', ye've got to go to Weepin' Willer t' boardin'-skule. Hurry up an' git her a lot o' new dresses made, Jemime; she's got to go next month. Oh, ye needn't cry, Miss Kit; ye've got to go to skule, an' l'arn to be a lady. I'll buy ye a silk dress an' a pianner, but I'll be hanged if I'll let ye drown'd yerself."

Vainly the child protested that she didn't want to go to school, and that she would do differently if her guardian would only allow her to remain at home. Jerry was inexorable. Jemima had her orders to use the best goods in the store for Kit, and the childish wardrobe that materialized under the careful manipulation of that worthy spinster within the next fortnight was a marvel of color and finish. Jerry had a vague notion that he could overcome Kit's *scruples* against education with finery, but in this he soon discovered his mistake. The child absolutely refused to have anything to do with any part of her extensive new wardrobe except a little red jacket with brass buttons, in which gaudy bit of raiment Bowser found her attired one morning, astride an unbroken colt, chasing the cattle around the barn-yard in a wild glee that would have made Jerry's heart sink if he had seen her.

The day came all too soon for the child to leave the only shelter she had ever known, and with it came a battle in which the weaker went to the wall, and the weaker, as you will readily suppose, was Jerry. The old man had even gone so far as to buy a new buggy, in which Kit was to be conveyed to the school, in order that her school-mates might not ridicule the ancient huckster wagon, and so embitter her young mind against "l'arnin'" in the very first instance. Kit's trunk was strapped to the back of the buggy, and Bowser, who was to act in the capacity of driver, stood ready and waiting, attired in his quaint Sunday suit, which he had worn ever since the child was a baby. Jemima Lovely was in the pantry cutting huge slices of plum-cake, and wedging them into an immense lunch-basket, together with roasted chickens, sweet pickles, cookies, jellies, and good things galore, for Jemima was a firm believer in the prevalent theory that children are always starved at boarding-school. Every now and then she would cease operations long enough to duck her head in her apron, for Kit had come nearer to investing her with the tender mantle of motherhood than any other helpless little being probably ever would, and more than one briny tear went into the big lunch-basket along with its more substantial contents.

"Come, hurry up, Jemime; Dick's ready. Never mind fixin' any more grub; ye've got 'nough thar for the hull skule naow. Whar's Kit? It's time she hed her bunnit on. Startin' so late 'll make Dick late gittin' home to-night."

It was Jerry's voice, and something in its clear, sharp tone cut through Jemima like a knife. Where was Kit? She had not seen the child for half an hour. A sudden suspicion entered the woman's mind as she dropped the basket in obedience to Jerry's summons and went over the house calling: "Kit! Kit! whar be ye? Don't ye hear me, Kit? Yer daddy says it's high time ye was off." But no Kit answered. In vain Jemima explored every nook and cranny in the house, not omitting to look under the beds and into the closets, for she knew Kit's habits, and would not have been surprised to have found her stowed carefully away in a drawer, if only there had been one large enough; but all to no avail. Kit was not there. Jerry, who had followed close at Jemima's heels, began to grow very red in the face. Presently the man and woman looked at each other, and both laughed. "Waal, Jemime," Jerry said, his big hearty guffaw ringing out through the silent house, "it looks consid-able like the little devil had gin us the slip, don't it?"

Then they went to Kit's dog house—a favorite resort of hers, which was inhabited solely by her two dogs, that were chained, and howling as if in anticipation of their mistress's departure. By this time Bowser and Sol Perkins had joined the search, and the quartette proceeded to the barn, where its members separated, each taking a different route. Precisely as might have been expected, Jemima was first to get trace of the lost one. Directly above the wide threshing floor, which composed the centre of the barn, ran a high dark loft, so densely packed with straw that the eye at first could distinguish nothing but a golden mass, tinted here and there with pale flecks of light which struggled through a single pane of glass in the end of the barn. But forty years of service had not dimmed Jemima's eyes, and her sight soon became cognizant of a small patch of scarlet which flamed among the yellow straw like a red-bird. Kit's passion for the red jacket had betrayed her. Jemima lost no time in giving the alarm, and the men, whose eyes followed the indication of that good woman's bony forefinger, soon observed the child burrowing under the straw. Kit had the best of her pursuers, because the ladder upon which she had climbed to the loft was too frail to support the weight of a man—Jerry had already engaged the Cross-Roads carpenter to replace it—and ladder-scaling was not included in Jemima's *repertoire*. It was impossible to effect her capture by physical means, and so Jerry had recourse to strategy.

"Why, Kit," he shouted, "what do ye mean by hidin' this way? Don't ye want to go to skule, an' l'arn to be a lady?"

"No, daddy, I don't," promptly answered the child, advancing to the centre of the loft, where she stood with heightened color, her big black eyes burning with excitement, and looking down unflinchingly into Jerry's, which twinkled in spite of themselves.

"Jest want ter stay here an' grow up like a wild critter, ridin' colts, an' drowndin', an' runnin' arter the keows every night fur Jemimer?"

"Yes, daddy."

"An' how about the silk dress an' the planner?"

"Ye can give 'em to some other little gal. I don't want 'em."

By this time Jerry, who, to use his own expression, was a bad hand at an argument, felt that he was rapidly running out of ammunition. "Kit," he said, desperately, "don't ye know daddy wants ye to grow up like a lady, stidder like a weed? Wouldn't ye like to go to skule an' l'arn to play planner, an' draw pictures, an' sich, jist 'cause daddy wants ye to?"

This was a poser, but not in the way Jerry intended it to be. Poor little Kit burst out crying as if her heart would break.

"I love my daddy, so I do," she cried; "an' I don't want to go 'way off to Weepin' Willer to skule, an' leave him an' Jemime, an' Dick Bowser an' all of 'em. Oh, daddy, I can't, I can't!"

And this was the end of Kit's education, of which Jerry had dreamed for ten long years, and for which he had hoarded and saved with renewed diligence ever since the night Bowser had brought home that strange little human morsel in the basket.

* * *

It was a strange coincidence that poor old Jerry Huntley should have lost his eyesight the same year that his savings of a lifetime went, as he expressed it, up Salt River. It was a strange thing that a man who had lived as long as he had, and knew human nature as well, should ever have consented to have gone Eli Bronson's security for so large a sum of money; but such, nevertheless, was the storm that brought about his shipwreck, leaving him quite as empty handed as he had been more than half a century before, when he started the Cross-Roads store, with no capital save that of honesty and industry. The Little Giant, who had a passion for speculation in live-stock, had indulged it to a ruinous extent. His old neighbor had seen fit to befriend him when nobody else would, and the result was disaster at the Cross-Roads store for the old man and those dependent on his bounty. The storm broke with pitiless force upon Jerry, who went down into the depths of despair, and came out a feeble, broken old man. Then his eyesight flickered and went out, and he might as well have lost his other senses too, for all the use they ever were to him after that.

In this sad reverse of circumstances, Kit, who was now grown into beautiful, blooming young womanhood, was her father's only consolation. As he had guarded the helplessness of her infancy, so now she became the staff of his declining years. As he had pitied her orphanage, so she sorrowed over his infirmity and misfortune. When William Lovely, who had been her accepted lover for some months, told her openly and brutally that he did not propose to provide for Jerry simply because he happened to be her foster father, she did not hesitate an instant. "Ye kin go back to Weepin' Willer, William Lovely," she said, with a dry sob, "an' pick yerself out a wife from the fine ladies thar. They'll mebbe suit you better nor I would, anyhaow. Leastways, *I* don't want ye. I'm goin' to stick to daddy."

And that she kept her word none would have doubted had they followed her throughout the next few years, for the old home at the Cross-Roads soon fell into the hands of strangers, and the old man and the girl had to go out into the world, where one of them must fight a sharp battle for bread, and that one, of course, was Kit. Just how this was to be accomplished was for some time a perplexing question, but that mystery was soon solved when a travelling circus came along, camped in the woods back of the store, and observed collectively and individually how superbly the girl could ride. She arranged to accompany the circus without the knowledge of Jerry, who she knew would oppose the measure strenuously at first, and they were well on the way before he discovered that they had become part and parcel of the caravan, for the provisions of Kit's engagement included her "daddy," the main requirement on her side being that he should be comfortably provided for.

Oddly enough, when the time came for parting, both Bowser and Jemima refused stubbornly to be left behind, and so the manager, who carried a soft heart under a rough exterior, gave them his profane permission to join the show, in which they soon found employment. Unlike her brother, Jemima was faithful to her old master's interest, and would gladly have followed him and Kit to the end of the world. As for Bowser, the idea of deserting them had never so much as entered his head, and he was glad to follow in the pathway which Kit thought led to independence. It was a comfort to the girl to be thus constantly surrounded by the three dear old faces and after the first few weeks Jerry began to be more reconciled to the strange, wandering life.

The last strains of the big strident orchestra had just died away. The trumpets had blared, the bugles had blown, and now "the ladies," superbly mounted, some on chestnut, some on beautiful milk-white horses, rode gayly into the ring. Kit, by reason of her superior beauty, rode alone at the head, and behind her, two abreast, came the others in a long, graceful, sweeping line, all the horses keeping perfect step, all the riders sitting like queens in their sweeping velvet skirts, with their rich plumes nodding softly in the summer breeze which stole in at the top of the tent. Kit's habit was of bright emerald velvet. Her hat had a long white plume on it, which drooped almost to her waist, and a brooch of presumably precious stones gleamed at her throat. She was tall, supple, finely moulded, and retained the brilliant olive complexion and dark burning eyes of her childhood. Her glossy black curls hung in a thick, luxuriant mass under her hat; surely she was a goodly sight to see, and her triumphal entrance on the magnificent white horse she rode was always a signal for a burst of applause. She had chosen a fiery animal to ride, because there was something in her which rejoiced in quelling an unruly spirit, and because she was not averse to showing her skill.

One, two, three! The ring-master in blue coat and brass buttons cracks his great whip, and the riders start on their second round; but by this time Kit's horse is growing more restive than she has ever known him, and she has all she can do to retain her hold upon the reins. His delicate mouth is covered with foam, and the girl, who in turn quickly resorts to both harsh and gentle measures, is surprised to find that neither has any effect.

One, two, three again! Kit's horse is flying like a centaur, but her splendid courage does not forsake her. Her faith in herself is strong, and she would rather die than ask the ring-master for aid, or allow any one to suspect that she is in need of it.

One, two, three! Oh! how harshly the cracking of that cruel lash sounds to the poor girl now! Her arms ache as if they were being pulled out of their sockets. There is a film before her eyes. Her hands are growing cramped and rigid. Surely, surely her faultless horsemanship must triumph, but she knows now that there will have to be a mighty struggle, and steels herself for it, every nerve tense, every sense concentrated on the feat before her, every wish merged in the one to win.

One, two, three! The signal is given for the leap over the hurdle, and as Kit's horse rears and plunges, she brings down her whip upon his beautiful white neck with a cut of fury. In another instant he has thrown her viciously over his head, and she lies bleeding and senseless.

As the ring-master stoops quickly over her he is angrily put aside by a common roustabout, whose coarse laborer's garb is soiled with the dust and grime of the circus. It is Dick Bowser who lifts the tall girl as tenderly as if she were but an infant, and carries her speedily to the village inn, where poor old Jerry Huntley sits dozing in the afternoon sun.

"Jerry! Jerry! wake up!" he cries, in frenzy. "Kit's been throwed from her horse in the circus!"

Something in Dick's wild, piteous tones rouses the girl for a moment. Wonderingly she opens her eyes from which the light is fast fading. Tenderly the old man presses Kit to his heart, and lays his wrinkled cheek against hers, pale with the pallor of death. Wistfully the dark misty eyes look up at the poor old sightless ones, of which they have been the light for more than twenty years.

Brokenly she murmurs, "I—done—it—for—ye,—daddy,—didn't—I?"

Then her eyes close, and Kit has gone on her last, long ride to eternity.

WITH THE SQUADRON OF EVOLUTION.

Among the exercises for the carrying out of which the Squadron of Evolution is in existence, no other has anything like the importance that must be attached to target practice with the guns of the main and secondary batteries. It is to carry and use these guns that men-of-war are built and equipped, and the rapidity and accuracy with which they can be used is a measure of the efficiency of the ships that carry them. In the case of the new high-power guns with which the vessels of this squadron are armed, careful and systematic instruction and practice are of especial importance, and for several reasons. In the first place, the guns are capable of marvellous accuracy if properly handled; but the same peculiarity which gives them this great accuracy—the flat trajectory, due to the high velocity of the projectile—results in a correspondingly great inaccuracy if the finer points involved in sighting are neglected. The roll of the ship, for instance, if not allowed for at the instant of firing, will cause a far greater error in range than would be caused with the old muzzle-loading guns firing light projectiles with low velocity. Furthermore, the ammunition for the new gun is so heavy and bulky that only a comparatively small number of rounds can be carried, and every round that is wasted represents an important loss of offensive power. Of far less consequence, but not unworthy of consideration, is the fact that it represents also an expense of about fifty dollars in the case of an 8-inch gun.

Still further, while very little can be safely predicted of the naval battle of the future, it is quite certain that it will, as a rule, be short; and under certain circumstances, particularly with unarmored ships, a single well-aimed shot may determine victory for one side or the other at the very opening of the action. So far as regards the value attaching to the ammunition from the limited supply which can be carried, it will be seen that this acts in two conflicting directions, making it important to have target practice frequently, and at the same time limiting the amount of ammunition which can be spared for such practice. The *Chicago* carries fifty rounds for each of her 8-inch guns. Each gun should have at least two trained marksmen. But it is clearly impossible to spare a sufficient number of rounds of ammunition to train these men. If we had a gunnery school-ship—as it is to be hoped that we soon shall have—they would be trained before being sent to sea-going ships; but for the present each ship must train them for itself, and there is raised the problem to find a means of exercising and educating men to sight and fire heavy guns rapidly and accurately without actually firing the guns. The simplest way would be to take a time when the ship is absolutely stationary, require the gun captains to point at certain fixed objects, and let their sighting be verified or corrected by their instructors. This is tedious, and contains no element of possible interest for the average blue-jacket. Practice with a musket can be made interesting, because the results of it can be seen, and it gives a certain familiarity with the use of sights; but the differences between the firing of a musket and that of an 8-inch rifle are greater than the resemblances. A much more satisfactory method is to secure the barrel of a musket inside the bore of a great gun, and use the sights of the latter (properly corrected) for firing the musket at a target a few hundred yards from the ship.

This is a very nearly perfect substitute for actual great-gun practice, but it cannot well be carried out at sea and there are not very many ports where it is safe to do very much firing, even with a 45-calibre musket. It has been proposed, for occasions where this method is not available, to attach a small camera to a gun in such a way that the axis of the lens shall be parallel to the line of sight, and to fit the shutter with a string, which the gun captain would use exactly as if it were a lock string for firing the gun. Having gotten his aim at the object selected, which might very conveniently be one of the ships of the squadron, he would snap his shutter, and the photograph taken would, when developed, show what his aim had been. If each gun captain were given prints of all his shots, he would soon learn to feel a pride in making them the best possible. A sighting drill of this kind could be carried on at any time and in any place.

In the few months since the Squadron of Evolution was organized the men have been carefully instructed in sighting, and have had such drills as have been found practicable; but all this had little meaning for them so long as they had not fired the guns, nor seen them fired. This has been fully realized, but the instructions of the Navy Department require that the first firing of a cruise shall take place at anchor, and under the most favorable conditions that can be found. To fire for the first time at sea, with the ship rolling, would be to miss many of the most valuable lessons that should be drawn from the first trial of the guns, as it would be impossible to separate the various causes of error involved. There are very few anchorages in the Mediterranean where permission can be had to fire, or where it would be safe to do so even if permission were given. But at Corfu was found an ideal place. The long narrow stretch of water between the island and the main-land of Albania affords an unobstructed range of over twelve miles. On the second day after the arrival of the squadron, the *Yorktown* got under way at daylight and went outside, anchoring just to the southward of the picturesque old Venetian fortress which is supposed to defend the entrance to the harbor, but which the *Yorktown*, with her modern guns, could batter down in a few hours. Her guns upon this occasion, however, were trained to seaward. In order to secure uniformity in the manner of conducting and recording the firing, the Admiral had appointed a board of officers to direct the work, one officer being taken from each ship. These officers went out each day, and kept careful notes, not only of the firing, but of the working of the guns and their mechanism, the arrangement for supplying ammunition, etc. Two targets were laid out at distances of one thousand and fifteen hundred yards, the nearer one being for use with the "secondary" battery, the more distant one for the great guns of the main battery. Abreast each target, but at a safe distance, was anchored a boat with an observer to note the fall of each shot, whether short of or beyond the target, and by what distance. An observer on board ship noted similarly the errors to the right or left. There was no difficulty about these observations, as every shot, on striking the water, throws up a column of foam which can be seen at a great distance, that from an 8-inch shell rising fully forty feet. With the co-ordinates determined by these two observers, the exact point of fall can be determined for each shot, and plotted on a chart having the target for a centre. It is then easy, with a knowledge of the path of the projectile, to determine at what point on the side of a ship each shot would have struck.

The regulation navy target is a pole, fifteen feet high, carrying a small flag at the top, and having canvas wings spreading ten feet at the bottom, and supported on a light raft, which is floated by empty casks. At a distance of fifteen hundred yards this makes a very small mark, but it was repeatedly struck by fragments of bursting shells, and three targets were, in the course of four days' firing, struck squarely and totally destroyed, while the plotting shows that scores of shots which did not touch the target passed within a few feet of the bull's-eye. Had the target been a ship of the size of the *Chicago*, presenting only her bow for a mark, it would have been struck by about sixty per cent. of the shots fired by all the ships in their four days of practice. Almost every shot was a nearly perfect line, the errors being all in elevation.

The scenes on board the ships during the firing were very animated. Every one was interested, eager, and more or less excited. When a particularly good shot was made, a murmur of applause ran around the ship; and when the target was destroyed by a shell striking and exploding squarely at the base of the staff, the murmur rose into a shout, and the gun captain who had made the shot became the hero of the ship. The regulations of the Navy Department for target practice require that the firing shall be as rapid as possible, and the interval of time between successive shots from any gun enters into the percentage of merit allowed for the shots. In this first firing by the squadron it was not thought well to bring in this time element, and all operations, but particularly that of pointing, were gone through with very deliberately. Nine rounds were fired from each gun of one broadside of the main battery, and twenty rounds from each machine and rapid-firing gun. Thus the *Chicago* fired two hundred and sixty-three shots, the *Boston* and *Atlanta* about the same number, and the *Yorktown* about half as many. Sixty-three of the *Chicago's* shots were from the main battery. Of these thirty-six are plotted in the accompanying picture as they would have struck her sides had the *Chicago* herself been the target.

In connection with the subject of target practice, tests were made of the arrangements for supplying ammunition to the guns. This is a matter of great importance in connection with rapidity of fire. Assuming that the 8-inch guns could be loaded, pointed, and fired in two minutes, and the 6-inch guns in half that time, it is found that the supply of ammunition can just about keep pace with the firing, but without any margin of time. The ammunition is kept in special magazines at the very bottom of the ship, and must be hoisted to the upper deck, and from there transported some distance to the guns. The shells come up in hemp slings, and the powder in copper tanks hermetically sealed. Inside of these tanks the powder is put up in cartridges of regular and symmetrical shape, and enclosed in bags which fit tightly over the powder grains and keep them in position.

The powder used with all the new guns is of the modern "slow-burning" kind, the essential point about which is that it burns and gives off gases very slowly at first, starting the projectile from its seat with a moderate pressure, which gradually increases until it reaches a maximum which is much below that given by the old and violent black powder. This low maximum pressure is, however, sustained for a much longer time than the higher maximum of more violent powders, and thus more work is done upon the projectile and a higher velocity imparted to it, resulting in greater range and penetrative power. The difference in the action of the two powders is that between a push and a blow, the action of the slow powder representing the push.

THE WEST POINT MILITARY ESTABLISHMENT.

THE theory so universally held both abroad and at home that we are a practical people is greatly in need of revision. There is such a thing as being too practical for one's material good, and so far as government is concerned, this country is suffering from the *reductio ad absurdum* of the national theory. Practical legislation has come to mean, among other things, an undue interference of the law-making power with the administrative departments of the government. This necessarily involves the application to the work of government of a mass of crude theories that are the result of the half-knowledge of Congressmen who have no practical and intimate acquaintance with the duties which they undertake to direct. Among the greatest sufferers from this state of things is the military establishment, so that it may be truly said that this most practical of people has a theoretical army—a small body of men armed with ancient weapons, whose chances against fully equipped modern soldiers would be infinitesimal. And these troops are commanded by officers most of whom are graduates of the Military Academy, an institution which ranks deservedly high among kindred institutions, and which has given to us many admirable soldiers and many more first-rate scholars. All of us have a just pride in West Point, and we have been often told that it is the best military school in the world. Perhaps it is, but there are others that rank dangerously near it, and there are persons who think that there is too much of the academic and too little of the military spirit at West Point. This is probably a false judgment. There is, it is true, a creditable percentage of well-trained scientific men among the officers of the army, and there are a few whose soldierly qualities are subordinate to their science; but one who knows the army well would be hardly justified in saying that inordinate scholarship is the curse of the officers of the line. The intellectual and moral tone of the service is exceptionally high—higher than it ever was before. "Tom Burke of Ours" would find an American officers' mess in 1890 sadly lacking in fun, while Barry Lyndon would certainly regard some of our soldiers as poor-spirited creatures, with more head for books than stomach for fighting. The difference would be simply that between the gentlemen of the two adjoining centuries. Although life is governed and war is waged by scientific students on scientific principles, there has been no physical deterioration in the army, and there is quite as much fighting spirit and courage as there ever was. There has not been a finer-looking lot of cadets at West Point than those who may now be seen there. The books have not and will not hurt them, for the more books of the right kind that they know, the better soldiers will they be.

There is no doubt, however, that the Military Academy suffers from the causes that are so injurious to the whole service. Congress has undertaken the command of the army, with the result of making it as inefficient as the ability and ambition of its officers will permit. Congress is perfectly logical in its ruinous policy, for the school in which cadets are taught to be soldiers and officers is no more antique and obsolete in its military material than the army. It is a striking fact this, that all the elements and arts of the military service are suffering alike, not only from the non-possession of modern armament for constant daily use, but from absence of training in the implements which must be used familiarly whenever this country comes into hostile contact with another.

Every one who visits West Point during the months when the cadets are out in camp cannot but be delighted with its quiet academic atmosphere. A few sentinels, soldiers of the engineer corps, walk up and down the sidewalk here and there; a number of exceedingly ill-shapen men in outrageously dirty uniforms perform police and fatigue duties about the post. Officers and cadets make up the rest of the population of the place. These latter march to their meals, to recitation, and to the various tasks which are assigned to them. They go once a day, after their first year, to the riding school, and are taught to ride and in cavalry drill.

The riding-school and its adjoining stables are characteristic of West Point. They have been unfortunately placed where they become the most offensive features of what is naturally one of the most charming landscapes in the country. The circular roof of the riding-school is a familiar object to every one who has gone up the river in the day boats. The building is of stone, and is without any ornamentation. The brick stables stretch out from it. They were once painted, but time and stress of weather have washed off much of the color, leaving only an impression of lightness. The little square unglazed holes are the only relief to a long, ugly, dirty wall. It is a disgrace to the government that such a beautiful spot should have been selected for such hideous disfigurement. The stables and the riding school might have been hidden away, instead of being made a blot upon so fair a scene. It must have been a singular mind that selected the most conspicuous spot at the Point as the site for the most offensive structures, but in many respects we have a very singular government, and its eccentricities have manifested themselves in other respects than in the choice of the spot for the stables.

There is a severe and hard conservatism in the management of the public property which is not on the plain. Congress, on the theory that it knows more about the needs of the post than the officer in command, does not appropriate enough money for the proper preservation of all the property, and the consequence is that in taking care of the buildings on the plain, which are in constant sight of visitors, such buildings as the stables, the riding-school, and the barracks, which are under the hill, are the victims of decay. The windows in the upper story of the stables, for example, have not been glazed for many years, and the longer they are permitted to remain in this way, the more firmly will there be established a precedent against ever replacing the lights that were broken out almost a generation ago. The riding-school itself is a cold and dreary place. For several hours of each day, in inclement as well as pleasant weather, the officer who is instructor in riding is compelled to remain in the damp and unwholesome atmosphere. While the cadets are in rapid motion, his horse is almost motionless. During the fall and winter the last riding lesson does not end until long after dark, and it is not to be wondered at that severe colds, and sometimes malarial disorders, are accompaniments of a detail as instructor in cavalry tactics at West Point. There are many inconveniences also about the building, but this absence of heat, injuriously affecting, as it does, the health of the officer and cadets, is most serious. Whether the hall is not heated because it has never been warmed artificially, is a question that the Appropriation Committees and the Quartermaster-General's Department can best answer. Whatever the reason is, it cannot be strong enough to overcome the fact that the government is barbarously cruel in compelling men and animals to face the severe and dangerous conditions that obtain in the riding-school.

The hall is badly lighted, and the accommodations for visitors are absurd. The first is a decided drawback to the work of instruction that is carried on in the building, for the few strong electric arc-lights which hang low down in the centre of the apartment make the horses nervous, and distort objects and shadows to such an extent that they often add to the confusion of darkness. There is hardly a riding-school in the large cities of the country which is not in every way superior to that at West Point, where the instruction should be most serious, for in the army riding is a necessary and not, as it usually is elsewhere, a luxurious art.

The galleries for visitors are small affairs on the two long sides of the rectangular hall. They are sixty-five feet long and four feet wide, except for thirty-five feet in the centre, where they are ten feet wide. They do not begin to accommodate the public which is at West Point for the closing exercises of the academic year, and they are now supposed to be so weak that ropes have been rigged in the roof of the building, which may be made fast to the galleries in order to support them from above if they should chance to be too crowded. This is very like a good many other primitive and slipshod methods that must be resorted to in the army to make up for the deficiencies occasioned by the fact that the army from top to bottom is under the command of civilian politicians.

The main difficulty with the Military Academy, however, is the lack of professional training received by the cadets. It is not the purpose of this article to controvert the decision of the Academic Board as to the course of study pursued by the cadets. As I have said, there are some officers who think that books play too important a part in the education of the cadets. But there is no necessity to enter into this controversy. Moreover, the course, even in mathematics and philosophy, is not more advanced than that of the ordinary college, and is not, in general, equal to that of the leading universities. The cadet has an hour and a half of class-room work in the morning, and another hour in the afternoon. He is expected to study about five hours of the day. There is other instruction, of course, of a physical and professional nature. The cadet is taught fencing, dancing, and riding. He must exercise in the gymnasium, and in summer he must take lessons in swimming. He does guard duty, and he drills and parades. His mental work, however, ought not to be the burden to him that it is said to be, and the constant dropping out of cadets as deficient and unable to proceed with their classes can only be accounted for on the supposition that a majority of the young men who are appointed to the Military Academy must be exceptionally ill prepared for advanced instruction. There is no doubt, however, that the cadets who graduate in the upper half of their class are exceedingly well trained mathematicians, chemists, and engineers. They are masters of their branches of the military profession and of the kindred arts. They know how forts should be constructed, the most economical and effective methods of bridge and road building, how guns should be made and of what material. They know the economic questions that are incidental to the mechanical industries with which they must deal, as representatives of the government. They are familiar with the fundamental literature of their profession. The course is well enough, and its product, in some respects, is fine, but it confessedly does not make well-trained officers.

There are many reasons for this. In the first place, the government is instructing the future officers of its army, as it is training the army itself, with obsolete material and with insufficient equipment. The school at West Point turns out, perhaps, the best-drilled infantry corps in the world. It is a delight to see the cadets in the line of a procession. All the virtues of the marching machine are developed in them. Each one is perfect in his part, and the whole is a steady, orderly moving mass. It is not a machine in the sense that it is a mere controlled body, lacking in a self-directing intelligence; it is a human machine instinct with intelligence. Foreigners who are familiar with troops have repeatedly asserted the West Point Cadet Corps to be the finest body of infantry in the world, so far as their marching goes. And it ought to be, for the cadets are marching from the beginning to the end of their four years' course. At 6 o'clock in the morning the cadet falls in with his company at reveille; at 6.30 he marches to breakfast; at 7 he marches from breakfast; at 8 he marches to his section room; at 9.30 he marches to fencing; at 10.5 he marches to barracks; at 1 he marches to dinner; at 1.40 he marches from dinner; at 2 he marches to his section room; at 3 he marches back; at 4.15 he marches to drill, if the weather permits, and he drills until 5.30. In the fall the first, second, and fourth class men march to and from the riding school in the afternoon. He marches to and from supper, and if he is on guard duty he has still more marching to do before he puts out his light and goes to bed. It is easy to see from this that the cadet ought to be a good infantryman; and he is also an admirable rider, for his instruction in equitation is thorough and excellent. Nevertheless, the cadet has very little drill in cavalry tactics, and still less in artillery. Professor Michie, who is at the head of the department of Philosophy at the Academy, in an opinion given at the request of the Board of Visitors of 1877, on the "Character and Scope of Instruction at the Military Academy," said: "But though our graduates may be regarded as equipped for the learning of their profession, they are by no means experts in any of the branches of the military art. Hence their professional improvement must be provided for in the army and under its direction."

The popular idea that a graduate of West Point is fully instructed in all the intricacies of his profession is therefore erroneous. He must continue to go to school after his graduation. If he is an engineer, he goes to Willets Point; if he is an officer of artillery, he goes to Fort Monroe; if he is a cavalryman or infantryman, he goes to Fort Leavenworth; if he is in a light-artillery battery, he goes to Fort Riley. At least he goes to one of these schools when his turn comes to be detailed for further education. One of the evils of the system is that he may not go until he has forgotten much of his instruction at the Academy. In other words, the post-graduate course is too remote from the preliminary training to be as serviceable as it might be made. If the graduates of West Point were sent at once to the schools of the various arms of the service, we would not have the present state of affairs, in which gray-haired officers are studying the principles of their profession from text books, and from the lectures of the captains who are detailed as instructors.

The mistake of the public in supposing that the graduates of West Point are well-instructed soldiers is very natural. In the first place, the Military Academy is a professional school, and we are frequently told that it is of the first rank. Its graduates are commissioned officers of the army, because they have successfully gone through the course of the school and have taken its diploma. During their under-graduate four years, in addition to their purely academic studies, the cadets are taught tactics, fortification, ordnance and gunnery, explosives, mechanical manœuvres with heavy guns, and strategy, while they drill in every arm.

The drills in everything but infantry tactics, however, are entirely insufficient. In the first place, the plain is not large enough to admit of the thorough training of man and horse necessary in cavalry drill, and the same may be said of the artillery drill. In the second place, the government does not provide a sufficient number of horses, nor horses of a sufficiently good quality. There are about seventy horses in the stables. Many of them have been there for a long tour of duty. Some of them have been at the Point for fifteen or sixteen years. They are not of uniform color, and they are running down in quality. They are those that are left after the Quartermaster-General's Department has supplied the cavalry and light artillery batteries. Some of them are big, and some of them are little. It is the custom to buy saddle-horses for the army in Missouri. This was once a very good custom, for a large number of excellent riding-horses were raised in the State. There is a terrible conservatism about military usages, however, to which there stand always as a monument the tales of sentries posted to guard snow-drops, sentry-boxes, etc., long after the objects of the guard had disappeared from the face of the earth. Missouri has been for many years growing to be more and more of an agricultural State, and saddle-horses have been giving place to other and bigger animals—Percherons and the like. Still, the government goes on buying saddle-horses in Missouri, just as it declines to reglaze the windows in the stables. When these horses, of various sizes and colors, are drawn up in line, they are far from presenting an attractive appearance to an exacting cavalry officer. To add to the discomfort of the officer who is in command of cavalry instruction, he no sooner has trained his horses to some degree of fitness for the needs of the cavalry than they are required for light-artillery drills, whereupon they are spoiled for the first purpose. It takes a long time to train a cavalry horse properly, for the horse and man are one soldier, a most complicated personality, and the drill of both, in order that the whole soldier may move to the command of the single human mind, must be long and arduous.

There are some officers who think that a single term of enlistment—five years—is not long enough to make a good cavalryman. If they are nearly right, it cannot be expected that West Point cadets, mounted on horses that can never be properly trained, themselves having only 200 hours of cavalry drill in a year, can become first-rate officers of horse troops without going through a training subsequent and supplementary to that which they receive at the Military Academy. Almost any one at all acquainted with the horse will recognize the inadvisability of compelling an animal who is wonted to bear burdens and to keep himself habitually well together, to drag about a heavy gun—a labor which involves the straining and spreading out of muscles and form which should be kept compact and collected. And yet Congress insists that its officers of cavalry shall be instructed with horses that are not and that cannot become trained to do the work which every efficient captain on the frontier demands of his troop. Besides this, the horses are not thoroughly well groomed, and their equipments are not neat and shining, as good soldiers insist that they should be. It was for some time the tradition that the cadet could not spare from his studies the time necessary to keep his cavalry accoutrements in good condition. Some improvement has been recently made in this respect. Whether or not the cavalry equipment is what it should be is difficult to say. Indeed, it would require a good deal of hardihood for a civilian to decide a difference of opinion between practical cavalry soldiers and the ordnance bureau which decides the trappings of the army horses. It may be that the time-honored bit of the service is precisely what is best. The men who sit at their desks in Washington say so; many of the men who sit in the saddle say that it is not.

The cadets learn in the army, and after they have gone away from West Point, what can be accomplished by long continued, strenuous drill of man and horse together. They are given commissions, and put in command of men who have a much better practical knowledge of drill than they. This could be remedied by sending the young cavalry officers at once from West Point to Leavenworth or Fort Riley.

So far as the ordnance in use at the Military Academy is concerned, the same story is to be told as has been recited so many times of the army. Modern field-pieces have been recently issued to a light battery or two, and there is one gun of the new pattern at West Point. It is sometimes pointed out as an arm of which the American soldier of the future ought to possess some knowledge. Its abiding-place is in the museum, where there are samples of Gatling guns, old field-pieces, Brown Besses, muskets, breech-loaders, and recent inventions in magazine guns. But the cadets who are destined to command the American soldier of the future are not instructed in the use of modern arms. They are, as has been averred, the finest infantry corps in the world, so far as precision of marching and of drill in the manual are concerned, but they are armed with Springfield rifles of the short cadet pattern, an excellent piece for target practice, barring its recoil, but too heavy and cumbrous for use in the field. It has been previously stated in these columns that an infantry soldier of the United States army, other things being equal, is only one-third as effective as a European infantryman, because the latter, with his piece of smaller calibre, carries three times the number of rounds of ammunition that are carried in the belts of our own troops. It may be said that in this respect, and in respect of field-pieces and heavier ordnance, the cadet is as well off as the officer of infantry or artillery. It is very true, more's the pity, that the American infantry is armed with rifles that must put it at a great disadvantage in contending with almost any modern foreign force; and that the American artillery might nearly as well be armed with catapults as with the Rodmans, Parrotts, old Napoleons, and 15-inch guns, that are about as destructive to those who fire them as to those at whom they are aimed. Nevertheless that is no reason why the cadets should be instructed with the ancient ballistas, as if the army was never to have modern breech-loaders. The existing evil is recognized. The country knows that the poverty of the army in respect of arms is to be relieved; that the ordnance corps is struggling out of the mediæval darkness in which it has been wandering for so many years; and while the corps will move slowly and with dignity, it will move. The army will wake up some morning and be surprised to find that it is

Google

really armed and equipped after the fashion of modern troops.

Now that I am incidentally on the subject of the ordnance corps, I may as well narrate a tale which illustrates the opinion of the line of this scientific staff corps, which has not yet invented a breech-loading siege piece or a magazine-rifle, but has inquired diligently and learnedly into the capacity of metals for transmitting zymotic diseases. It is generally known to those who are familiar with Detaille's and Neuville's pictures that European soldiers carry their rifles slung on their shoulders by a strap. Our own infantry officers have long endeavored to secure the adoption of this labor-saving device, and they assert that the only reason given by the ordnance corps for not agreeing to the change is that it would involve an expenditure of $20,000 for the necessary changes in the arsenal. However this may be, there is a strong feeling throughout the army that this corps is largely responsible for the present condition of affairs.

There is no doubt that we are to have modern arms in a short time. The navy is already in possession of them, and large sea-coast guns are in process of manufacture at the army arsenals. A field-piece has been adopted, and one of the guns is at West Point. But during all this long period of gestation the young officers who have been yearly coming into the army have been taught to manipulate and fire old muzzle-loaders. The mechanism of the new piece is different; the character of the ammunition is different; the drill is different. And yet all these considerations have not induced the government to purchase a sufficiency of modern arms for the education of the young officers who will soon be called upon to instruct the enlisted men. It is true, of course, that modern weapons differ from one another. How they differ may be seen from the few samples of European small-arms that are on exhibition at the West Point Museum. But the principle that governs all of them is the same, just as the same principle lies at the basis of all sewing-machines.

If the government had provided the Military Academy and the Artillery School at Fortress Monroe, as it might have done many years ago, with batteries of modern ordnance, from the heavy sea-coast guns to light-battery pieces, and if at the same time the Academy and the Infantry School at Fort Leavenworth had been equipped with proper small-arms, there is hardly an officer of the army who would not now be ready to instruct his men in whatever weapons may be issued to the service. As it is, our officers' knowledge of modern arms is derived almost entirely from professional literature, while the graduates of the Military Academy are sent to their companies and batteries absolutely without any practical knowledge of the weapons of to-day.

An episode at the Academy will illustrate the utter carelessness of the government in respect to the character of the military education which is furnished to the cadets at West Point. Some years ago one of the old-fashioned guns of the siege battery bursted. Complaint was made, and the old battery was taken away, and replaced by guns of another pattern, still old fashioned. Last spring, as had been anticipated, one of these guns bursted. By an extraordinary bit of good-luck no one was killed. The battery was taken away, and other guns were sent in their place. When they reached the Point, they were found to be the very guns that had been first removed as dangerous. It would be interesting to know whether the two batteries are to be used up at West Point by alternate burstings.

From what has been said, it follows that the West Point cadet, thoroughly drilled as a marching infantryman as he is, is not the well-trained soldier that he ought to be. Under existing conditions it is impossible that he should be a first-rate cavalryman or light artilleryman. The government gives him neither the proper horses, equipages, nor guns. As a fighting man in command of other fighting men he is not what he ought to be. He is brave, intelligent, and well-disciplined, but he is not accustomed to the weapons with which war is now carried on. He is not like Hereward after Brain Biter was taken, but he is as weak as were Hereward's enemies when Brain Biter was doing service in the grasp of the last and greatest Englishman. In order to acquire all that the government can teach him he must take a post-graduate course; but even the advanced schools are without the implements for his education. Moreover, his education is not proceeded with at once. There is an interval of several years, during which he may forget a good deal of his preliminary scientific training. Crude and uninformed as he confessedly is, he is sent at once to the command of men, knowing nothing of the character of soldiers, having been taught little of the spirit which should actuate and govern those who are set above and placed in control of their fellow creatures.

We now come to the point of contact between the Military Academy and one of the grossest vices of the service. Most of our enlisted men are laborers, and there is no doubt that many desertions are caused by the undue amount of fatigue and police duty which are demanded of the private soldier. We have no corps, with its distinctive uniform, for the performance of laborers' tasks at posts; such corps as exist in foreign armies. The cleaning up of the grounds, repairs to buildings, and all the little details of laborer's work are done by the men of the ranks. The duties of the enlisted man may be divided in the following order:

First. Guard, fatigue, and police duty. The soldier must walk his post, keep the paths clean, the grass cut, the gardens weeded, the flower beds in order, the buildings and fences in good condition, the fires bright, the ashes and dirt dumped in convenient places, and the slops emptied. He must be man and maid of all work, and sometimes he must be cook or mechanic.

Second. He must go to a primary school during his first enlistment.

Third. He may be drilled in company movements if he has time. Occasionally, very occasionally, he may find himself in a battalion. Once a year he shoots at a target with a Springfield rifle that kicks his shoulder black and blue. Until recently he shot with this even though he was a cavalryman, whose arm is a carbine. Another piece of luck is an opportunity that some of the regulars now enjoy, of going into camp with militia.

So a United States soldier finds that he must do the guard duty and labor required at a post and go to school. His military duties are incidental.

Is all this to be charged to Congress? Not all directly, but most directly, and all indirectly. An overgrown staff of officers, who have not served with troops for many years, is responsible for some of these evils, but then this staff is made necessary by civilian control of the army. There ought to be a corps of laborers, as well as fewer posts, and if there were, we should hear less discussion of the subject of desertions in the annual reports of the Major-General in command of the army, of the Adjutant-General, and of the Secretary of War. At the Military Academy the system of turning soldiers into laborers is carried to its utmost extent. With the exception of the engineer company, all the enlisted men are laborers, and nothing else. These engineer soldiers are as good men as can be found in any army in the world. They are enlisted after a personal correspondence between them and the captain of the company, and after a month's trial on their part of the life of the soldier at the post. They do the guard duty, and assist the cadets in practical engineering work, such as bridge-building, etc. They are the only real soldiers with whom the cadet comes in contact. There are two other detachments of enlisted men—one of cavalry and the other of artillery. The artillerymen are no more like soldiers than a gun carriage is like a captain of cavalry. Recently, when the Pan-American delegates made a visit to West Point, some of the sailors and marines of the *Yorktown* went ashore. It was a striking and interesting lesson that will not soon be forgotten by those who saw it, the contrast between two or three of this artillery detachment—ragged, slouchy, covered with the dirt of their work, hands in pockets, blouses unbuttoned—and the neat and soldierly marines. The artillerymen work at all sorts of odd jobs, and receive extra duty pay. The cavalrymen are hostlers. They go to work earlier and knock off later than the artillerymen. They do not receive extra-duty pay, and hence there is much dissatisfaction. They do not know why the government should not pay as much for cleaning, harnessing, and occasionally exercising horses, as it pays for driving carts, sweeping roads, or doing other chores about the grounds. Probably no one could give the reason. This discontent does not often lead to desertions, because the enlisted men at West Point are bound to the neighborhood by domestic ties. They are not apparently discouraged from marrying, and Highland Falls, the neighboring village, is made up of the enlisted men of the two detachments who are married and have children. Often service in these detachments becomes the vocation of the male members of the family, and the uniform descends from father to son. The practical result is that these soldiers—for their enlistment entitles them to the name—are very good specimens of the country laborer, whose incapacity to rise higher has been transmitted from generation to generation. The number of married men in the detachments may be judged from the fact that recently of the 67 cavalrymen, only 38 lived in barracks, and of the 130 artillerymen, 30 were in barracks. My space does not permit a description of these barracks. Suffice it to say they are unfit to live in. These men are not set up nor drilled to any extent, nor required to keep themselves and their uniforms clean, because the nature of their work is incompatible with neatness. Many of them do not know how to salute their officers. In the winter they slouch around the post, their general offensiveness being increased by the musk-rat caps which are issued to the troops in the blizzard region for protection of sentinels from the extreme cold weather.

It is true that the work which these men do is necessary, and it cannot be intrusted to citizens, who might easily break up the discipline of the post, because they could not be punished by the military authorities for aiding the cadets to violate the regulations. The fact, however, that the work must be done does not compel the absence of all soldierly enlisted men except the single company of engineers, nor is there any reason why there should not be established a distinctive corps of enlisted men for laborers' duty.

If the cadets are to come in contact with enlisted men, they should see the kind of soldiers whom they will command after their graduation, for notwithstanding the evils of service in the United States army, its soldiers who remain with it are, as a rule, excellent, self-respecting men. The cadet in time will command such men, and in learning how to be an officer it would be well for him to acquire a knowledge of the kind of human nature he will be called upon to deal with and direct. It is the testimony of some graduates of West Point that after their experience with the detachments at the Military Academy, they were greatly surprised on reaching their posts to find what soldiers really are.

Notwithstanding all these afflictions of which it is the victim, the Military Academy is a school of which the country may be proud. Its professors and instructors are able and enthusiastic. But they can never make it a first-rate military school until we have a first-rate army. In other words, until the civilian politicians turn over the command to the soldiers, to whom it belongs.

HENRY LOOMIS NELSON.

HUNTING THE JACKAL IN INDIA.

"THE gridiron jump" is one of the many expressions that have been incorporated into the English sporting vocabulary by those whom duty, business, or pleasure has caused them, for a time at least, to make their home in India. The fox-hunter who knows Leicestershire, Cheshire, and Ireland, is impressed with the idea that he has topped or jumped every obstacle in the chase. The generality have not attempted a chalk-pit, though some unwillingly have, and landed safely. It is on the plains of India that his experience is enlarged.

In most of the large garrison towns there are packs of hounds imported from England that give to the sport-loving Briton a not bad substitute for the chase he loved so well in the old country. There are no foxes certainly, but the jackal is brought into requisition, and a right good run he gives. It is only after the rainy season is over that the hunting begins. The large paddy fields have been cleared of their rice crops, and the corn in the higher lands cut and harvested. The meet is always with sunrise, and there is generally a large "field." Soon the hounds are on the scent of some jackal that till early morning was prowling round the cantonment. The "going" is by no means pasture or even plough. The ground, baked hard by the heat, has opened out into cracks, and here and there, where one least expects it, some treacherous hole sends pony and rider "to grass."

The Indian ryot, or farmer, is dependent for his crops on irrigation, and small canals intersect the field. It is when three of these running parallel are met with that the rider has to negotiate "a gridiron." An "in and out" is not an uncommon obstacle to meet with when hunting in England. It consists of a ditch, a bank, and a ditch beyond. It wants a clever horse and a steady rider to come "out" all right, for, as the animal lands on the bank, it must immediately leap again to clear the further ditch. In "the gridiron" there is the extra jump, for there are three ditches and the two inner banks, that only allow of enough room for the spring. The least mishap in landing sends horse and rider into the further canal.

Ponies and galloways only are used in India for hunting purposes. The former either Arabs or Australian "Walers," with occasionally polo ponies imported from England. The galloways are Indian bred. Of these undoubtedly the Arabs are the best, as is shown by their winning most of the sporting prizes. These useful cobby ponies, always hog-maned and docked, soon learn how to get in and out of "a gridiron," though of course there is many a mishap. The "gridiron" is one of the peculiarities of the steeple-chases that always form a chief feature of the "gymkhana," a medley of sports, both for officers and men, that ever and anon enliven the monotony of a tropical garrison life.

A GREAT OPERATOR.

WE must characterize Mr. B. P. Hutchinson, of Chicago, as "Hutch." His birth and baptism, mortgages and certificates are recorded Hutchinson, but he is world-known otherwise. "Hutch" was trained in New England, and in his youth went West, and succeeded there by reason of his pluck and energy. He "grew up with the country," and made for himself all that could be made from the early development of a Western city—of Chicago. To succeed thus is to succeed as a matter of course; it is to make the most of the opportunities. Anticipating the requirements of a growing community, "Hutch" early allied himself with the enterprises to provide them. He was a pioneer in the pork-packing industry of the West, and active in establishing a business that profited by his foresight and ability. He is not to be regarded as phenomenal because he has made so much money; he is rather to be regarded as an expression of a force. He had judgment, the instinct of industry, audacity, and grit, and now at sixty-three these qualities remain unimpaired.

"Hutch" is striking in appearance. Tall, erect, with a deep sunken eye that takes in everything, with a memory that forgets nothing, he moves about the Chicago Board of Trade seemingly isolated from every member, but the most aggressive factor in it. He dresses in black, is seldom seen without his felt hat, and when in repose reminds one of President Lincoln as he appeared in 1861.

A speculator, such a one as "Hutch" is—for he long since neglected his more legitimate business—must possess superior discernment, nerve, and be able to command the best information. Operations in products are conducted on what seem to be the most reasonable grounds, with a fine calculation for chances. While the factors of demand and supply establish the tendency of values for a long-run, the constant interruption in the movement toward higher or lower prices results in fluctuations, of which it is the province of the speculator to take advantage. "Old Hutch" is skilled in counter operations against the well-laid plans of other clever speculators, and he delights in leading in an action contrary to the apparent logic of the situation.

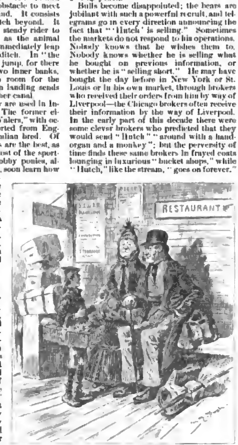
When he is not in the pit trading, "Hutch" may be found seated in an old-fashioned chair near the telegraph office. To him come brokers for orders, messengers with telegrams, and operators for "points." He seems to enjoy the position which he occupies among his fellow-members, and he delights in the mystery with which he is regarded. The study of human nature and its effect upon speculative markets is his pastime. When news becomes current which is likely to affect the wheat market, he rises from his chair—which remains unoccupied until he returns—steps upon the wheat pit, and surveys the crowd for a few minutes. He observes buyers and sellers. One set of brokers trades for local speculators, another for "the country," and another for New York. If the news be of a character that causes an advance—news of higher European markets, export sales at the seaboard, reports of crop damage, all of which he has been duly informed by his correspondents—he is interested to know when it shall have exhausted its effect. He notes every trade as the buying progresses, and in an opportune moment he begins to sell, and from that time seems willing to supply any further demand.

"What's bid for May wheat?" he asks.

"A half," shouts a dozen brokers.

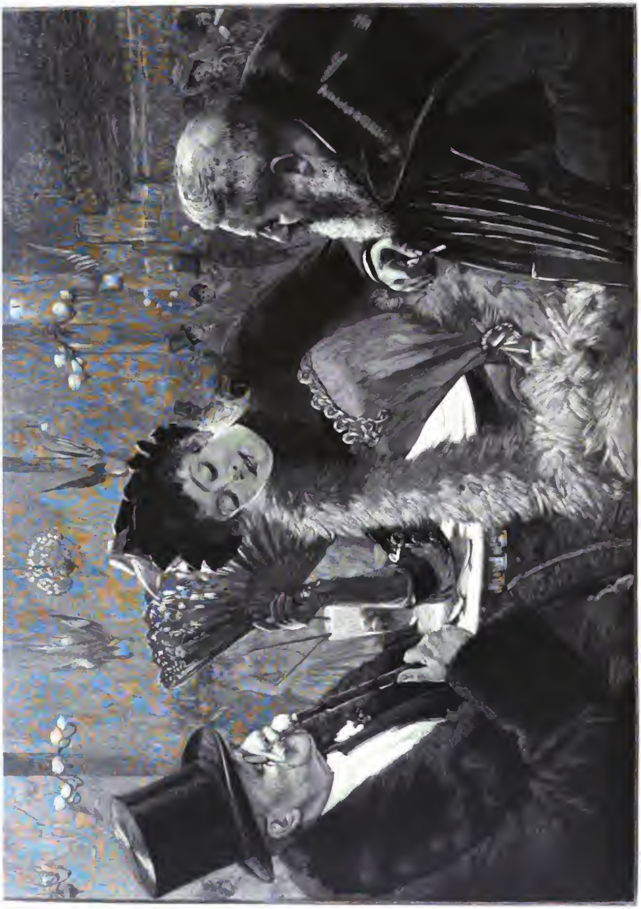
"Boys, here's my card. Take what you want at a half, and put it down yourselves. I've no pencil."

Bulls become disappointed; the bears are jubilant with such a powerful recruit, and telegrams go in every direction announcing the fact that "'Hutch' is selling." Sometimes the markets do not respond to his operations. Nobody knows that he wishes them to. Nobody knows whether he is selling what he bought on previous information, or whether he is "selling short." He may have bought the day before in New York or St. Louis or in his own market, through brokers who received their orders from him by way of Liverpool—the Chicago brokers often receive their information by the way of Liverpool. In the early part of this decade there were some clever brokers who predicted that they would send "Hutch" "around with a hand-organ and a monkey"; but the perversity of time finds these same brokers in frayed coats lounging in luxurious "bucket shops," while "Hutch," like the stream, "goes on forever."

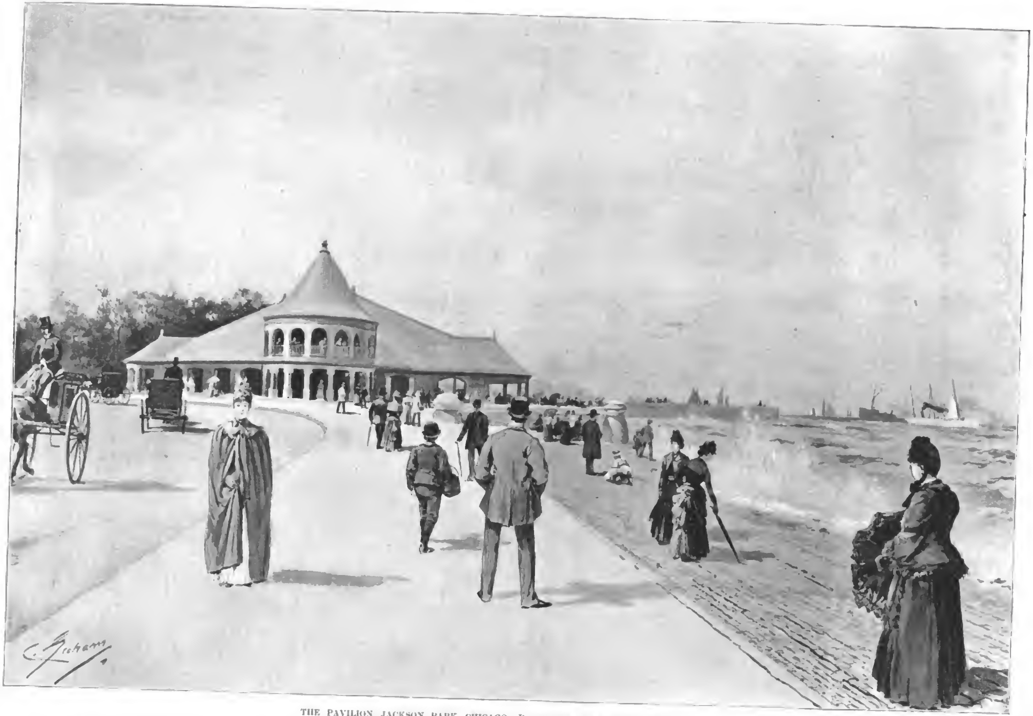


DISCRIMINATING.

"How much are your oranges, my little man?"
"Ten cents, sir."
"What—apiece?"
"No sir; a whole un."



"SUZANNE ET LES VIEILLARDS."—ENGRAVED BY CH. BAUDE FROM THE PICTURE BY BROUILLET, IN THE PARIS SALON OF 1890.



THE PAVILION, JACKSON PARK, CHICAGO.—DRAWN BY CHARLES GRAHAM.—[SEE PAGE 372.]

IN THE BUSH.

THERE was a considerable extent of rock-maples two miles west of Claridon, which every spring yielded to Gilbert Custin and Levi Holmes, who owned it, a good part of their moderate farming incomes. old neighbors and friends, they had joined in more than one modest partnership enterprise. All the year the great sugar bush stood in gloomy idleness, except when old trees were felled and hauled off, but in the early spring it bestirred itself throughout, and seemed to send up the smoke of its sugar-boiling fires in token of its satisfaction

In its heart its owners worked together on a March day whose stillness was warmish and whose breeze was sharp. The rough sheds, which stood from year to year, where the sugar was boiled and panned, and where the workers passed a night at the height of the season, were at a sociable distance of a few rods. A man was likewise busy at either end of the bush; here the owners took the yield at first hand.

Levi Holmes, who was the younger, was the slower worker. He was a good looking fellow in the thirties, largely built. He went through his routine steadily enough; bringing in the sap, two great pails at a time, emptying and replacing them, replenishing the fire with gathered brush, stirring and testing the fragrant, bubbling contents of the huge kettle slung over it; finally ladling the boiled-down syrup into divers sized and shaped pans standing ready along a board.

But Levi stopped now and then, looking and listening with a dawning half-smile, not wholly alive to the poetry of the spot, yet not dead to it. There, under the branching trees, it was not spring yet, but it was not winter. No new grass disturbed the matted dead leaves, but moss patches were getting green. The air was full of sound, mostly of a clicking nature—the rattle of old leaves in the wind, the tapping of woodpeckers, the clink of the near creek under its thawing ice; with now and again, far off, that sound which is like the voice of the woods—the explosion of a gun. Seeing a squirrel scuttling over a branch, Levi was young enough to take experimental aim along his arm. He had already scented a pursy woodchuck, and had called out to Gilbert, "Golly, I wisht I had a dog!"

"We're making sugar, ain't ketching wood chucks," Gilbert had returned. He was so hard at work that the sweat beaded his forehead. Being of small physique, he toiled with nervous energy. What Levi did with slow ease he puffed and panted over. He was red and hot, and had opened his collar. Bringing in the sap buckets he had the appearance of being dragged along by his too great load; for convenience in stirring his kettle he stood on a block of wood in seeming peril of falling in. He was soot-blackened, dishevelled, and blown.

"I'm hungry enough to eat out the hull business," said Levi, when his partner ranged near. He sat on a stump, correcting a defective spile with his jack knife. Gilbert did not pause in his rattling retreat with four emptied buckets.

They had provisions to last till the next afternoon. "Being out-doors this time of year makes me keener'n a bear," said Levi.

"Eat what you want. *I* don't want nothing," was Gilbert's rejoinder. His tone was snappy. Slow by nature, what would have struck another some time back caused Levi his first stare at that instant.

His large red hands came down on his knees. "W'y, Gib, what's the rumpus?" he queried. His ready smile twitched his mouth. Gilbert was notably "quick"—quick to anger and quick to recovery—and in his conscious blamelessness he awaited the new development tranquilly.

Gilbert scratched up some fuel in a silence whose hostility was now clear. Levi's smile grew with his curiosity. He pushed his old soft hat to a corner of his head.

"Come, now, what's riling you, Gib?"

"I warrant you know," said Gilbert, with dry resentment, "or you ought to." He went and poked and built up his fire, held his ladle dripping over the kettle a minute, and returned with added soot marks. He sat down uncomfortably on a high tree root and folded his arms. "Or you ought to," he repeated, with the voice and air of severity and challenge.

Levi gaped, and the older, smaller man eyed him.

"I've let it go along, Levi," he started, nervously hitching, "because I hain't wanted to say a word. I hain't really known how to. I never had no such a word to say. It's on Sally's account I'm saying it. Being her brother, I'm her protector, she hain't any other. It's ben noticed and spoke of, and it's time I told ye. You hadn't ought to force me *to* it. You'd ought to known your intentions and out with 'em. You've ben coming to our house for a long time stiddy. I wish to ask what your intentions be?"

Levi twisted slowly round till he faced his accuser, who all at once looked to him like somebody he had never seen before. His inquiring grin died away, his jaw dropped. Under the strain of his emotions, which were dumfounded amaze, a sense of ludicrousness, and struggling deprecation, his face expressed none of them, but was vacuous. He was afraid to laugh, but he gave explosive vent to his familiar expletive. "Golly!"

"I say it's ben noticeable," said Gilbert.

Had Levi been shrewder he might have been touched. Gilbert sat fairly rigid with the strain of his effort. His small blue eyes stared and blinked; one hand clutched his grayish chin whiskers. Never self-confident, he was embarrassed now to the point of misery. But seriousness stamped him, anxiety, worriment.

"What's ben noticeable?" said Levi.

"The way you've ben coming to our house," Gilbert repeated, wetting his lips. "Hain't you ben coming two or three years stiddy? What you ben coming for?"

Levi whistled. Astonishment gave his eyes a childish roundness

"Sometimes," said Gilbert, "you've come twice a week, and sometimes you've ben more. You've ben 'most every Sunday. You ain't a fool, be you? What do you s'pose folks are saying?"

"I don' know." Levi dropped his chin in his hands and planted his feet toes inward. "You're crazy as a loon."

A slow red rose in the little man's cheeks. "That all you got to say?" he demanded. "I've got the right to ask. That all you intend to say?"

"W'y Gib, there hadn't such an idea come into my head," Levi gasped. "W'y, she's older'n I be, Sally is. Older'n you, ain't she?" The image of Sally Custin rising before him, he slowly chuckled.

"Laff!" said Gilbert, warmly. "What you laffing at?"

"I tell you," said his partner, with sobered desperation, "I hain't had a sign of no such a thought. I've run in to be neighborly; so've I run in to the Clarks' and the Searles'. Since Clara died I've felt lonesome, and got into the way of going round so. It took my mind off, along to the first," said Levi, his face twitching. "I've always felt to home to your house, Gib, and I've come and ben thankful. I s'posed I was welcome. I hain't come with no such object; now I hain't, Gib."

Gilbert squirmed on his seat. Levi's guilelessness was fuel to the flame of his ire.

"Then you'd better staid away," he snapped. "Hain't you got common-sense? You've come there to my house and set round, and talked and played cards and checkers, and et supper time and agin. The neighbors have ben in and found you there often *enough*. If you hain't wanted nothing, then you'd better staid to home."

Levi gulped. "I hain't ben thinking of gitting married, Gib," he said, humbly. "Clara hain't ben dead but three years."

It did not give his censor pause. His little eyes sparkled wrathfully.

"Mebbe you hain't," he said; "but you don't git me to believe it. It's that Tyler girl; you want George Tyler's girl. You're after *her*. I've ben told it."

The poor fellow who heard him grew red with a painful slowness, which was like a strangulation. To his own shy consciousness the dawning idea had been alarming; confronted with it in this wise it seemed an enormity, a crime. He struggled for his voice.

Grasping his knees in his arms, Gilbert looked glaringly across them. "Go ahead! Do as you're a mind to. But don't you come hanging round to *my* house no more. You hear that?"

Levi struck his knife into the stump between his legs. "I hadn't any suspicion you was such a fool," he ejaculated, simply. "W'y, it's ridiculous. There hain't nobody but you had no such a notion, Gib. You ought to know it. Where under the heavens did you scare it up? Tell it to anybody, and they'd laff. W'y—"

Gilbert arose. Grotesque in his angry heat, his disarray, and his sootiness, he had yet the dignity of honest wrath. "I know what folks are talking," he declared. Small-volumed at last, in excitement and anger his voice rose shrill. "I know what's ben circulated. There ain't but one thing to think, and folks have thought it, and now you set there and laff at the idea. You've ben underhanded, I'm free to tell ye. You needn't 'a' come hanging on. Knowing you didn't mean nothing, nobody 'd wanted ye. You've ben mean and sneaking. Nor I don't want nothing more to do *with* ye! I've had my last word with ye."

Sputtering and swelling, he turned and stumped away so hard as to plough a track in the dead leaf carpet.

Thereafter the first thing that struck Levi clearly was the evening song of a robin, that tincture of all spring-like sounds. He had the feeling which a shock imparts that activity was going to wait at a stand still till he should repossess himself. He sat for some time following Gilbert's distant movements with a blank stare, his lips fallen apart. Resentment had no appreciable share in his sensations. Had Gilbert spoken to him again, he would have responded as usual. He waited, in the expectant hope that he would, and once or twice opened his lips to speak first. Reaching out at extreme tension, as though fastened to his stump, he drank the contents of a two-gallon pail newly placed, and sat waiting still. Finally, since a far view of Gilbert's back was all his gaze conjured, he got up, and went back to his shed.

The syrup seethed thick and low in his pot, filling the air with its redolence. By the time he had transferred it to the pans and accomplished the refilling of the kettle, in the thick grown spot it was almost dark.

He stood looking around in a lonesomeness not born of the dim solitude but heightened by it. There was no moon, but the branches showed against a clear sky. The air was growing sharper; before long the drip of the sap would cease, for it would freeze yet again; already the sound of the brook was lessening as the ice thickened. Bird notes were short and crooning; quiet deepened with the darkness.

He had forgotten his hunger, but he presently got out his provisions, and, sitting down in the light of the fire, ate something. He remembered how last year he and Gilbert had sat thus and eaten together; he recalled how Gilbert had fallen into reminiscences of the time he had gone out West selling fruit trees, and how his cackling laugh had accompanied them.

He stepped out and peered through the shadows. Gilbert might have been forty miles away. The light of his fire was indistinctly visible, but there was no sound. Levi stood and hopelessly stared at it.

One thing was a sharp regret: that he had not put forth against Gilbert's tirade the certain fact that plain, angular, peaceful Sally Custin had thought as little of marrying him as had he of marrying Sally; that with her literal mind beholding him as a boy, she had gone out to him in some sort maternally. He tried vainly to muster courage to go and say it to Gilbert now.

His mood was solemn. He saw the drollery of Gilbert's attack no longer, or he could not smile at it. He realized only that Gilbert had quarrelled with him and put their friendship to an end, and the fantastic unreason of the cause did not lighten his keen sorrow. He stood there in the sharp night, with a forlorn blur in his eyes, till he shivered, and then he went in, and pulled out his blankets by the fire and lay down.

Toward morning Gilbert Custin awoke. To shut out the cold night he had ranged boards along the open side of the shed, and the little hut was warm, though only sparks of his fire remained.

The cry of a young owl, like the plaint of a human being in strange distress, fell on his ear, the more weird for being far off. Through a crack in the roof and through the overhanging tree a high star made itself visible. As his eyes roved further, aimlessly searching the darkness, Gilbert sat up.

Low down, the spaces between the set-up boards shone with a bright light. With a panic-stricken notion that the woods were on fire, Gilbert knocked them down. But the light was small, and blackly barred by the trunks of intervening trees. In the stillness he could hear its crackle, and against the early dusk could see every spark as it rose. The sight and sound and a smell of burning sugar which struck him turned him pale and sick with fright. Levi's shed was afire.

He ran out, tightening his loosened clothes as he ran, and sending a hoarse shout ahead. Pushing his frantic way among the trees, he bumped into them in the darkness, stumbled once and fell, and dragged a cumbering dead limb on with him. Already his slender strength was tremulously oozing; when he reached the flaming structure he was shaking from head to foot and panting.

An end of the shed still waited for the flames, and he wrenched it away. Within, all was hot and glaring, and so dense with smoke and the choking fumes of the burning sugar that the little man fell back.

Then he shut his mouth tight over chattering teeth and pressed in. Breathing was not possible, and he was so blinded that no object but the flames was visible. He fell on his knees and groped for Levi. Nothing but the heated ground met him, till his hand touched a dead ember of the fire in which the conflagration had found rise. The tripod fallen, he saw the kettle and the scorching sugar-cakes and the melting tins uniting in a common ruin. Beyond them he saw Levi lying with head thrown back and arms extended.

He stretched out and clutched him. He shook him. But Levi lay loggy. Scrambling to his feet then, he gripped him under the arms to drag him away

It was a labor almost beyond his strength. In its unconsciousness Levi's heavy form was an overpowering weight. A strong man might have puffed over the effort; Gilbert strained convulsively. He felt as though his back was breaking, and his short arms coming out of their sockets; his head throbbed and buzzed. He knew not whether or no he was burned; he was in pain all over. The smoke stung and stifled him, and he felt the near heat of the fire. He feared the roof might fall in, and he labored on, staggering, till he had hauled his burden fairly out of the shed.

In the cold air he jolted him and shouted in his ear; then snatched a sap bucket, and tore down to the creek. He knew he was burned somewhat; his hand smarted, his eyes stung, and his wrist had a painful wrench. Stumbling back, he sprinkled Levi's face. The shed fell together, and lay a waning fiery heap. When Levi opened his eyes, Gilbert was sitting with folded arms and blinking at him

"Your shed ketched a fire and burnt up," he said, in a tart voice. "What did you go to sleep leaving things helter-skelter for? Fire going hard, likely. It's jest an accident 't you wa'n't burnt up to a cinder."

Levi sat up. "Did you git me out?" he gasped, wiping his wet face.

"You s'pose I was going to set and see you roast alive?" said Gilbert, shortly. He was ill at ease, and kept his smoke-inflamed eyes on the smouldering mass of the shed.

"You got burnt," cried Levi.

Gilbert had his hand in the water pail. He gave a high-keyed cough and took it out. The early dawn was broadening to a paler gray. Such feathered life as had fluttered over the spot in cheeping fluster settled down again. It was as though the fire had been a whimsical freak of the dryads.

Levi fingered his tremulous lips. Overflowing, his honest heart would have poured itself out to another, but to Gilbert he was half afraid to utter a word.

"Gib," he said, huskily—"Gib, I'm sorry if I've done—ben— Gib, I'll marry her if you think I better; I'll marry her if you say so. I'd jest as lief as not, if you say so."

Gilbert went and poked in the ruins of the shed. Of a slow enlightenment and chagrin which sober thought had wrought in his own inflammable mind he could no more have spoken than he could have flown. He sent back a sharp response.

"You must 'a' been fairly calculating to burn things up, way you left 'em. Marry who you're a mind to. I don' know as Sally'd want ye. I should be against it for one," under the stress of his commotion he asserted. "We'll have to git this kettle set up and go right along; this sugaring can't be stopped for a piece of carelessness. I wouldn't 'a' thought a child could done it."

EMMA A. OPPER.

THE BOWERY THEATRES.

ILLUSTRATIONS BY E. W. KEMBLE

To one who desires to study the popular taste in drama, the Bowery has been for many years an inviting field. It is so still, though the glory of the elder days has faded, and will probably never be renewed. In our fathers' days of play-going on this street, then beautiful and even fashionable, it saw the great theatrical successes of the New World. Here Forrest played, and the elder Booth, the elder Wallack, his son James Wallack, and the lately deceased Lester Wallack, Proctor, Burton, F. B. Conway, E. L. Davenport, and Charlotte Cushman. To-day the stars, as famous in their own circles as their predecessors were, are William Dulaney and Edward Marsden, both veterans who played with the former stars, Charles Seabert, Morris Pike, James Tighe, Edith Crolius, Alfred Wallace, and Mamie Wallace. Highly as they are rated by their admirers, they shine in a narrower orbit than the others.

The attraction to the stranger who visits the Bowery to-day lies in the audience and the surroundings, rather than in the play. This last is invariably melodrama or some variety of the border drama, so called, and must, to meet the views of its patrons, reek with gore. Four or five persons might be killed in the course of an old-time play, but from ten to forty lives must be sacrificed at each performance now.

The scene is changed with all else. The Old Bowery Theatre, for many years the chosen resort of the east side play-goer, after the higher class of plays had ceased to "draw," is no longer the typical theatre of this class. The real Bowery houses now are the National, the Oriental, and, on occasions, the London Theatre.

They are always well patronized, and when the play is particularly strong a crowd will gather on the sidewalk before the doors are open. It is a rough crowd, though orderly enough in its own boisterous way. There are newsboys, factory hands, a few colored

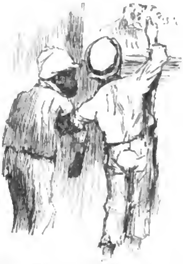
SOME OF THE AUDIENCE.



"SAY, BOSS, GIVE ME AND MY PAL TEN CENTS' WORTH."

persons, an occasional Chinaman, and many Germans, some of whom bring their families. This is the gallery audience, and they are as powerful as ever in determining the fate of a play or an actor. Woe to the aspirant who fails to please the "gods of the gallery"! He is hissed and jeered with the same hearty fervor with which the favorite is applauded, and seldom succeeds in winning favor after he has failed at first. On one occasion not long ago, one unfortunate, embarrassed by hisses, dropped his sword on the stage, and the star, not sorry to join in the guying, picked it up, and asked, "What will I do with it?" "Stick him with it!" yelled a boy in the gallery, and the audience cheered at the suggestion.

In the gallery the seats are ten and fifteen cents apiece, none being reserved. After this part of the house is filled the other doors are opened, and the more aristocratic portion is occupied, at from twenty to thirty-five cents a seat, by mechanics, shop-girls and their escorts, and small tradesmen and their families. They are equally appreciative with the gallery audience, and, according to their standard, are remarkably well behaved. No habitué of one of these theatres will make a disturbance, though the men all smoke during the play, cigarettes, pipes, and the worst of cigars being deemed legitimate indulgences. Whether they are served with drinks or not in their seats depends on the strictness with which the police are enforcing the excise laws at the time. Should the city be undergoing one of its occasional spasms of official rectitude, no beer is served; otherwise it flows freely, and stronger drink may be had on ordering. Beer, however, is the favorite beverage, and little strong liquor is called for. Other refreshments are served also, and there is a steady demand for pea-nuts, pretzels, and German confectionery of various kinds, with which the gentler sex regale themselves.

No canon of social ethics operates to suppress or even subdue the most outspoken criticism of the play, whether it be favorable or otherwise. If the former, it is expressed with hands, feet, and voice, and the noise of the cheering is sometimes almost deafening when the fancy of the audience is caught. This may happen when anything of excellence is presented, whether it be a speech of high and platitudinous virtuous sentiment, or a scientific blow from the hero's shoulder that sends the villain headlong to the boards, a song by the heroine, a desperate bowie-knife fight, or a skilled shot with a revolver. Bouquets and flowers are unknown as expressions of popular favor.

If, on the other hand, offence is given, the noise is equally great and less pleasant. Cat-calls and hisses of almost superhuman vigor are easily evoked, and not easily stilled. What social ethics fail to accomplish, however, is commonly attended to in the gallery by "the officer." The special officer who maintains among the upper seats what passes for good order is one of the interesting sights of the place. He is commonly some burly ruin of humanity, who may have been on "the force" for years, and who has all the importance of bearing that belongs to a brand-new policeman. He is always reasonably sober when on duty, and carries in his hand a stout rattan, so curled at the end that no mischievous boy can snatch it from his grasp. With this he pounds vigorously on the benches from time to time, shouting, "Order, gentlemen!" and he does not hesitate to strike with it any particularly obstreperous youngster who shouts more than his fellows. His authority is never disputed, and he summarily squelches any battle that may begin among the boys by ejecting the one he comes to first.

The play, as said, is always melodrama, and is always preceded by an "olio" of variety performances. Nothing else has any show of favor. Some time ago a society drama was presented at the National Theatre, and was greeted by the audience with derisive shouts of "Ah! what are you givin' us?" It was to run a week, but on the second night the house was almost empty. Even spectacular plays, with the most lavish displays of tableaux and pretty actresses, have little success. The audience is as eager for blood as the crowds in the Coliseum. In every play there is a hero, honest, handsome,

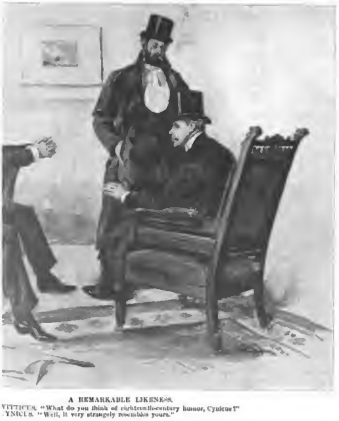
OLD LADY. "Is there anything you can do round the house, if I give you a good meal?"
TRAMP. "Yes, marm; I kin make yer hair curl wid a lecture on Wagner, an' me frien' here kin give practical illustrations on der piannyforty, ef you've got one."

tively short distance to the west of it, and has 372 acres. The two contain fourteen miles of interior drives, and thirty miles of walks. They are approached by the Drexel and Grand boulevards, which are 200 feet wide. The former is modelled after the Avenue l'Impératrice at Paris, and both are very fine driveways. On the west side of the city, and to be connected with those just mentioned by improved roadways, are Douglas, Garfield, and Humboldt parks. The combined area of these is about 600 acres. On the north side is Lincoln Park of 250 acres, with its shore driveway and zoological garden. There are, besides, many small parks in th- ·r, the most important of which is that o- . h the old Exposition building now stands, on the lake front, and which is the most prominent competitor of Jackson Park for the Fair. To offset its inferior size, is the fact that it lies just off the business centre, hotels, etc., and is accessible to the greatest number of people.

Chicago must quickly decide the difficult question of the site. The responsibility for the conduct of the enterprise now rests squarely on her shoulders. The Fair bill received the Executive signature and became a law on April 28th. On the same date the temporary organization, under whose auspices the present situation of the project was arrived at, surrendered matters into the hands of the permanent body of forty-five directors, selected mainly from Chicago's best known citizens. The law provides that before the first day of June the President shall appoint a commission, composed of members from the several States and at large, whose duty it shall be to meet before the first day of July in Chicago for the purpose of passing judgment upon the proceedings of the directors, and deciding whether or not the conditions of the bill have been complied with. Upon their verdict will depend the action of the government authorities in performing their share of the contract. The commissioners are to examine into the character of the subscriptions to the guarantee fund, and to see that the sum of $5,000,000 at least is safely provided for. They are also to inspect the site selected, and pronounce upon its suitability, and to review the plans generally that have been determined upon by the directors. If a satisfactory condition of things is reported, the government will send invitations to foreign nations to participate, and set about preparing for its own exhibit. For the latter purpose Congress has appropriated $1,500,000, of which $400,000 is to be used for the erection of buildings.

The Fair is to be formally dedicated, with appropriate ceremonies, in Chicago on October 12, 1892—the anniversary of the landing of Columbus on the island of the Bahamas to which he gave the name San Salvador—but is not to be opened until May 1, 1893. It is to be closed on the 30th of the following October. So far as the national government is concerned, Chicago is to have the quadri-centennial celebration all to herself, with one exception, viz., the grand naval review which is to take place in New York Harbor in April. All the nations of the world will be invited to send ships to take part in the latter. The rendezvous will be at Hampton Roads, whence the fleets will proceed Northward. It is expected that the acceptance will be general, and that the display will be the largest and most impressive of its kind that ever took place.

To Chicago the government will send exhibits representative of the various departments, special attention being paid to Agriculture, the Geological Survey, and the Patent-Office. The work of the Fish Commission will be given a prominent place, and whatever is feasible and desirable to take from the Smithsonian Institute will be forwarded. Each State and Territory will have its exhibit, and it is predicted by some sanguine Chicago people that the spirit of emulation will produce remarkable results. The tone of the local press is hopeful, not to say exuberant, but there is an undercurrent of seriousness manifested in the more prominent journals which reveals a consciousness of the weighty character of the undertaking. Rooms on the second floor of the Adams Express Building, on Dearborn Street, have been taken for the head-quarters of the Fair management, and it has been decided to make the capital stock $10,000,000.



A REMARKABLE LIKENESS.

WITTICUS. "What do you think of eighteenth-century humour, Cynicus?"
CYNICUS. "Well, it very strangely resembles yours."

IF YOUR LIVER REMINDS YOU

Of its existence by dull pain or sharp twinges in the right side, or beneath the dexter shoulder-blade, accept the reminder as a warning, and regulate the organ without loss of time by the use of Hostetter's Stomach Bitters. The above symptoms are usually accompanied by yellowness of the skin, constipation, furred tongue, disorder of the stomach, sick headache, and morning nausea. But a reform is promptly instituted by the Bitters, the best possible substitute for calomel, blue pill, and other super-potent and hurtful drugs erroneously designated as remedies for biliousness. Appetite and digestion are restored, and the bowels resume activity, when an impetus is given to the functions of health by this sterling anti-bilious medicine, which also has the effect of enriching and purifying the circulation, and fortifying the system against malarial infection in air or water. It is also highly beneficial for rheumatism, kidney and bladder troubles.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

FOR COUGHS, SORE THROAT, ASTHMA,

Catarrh, and diseases of the Bronchial Tubes, no better remedy can be found than "BROWN'S BRONCHIAL TROCHES." Sold everywhere, 25 cents.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures
Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

NICHOLSON'S Liquid Bread is a truthful temperance tonic. It builds up the constitution on scientific principles, assimilating with the food and making pure blood. Try it. Grocers and druggists keep it.—[*Adv.*]

BURNETT'S COCOAINE promotes the growth of and beautifies the hair, and renders it dark and glossy.—[*Adv.*]

The best regulator of the digestive organs, also best appetizer known, is ANGOSTURA BITTERS.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

BURNETT'S FLAVORING EXTRACTS are the best, the strongest, and most healthful.—[*Adv.*]

THE value of a remedy should be estimated by its curative properties. According to this standard, Ayer's Sarsaparilla is the best and most economical blood medicine in the market, because the most pure and concentrated. Price $1. Worth $5 a bottle.—[*Adv.*]

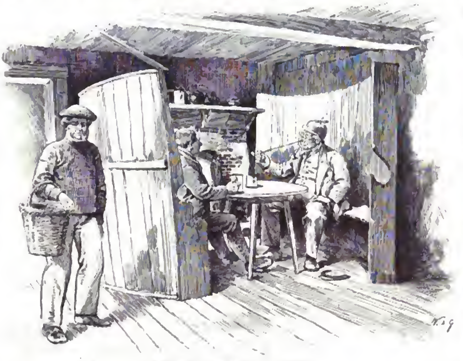
A QUAINT CORNER OF ENGLAND.

BY JULIAN RALPH.—ILLUSTRATED BY GRAHAM AND WILDER.

MANY Americans are proof against the fascinations of London, but, happily, I know few who have seen the English country sides without surrendering at once to their marvellous beauty. Until we have been to England we do not know what the country is—the country of English song and story. Until then we cannot appreciate the literature of our language. Fortunately for the modest expedition that set forth for the WEEKLY last summer, we did not arrange a programme for the usual bareheaded, hush-breathed round among cathedrals and tombs. We made no programme. We went, above all else, to see the things that guide-books had not hackneyed nor tourists staled. If we had a plan at all it was to see the people—that astonishing people who are our grandfathers and the monitors of the rest of humanity. But when the trip was finished, and writer and artist were aboard ship homeward bound, we realized that nearly all the other Americans had been tomb-haunting and relic-gazing. To have missed one of the cathedrals was in their eyes to have wasted the cost of the whole journey. But we would not, then or now or ever, exchange a sight of one mile of Kent, or one half hour in Devonshire, for a chance to sit upon a magic carpet and have all the cathedrals swing by us in a hushed and damp and gloomy circle. Cathedrals and tombs do well enough in London, but where there is a choice between an English lane and a tumble-down old castle, or between a bit of English sward and a tedious tour through an abandoned palace, we know which to take, for castles and tombs look best in pictures, while neither painter nor poet, ravished though he be, can describe the beauty that English rustic scenes contain.



BOOP INN, ON THE ROAD TO CLOVELLY.

No one can call this series of letters Anglomaniacal, therefore they will have full weight if we say in them that American grass is a fell disappointment to one who has seen English grass, and American trees seem thin and half-fed things after an English woodland view.

In this spirit will all this letter be written. Therefore let the Anglophobic reader take warning and skip what follows, for the eternal truth will out, like or leave it, as you please.

English rivers are small. They are all babies compared to our monster streams; all petty and modest, without palisades, or mountainous banks, or cañons, or vast swellings into lake-like breadths—without any grandeur whatsoever. That is true of all England; Nature plans her work on a very small scale over there; at retail, one may say. But there is a picturesqueness about the rivers that we wot not of in America. The green at the sides is so very, very green; it is laid on so thick and seems so solid. The foliage of the trees is so opulent, so dark, and luxuriantly abundant. The trees are like great bouquets or balls. They mass against the sky like cloud forms—full-bodied, round, and dense. And then you see these things beneath such gentle skies, in such a soft atmosphere. And you get your views through the graceful arches of stone bridges, and with quaint Norman towers peeping out here, and red-tiled roofs aglow there, while from yonder a soft, sweet chime of bells sounds daintily. Ah, me! what torture it is to have to sit on either side of the ocean and write about the other! But do you want to know why no one has fully and adequately pictured the beauty of English country scenes? (Nobody has.) It is because the English can't appreciate it to the utmost, being born to it, and because no American dares to give free rein to his feelings upon any subject. I dare not, lest the public should send me nerve tonics, hop pillows—and *Punch's* advice to the unwary.

My first country view in England was when I took a Sunday ride up the Thames toward Hampton Palace, on what they considered a wonderfully fine boat—the *Cardinal Wolsey*. A wretched thing it would seem in America. The Thames at London is something like a sluggish, muddy East River, with massive stone or iron bridges spanning it in close succession. A little way past the thick of London the city became broken into little village-like clusters of houses, with private parks and meadows beyond each thickening of the population. Then the graceful trees and the vivid green meadows began to be seen. Naked men were bathing in the river edges, and at other places men who were fishing stood in the water with their trousers rolled up to their thighs. The tide was low, and the queer black scows and barges lay high and dry on the shingle beach, with here and there a few keel boats careening toward one another on their sides, their masts touching, one's against another's, in neighborly attitudes. Pretty steam-launches with copper funnels shot along the stream, and there were many electric yachts, with spacious cabins enclosed in plate-glass, the only pleasure-boats I saw abroad that we would not be ashamed of in this country. Now and then we saw a freight boat, and these often had saffron-colored sails; and swans loitered near the paths of all the vessels, hoping to be fed.

Occasionally we came to what we in America would call picnic places—the grounds of water-side hotels, whose lawns bore blue and white tables, and private dinner boxes enclosed in green lattice-work. Fancy that, amid the dark greenery of opulent ash, willow, and horse-chestnut trees, upon the rich green of an English sward, under an English sky, and with red tiles seen in glimpses through the foliage!

At Kew we took a 'bus to Hampton, and rode for an hour through wondrous lanes, enclosed between green hedges or high stone walls. The road was like all the roads in England, which is to say like the roads in Central Park. You can never get away from good roads in England, go where you please. We passed scores of grand houses, and some that were historic, but I will not speak of any English homes here farther than to call to mind that passing by these brought us in the presence of the most luxurious gardens and the most splendid parks, beyond which we caught glimpses up the river, and among which the typical English boys in sailor suits were playing in charge of their nurses. And so we came to Bushy Park, which no lover of nature should miss. Its broad main avenue, shaded by four rows of horse-chestnut trees and bordered by the richest grass imaginable, remains upon the mind as a high attainment of man's power over nature, until one sees Fontainebleau and Versailles.

In a restaurant close by, our party saw the perfection of English womanhood—the realized ideal toward which the fashion of bleaching the hair was aimed some years ago. Whether she was a duchess, a tradesman's daughter, or what her class or station was, matters not. We did not know. She had that yellow hair in the tone of which there is a living lustre. She had a complexion the color of a pale rose. Her eyes were the eyes of a personified fawn, instinct with intelligence and aflame with health. And they were dark as a fawn's and spanned by dark eyebrows. Upon her tresses was a great summer hat of white lace, and for a gown she wore a plain dress of mouse-colored summer silk, with gloves and boots to match. I cannot describe her dress at greater length, because I could not look away from her face. It was of a type seen but poorly in America, which is none the less the home of the most beautiful women on whom the sun shines—women of the blended and heightened beauty of nearly all the world's types. You learn that about America by going abroad.

We endured the martyrdom of a parade through Hampton Palace, where the beds of dead kings and queens form interesting breaks in the tedious progress. We revelled in the royal park, where the loveliest willows trail their arms in the brook, and where the grass feels to the foot, as it looks to the eye, like a great green rug. And so we reached the Thames again, to find it fairly swarming with small boats. No wonder London is dull of a Sunday, since so many persons leave it. But who shall say after a journey up the Thames that its people are Puritanical? Why, we never saw such an approach to unanimity in Sabbath-breaking in this country.

Steam-yachts, electric yachts, working boats, row-boats, punts, steam-boats black with passengers, racing shells—the river was crusted with them. In many boats the ladies were at the oars, nearly all in flannel skirts and silk waists, and with the everlasting British stiff straw hat, almost with no rim at all, tilted down close to their noses in front, or perched on their rolls of back hair behind. The men were often in "sweaters" and knee-breeches, or flannel shirts and flannel trousers. As we noticed at Henley, the row-boats were made glorious with flowers heaped in the bows, and with colored rugs over the stern-boards and showing over the gunwales. Here and there were house-boats, like beautified barges at home, with lace curtains at the windows, and garlands of blossoms and rows of potted flowers on the edges of the roofs. The beautiful lawns of club-houses, reaching to the Thames's edge, were dotted with garish young men in striped shirts, and with gorgeous young women red as a New Jersey barn, as to their cheeks, their silken waists, and their parasols. Some of these clubs had hired bands to play in little cage-like pavilions on the grass.

And lo! as we looked at one of these club lawns—as beautiful in every detail as a Watteau picture—there arose a hubbub along the river-banks. The four-in-hands stopped, and the passengers stood up and shouted; the bicyclers got off their wheels; the loungers on the greenswards threw off their languor; all eyes were turned down the river. There all saw a small steam propeller boat literally swathed in purple hangings. As it passed my boat I saw in the front cabin the rotund form and wholesome half-German face of the Prince of Wales, as he sat in the glass-walled cabin on a red-cushioned seat, with half a dozen aristocratic-looking women around him. He lifted his hat as our boat shot past him, and then we saw his flunkies in the back of his boat opening champagne baskets. And there were champagne baskets on the [illegible] to which he was speeding! It seemed, then, that royalty's Sunday and the people's Sunday were spent in the self-same way.

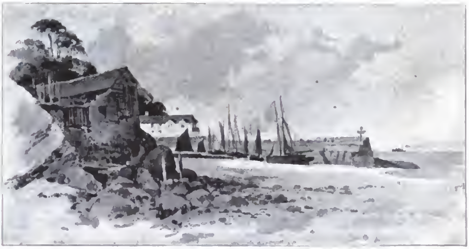
This was an accidental view of only semi-rural scenery. The WEEKLY had especially enjoined upon its travellers the need for finding some part of rural England that should be at once the most beautiful, the most quaint in population, and the least known to the world at large. That was a commission calculated to stir even the blasé spirit of an old war correspondent. Once in England, and there loosened like a bird set free, that command brought disquiet to a hundred brilliant men like Mr. Edmund Gosse, Joseph Hatton, Henry Irving, James R. Osgood, and all the rest whom the tourists met and button-holed for answer to the riddle, "What is the loveliest place in England, which no one ever heard of, and which has the quaintest population?" None of these could tell; but an innkeeper's wife in Birmingham answered it quite unconsciously.

"I spend my summers in the queerest place in hall Hengland," said she; "where the 'ouses are built on the steps of a staircase, and you carn't understand a blessed word the boys say when they speak to you."

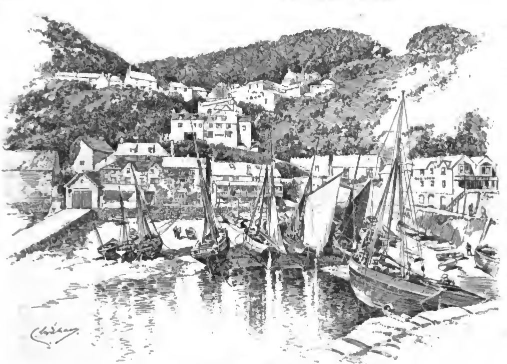
"And where is that?"

"It's in Devonshire," said she, "and it's called Clovelly."

If we had only thought to get that woman's name, it should



THE QUAY.



CLOVELLY FROM THE QUAY.

shine in an eternal galaxy with the names of the other heroines of history.

I.—CLOVELLY.

You are fortunate if you first see Clovelly from the Hobby Drive—a roadway through a private park in the neighborhood. The park is opened to the public for a small admission fee, and your driver is quite right in urging you, as all drivers will, to turn out of the road and go through it, for it is a wonderful specimen of half-trained, half-wild, and wholly luxuriant natural scenery. The road, or Hobby Drive (so called because the making of it was a rich man's mania), is a level, well kept way at the top of one of the bluffs with which Devonshire confronts the ocean. The park on either side of the road is almost overladen with vegetation. Splendid trees, enormous ferns in unwonted clumps, bushes of grand growth, wild flowers, and pretty vines press upon the neatly ordered road, and embower it so that it gets little else than a half light sifted through the leaves. It is like a grand temple. It is fit to be copied as a setting for one of Shakespeare's woodland plays. Now and then you get a glimpse of the sky and the sea meeting far below you—an Italian sky when we were there, and the sea a sheet of turquoise dotted with tiny fishing smacks. Suddenly Clovelly appears, forming a picture never to be forgotten; not likely ever to be ranked by any view to be had in this world.

The view comes with surprising suddenness. There is a break in the foliage, and this discloses a promontory just before you, on whose precipitous edge the white houses of the extraordinary village peep through the greenery. They might be likened to goats perched here and there upon the broken, rocky face of a cliff, or to the whitened waters of a series of cascades leaping from ledge after ledge. If you can conceive it to be a village, formed of houses in such fantastic order, then it must seem like a settlement that is sliding into the sea. But no, not sliding; reaching is the better word; for, as your eye follows the descent, you see—just at the point where the last house and the sea come together—a little jetty of massive masonry that is bent like a crab's claw. It juts into the ocean, and forms a tiny but secure harbor. That hook of stone is the hand of Clovelly, with which it earns its living; for if the village were personified, it would take the form of a man lying on a steep bank and reaching one hand into the water for what he can find there.

A moment more and your carriage is at the edge of the next promontory to Clovelly, and you seem to be hovering above the little village. It is embedded in luxuriant vegetation, as it were a collection of toy houses half buried in moss. The seemingly white dwellings shine in the greenery like dominoes upon a heap of velvet.

While you are still high in air, and again shut in from all views except of the trees around you, the driver says you are now as near to Clovelly as a wagon can go, and will you please pay him and get out and walk half a mile or so to the town. The walk quickly becomes an almost headlong run, and presently you stand at the head of the main street of Clovelly—by long odds the quaintest place in England. Never can you have had such a scene spread before you as this village presents. On either side are the uppermost houses, but all the rest are beneath you, so that the second stories of some are on a line with your eyes, and you look upon the roofs of all the others.

The main street—really the only one—leaps down to the sea by rapid jumps. It is wide enough for two wagons (so to speak) at the top, but it narrows and narrows until it is only seven feet wide at the bottom. It is all laid with big pebbles brought up from the beach, and these and the earth itself are held in place by timbers laid like railroad sleepers across the thoroughfare. What holds the houses in their places is not apparent. Toward the bottom the road seems to run at the houses and dodge around them, like a marble on a bagatelle board, until it has made five curves, and obtained the shape of a z on top of a letter s. If you can imagine a street formed by putting houses on either side of a winding stairway 1000 feet long, you can imagine Clovelly, not otherwise.

On Brooklyn Heights people have gardens on the tops of the houses below them; but in Clovelly, Tennyson, in order to make himself understood, would have had to write, "Climb into the garden, Maud," since the village is built in a gully, and the gardens, which are the gully's sides, either hang over the houses or rise high up behind them. Such a town must have suggested the tale of *Asmodeus*, in which the devil goes about looking through the roofs of all the houses. There is no uptown or down-town to Clovelly; it is all up-stairs or down-stairs. It is a human realization of the way that chickens sleep—on perches one above the other.

We put up at the New Inn, and sought the seclusion of a bedroom, in order to rest our faculties after the blow of the first sight of the place had fallen upon them. But there was no escaping the situation. When we threw open a window of the room and looked out and up, as one might look at the sky anywhere else, we saw the women of the opposite house drying linen in their back yard. To the waitress who brought in the towels we suggested that it was queer to see the houses on top of one another. Deep down from the bottom of a truly British sense of humor she replied: "They are not exactly on top of one another. They only look so."

But the porter who brought up the trunks said a funny thing: "The folks do only dare get tight like at one Inn—the one at t' bottom o' the hill. Them as lives three doors away must keep always sober."

Once established and reposing in a rocker on the hotel porch, we were amused to see the other visitors of the day come scurrying and rattling down the tilted, cobbly street. They had to drop into Clovelly much as Santa Claus makes his annual calls—from overhead. Visitors there reminded us of raindrops that had fallen on a roof and were hurrying down to the leaders. We observed that the front steps of the New Inn at one end of the building were but three in number and small at that, but at the other end, thirty feet away, our heads were above the gutter of the house next door. Since no wheeled vehicle can visit the village, the trunks of tourists are dragged upon queer sled-like frames. The butcher travels up and down the ladder of cobbles with two baskets and a saw and scales, and every man who carries a burden "tacks" from one side of the way to the other, like a sailing vessel beating against the wind.

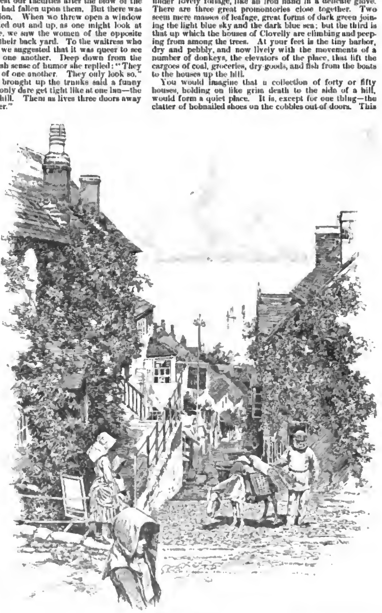
The street itself does the same thing. That accounts for the turns and angles at which it seems to breathe in its mad course down the hill. Little blind streets jut out from the main way here and there like pockets in the side of a mine-shaft. You may touch either side of one of these streets when you stand in the middle of one.

So much for Clovelly's main peculiarity. But it has another almost as great, and that is its beauty. Travellers liken it to Capri, because of its environment of gaudy sea, bright sky, and chromatic land views. Certainly it is beautiful beyond any power of man to describe it. Its houses are of the queerest shapes and types, with their gables and moss-grown tiled roofs, their queer cupboards sunken in the outer walls, their enticing bay-windows, their ramshackle steps, and the wedge-shaped platforms of stone before them, that make it possible for them to be inhabited. Most of the houses are stuccoed with plaster painted a light buff-color, but many of them are as green as the rocky cliffs around them—not with moss or grass, but with ivy, honeysuckle, and fuchsia. These walls of verdure are resplendent with bloom in the summer, and all around the houses are beds and boxes of roses and other flowering plants.

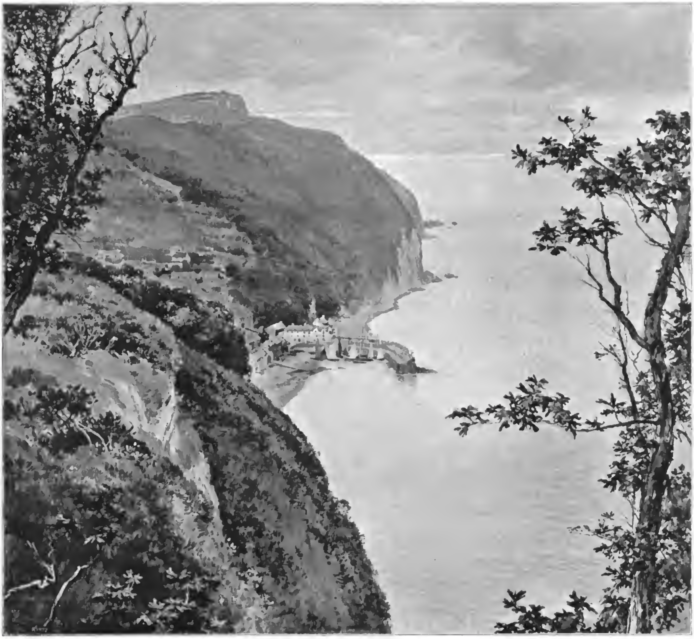
The rise and fall of the tides in England is very much greater than the same movement on either side of our country, and so half the time there is no water in the little crab-claw harbor, where the smacks then lie tumbled about on their sides. Their masters and sailors at such times lounge on the harbor wall, which in the evenings becomes a promenade and lovers' trysting-place. It is as broad on top as a carriage drive, and on the long scaffold poles that rise above and fret its sides the fisher's nets are picturesquely hung to dry. The men are stalwart bearded fellows, in caps and flannel shirts—as fine men as we saw anywhere in England. Their lingo is peculiar, and constantly calls to mind the Irish brogue; their faces also suggest a Celtic origin. They say "rayson," for reason; "dacint," for decent; and "nits," for nets. But then they also say "pesbly," for especially; "they two women," for those two women, and use many another queer expression, hints of some of which will occur farther on in this recital.

The view of the village from this quay is exquisite. Behind lies the blue sea, with Lundy Island, the loneliest place in England, hazy and indefinite in the distance. The white sails of tiny fishing smacks dot the azure expanse like the wings of white moths lighted on a field of lavender in bloom. Down the coast, in the only direction in which the coast can be seen, Westward Ho is faintly discernible—a tedious place, visited by those who know no better. But high in front of you rises the cruel Devon coast, hiding its rocks under lovely foliage, like an iron hand in a delicate glove. There are three great promontories close together. Two seem mere masses of leafage, great forms of dark green joining the light blue sky and the dark blue sea; but the third is that up which the houses of Clovelly are climbing and peeping from among the trees. At your feet is the tiny harbor, dry and pebbly, and now lively with the movements of a number of donkeys, the elevators of the place, that lift the cargoes of coal, groceries, dry-goods, and fish from the boats to the houses up the hill.

You would imagine that a collection of forty or fifty houses, holding on like grim death to the side of a hill, would form a quiet place. It is, except for one thing—the clatter of hobnailed shoes on the cobbles out-of-doors. This



STREET IN CLOVELLY



CLOVELLY, FROM HOBBY DRIVE.

tattoo is kept up all day and late into the night, and you would not believe how loud it is. Some itching poet has written a clever bit of rhyme about it in the visitors' book of the New Inn:

"The Vision bright
Of that dark night
  At Bethel, long ago,
Had steps of light,
With angels white,
  Whose feet tripped to and fro;
And now, in Devon,
One catches heaven
  In glimpses passing fair,
And hears the feet
In Clovelly's street—
  Not angels and *not bare!*"

What the British are as a nation they are as individuals. They must have a hand in everything, and always for a high moral purpose—if you believe them. The consequence is that when an old-fashioned Englishman or English woman goes to an old-fashioned inn like the New Inn, at an old-fashioned place like Clovelly, he and she must send for the register, and write not only their names, but their experiences and comments. Such well-meaning prigs as Lord and Lady Markswell wrote, "Inn good, and charges moderate"; and Mr. and Mrs. Francis A. Gamble dropped this patronizing line: "Charming place; very sorry to leave." Another public guardian wrote, "This place and Inn great contrast to Bude, which avoid." Another man, a Mr. —— ——, of Longford Park, Gloucester, remarks: "Visited this place, and much enjoyed luncheon at the New Inn." But here a different note was struck:

"The winding stair which natives call Clovelly Street
The treadmill were a name more meet.
Good-by! 'Tis hard to go away,
But 'twould be harder far to stay."

II.—GREEN LANES ABOUT CLOVELLY.

The English readers of Kingsley's novels have been the pioneers of the grand army of idlers who must sooner or later spend their vacations on this corner of the Devon coast. They know what not all the American admirers of the novelist have found out—that the very country he describes, the very villages, traditions, and even some of the families from whom he has selected characters, are to be enjoyed where he placed them. It is his fault and not theirs that they have gone to Bideford, where the room in which he wrote *Westward Ho!* is reverentially preserved, and to Westward Ho itself, only straggling into Clovelly and the neighboring country side in small numbers and by accident. Yet Bideford is a stupid, moribund place, and Westward Ho is a forced and not a popular resort, while one could scarcely miss rare treasures of nature and rural simplicity by going anywhere else in North Devon than to those places.

We were riding in the best fair-weather wagon I ever saw—the best because it almost compelled you to walk. It was of a kind they make in Devonshire, and that you cannot sit in and do anything else at the same time. It was a sensible-looking vehicle, with a high seat in front for the driver, and then a long seat down each side. But the seats were covered with horse-hair, which is as slippery as the average political view of the liquor question, or as banana peel on plate glass. Sitting on those seats was like carrying live eels. It required an earnest purpose and a firm clutch, united with a genius for sticking. A suit of sand-paper clothes in addition would not have come amiss. We had not gone half a mile when a New York lady in our party—Miss Mabel Griffith—sank, with a sudden but soft and graceful "plunk," upon the sandy bare floor of the wagon. "It had to be, sooner or later," her expressive face seemed to say, "and I'm glad it's done."

"When you feel obliged to join me down here," she said aloud, "please let me know in advance. And," she added, "if you see any pretty scenery, let me know."

The rest of us looked reproachfully at her for this. Her fall from the seat had interrupted an outburst of extravagant expressions of delight from her father and from her impatient lover, Mr. Macy, who were just then declaring that they never dreamed of anything more enchanting than the view that the ascent of a hill was opening up before them. Then to have her speak of pretty scenery as if its existence were only a bare possibility (and in Devonshire, of all places) was too shocking.

"Oh, Mabel, Mabel!" said the one. "Oh, Miss Griffith!" said the other.

"Well," said the incorrigible maiden, "I do believe you're seeing something now, and are not telling me. I know what I'll do, in order not to be robbed of scenery which is mine by right as much as yours—I'll get out and walk."

So the wagon stopped, and Mr. Macy got out to lift her down the steps, but the lissome girl merely touched his hand with the tips of her gloved fingers, and tripping lightly down, sprang from the bottom step to touch the ground as airily as a falling feather. The embodiment of beauty, grace, and health, whatever she did pleased both her father and me, but I saw a cloud pass over Mr. Macy's face. He had wanted to be of real service to her, to have really lifted her down—solidly, so to speak—and she had not allowed him to. It was a little thing, but little things make even the solid mountains, as the poets have observed. He was that sort of lover that you might call a monopolist. He seemed to want all of his sweetheart's soul and thoughts and time and attentions. Anything less was unendurable and worse than nothing at all. When that is the characteristic of a man, not only in his love but in his every respiration, I have no word to say for him, but in Macy's case I laid it to the uncertainty of his mind with regard to his sweetheart's purposes and feelings, and, more than that even, to his youth. He had crossed the ocean with her, fancying they were to be married in Europe, and now they were finishing their trip with their relationship unchanged. Again and again we met them, as at Clovelly, for a day or two, and their affairs became as interesting as any other curiosities we ran across in Europe. In his whisperings to me he always spoke of his journey as "an elopement." "We are taking the father along for propriety's sake," said he. But nothing in her speech or conduct betrayed any lively sympathy with such an odd view of the situation. To me it seemed that, for some reason, Miss Griffith was aware that her admirer so regarded the matter, also that she did not herself view it in that light at all, and, furthermore, that she nevertheless failed to correct his impression. Why did she so torture him? Ah, I never venture to explain a lady's "why."

But to return to that wagon ride. What a view it was that we all looked back upon! All traces of Clovelly had sunk behind intervening hillocks and curves of the road, and where we had supposed the village was there now arose a great purple headland, as soft and rounding in all its outlines as any soft and rounding cloud. Above hung the pale blue sky, and below lay the dark blue sea.

"That's heather," said the driver.

"Heather!" exclaimed Mr. Griffith. "I'd no idea it was so beautiful."

"I thought it was a brownish, dead-colored grass, or weed," said I.

"It's all flowers," replied the driver.

So, then, what we saw was a great block of bloom hanging between the sea and the sky. And in the sky were fleecy white clouds, and the sea was again dotted with the sails of fishers' smacks. We halted the wagon again that we might feast our eyes upon the view. Leading to the central mass of purple were the dark green walls of the roadway between pale green fields, and just midway of the great soft pile of purple was a tiny cross-roads village, some of the

nounced "Porgan." The route was
pare. It lay all the way through nar-
h on either side with earth, and with
h and gloriously surmounted by the
tion. So that the ride was between
dge growths. Green walls, did I say?
een at times, but now they were aglow
n of blossoms. Little as I know of the
rest, I was able to recognize almost a
ants in every hedge I saw. There were
ert, fern, haw, honeysuckle, raspberry,
white and black thorn, meadowsweet,
rose. There must be fifty sorts of plants in every Devonshire hedge. Of ferns alone there were half a dozen kinds.

In some places the farmers' wives were drying snow-white linen on these gorgeous walls of verdure, and wherever that occurred there were breaks to permit the houses to meet the lanes. Such houses! Some were capped with thick thatched roofs—for all the world like heads of hair—and some wore old-fashioned bonnets of red tiles. Often the houses were built with "cob" walls that were eighteen inches thick, and calculated to last for centuries. This composition is made of clay well mixed with straw and trodden hard. Small stones are "jobbed into the outer face," as they say, and so the composition seems one-half stone.

We stopped in one house in Parkham to ask for a drink of water. The floor of the main room was of flag stones level with the street, which had its gutter in the middle and its houses rising abruptly from the cobbles, without front yards or sidewalks. That was the way with all the Devon villages we saw. We asked the young girl of the house what she called a stove, and she said, "A bodley, zur." The smoothing-iron upon it she called a "heater." We ran across an Americanism when a man of the place, being asked if he liked sweets, replied, "Yes; *some*." As a matter of fact, many of the first English to come to America hailed from Cornwall and Devon. We heard the natives say of one another, "He'n up to Mrs. Jones's." "Where's Jamie?" "Oh, he's up along; he'll be down along soon." But the Celtic brogue came in again when our driver told us that his horse had "good mate [food]; he gets all the corn and banes he wants." We must have talked as queerly for their ears, because I could not make my landlady see why I wanted "a pitcher of water."

It seems that what one finds on a washstand to pour water from is a jug. That is true all over England.

"What makes your children so healthy?" I asked of one villager in Parkham.

"It is not ating, zur, as makes 'em," said he. "Many stranger folk talks about 'em zame as you, zur. They says as we've the finest childer they zee in their travils. Lord knows our working folk gits a good many of 'em—five or six or seven. In the marnin' they get up and have their wash—apt to be the best wash they'll git till next marnin', zur; and then they 'ave their broth out of the kettle, and milk and a little salt, and perhaps they'll git a little bread and trycle [molasses], and aff they go to school—yis, zur. Poor little things! You'll zee them barelegged to the thigh in the coldest weather. After school they git the zame, or perhaps bread and trycle again, or maybe a little jam. Zometimes a little bacon, zur, but not much meat comes to them. A laboring man will be able to buy a pig of nine or ten score in the course of a year, and they'll git some once in a week or zo; but you can zee they won't git much out of one pig. We don't think much mate is good—not for children, zur."

And now a word about what we tourists had to eat. Truly we lived like royalty, however humbly the people may have fared; but to us the dishes had the charm of novelty, which was lost to those who served them. The two distinctive dishes of the region are "junket" and "Devonshire cream." Feeble imitations of both are familiar to all who are of English descent, but the genuine dishes come like revelations to the palate that they touch for the first time.

Junket is to be eaten with "sweets"; that is to say, marmalade or jam, without one or the other of which no breakfast or supper in England is complete. To make junket, start by taking a bowl, and putting into it a dessert-spoonful of rum or brandy for flavoring. Add half a tea-cup of sugar. Heat a pint and a half or a quart of milk lukewarm, and pour that in the bowl. The milk must be fresh from the cow. Then add a dessert-spoonful of rennet, and give the compound a couple of sharp stirrings, when it will be ready for the table, especially if a little Devonshire cream be laid on top to make the dish most exquisite to the taste.

The milk for Devonshire cream must also be fresh from the cow. "Set to-night's milk by till morning," said the dimpled girl with flaming cheeks who made the best I tasted. "In the morning put it in a pan on a slow fire. In time a rim or skin the size of the bottom of the pan will rise to the top of the milk. When that happens, set the milk in a cool place—a dairy if you have one—till the next morning; then spoon off the thick cream that has come to the top, and serve it, leaving the scalded milk below." How do you eat this most delicate and wholesome of dishes? On everything, with everything, everywhere, always!

It had been one purpose of ours to compare the intelligence of the average British subject with that of the average American, and to that end I had questioned a chance shopkeeper on Third Avenue, New York city, a farmer at Chapel Hill, New Jersey, and a factory hand in Peekskill, asking them who represented them in Congress, and what were their views on the Fisheries and Samoan questions. The plan was carried out in England, but it would not be fair to publish the result, so entirely different are both the social and political conditions of the two peoples. But one test that was fair we made in a grammar-school in Wolfardisworthy. The school-house was a handsome new stone building. It was filthy within. The windows needed washing, the floor needed sweeping, the walls were streaked and neglected, the school-master was an unkempt, slouchy fellow, who wore a soft felt hat and green goggles and a forsaken beard. The pupils were farmers' boys—ruddy, healthy lads, but with shock heads of unattended hair, with dirty hands, ragged, soiled clothes, and with heavier faces than we are used to seeing in America. One lesson never taught there was the need of pride.

On the walls of the boys' room were maps of Europe, the British Isles, of England, and of Africa. In front of the map of Europe was a huddle of four boys, each with his shoulders bent, his spine limbered, his feet in his way, his hands troubling him, and his lower jaw hanging; no pride, no spirit, no *savoir-faire* about one of them. Not one had his hair combed, or wore a collar or a laundried shirt. I have seen these conditions approached in this country, but never equalled. As for the heavy faces and lustreless eyes, those I thank God I never saw in an American village school unless as exceptions, while here they were dominating characteristics.

"I want to see what English school-boys know about the United States," said I. Then, addressing the boys, I asked, "Where is my country?"

"Across the ocean," said the only boy who answered at all.

"How many States form it?"

"Thirty-eight."

"Any Territories?"

A grin.

"There are Territories as well as States, aren't there?"

A grin.

"What is the form of government over there?"

Blank faces.

"King? Queen? Czar? What then?"

Hanging heads.

"What is the government of Switzerland?"

"A public, sir," says the one boy who shows signs of life.

"I know, sir"—from the benches—"a republic."

"What is New England?"

"A State," says the responsive boy.

"What's north of the States?"

"Canada."

"What's south?"

No answer.

This being tedious work, I asked the master for samples of the school-books. He handed me a geography and a reader. I found that the geography told the number of the States, the population, form of government, the principal products, and very little else. A number of pages in the reader were devoted to America. It was unsystematic and incoherent matter, however. There was a chapter on New England, a chapter on California and its big trees, one on the Mississippi River, and one on the Middle States. I noticed, with a smile, that the English connection with the founding of the colonies was set forth, but their revolt and victorious war with England was dismissed with one sentence, "After the declaration of independence," etc., etc.

In a dark, poorly ventilated, cupboard-like room were four forms occupied by little girls in charge of a sad-faced young woman in black. It was the hour for the knitting lesson, during which stockings are made. The little girls are taught needle-work from the learning how to sew to the cutting out of a chemise. The children buy the wool, the School Board buys what they make with it, and the parents or public purchase the products from the School Board. A little kindergarten work, such as tuition in colors and shapes and pleating with colors, is taught there

When school was out we noticed with fresh surprise the beauty of these children that had looked so stolid and awkward in the class-rooms. Stolid and awkward they remained, but they were very wholesome, rugged, rosy little chaps and lasses, each one a treasure-house of health. We gave pennies to them, and their master said: "They will not spend the pennies. All are taught to save. Their parents will buy lambs or calves for them, so that when a boy grows up he often owns three or four cattle."

"Then," thought I, "they are forgiven for not knowing more of America, since they have learned something that is of greater value."

But a word apart from Devonshire. The fairest half of my readers will never take up another of these letters if those lovers who were with us are left in such a cloud of uncertainty. Alas! the added word must be a sad one. On the night before we started back to London I could not help hearing, as I sat in the parlor of the New Inn, a few words that were spoken on the porch.

"You are tired of my society," came in Mr. Macy's voice.

"I am tired of one subject only," replied Miss Griffith.

"Yet you gave me the right to think of this trip as taken only for one purpose."

"No; you owe that to yourself. *I* said if you would come to Europe I would give you an answer. *You* said, 'It shall be an elopement, with your father brought along.' *You* said that, not I."

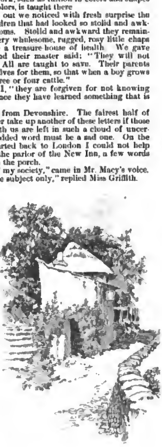
"But you acquiesced. At least, you did not correct me."

No answer.

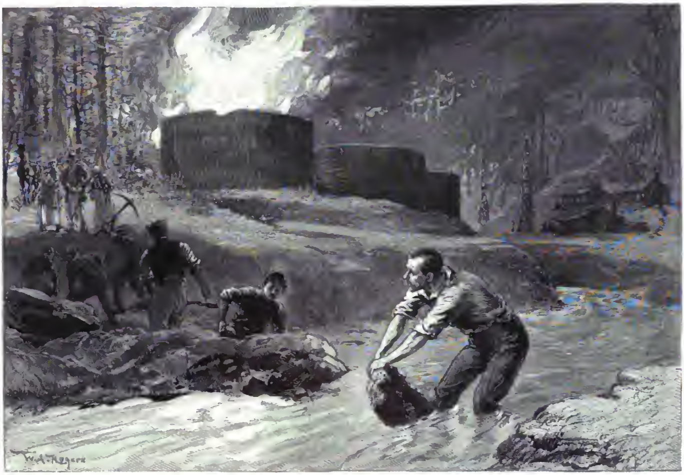
"Did you?"

Silence.

And Harold Macy, as grim and sullen as an Indian taken in war, rode with us to London, leaving Mr. Griffith and his daughter at Clovelly.



COTTAGE IN CLOVELLY.



"'DOES GO EASIER,' HE SAID, CHEERILY, AS HE STRENGTHENED THE SIDE OF THE SLUICE WITH A LARGE STONE."

GABE HARRIS.

THE wooden tanks on all the leases in the Harford oil region had been full for many days, and every time a well flowed "off a head" the petroleum was wasted. It ran over the tank's brim, saturated the dry leaves, and formed pools on the hill sides in the depressions behind trees and stumps.

The spring had been early: by the last week of April the snow was all gone from the recesses of the deep forest. There had been but little rain, and the warm sun had dried the rotting timber in the woods. The leaves strewing the ground were crisp and combustible as paper. They were scattered hither and thither by the frequent breezes blowing strong from the Great Lakes, and they found lodgement only where they fell into waste petroleum and became soaked. Never were there conditions more favorable for a terrible, disastrous forest fire.

Everybody was careful of fire. Men who in sullen silence, or with angry denunciation of the Pipe Line Company, watched their oil run to waste, forbore smoking in the woods for fear a spark from a pipe would start the conflagration they all dreaded. Drilling was stopped; fires were drawn from the boilers at pumping wells.

The producers had held mass-meetings and denounced the action of the company; they had even attempted violence. To all complaints the company seemed indifferent: to protect their property they had called upon the sheriff of the county and his posse, which consisted mainly of men in their employ.

From all the meetings Gabe Harris had been absent. In the attack upon the pump station he had taken no part; but every day he had gone to the office of the "Lines" and asked to have his oil "run." Having made the request and received an answer, he handed the superintendent an estimate of the amount of petroleum that had run to waste on his lease the previous day. The reply he received was the same that all applicants were met with:

"We have no room, but are increasing our tankage daily, and hope to relieve you soon. However, if you wish to sell your oil for immediate shipment, we will run it at once."

"Immediate shipment" oil brought twenty cents a barrel less than the market price for crude petroleum, and many of the producers, pressed by their creditors or needing money to buy the necessities of life, were forced to accept the company's terms. But Gabe, though his credit was nearly exhausted, would not thus yield to monopoly. Rather than sell his oil for immediate shipment, he would let his creditors have his property, and support his family by working on the streets of Harford. His home he could retain, for the little portable house with its furniture was paid for, and he would not have to pay ground-rent, as on the leases the surface of the ground had no value, save where the derricks and their engine-houses and tanks were located.

Perhaps he would not have been so courageous had his wife not been of the opinion that his course was right. Her nature, though affectionate and gentle, was independent and self-reliant. Poverty had no terrors for her. She had endured it, had suffered many privations in practising a rigid economy in order to save the wages Gabe had earned as a driller, so that some day they might have a lease of their own. They had secured one; on it had put down three wells, and were meeting with regularity and promptness the notes given for machinery and tanks when the "shut down" came, and their oil joined that of other producers on the hill-side—forever lost. She was glad Gabe had not become violent and made threats as his neighbors had done, because she thought much talk a display of weakness, and she would have regretted her marriage had she at last found herself the wife of a weak man. She knew she could rely upon his silent determination to win in his conflict with the "Lines" without an appeal to dynamite, which remedy for their abuses was daily threatened by the producers.

Meantime Gabe formed a plan. He resolved to run his oil himself, first gauging his tanks in the presence of witnesses to ascertain the amount they contained; then he would turn the stopcock, and set a donkey-engine to work pumping the petroleum into the main line. When his tanks were empty, he would demand of the "Lines" a storage certificate for the amount of the oil run.

On a clear warm morning in May he kissed his wife good-by for the day, and set out on horseback for Harford to make a final demand on the company to run his oil.

His lease was at the head of the Kendall Creek Valley. From the door of his house he could see the Tuna, into which the rapid Kendall Creek emptied. Scattered through the valley were several villages, the nearest to his home being Kendall. On the banks of the creek were a great number of iron storage tanks, each one painted red, and having on one side the name of the owner and its capacity stated in white letters. Gabe had often looked at them, and thought, as many another passer had done, what a big fire they would make if the petroleum in one of them should be ignited! But that day as he rode toward them his thoughts were far from the subject of a conflagration in them. Suddenly his revery was rudely interrupted. The sound of an explosion startled him, and looking up, he saw a large flat object flying in the air. Recognizing it as the roof of an iron tank, he gave rein to his horse, and dashed toward the column of smoke and flame intertwined that he saw rising near the town of Kendall.

The petroleum in an iron tank was burning, and he knew with what danger the fire threatened Kendall. The tank was one of a group on the bank of the creek, and if it should overflow, or another tank be ignited and burst with an explosion of gas, the burning fluid would surely be borne on the stream among the houses that farther down lined its banks. From these houses the town lay in the direction the wind was blowing, and the wooden, canvas-lined dwellings were as combustible as tinder. If a fire should break out among the houses on the creek, the town would soon be in ashes and many families homeless.

All of this Gabe comprehended in a moment, and he rode right into the village, shouting to the women whom he saw standing in their doorways and gazing curiously at the blazing petroleum, "Bring all the shovels and picks you can find."

Looking back over his shoulder, he saw fire running up the side of the hill, the blazing leaves blown by the wind apparently in a hot race to spread the conflagration, to carry destruction far and wide. At a glance he saw the direction of the fire was toward his own home and lease—toward his wife and children, whom he had left but a half hour before.

At the telegraph station of the "Lines" he drew rein, and yelled to the operator. "Tell Harford we want men with picks and shovels, and we want them quick. Wire the railroad company for a special train."

The operator, who had already reported an iron tank on fire, promptly sent Gabe's message. Before it reached Harford, Gabe was on his way at full speed of his horse. He rode to within a hundred yards of the burning tank, and hitched his horse securely to a tree on the windward side of the fire. Then snatching a shovel from one woman and a pickaxe from another, he ran to a bend of the creek, and began the construction of a dam.

Two old men and some boys came to help him, while the women brought picks and shovels, and laid them on the bank of the creek, in readiness for use by husbands and brothers, who to a man were attending a mass-meeting of the producers in Harford.

The blazing oil heated the tank, the flames roaring and struggling to maintain a perpendicular against the wind, growing in force and blowing steadily.

Gabe was working with wonderful energy, making a sluice for the escape of the water, at the same time directing his assistants how to build the dam, which was to be constructed of stones laid one on the other and banked with dirt. The old men, whose strength was unequal to the efforts they put forth in the excitement, leaned on their shovels presently, and took an observation of the progress of the fire, and reckoned on the probability of the small force being able to complete the dam before the overflow would come.

"Why, Gabe, how can you work so hard in this heat with your coat on?" one of them remarked, querulously, as he wiped his brow with a soiled handkerchief.

"Didn't think of that," said Gabe, and in a moment he was at work again without coat or vest to impede him. "Does go easier," he said, cheerily, as he strengthened the side of the sluice with a large stone. "Now, if you old fellows ain't played out, you can shovel some dirt behind that rock."

"I ain't played out," one of the old men said, "but I'm thinkin' you'd better git fast as your hoss can carry you, or you won't save much from that little house of yours up to Summit."

One of the boys stopped in his digging, his breath growing short, and looked at the conflagration sweeping up the mountain-side. "Gabe, hadn't I better ride up and tell your wife the fire's comin'?" he said.

"No; you stay here and dig. Mrs. Harris knows as much about the fire comin' her way as we do. She's got eyes."

Yet, with all his cheerful manner and the courage in his voice, Gabe did not dare to look up from his work, for fear the sight of the tempest of flames that was rushing to the destruction of his home would overcome his resolution to save Kendall if possible.

"But don't you think you'd better go, Gabe?" the old man queried. "Charity begins to home, you know."

"Stop pesterin' me and work, or get out of the road."

The old man, offended, shovelled in a desultory way.

"Spoonfuls don't count; 'tain't the little grains of sand we want here, but shovelfuls," and suiting action to word, Gabe dumped a pile of sand against the stone he had just put in place. The old man, feeling that he was useless, threw down his shovel and walked away; the other one joined him, and together they went to chatter with the women who were standing in the highway, alternately gazing at the fire and noting the progress of the dam.

"Is the dam done?" asked one woman eagerly of the old men.

"Done? It will never be done, for the overflow will come first."

"Better get out your things," said the other old man.

This suggestion stampeded the women. They scattered, each to her home, the children crying after their mothers, who were hastening to save keepsakes and small valuables. Here and there a frantic woman carried a baby, but was heedless of its cries.

Meanwhile Gabe was cheering the boys, some of whom were beginning to flag—one, then another of them, pausing to draw a shirt sleeve over his perspiring forehead.

"Here, Dick, you carry stones awhile. You help him, Bill. And you two fellows there with picks, take shovels. We'll beat that fire, or we ain't men."

Thus encouraged, the boys worked with increased vigor, and Gabe saw with growing hope that the dam was assuming proportions which would offer effectual resistance to considerable of a "boil over," as the overflow was sometimes called.

Once again the boy who had wanted to ride to Gabe's home with news of the approaching fire recurred to the subject.

"'Tain't too late yit, Gabe. Hadn't I better go?"

"You can go if you want to, Dick, but only not to my house. We need all hands here."

The boy shamefacedly renewed his exertions, and the others, in dogged imitation of Gabe's unflagging zeal, worked with their heads down, bestowing all their attention to obeying his orders.

There was silence among them except when Gabe spoke, but amid the roaring of the fire in the tank they could hear the shrill voices of the women screaming to each other, and presently there came to their ears the welcome screech of one of the little narrow-gauge engines. Buoyed by a repetition of the whistle, the little band seemed to redouble their efforts. Soon again the locomotive shrieked, nearer to them, and there was silence until the rumble of the train was heard. Then the boys looked up; but Gabe did not pause in the particular task he was engaged upon—packing the sand between some stones. The train ran up to a point opposite the tanks, and before it was at a stand-still men carrying picks and shovels had leaped from the platforms and were running to the dam, shouting to the workers to make way for new men.

Then Gabe paused. He looked up the valley, but could not see his home for the dense smoke that was blowing over the summit. He was jostled aside by the new-comers, who came to the work like a company charging a battery. Gabe felt that he would not be needed now. He could no longer restrain his heart. It called on him louder, more urgently than it had done when there was time for him to get to his house before the conflagration had reached it, and he obeyed.

In the tumult he was not missed, and no one heard the clatter of his horse's hoofs over the stony road. Bending low over the pommel of the saddle, he dashed into the smoke. He could not see, but he trusted his horse, now mad with fright. Presently he said, "Thank God!"

The lessening of the heat on his cheek, then a breath of cool air, told him that which he had not observed—the wind had veered, and had carried the fire off in another direction, west of his house, and it was safe. He knew, too, from faith in his wife, that she had conducted the children to a place of safety. Soon he was out of the blinding smoke, and the horse slackened the pace of his own accord. Then he dismounted and climbed the side of the mountain, where he soon found his family on a point of rocks.

"I saw it all," said his wife; "but I did not know it was you working there all that time till I saw the horse start up the valley. Then I knew." And she kissed him.

"But the overflow? Did it come?"

"Yes. Just after I lost sight of you in the smoke."

"And the dam?"

"It held. See, Kendall is safe; and there would not have been time to save it after the train came."

And in the look of pride and love she gave him Gabe found his reward.

Alexander L. Kinkead

"THE DUEL."

An ugly business, this premeditated manslaughter, and as Mr. Frederick James has painted it, you see how desperate is the situation.

More than one artist of the modern French school have tried their hands on this same subject, but the sentiments inspiring them have been different. There was a picture called "The Duel in the Snow," which was a tragedy after the farce. From the masked ball to the Bois de Boulogne, from the strident orchestra to the metallic clickings of the rapiers, there might have been but a short interval. It was all about nothing. Too much rum in their punches, with perhaps a woman's finger stirring up the brew, was the cause, and so Pierrot was offensive, and, flushed with bad liquor, two men crossed swords in the wintry woods, and one poor wretch was spitted. Sympathy is wasted on a work of this character. When buffoons engage in the dance of death, the sardonic grin mocks the situation. Another picture showed two heavy cavalry soldiers fighting a garrison duel with sabres. Two butchers from the abattoirs would have slashed their carcasses in a similar manner.

In Mr. Frederick James's picture there is nothing recalling the more florid periods of duelling, which were at their height during the reigns of Louis XIII. and the Regency. There is nothing here relating to red heels or curly wigs or flashing rapiers. The picture has an Anglo-Saxon bull-dog phlegm about it. There stand the antagonists. You can measure the distance between them. There are nine men, the major part in uniform, on the one side of the dinner table, and that many men would measure a fair ten paces. The company have not been drinking. Though it was the fashion of the day to imbibe hugely, the empty flasks are not numerous. The old-fashioned decanters still hold a sufficiency of port and Madeira. All the glasses have not been drained. There are corks on the floor, but libations have not been over-heavy. The men themselves—the lookers-on, the principals—are not even flushed. There are no bleary eyes nor rubicund noses. To the right, clear of them all, stands an officer holding a white handkerchief. The men at the table, who are standing with their backs to the wall, who witness the fight, have about in their middle one who has his watch in hand. He with the handkerchief having asked if the combatants are ready, and having received the answer "Ready," will drop his handkerchief—the signal to fire. The other man with the watch will count "One—two—three," and after that "three," which according to agreement may occupy a lapse of time from one-half to a whole minute, no firing is permissible. It would not be considered a murder to send a ball through a man's heart between the dropping of the handkerchief and "three," but brutal assassination if a pistol were fired after it.

So truthful is it all, so serious, so matter-of-fact, that the question arises, Who was the aggressor? What was the cause for a duel? The artist specifies the time, the locality. The period must be during the Presidency of James Madison. The place some tavern dining-room, probably in Virginia. The civilian who is pitted against the officer has a hard and determined face. He might be a Federalist, and political rancor brought about the crisis. Why has he his hat and top-coat on the chair? Was he invited to the dinner? Has he so far forgotten himself as to come an unbidden guest and insult some one there? The age of both combatants precludes the idea that there is a woman in the case. It was so easy, however, just then to pick a quarrel with an army man, for all the glory had fallen to the navy; for really Lundy's Lane and Chippewa had been but sorry battles, in which the army had not behaved over-brilliantly; and then Washington had been burnt, but New Orleans had retrieved many disasters on the land. Feelings had been much imbittered, for through political appointments many incompetent officers found prominent positions in the ranks. Still the red-headed man, with no Bob Acres look about him, has a vengeful, spiteful face. You can see only the back of his military adversary, who stands to the front of the picture. The men hold their flint-lock, duelling, smooth-bore pistols, in approved style. At least the civilian knows the way of it. If he were a little slow, his pistol arm would cover at least some part of his body.

On the wall certain handbills show the lay of the land. Here is the announcement of a stage-coach departure, and underneath it the notice of a runaway slave. It is a room in an inn, for on the mantel-piece are candles of many lengths in the candlesticks. The mantel-piece is a careful study, with its neat and fine carvings and bead-work. In one corner the officers have put their swords, and their different forms show a mixed service of horse and foot. On a quaintly formed mahogany side-table, with its peculiar bulge, stand the empty bottles and an earthenware jug of Hollands and a bowl of old Pekin china. The time may be three or four o'clock, for the dinner was served at sharp two; and now there is nothing but the wine on the table, some few cigars, and a clay pipe. The servants have been dismissed. Maybe the landlord has an inkling of what was likely to take place, but he held his peace. There might have been some angry words interchanged, but officers are apt to be noisy, and it was none of Boniface's business to be over-discriminating. The custom these officers brought him was good, his wine flowed like water, and his larder wanted constant replenishing. Why should he interfere?

The chairs tumbled toward the front have not been upset in any fray. They have been thrown there just so, so as to make the coast clear. The men must have room, and if there is a pace or so more than the regulation "ten," what matters it? Is much pity, solicitude shown on the part of those present? Very little is there. It must have been a cold-blooded tragedy. There is one slightly blanched and anxious face, that of a young man. Perhaps it is his début. But, bless you! our great-grandfathers, who really were no better nor worse than we are, were in touch with my Lord Camelford, who was the most business-like and sanguinary of duellists. Saint-Evremond and Saint-Foix were gay roisterers, but Camelford was a dull matter-of-fact fiend in a duel. When Fox, Pitt, Canning, and Castlereagh were quite ready to go out on the field of honor, why should not our gentlemen follow suit? Did not Hamilton fall in a duel with Burr in 1804? What, then, is there surprising about a fight in a tavern parlor some ten years later?

The predominating feature in Mr. Frederick James's picture is its intensity. Absolute faithfulness in all the details is a question of research. No great lavishings of applause should be meted out to an artist who commits an anachronism. He who seeks and studies objects fitted to periods always finds what he wants. It is only a question of time and patience. The lumber of the past is to the faithful artist not, however, immaterial. It dates his picture better than could a reference in a catalogue. But what is high art in Mr. James is this; he shows that he has a dramatic power held under control. He tries to convey the idea of that supreme moment of suspense, which suspense tells more on the imagination than the actual facts which must follow an instant later. For this reason "The Duel" is a picture of singular merit. Drawing, coloring, accessories, all tend toward the one general effectiveness. It is a work in which the unities have been studied. Nothing is forced or put too much to the front. It means, without flourish, display, exaggeration, the first act of a social drama of a past period. In an instant pistols will blaze, and a man will go down. Will it be the civilian or the officer?

SEÑOR LUIZ'S BENEFIT.

BY ROBERT GORDON BUTLER.

There were to be two plays this evening, for it was the benefit night of Señor Luiz, the leading actor and manager of the theatre. The first play was finished, and the curtain had just shut out the tableau of triumphant virtue. The empty lamps were being replaced by a servant of the theatre, and the audience, in a state of cheerful and comfortable expectation, was watching him with the strained attention that one gives to small happenings between the acts at a theatre. The first play had been most enjoyable, but the second play is always better than the first. To-night, too, the second play was entirely new—it had been written by Señor Luiz himself—so that to the advantage of being better than the first it added the charm of absolute novelty.

The audience was most distinguished—naturally, too, for the prices of seats had been raised; you could not enter the theatre for less than a real, and the best seats cost four times that amount. In the front row of seats, right opposite the centre of the stage, sat the Prefecto Politico, a very great man, with only one eye, fat, and bald-headed, a keen critic and student of the drama. He invariably attended the theatre, and formulated "critiques" on the performances to the crowd in the morning at his barber shop—for he was a barber. He did not move about the house between the acts; persons of less distinction could do that if they chose. He did not call on friends; friends called on him. Beside him sat his wife and his lovely daughter. They always attended the theatre with him; he was a model husband and father in this matter. He and his family always had complimentary tickets. On the other side of the Prefecto Politico sat a stranger, Señor Garcia. The Prefecto knew him, and had introduced him to his many friends, as he stood at the door watching the audience enter, as "the principal manager at the capital, who is looking for talent to take thither." As the Prefecto had said this to every one whom he had seen, and as every one to whom the fact had been confided had confided it to some one else, it follows that Señor Garcia was an object of general interest and admiration. Did it not reflect credit on the towns-people of Señor Luiz that the great manager should come to see him act, with a view, perhaps, of securing his services?

The moon shone down on the audience, smoking and chattering during the intermission. The stage was the only part of the theatre covered; the rest of the theatre was open to the heaven, and surely no playhouse ever had a grander auditorium. Directly back of the auditorium was the great square of the town, with the cathedral shining white in the moonlight, and beyond the cathedral the snow-capped mountains of the Sierras. On one side the Casa del Gobernador stood; on the other, behind a grove of palm-trees, stood the empty barracks. With the full moon shining down and covering everything with its mysterious light, surely no stranger or grander theatre could be imagined. Meanwhile every one was smoking placidly; no one was impatient for the second play to begin. It would begin in time—that was enough.

"The stage, señor," said the Prefecto Politico to the manager from the capital, "is indeed a valued adjunct to our schools. It is a means of education too little used. Your vocation is indeed a grand one, too little appreciated. I count myself fortunate that I am able by education and training to point out to my friends the beauties and value of the plays presented before us by my worthy friend Señor Luiz. As I tell him, his is indeed a lofty vocation, too little appreciated. He, moreover, does not fully comprehend his opportunities. His choice of plays is not always what it should be. I am willing to admit that the performance of classical plays does not attract such audiences as that of light farces and comedies, but, as I tell him, he should be above questions of mere money; he should—"

But the manager from the capital had to speak to Doña Isabel, and apologized for not waiting to hear the remainder of the Prefecto Politico's well-considered and valuable ideas on the drama. He was desolated to leave the Prefecto, he said, but when the ladies— The Prefecto would pardon him?

"That Señor Garcia is a most intelligent man," thought the Prefecto, as he lighted another cigarette and looked patronizingly at the manager talking with his daughter. She was very pretty in her mantilla, caught on her shoulders by two big captive fire-flies. Her fan moved rapidly in her small brown hands, and the white cigarette smoke rose in slow curls from her full red lips. Any father might be proud of such a daughter. To think that her mother had ever been young and pretty and slender like her daughter! Look at her now. But she had been, her daughter is; that made a difference. But even as he thought so the Prefecto Politico repented, and moved nearer to his fat, homely wife, and pressed her arm fondly, and she smiled on him and smiled on her daughter.

Presently the curtain was drawn aside, and an actor appeared to announce the play —*The Miser*.

"*The Miser*," he cried; and the audience instantly became quiet. Only clouds of cigarette smoke rose in the air to show that the spectators had not been stricken lifeless.

"*The Miser*," cried the actor again. "Luiz will be Porfirio, a miser; Señora Soledad will be Magdalena, his wife; Benito will be Juan, a nobleman; Pedro will be Peppe, a servant." And he withdrew suddenly.

"Señora Soledad," explained the Prefecto Politico to the manager from the capital, "is really Luiz's wife. Benito is a new member of the company; it was Pedro who announced the play."

"Yes?" said the manager, gravely, and blew rings of smoke; and the new play began.

The old miser was superb. The audience approved him loudly: he was so fond of his money, he treated his servant Peppe so badly. Peppe tried to cheat him, and he discovered his tricks so cleverly. Peppe was nearly starved. He had a basket of grapes to take to his master, with a letter from the judge. He put the basket on a rock, and held the letter in both hands.

"Now the last time I took grapes to Señor Porfirio," said Peppe, "he beat me because I ate two bunches: how it hurt my poor back! And when I asked him how he knew, he said the letter told him. The idea of a little piece of paper telling him! Now if I put the paper under this stone it won't see me eat the grapes, so Señor Porfirio won't beat me."

So he put the letter under the stone, and looked to see that no corner of it was visible; then he ate three bunches of grapes.

"I'm all right now," he said, and took the rest of the grapes with the letter to Señor Porfirio. The miser read the letter, while Peppe looked on confidently.

"You thief!" shouted the miser, "you have eaten three bunches of grapes! You will ruin me with your appetite."

"What wonderful eyes that little piece of paper must have!" sighed poor Peppe as he rubbed his shoulders. The audience was delighted; this was pure comedy.

"You don't see this every day," said the Prefecto Politico to the manager from the capital.

Then the miser's wife came in—Magdalena. She was very miserable, her husband treated her so badly. She bemoaned her fate:

> "Alas, alas! Why did I wed with him?
> My father would have warned me, and my mother—"

and at that there was a great nodding of elderly heads in the audience at young heads that nodded back again defiantly.

> "A better husband might I well have taken!
> Juan were mine to choose, had I but chosen,"

sighed the miser's poor wife, and then Benito came on as Juan, the former lover. He was a handsome fellow, was Benito, as handsome as Señora Soledad was beautiful. Benito, too, was more than merely handsome, he was a scholar. It was said that he had studied for the Church, and had seen a great deal of life. He stepped up to Señora Soledad.

"Magdalena," he said. That was the name of the miser's wife.

> "Señor! 'Tis you! You should not fright me so."
> "I would not fright you for a kingdom, Lena."
> "You must not call me so. Am I not married?
> The time you could have called me so is gone,
> And with it, vanished are the ties of friendship.
> We are but strangers, you and I; not friends."
> "Too well I know that; tell me not again
> Porfirio is your—husband. I no longer
> Can even be your friend. But, Magdalena—
> For I must call you so; I call you so
> In my dear heart, whene'er I think of thee
> And of those days gone by; and sometimes, as
> Even now I did, I call you so aloud,
> When memories are too strong and will too weak.
> 'Tis an old custom; custom grows a friend,
> Sticks closer than a brother. Tell me, señora!
> Porfirio? Does he make you happy now?"
> "Thou hast no right to ask me. I am married,
> And happy husband should make happy wife."
> "Ay, should; but does it?"
> "What right hast thou to ask me? That of friendship?
> The question's dangerous for a friend to ask.
> Happy? Mated to Porfirio? Happy?"
> "Poor [illegible]—Magdalena!"
> "Thou hast no right to pity me! Me poor?

Thou mightst have had such right—"
"That I have not the right is not my fault.
My will and hopes would fain have conquered it."
"It was my fault—it was my fault. I pray thee
Stir not remembrance of my folly in me.
Comes it not day by day uncommanded to me?
Juan, miserable mayst thou be; but I,
I am most miserable. I am punished
For mine own fault, which knowing I committed.
Canst thou forgive me? Add not to my grief;
But if thou wilt, thou hast the right, to hate me.
What do I say? What, sirrah, hast thou heard?
I did but jest. What said I?"
"Magdalena!
My Magdalena, long since I forgave thee!
I know thy torments. I have borne them too,
And still I suffer; but when I think of thee,
Bound to a husband love for whom is loathing,
My sufferings I forget to pity thee."
"Juan—my Juan!"
"I love you! Hark! I love you! Shall our folly,
A momentary cloud that came between us,
Forever part us? Folly's punishment
I know is heavier often than is crime's,
But, Magdalena, listen: still I love you!
I love you, Magdalena!"
"I hate Porfirio; but I am his wife.
Thou shouldst not speak such words; I should not
hear them."

"Manuela, hearken to me. I love you, and you know it. For love of you I have given up much; I have joined this paltry troupe of strolants which Luiz calls a theatrical company. Leave this crazy fellow; come with me. Be not afraid; I have money and friends. Once out of this gossiping town we shall be free. Come, Manuela, come. What keeps you?"

"Porfirio," said the prompter. The audience was spellbound. The acting was wonderfully natural, thought the Prefecto Politico.

"Porfirio keeps you? Nay, it is not he that makes your will so sluggish. Manuela, Manuela! By the remembrance of the love you bore me once, by the remembrance of your cruelty to me, take pity on me! Pity on me? Pity on yourself."

"That's a poor argument to move a woman, Benito."

"Manuela, do not jest. I cannot bear it. I am in earnest. Manuela, by the remembrance of our childhood days. Do you remember the orange grove where we used to play? Do you remember the great bull, how it broke out one day, and dashed in upon our sports?"

"Oh, Benito, yes; how awful it was!"

"You are not speaking the words," said the prompter, as loudly as he dared; "the cue is, 'Magdalena, let Porfirio keep his money.'"

"The bull charged upon us, Manuela, and we scattered and fled to the trees for refuge. All of us but one put trees between ourselves and the monster. You were that one, and on you he turned."

"I know, I know!"

"'Magdalena, let Porfirio—'" repeated the prompter.

"I sprang from behind the tree, I rushed to your side, and dragged you from before the infuriated beast. We felt his hot breath on our necks as we fled! You stumbled and fell; and as you fell, I threw you to one side. The bull passed you by and pursued me. You were safe, but he overtook me, and tossed me high in the air; he would have killed me had not his keepers come. They drew me from his feet alive, but only alive. Do you remember?"

"Oh, Benito, I do, I do! Forgive me!"

"Then we grew older, and in a fit of pique you threw me aside and gave yourself to Luiz. Come, Manuela, you love me still? Is it not so? My love, my love!"

"Benito, I do love you. I will come."

"Manuela, there are horses at hand, under the palm-trees. Get what you need—you do not need much, for I have money—and let us go at once. You can trust me."

"Benito, yes, I trust you."

What a storm of applause broke from the audience when Señora Manuela as Magdalena and Señor Benito as Juan retired from the stage! The acting was superb—so natural! The description of the attack by the bull—it was magnificent! How real the lover's pleadings sounded! Was it not strange that the actors forgot their assumed names, and used their own names? But of course—this from the Prefecto Politico—even an actor's memory cannot last forever.

But hush!—the miser.

He seemed disturbed, and spoke sharply to Peppe, his servant. The audience laughed at Peppe; he was so awkward. Would he have any more letters to hide?

"Where's your mistress?" asked the miser, shortly.

"My mistress? Your wife?"

"Ay, my wife. Where is she? Find her out,
And tell her I would see her in my garden.
Dost hear me? Quick! Begone!"

"Here? In the garden? I—I don't think, master, that—"

"I know thou dost not think! I do not pay thee
To think; I think myself; I hire thee
To do the errands set thee—so begone."

When the man had gone, the miser was left alone.

"Why did the fool seem startled when I bade him
To bear a message to his mistress? Pshaw! 'tis as folly
From a fool, foolishness. Wisdom from a fool
'Twere quite as wise to seek as grapes from thorns.
But yet—I fancied that his manner toward me;
Something it should conceal—what, I must know.
How long his answer is returning! Can Magdalena—
Well, if she is? Her movements are her own;
[illegible] account she need not render of them."

Then Peppe came back, all excitement.

"Well?" said the miser, impatiently.

"Master, my mistress is not in her chamber,
Nor is she in the places she affects.
Where she may be I know not, but I think—"
"Thinking again? I'll cure thee of that habit."

"I think my lady's fled with Juan, her lover!"
"What makes you think so? Fled with Juan, her lover?"

"With Juan, said I?—I should have said with Benito."

How the miser glared at Peppe! The actor who played the servant had forgotten the name—or had made a mistake. No wonder the manager, who played the miser, was angry!

"What do you mean, you fool? Fled with Benito?"

"Luiz, I heard Señora Manuela speak to Benito—"

"Of course they speak together; they are both in the company. She does not know him well enough to quarrel with him. But come, no jesting. Play your part, man! play out the play."

"Shall I play it out? Do you bid me play it out?"

"Go on, Pedro! The word, José."

The prompter gave "the word," and Peppe spoke again:

"Fast down the road sped Juan. With him, mounted
On her brown mare, rode Doña Magdalena."

"Luiz, I tell the truth! They may not have gone yet, but as I live they will go! Hear me, and save your honor!"

"My wife has fled with Juan? It is false!
Magdalena! Magdalena! No reply?
Can it be true? She fled with Juan? Gone?
Has Peppe, for a wonder, told the truth?"

"As I live, Luiz, I have told the truth."

Peppe seemed to have forgotten entirely the words of his part, and spoke quite differently from the way he should have spoken. Besides, he took Señor Luiz by the arm and shook him. Luiz stared at him hard. The play stopped. The audience sat motionless; they did not understand what was happening on the stage. For a moment, no one said a word; then Luiz, the miser, spoke:

"Very well. Play the play out."

It was the perfection of acting. You would have thought that he really believed his wife was unfaithful. His voice was hoarse, it shook so; he trembled from head to foot, and spoke, evidently, only by a great effort.

"Bravo!" cried the Prefecto Politico.

The miser evidently recognized the voice, for he turned toward the speaker. He did not bow to him, but simply looked at him; and the Prefecto Politico felt quite uncomfortable.

"Leave me, Peppe," said the miser. His voice showed how excited he was. Then, when Peppe had gone, the miser almost fell into a chair, and wrung his hands. So he really did love his wife, did he? How haggard he looked! How wildly he stared about him! How he moistened his lips with his tongue, yet how dry they looked! How he tried to speak, yet could not! How his limbs trembled!

Suddenly he sprang to his feet and darted from the stage. The audience was dumb with surprise.

"Superb!" said the Prefecto Politico; and there was a burst of applause.

In an instant the miser reappeared, dragging Juan, the nobleman; in his hand he held his sword. Now, he could speak.

"Wretch!" he broke out. "You would have stolen my wife! Is this your gratitude? Did I not take pity on you when you were alone, friendless, sick, dying on the road? Is this your gratitude? I raised you from the road, I nursed you, made you well, and to repay me you tried to steal my wife—my wife! Oh, Manuela! Manuela! She cared for you like a sister. And now you—you—Benito, whom we loved, have tried to steal her from me! Well, I am in time. I have found you out. I might kill you as you stand; but because you have been my guest, because you have broken bread with me, I will give you a chance for your life. Take your sword. On guard!"

"You are crazy! Why shall I draw my sword?"

"You dog! Why do I not kill you as you stand? O God! Take your sword! Defend yourself!"

"I will not fight with you. Why should I fight? You are crazy! You think I have stolen your wife? Well, I have not."

"I know you have not, but you have tried to steal her. Come, draw your sword. If you do not, I shall flog you like a dog."

"Luiz, you are mad!"

"I am not mad. Pedro told me, and I could read your faces. You thought I was blind—and I was at first; but now I am awake and able to see, and I see everything. For the last time, I bid you draw your sword. In any case, I shall punish you, either with a whip or with a sword; I care not which."

Benito seemed as if about to act the man; he drew his sword, and tried its temper. He looked about the audience, as if for a means of escape; but the miser watched him as a cat watches a mouse, and he had to assume a bravery which he did not possess.

Suddenly the miser turned about; evidently he heard some one behind the scenes—some one was coming. Benito saw the miser's back turned toward him, and sprang upon him, about to plunge his sword into his back.

"Luiz, Luiz, beware!" cried the miser's wife. Like a flash the miser swung round, like a flash his sword caught the point of Benito's blade, and that blade went whirling into the air, falling with a clatter in a corner of the stage.

For a moment there was a dead silence; then, as if they could not remain silent longer, "Bravo! bravo!" cried voices from all parts of the audience.

"I shall not fight you now, Benito," said Luiz, the miser. "You can go; only go at once." And without a word the lover departed.

"Luiz," cried the miser's wife, coming upon the stage and falling on her knees; "Luiz, do not send me away; hear me first, if you will send me! I was foolish, Luiz. The remembrance of our childhood days was too much for me, and when he pressed me, I let myself be tempted. But, Luiz—I could not go. I thought I loved him—but, Luiz, I did not. I was prepared to go, but I heard your voice, and I stood still. It reminded me of our boy, and my heart turned faint at the thought of what I was about to do. I came nearer. I watched you from the door. When I saw you about to fight him, I would have stopped you. I did not fear for you, Luiz; but you were too good to cross swords with such as he. Then I must have made a noise, for you turned, and as you turned—You know the rest—you know the rest! Luiz, do not cast me off! Pity me, and forgive me!"

"Manuela," said Luiz, the miser, sadly.

"Luiz, I will go, if you bid me; but, remember, I had repented. I shall never see him again. I will go. You are right to send me away; but, believe me, I shall never see him again."

"Manuela," said Luiz, gently, "listen!" And faintly the noise of a galloping horse came to the ears of the audience, and died away in the distance. "You are my wife. You wronged me in your heart, but you repented. Look up, love; I believe you. You saved my life. Must I not forgive the wrong you planned? Manuela, Manuela, I cannot say more now; he is gone. You are still my wife."

For a moment the miser held his wife in his arms, seemingly too much overcome to speak; then he rose, and half carried, half led his wife from the stage.

Only after they had gone did the audience move; then shouts of "Bravo! bravo!" rang out from all parts of the audience, and loud and long was the applause; but no one appeared to acknowledge it. Suddenly the curtain fell.

"It was a wonderful play," said the Prefecto Politico, as he rose to leave the theatre; "wonderful!"

"But did you notice," asked his pretty daughter, "that they forgot their names, that they called one another by their real names? Was it not strange?"

"I noticed it," replied the Prefecto Politico, deliberately. "It was a blot on an otherwise perfect performance. I ascribe it to the natural excitement of producing a new play. Am I not right, Señor Garcia?"

"I do not think it will happen again, señorita," answered the manager of the principal theatre in the capital.

"The stage may indeed be a mirror of life," sighed the Prefecto Politico; "but a play like that which we have just seen is impossible in real life. Such a thing could never happen really; but it made a very excellent play—it made a very excellent play."

MAY DAYS AT THE PLAZA.

City life has its various currents, possessing distinctive characters. The stream of humanity which flows on either side of the New York Post-office is composed of those who for the most part are earnestly engaged in bread-winning or money getting. The hum of traffic dominates. Almost within a stone's-throw of the great business buildings in the locality are homes of squalid poverty that contribute more or less to the motley throng of people in the busy streets. The head-quarters of the municipal government is there, and the Tombs prison is close at hand. It is a centre *sui generis*. If the spot in the metropolis that presents the particular and greatest contrast with this be sought for, it is to be found in the Plaza at the southeast entrance to Central Park, a spirited and life-like picture of which, by Mr. Hawley, appears in the present issue of the WEEKLY. The scene here differs diametrically from the former in everything save a certain activity, and even that is of an opposite nature. The ruling motive in this case is recreation, and there are no homes of squalid poverty in the vicinity, but, on the contrary, those of notable wealth. May Fair is all about it.

The Plaza lies before the principal entrance of the chief pleasure-ground of New York, and there is no time in the year perhaps in which it presents a more interesting appearance than it does in these pleasant May days, when the weather specially invites the populace out-of-doors, and before our American substitute for "the quality" seeks the country and the shore. Through this ganglion, as it were, of the nervous system of the city course vehicles in infinite variety to and from the Park drive. Equestrians, who seem yearly to grow more numerous, of both sexes appear with frequency. Nor are pedestrians lacking on the sidewalks and crossings. These are for the most part making their way to and from the Park walks.

The Plaza is to New York largely what Hyde Park Corner is to London, and the entrances to the Bois de Boulogne, the Thiergarten, and the Prater are respectively to Paris, Berlin, and Vienna. It is suggestive, sometimes in one way, sometimes in another, of each and all of these, and also of the fact that the distinguishing points of difference in the great cities of civilization are becoming less and less marked as time passes. Dissimilarities in the vehicles, dress, and general appearance of the well-to-do classes are all but obliterated, and on the chief streets of the capitals of the world even the marks of a distinctive national architecture are rapidly disappearing. A glance at the Plaza reveals omnibuses that might be seen passing Apsley House or on the Paris boulevards, and coaches, victorias, coupés, dog-carts, etc., that are now peculiar to no special locality. The Hansom cab, which was exclusively English five or six years ago and a curiosity in New York, has now become common. The white-aproned and white-capped nurse-maids with their baby carriages on the Plaza, might have been set down there from almost any European city; the equestrians might have been translated from Rotten Row; and the horses disfigured by amputated tails bear sad testimony to the fact that the brainless fad responsible for the deformity may prevail against the sense of the ridiculous and regard for looks as well in one part of the world as in another, and is no index of locality.

The authorities did well when they secured this area from private ownership, and made provision for the amply demonstrated public need at the point where the finest avenue of the city and the best residence districts find their chief access to the Park. The "Circle" at the Boulevard and Eighth Avenue entrance has been similarly and wisely set apart, and is correspondingly useful. But the Plaza is the more important spot, and will hold its supremacy indefinitely. The immediate architectural surroundings of the Plaza are in a very irregular and unsatisfactory state, and present a marked contrast to what might be properly expected there and what will doubtless be seen in a comparatively short time. The new hotel to be opened in the fall, which occupies all the west side, is well enough, and consonant with the dignity of its location; but on the east side, on Fifth Avenue, yet remains a string of low wooden houses or sheds, that can only be tolerated in view of the appropriate buildings that must soon rise on their site. The value of the property precludes the erection of anything but structures suitable to the place and in accord with the residence neighborhood in the immediate vicinity. In this are the finest dwellings in the city, including those of the Vanderbilts and others. Upon certain vacant lots near by residences are in project that will confirm the character of the district outlined, and render the Plaza a more notable centre even than it is now.

This part of New York in fact is but just taking on its permanent shape. The east side of Fifth Avenue fronting on the Park from the Plaza north is gradually putting forth unmistakable evidence of what that part of the avenue, whose houses are particularly favored as to frontage, will become. The vacant spaces are constantly growing less and the line of handsome establishments more continuous. When the unfinished condition of things at and near the Plaza, now somewhat unpleasant to the eye, gives place to one of completeness, another of the chapters of the growth of the city may be considered closed in a very satisfactory way.

THE END OF THE SEASON.

Too much even of a good thing is tiresome; the saleswomen in the candy stores seldom taste the sweets they offer for sale. Even those most devoted to society, who most enjoy what it has to offer, and most uncomplainingly obey its demands, seem at times to become weary of its rush and whirl, and to greet with unconventional but not less hearty welcome the coming of the hour which puts an end for the time to "the season." The end is only temporary. One season is over; another season begins. Now it is dancing and dining, to-morrow it will be praying and penitence, and afterward racing on land and sea, sports of the summer, Bar Harbor, Newport, and Lenox. The name of the rose is changed, but the flower's perfume is the same.

The man and woman so capitally drawn by Mr. Smedley certainly seem well content that "the season" is ended. They are well satisfied, on the whole, with the work they have done in amusing themselves, and they do not regret it; but none the less are they relieved that the end has been reached.

Man when he is tired is an unreflective animal, woman when tired thinks. Look at Mr. Smedley's husband! His attitude is that of entire and absolute relief. For forty days and five no more balls and operas; no more late hours at night; no more early—or comparatively early—hours in the morning. The season has lasted him; his yawn is not so much that of sleepiness as it is that of a man wearied of his work. But he has enjoyed the season thoroughly while it lasted, he is simply glad to turn his energies into another channel. But he is glad; there is no doubt about that.

The graceful little woman whom Mr. Smedley has so generously bestowed on him for wife is none the less glad that it is the end of the season, but her gratitude shows itself less obtrusively than does her lord's. Phyllis in an easy-chair is she, watching the events of the season to which this night puts an end pass before her in the flames of the fire; and though she is glad it is over, she feels a little regret that it is gone.

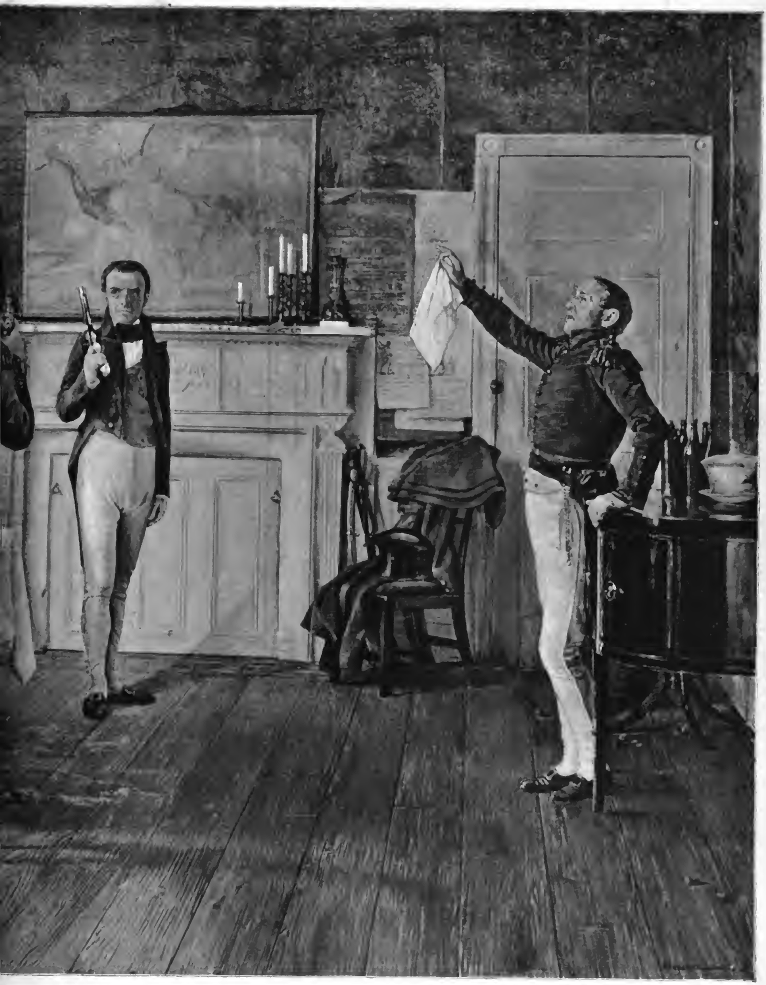
AN IMPROMPTU AFFAIR IN THE DAYS OF THE



DE.—From the Painting by Frederick James.—[See Page 382.]

MONTE CARLO.

THERE is, indeed, no better place than Monaco for a sceptic in general to exercise his scepticism, for things go on daily and nightly within its boundaries which are usually considered altogether immoral if not wholly irreligious—gambling on the grandest scale with all its attendant evils, of which suicide is not the least. Yet fortune joins with nature in crowning the principality in every respect. When the whole Riviera, Italian and French, was visited by the earthquake three years ago, which shook down countless houses and churches, and destroyed many a life along its course, causing panic wherever it passed, Monaco felt a tremor only, and the Casino covering the gaming-tables remained firm, solid, unscathed, and beautiful. Then, too, the place enjoys an ideal climate, an atmosphere pure and health-giving from blue sea and purple mountains, and no spot on earth—the earth, that is, as the writer knows it, and he has travelled much—can surpass it in beauty of situation and surroundings and general attractiveness. Lastly, its prosperity is such as in respect of any other place would be called phenomenal. Not to speak of the enormous profits of the gambling establishment, which during the year just passed amounted to more than half a hundred millions of francs, Monte Carlo is fast becoming *the* winter resort of the south of France. Whoever once makes a stay here during the winter months, and so comes to njoy the truly unsurpassed climate and to compare it with others he is accustomed to, will be sure to return the succeeding year f he can, notwithstanding the temptations which the Casino offers him, and which he oon learns by experience are good things to eep away from. Visitors are accordingly ver on the increase. Many who used to ass the winter in Cannes, Nice, or Menton or the sake of warmth and sunshine come ow in preference to Monte Carlo, where the verage winter temperature is several degrees igher and the change of weather less frequent and sudden than in the places named. nnumerable villas now cover ground where wo years ago there was no sign of human abitation, and there is at the present moment scarcely a nook or corner from the sea o the frontier of France that is not laid out or building, and worth its measure in bank-otes of large denomination. In some cases ven villas have stepped over the frontier, nd the mountain-side is certain to glisten ne day with the white walls of rich men's wellings.

Wealth is pouring in from every country. ll signs of untold luxury are evident on l sides. Last year it was still possible for ople of modest pockets to find a comfort- ble and respectable lodging within their eans, but this year prices have gone up ith such a bound that the mere rent for a ace to lay one's head wellnigh exhausts y but a purse of the very fattest propor- ons. Already a year ago there were more tels in Monte Carlo than in any other town its size that the writer ever saw, and most them of a palatial character, yet during e past twelvemonth another of gigantic mensions has appeared, as if by magic, fur- shed and equipped from cellar to roof with expense and luxury to take away the eath of all but millionaires. No wonder, en, that the hotel keepers elsewhere along e Riviera have raised a howl of deeper in- gnation than usual against the prolonged istence of Monte Carlo, for, they say, not ly does the Casino deprive them of great rt of their guests' money, but the villas and tels lately built in the shadow, so to speak, that fascinating structure deprive them so of the very guests themselves. Of course e increase of visitors is commonly attrib- ed to the attraction of the gaming-tables one, and indeed it looks at first sight as if ey really were the sole cause of it, for all e world seems to be seized by the demon play; but upon a closer examination you e that such is not the case, and that much the increase is composed of people who ver flirt with chance. It is even very obable, judging from the example afforded the gambling towns of Germany twenty ars ago, that the abolition of the tables uld make no difference in the number of sitors, for while there are very many who uld not care to come if there were no op- rtunity to gamble, there are also very any who now stay away because of what ey consider an abomination, and who uld be only too glad to avail themselves the climate were the atmosphere once rified of its moral rottenness. Be that as may, it is nevertheless for the moment ite certain that the number of players at Casino is augmenting in exact propor- n to the number of visitors to Monte Carlo. is is evidenced with great clearness by the t that as the town grows the building ows also. At the present time it is under ocess of enlargement by quite one-third of previous size, the entrance having been forward, and an entirely new wing being ded to its eastern end. Furthermore, a ir of picturesque and comfortable lifts ve been erected lately, to save visitors the uble of going up and down the steep in- ne that leads from the railway station.

From all of which it will be seen that nte Carlo is at the very acme of its pros- rity, besides being a synonyme for ease, mfort, and luxury. It charms the eye, it ngs health to the body, and, if one can ep away from the tables, content to the soul. But the difficulty lies in that "if." To remain in Monte Carlo without playing at least occasionally is a task worthy of Hercules, who is said, by the way, to have been the first discoverer of Monaco. The life of the place centres in the Casino. It overtops everything, and the proceedings inside of it are no less prominent in the thoughts and words of dwellers in the principality than its commanding exterior is to their eyes. Go where you will, you cannot get it out of your sight; talk with whom you will, and you cannot keep it out of your conversation. Its glittering roof covers not only the gaming-rooms and the offices of the administration, but a theatre and reading-room as well. In the former the best of plays and operas are given during the winter, and the delightfulest concerts by a perfect orchestra afternoon and evening throughout the year; while the latter contains the periodical literature of all countries. So that it is in the Casino that you are most likely to meet your friends or to find amusement in your moments of ennui. Unless, therefore, you have some absorbing occupation which requires all your time and energies, you are of necessity drawn for distraction to the centre of Monte Carlo life. When everybody enters the Casino, is it not the most natural thing in the world to do as your neighbor does, and enter also? Once inside, why not take a peep at the gambling? After a peep, why not try your luck too? And so on, and so on, until more likely than not you come out into the fresh air again with your pockets very much lighter than when you went in, and with an inward feeling of having been altogether foolish. Yet, unless you have the good fortune to possess a very strong force of character, you will soon repent your foolishness, and then again, and then again, until you become so accustomed to the proceeding that you continue it as a mere matter of course, sometimes winning, but more often losing, for the chances of the "bank" are against you. If you can afford to lose, no harm is done; but woe betide you if you cannot afford to lose, or if you lose your head—a very much easier matter, by-the-way, than most inexperienced people think. In the latter case the value of money escapes you entirely. Gold, silver, and bank-notes lie heaped up or scattered about promiscuously, like shavings; the coins are tossed to and fro or raked in by the croupiers with a nonchalance and apparent carelessness which increase the simile. You feel that what you possess is of the same character, and you only realize the truth after it has slipped away like quicksilver and you have to take thought where you can find more.

Let us, however, take a look in detail at this most gorgeous gambling hell. Outside and inside it is a beautiful congeries of different styles of architecture, the Moorish and the French of Garnier, however, predominating. Entrance is free to all decently dressed adults, with the exception of permanent inhabitants of the principality and of the *Département des Alpes maritimes* of France, unless they be members of the principal clubs. A small formality, however, must first be gone through with before admission is gained. As soon as you have mounted the broad flight of easy steps to the entrance you are met by a liveried servant, who asks if you have a card of admission, and upon your negative reply directs you to an office on your left. Here from four to six grave, black-coated individuals are always sitting, forming a kind of solemn tribunal, before which all who wish to enjoy the advantages of the *Cercle des Étrangers* must pass at least once. They give you a keen, quick, searching glance, ask your name (and, if you are very young looking, your age), nationality, and present address, all of which is written down in a big ledger, and hand you a card which admits you to any room in the Casino throughout the day. You may also have a ticket for a week, month, or year, but you must then first produce a passport or other document establishing your identity. Opposite the office is the door to the cloak-rooms, and between them the wide way into the atrium. This great hall is marbled, gilded, becolumned, and bemirrored as though it were the antechamber to the palace of an emperor, and around it, near the ceiling, runs a graceful balcony, above which are two large pictures, one of the principality under some curious effects of sunlight, the other of Cap Martin. Out of the atrium open the theatre, reading-room, toilet-rooms, and play-rooms. Divans there are in plenty for the repose of the weary, and those against the wall separating the atrium from the theatre command a vision of perfect loveliness through the wide-open entrance doors—a summer-like scene in this elsewhere drear month of January; a flood of golden sunlight, a harmony of bright flowers, waving plumy palms, graceful eucalyptuses, stately araucarias, velvety grass, dazzling villas scattered apparently at hap-hazard among the silver-grey olive orchards that creep up the mountains to the faint yellow line of the far-off Corniche Road—the mountains of fair France, one of them crowned with a fortress that commands the whole principality, and could crush it to atoms with a few shot from its heavy guns. Near the fortress the gray tower of La Turbie, or rather the quarter of a tower, which is all that remains (the inhabitants of the village having used the ruins for centuries as a quarry) of an enormous *tropæa*—whence the name La Turbie—built by order of the Roman Senate to commemorate the Ligurian victories of the Emperor Augustus. We have got a long way from the Casino, but it is difficult to keep one's self within the walls of any building when there is so much glorious warmth and beauty out-of-doors, although the crowd in the atrium betokens clearly that many are of a different opinion. Out of the west end of the atrium opens the reading and writing room, a delightful apartment, whose windows give on the sapphire sea and on shining Monaco, set on its dark and gloomy rock like a diamond in an iron setting. The theatre, probably the most comfortably roomy one in the world, lies next. It is a square space, gorgeous with gilded decorations and dark red velvet, entirely without balconies, but with a kind of apothecary-sized organ loft opposite the stage for the Prince of Monaco. Both, however, are subsidiary to the mysteries which lie behind two tall double doors in the east wall of the atrium. These open and shut without intermission from mid-day till eleven at night, a constant stream of people passing through them. Already by half past eleven in the morning a small crowd collects before each door, and rapidly increases in numbers when just before twelve o'clock, trains from Nice and Cannes, from Menton, Bordighera, and San Remo, bring their daily complement of sightseers and players.

The two crowds are kept in lines by officials, and await patiently the moment of entrance into what they hope will prove their El Dorado, talking the while in every language under the sun on subjects which without exception are all connected in some way with *roulette* or *trente-et-quarante*. How much this one lost or won yesterday; what a remarkable "series" of red that one had struck the day before; how the number thirteen had come out five times in succession to the discomfiture of the "bank," and the ecstasy of the players "on" it; the excellences of such and such a "system"; how so-and-so had lost five francs last year, and had to be sent away at the expense of the administration, and how he had turned up again the other day with a few hundred francs gathered no one knew whence, and playing with them had won nearly two hundred thousand; how such a one always stakes the "limit," with results usually disastrous to himself; how Monte Carlo compares with the former gambling towns of Germany, and so on and so on. Suddenly there is a movement along the waiting lines of men and women, and they part to give passage to servants in livery carrying strong-boxes which contain the money for the day. The doors open to give them entrance, but close again immediately, allowing no opportunity to the curious to know what passes out of hours behind them. The crowd goes on swelling until the clock strikes twelve, when the big brown doors are thrown wide open, and there is a mad wild rush, with a noise of hurrying feet, as of stormy waves dashing against the rocks of the coast. There is no politeness nor thought of any one but self. Women and weaklings are pushed aside by the strong, and more than one fall daily bears witness to the slipperiness of the well-waxed floor. Great part of this running crowd is composed of old hands each anxious to get a particular seat at a particular table to which he is attached, either through habit or superstition, and failing which they will not play. The rush ended, a lull ensues and comparative quiet. They who ran are now seated around the tables. The croupiers call, "*Messieurs, faites le jeu!*" the balls rattle in the roulettes, and the excitement of the day begins. But the atrium is by no means emptied. All day long it is the scene of moving life: men and women of all ages and from all climes passing up and down, some in and out of reading-room and, during concert time or between acts, theatre, but most entering or leaving the rooms whose tall doors might well bear the inscription which Dante places over those of Hell. You may sit there and know by a glance in the faces of passers-by how fortune has treated each; for, strangely enough, all self-control—or shall we rather say all desire to conceal one's feelings?—seems to depart the moment one seeks the fickle goddess. The writer has seen hardened men and women of the world, diplomatists, statesmen, actors, and actresses, as flurried over losses and as delighted with gains as the veriest novice of eighteen innocent years who timidly tries his luck for the first time. There is a subtle influence in the roulette's rattle and the voice of the "tailleur" at *trente-et-quarante* that upsets the very strongest heads.

The play-rooms are three in number, opening into each other by great doorless arches, so that, were it not for the different style of decoration displayed by each, they might be called one enormous room of the shape of a capital T. The first room is in no way remarkable, but the second is a beautiful example of Moorish architecture and coloring, while the third is more properly a grand hall in the most florid French style of the nineteenth century, massive with gilding, and bright with a series of fine pictures representing scantily clothed women at various out-door amusements. During the day these rooms seem rather dingy, for all the windows are heavily curtained, and scarcely any light penetrates save that which falls from sky-lights immediately over the tables. But at night they are resplendent with great chandeliers blazing like midsummer suns, and reflected by many mirrors and much gilding. In the evening the women who play, as well as those who are there only to pass time—many of the prettiest no better than they should be—put on all their finest toggery. Bright eyes and jewels flash in every direction. Fair cheeks, all aglow with the excitement of gaming, shine above gowns of the latest fashion and costliest material. There is a buzz of conversation and a ripple of laughter, above which rise the ceaseless rattle of ivory balls, the sharp click of coin against the croupiers' rakes, and the ever-recurring phrases, "*Messieurs, faites le jeu!*" "*Le jeu est fait!*" "*Rien ne va plus!*" It would be interesting to know why ladies are omitted from the formula, for the *dames* are quite as numerous as the *messieurs*, and often much more reckless gamblers. All this glittering movement and magnificence was until lately marred more or less by the stuffiness created by innumerable gas jets and oil lamps; but that is now obviated in great measure by the introduction of electric lights in all places except just over the tables, where the oil lamps still remain, and are likely to do so. For there would be a fine state of affairs if, in the absence of lamps, the electric current should be cut off suddenly, where money lies about as plentiful as dust in the streets, and where one grab in the dark would amount to a prince's ransom.

At present there are six tables for *roulette* and two for *trente-et-quarante*, and at each of them play is continuous from the moment the doors open in the morning to the moment they close at night. The number of players during the day must be positively enormous. At no time are there less than sixteen around each table, and often there are quite forty, without considering the many, so to speak, perambulating players, who go from table to table, playing at each as long as they win, but quitting it at the first loss, and seeking another. Besides those who sit quietly, there are usually others who stand two and three deep behind them, pushing and shoving and quarrelling in their desire for gain. It is really an astonishing sight. The complete absence of self-suppression that characterizes players for the time being is in a sense most entertaining, for it brings home to one in forcible fashion the fact that the brute side of humanity is by no means such a thing of the past as some optimist philosophers would have us believe, but that it only wants a fitting opportunity to show itself in full strength. Quarrels are of such frequent occurrence as to cause no particular remark, save in very flagrant cases. Tempers are all high-strung, and it needs but the smallest touch or provocation to make them snap. When nervous with losses, the habitually meek become violent in language. Insults are flung which anywhere else in Europe would certainly lead to duels, but which here seem to pass unresented, save by angry words. Disputes about the ownership of a stake are, above all things, frequent. Indeed, you have to keep an uncommonly sharp lookout for your money, for if left a second on the *tableau* it is sure to be seized, or at least claimed, by one of the many scamps of both sexes who are always on the watch for such opportunities. Often and often the dispute grows so hot that the "bank" actually pays both claimants, unless the dishonesty of one or the other is clearly manifest. The writer once had a *masse* seized from between his fingers by a woman, who maintained stoutly that she had made the stake, and who called two by-standers to witness that they had seen her make it, which they did with due alacrity. Yet all three were lying, and the "bank" knew it, for two of the croupiers had seen the writer place the stake. He, therefore, was paid; but the woman would not give up what she had grabbed, and as there was no clear proof that she was not honestly mistaken, she was allowed to keep it, and, no doubt, subsequently divided it with her confederates.

On the other hand, you see occasionally a touch of warm-hearted human nature that excites feelings of a tenderer order than those aroused by such events. One evening lately a man was playing *trente-et-quarante* with an ill-luck that surpassed comprehension. Put his money where he would—*noir, rouge, couleur*, or *inverse*—it was presently drawn in by the "bank." Finally he pushed his chair back with a jerk of impatience, and arose from the table. As he did so a pretty little woman came running to him from across the room with a pained expression on her face, and looking up into his, inquired, "*Eh bien, mon ami?*" with a tone of infinite soothing tenderness in her voice. "*Eh bien*," he replied, quietly, "*j'ai tout perdu!*" Whereupon, without a moment's hesitation, she thrust her hand into the reticule that hung from her belt, and pulling out a handful of gold and bank-notes, held it out to him, pleading, "*Tenez! allez vous refaire.*" And yet that little woman was neither his wife nor his sister, but of a sort commonly supposed to have no heart, and to go out of life as "one more unfortunate." Her friend, be it said for the sake of his manliness, refused her offer, although she continued to urge it upon him with tears in her eyes and a look on her pretty face that wellnigh brought tears to the eyes of the beholder.

It may here be said that all sorts and conditions of men and women frequent the play-rooms, but all are equal before Mammon. Princes of the blood gamble side by side with the small shop-keeper off on a holiday, and great ladies are content to sit next to strumpets. Indeed, the latter two categories cannot always be told apart, they are so alike in their apparel, and often in looks, while of the two the erring sister frequently wears the least noticeable attire. It is even related that last year the Duchess of M—— (those who know the lady will easily realize the incident) during play happened to make a remark to her neighbor, a young Englishman, who rebuked her promptly, requesting in a low voice that she would not speak to him now, as his mother and sister were just behind him!

It is diverting in a high degree to watch the faces and actions of players. Nothing that you read in romances on the subject surpasses one tittle the reality. Faces flush, eyes glisten, hands tremble as they rake in the glittering coin or it is raked from them. The laughing, merry good-humor of the lucky; the nervous irritability, the profound melancholy, the vacant far-off stare of the unlucky; the tense nerves and fixed gaze with which they watch the ball as it circles or the cards as they turn, and the resultant smile or half-suppressed sigh according as they win or lose—all this is so common as to escape notice save from new-comers. Envy too, and hatred, malice, and all uncharitableness, are depicted in the various countenances, old and young, around those masses of coin, plentiful as sand upon the shore.

Diverting, too, it is to watch the remarkable luck or ill-luck which follows certain players. Some have but to make their stake, and the ball or cards seem to obey their will; while others play over and over and over again till their pockets are empty without once winning, although most of the time they only just miss it. If they put on one number, the number next to it will come up; and if they change their number, that on which they staked previously will be called. It seems almost as if there were some mocking spirit with guiding hand to prevent their winning. Some are utterly cast down and rendered limp by repeated losses, walking slowly away from the table with dejected mein and abstracted look. Others push their chair away violently as they rise from their seat, wholly regardless of the toes, shins, and stomachs of those standing behind them. Others are downright angry, and swear at the table as though it were a personality with mind full of malice against the discomfited gamester. Some stake their money with confidence after deep thought, and apparently as the result of severe calculation based on a pile of little papers whereon they have kept the run of the game, and their faces take on an expression of surprise and disgust if they lose. Others make their game hesitatingly, slowly, and painfully, as though hating to part with the coin, sometimes changing its place or wholly withdrawing it before the dry "*Rien ne va plus!*" of the croupier sounds, and the loss of it contracts their muscles and brings a haggard look to the previously hopeful face. Others fling their money lightly all over the *tableau*, chatting the while to themselves or their neighbors, and seeming to care no more about the result than if they had no connection with it. And of course these are the very players that have the best luck and win most frequently. Every now and then a great gambler will put in an appearance, but you rarely see such overwhelming good fortune as you read of, and as the renowned Garcia used to enjoy in the gambling towns along the Rhine. Nevertheless large sums are not infrequently won or lost. The writer saw once a quiet-looking individual win over one hundred thousand francs in the space of five minutes at *roulette*, and at another time over fifty thousand at *trente-et-quarante;* but that was three years ago, and he has seen no like case since.

Altogether, for one who is fond of studying human nature in its various phases, there is no more promising field of observation than Monte Carlo, for gambling emphasizes many of its strongest traits, and the very air here is saturated with the gambling spirit. In spite of the entrancing beauty of the gardens and surroundings, little is talked of save "luck," and play seems the object in life of every man and woman that one meets. If you see a person thoughtfully studying a note-book or package of papers, pencil in hand—and the sight is a very common one—you may be sure that person is calculating his chances, working up his "system," trying to discover why he lost awhile ago, or laying his plans for future play. Go into any hotel, restaurant, or café anywhere in Monte Carlo, and you will find the chief topic of conversation to be play. Stop at the head of the stairs that lead from the Casino to the railway station and note the remarks of those coming and going, and you will have the same experience. No matter what subject is broached, the talk is absolutely certain to work around in the end to those absorbing tables, without any one knowing how. Even people who do not play seem to catch the infection to the extent of taking an interest in others' fortunes; or else they become so heartily sick of the all-pervading subject that they take themselves out of the principality, bag and baggage. In the windows of the book-shops and on the counters of the news stands—and the same is true in Nice and Menton—you may see in profusion books and pamphlets, sold at prices not far short of their weight in gold, giving infallible "systems" for winning habitually with a small capital. Then, too, there are "professors" who have equally infallible systems, and who will teach you how to win in return for a certain percentage of your winnings. If you ask them why they themselves don't play, they will reply, in a hurt voice, that the administration had withdrawn their tickets of admission because they had solved the problem of how to win always. And these systems, according to the proverbial good-luck of beginners, *do* succeed for a time, just long enough to give the delighted player confidence in his game, when suddenly they go all to pieces, without the least warning, and the last state of the player under such circumstances is truly pitiable. It is said, however, that there really are people who succeed in making a living out of the tables. But they are old *habitués* who are content with small gains, who never allow themselves to enter the rooms with more in their pockets than they are willing to lose, and who make it a rule to leave always the instant they have won their daily modicum. It may not be out of place to say here that the hopes all new-comers entertain of breaking the bank are quite vain, for the bank of Monte Carlo never breaks. Almost unlimited capital may be produced at a moment's notice, and if one table is near to losing all its stock in hand (an event which the writer, who has passed three winters here, has not yet known of), more will be brought immediately, and the game goes on without intermission. The limit of a stake at *trente et quarante* is twelve thousand francs, and more than that cannot be won or lost at that game at one time. But at *roulette* more may be won or lost, although the limit of any one stake in this case is only six thousand francs, for by placing the limit on every point simultaneously on which a stake may be put, and by risking in consequence something over thirty-one thousand francs, a sum amounting to more than one hundred thousand may be won at one single lucky turn. There are thirty-six chances, however, to one that the turn will be contrary, and that some at least, if not all, of the thirty-one thousand francs will go to swell the profits of the bank.

The most reckless players are Russians. They are born gamblers, and they seem to have bottomless pockets, scattering their gold about as if they had the mines of Siberia at their backs. They all play for amusement, and apparently care not a straw for the result. There is a young Russian girl this winter in Nice of the age of fifteen, who comes over occasionally with her brother and governess for a few days' distraction. She plays exclusively with gold, and she almost invariably wins; but when she loses she takes the matter with perfect indifference, and goes back to her fond guardian at Nice with the same placidly happy and smiling face she had upon her arrival.

Superstition is of course rampant. Some seek the numbers on which to play in the date of the month, their age and that of their sweethearts, their birthday and name-day, the number of their room at the hotel, of the car or carriage in which they came, of their railway ticket, of the check given them in the cloak-room when they deposit their impediments. Others will not play at certain tables, nor on certain days, nor if they see in the rooms certain faces which they have come to regard as their evil geniuses. On the other hand, to see and touch a hunchback brings unbounded good fortune, so that the moment one appears he is forthwith beset by a shameless crowd eager to touch his hump, and quite regardless of the poor man's feelings. A hangman's rope which has been in actual use, or that of a suicide by hanging, is considered of like efficacy, and strands thereof are in great demand.

B. C. N.

THE LAST OF THE "SLIPS."

It was in the year 1615 that the good ship *Tiger*, Captain Adrian Blok, surmounting the perils of the tortuous channels in the Lower Bay, dropped her anchor at the mouth of the Hudson, a couple of hundred rods or so off the present site of Castle Garden. She carried as passengers a company of Dutch traders which, including women and servants, numbered about twenty-five, who had come to join a small settlement of their countrymen already located upon the island of Man-hat-ta about two years previously. The glowing reports that this first group of traders had forwarded to Holland had inspired the second expedition with the true Dutchman's readiness to risk his life and all for a share in the "soft things" to be found in trading with the Indians. They brought with them a cargo of assorted trinkets, such as would best catch the infantile fancy of the guileless aborigines, and a goodly quantity of "schnapps." This was Captain Blok's first voyage to the country so recently visited by Henry Hudson, and the safe disembarkation of his ponderous passengers and their precious cargo was as yet a problem. Surveying the shore from the deck of his high-pooped and square-stemmed craft, the outlook was certainly not reassuring.

For a Hollander, Blok was decidedly enterprising, and he lost no time in getting out his yawl-boat that he might search the shores for the landing place of the preceding colony of traders. He spent but little time in examining the shore of the Hudson, which he found on closer inspection was practically impassable because of the thick growth of indigenous scrub oak and thicket; passing also the inhospitable rocks now covered by the beautiful greensward of the Battery Park, he rounded this point into the turgid waters of the East River. Captain Blok's search for a landing-place was now at an end. He had no sooner turned the prow of his yawl fairly into the East River than he discovered a delightful little cove in the banks, at the foot of which was found a small brook discharging its waters into the river. The channel of the brook indicated to Blok's experienced eye that when the tide was full there was a set-back of the river waters for quite a distance inland, creating a stream of some considerable depth. This was what he sought, and adopting the same measures as were customary on the tide-water canals and estuaries of Holland, he brought the *Tiger* to an anchorage in the cove at high-water, and so close inshore that at low tide she was all but high and dry. His passengers and cargo unloaded, the first permanent settlement on Manhattan Island was made, and called New Amsterdam. The point of Blok's debarkation was but a few rods below and to the left of the stretch of shore shown in the first picture on page 388, and known in modern locale as about the corner of Pearl and Broad streets, which in those days was on the water-line.

This primitive method of discharging cargoes was pursued until a short time after the accession of Peter Minuit as Director-General, when it was slightly improved upon by the building of a small wharf out from a point now known as Pearl and Moore streets. The wharf was built by one Litschoe, who kept a tavern hard by; but as it only extended a little beyond low-water mark, vessels were still compelled to unload their cargoes into flat-boats or scows, which in turn unloaded at the wharf, the owners paying for the privilege in patronage of Burgher Litschoe's tap-room. In 1658 this wharf was extended about fifty feet, and became available for docking purposes to the larger vessels of the day.

Under the administration of Walter the Doubter (Van Twiller), New Amsterdam began to assume the aspect of a considerable town. A proper care for the shipping interests was of the first importance to the colony's welfare, and which the Governor and the Burgomasters endeavored to appreciate. They first contemplated a system of intersecting canals for Manhattan Island as in Holland. They smoked many pipes over the project, and sometimes talked about it, but the expense of penetrating the rock-ribbed backbone of the island deterred them from any action; so they sat smoking and drinking while dreaming of the fading glories of Van Tromp and profitable trades with "Poor Lo." Failing in any conclusions for the betterment of the shipping, the worthy but procrastinating burghers allowed the question to settle itself, which it did, and from the little personal speculation of the tavern keeper was evolved the system of docks and slips, which, having served their purpose more or less acceptably for two hundred years or more, have now become a memory.

The Dutch merchants all sought to build their houses close to the East River front and near to the Whitehall, and almost all were occupied both as warehouses and dwellings. Their improvements of the water front were of an unsubstantial character, and therefore impermanent. All vessels coming into the port were compelled by law to find anchorage between "Capsie Hook" (the Battery) and "Smit's Vly" (Maiden Lane). The reason for this regulation is lost to present determination, but it is possible that the object was to centralize the labors of custom-house or port officials in a circumscribed space. The Dutch were most economical in their expenditure of physical energy and in the wear of shoe-leather.

The high road leading from the fort to and through the business section of New Amsterdam was known in part as Dock Street, and also as Perel Street. The Pearl Street of to-day, three blocks back from the river, follows the line of the old highway then on its brink. When, in 1642, the necessities of visiting strangers required more extended and better accommodations, it was decided by the Burgomasters that a public tavern be erected for their benefit. It was located on Pearl Street, exactly at the head of what became later on Coenties Slip, and was known as the Stadt Huys. The house was a great, clumsy, stone affair, and, as stated above, its primary purpose was the entertainment of travellers. Its use, however, was not thus confined; it served also as a school-house, warehouse, and jail until the town was incorporated in 1652, when it acquired the functions of a city hall. An excellent sketch of the building from an authentic print is given on page 388, where it is seen to be within a few steps of the river. The location of its site in the second illustration is identical with that of the two high-peaked warehouses that appear at the head of the modern Coenties Slip. Part of the foundations of the old City Hall are said to be embedded in the substructure of these two warehouses.

After the final cession of New Amsterdam to the British in 1674, a large influx of English, Scotch, and Yankee emigration followed, and under their energetic influence a fairly good system of docks was inaugurated and largely completed by the year 1700. Extending from Whitehall to the line of Coenties Slip was a large basin divided half way through the centre by a long pier jutting out from the foot of Broad Street, then called Exchange Slip at its lower end. The basin was enclosed on the river side by two wharves, semicircular in shape, with an opening just sufficiently wide to allow a full-rigged ship of those times to pass through handily. This basin was a haven of safety to the skippers in winter time, the heavy fields of floating ice often making an anchorage in the stream extremely hazardous. After the building of the Exchange Slip pier the basin was known as the "East Dock" and the "West Dock." The "New Docks" were finished about 1700, and extended from the line of Wall Street to Peck Slip. They were rectangular in formation, but otherwise built upon the same general plan as the old basin.

Under the impetus of these improvements and the general prosperity of the city, the shipping trade increased enormously. The arrivals of ocean craft numbered but eighteen in 1678, whereas in 1696 there were 164 entered at the Custom-house, besides coasters and river boats innumerable.

With the turning of time's cycle into the eighteenth century was commenced the reclamation of lands under water along the East River, and by the year 1737 Water Street appears as the boundary line, and Pearl Street is one block inland. Coincident with this filling-in process the improvement of the slips was begun, and the docking facilities of the city largely augmented. The first of the slips made a docking place was Old Slip, at the foot of the hill below Hanover Square. It was filled in and built upon early in the present century, but still retains its familiar name. Exchange Slip, at the foot of Broad Street, was the next improved. It opened into the "Old Dock," and took its name from the Merchants' Exchange, which stood at its head, at the corner of Broad and Bridge streets. It was filled in when the shore line was carried out to South Street.

The crib work that enclosed the waters of Coenties Slip was built about the year 1735, and to Coenrach Ten Eyck, a Dutch merchant who owned the property on its northern boundary, is due the peculiar name. This was in old times the most important as well as the largest of all the slips, its docking accommodations being threefold greater than any other. By 1790 it had become the headquarters for most of the vessels engaged in the Hudson River traffic, and for many years was familiarly known as the "Albany Basin." It maintained its monopoly of harbor for this class of boats until a rival basin on the Hudson River front drew many of them away from their old berths. The slip was not then overburdened with trade until the opening of the Erie Canal in 1825, when it once more became crowded, but almost entirely with "canallers." It is within the easy memory of men not yet fully matured, that every-day sight of urban canal life apparently enclosed within the stone pavements and brick walls of a big city. Coenties was the last of the old-time slips, docks, and basins to give way to the march of improvement on the water front. It is only about ten years since it was filled in to South Street, and a uniform bulkhead line completed from Whitehall to Corlears Hook. In its later days occasionally would be seen an ocean craft unloading cargo directly into her owners' warehouse on the line of the slip, and it served well to illustrate to the present generation the close communion that formerly existed between the warehouse on shore and its "tender" afloat. The old mercantile houses that formerly crowded the land space on either side are gone, all of them except one, which is still in active business on the same spot where it was established by an ancestor of the present proprietors in 1798. This is the house of E. & R. Mead & Co., wholesale grocers.

Other slips on the East River at the beginning of this century were Coffee-house Slip, at the foot of Wall Street; Lyons, now Burling, Slip; Beekman Slip, at foot of Fulton Street, Peck Slip; New, now James, Slip; Catherine Slip; George, now Market, Slip; Charlotte, now Pike, Slip; and Rutgers Slip. All these were filled in before 1850 with the exception of Coenties, as stated above. Besides the public slips and docks there were in 1750 on the East River the wharves belonging to Isaac and Nicholas Gouverneur, Robert Murray, Walter and Samuel Franklin, John and Henry Cruger, Hugh and Alexander Wallace, Leonard and Anthony Lispenard, Philip Schuyler, Anthony Van Dam, William Walton, the Livingstons, Delafields, Beekmans, Constables, Ten Eycks, Schermerhorns, Beaches, and Halletts. Most, if not all, of these merchants were ship-owners as well, and as England was then as now "queen of the seas," the vessels were of the best class. The long war with France, that lasted from 1753 to 1761, presented a golden opportunity, and from legitimate merchant traders many of the New York ships were turned to privateersmen, and scoured the seas under "letters of marque" from the royal Georges.

The prizes of these privateersmen were brought to New York in great numbers, cargoes discharged, rechristened, and put again to sea, in turn seeking prey also. Tradition says that the skippers were not always particular as to what flag their ocean quarry might fly, whether of friend or foe, and that many a bottom belonging to nations at peace with England was seized by unscrupulous captains, and conscientiously despoiled by equally unscrupulous owners; and it is further said that more than one of the big fortunes of the metropolis owes its birth to such a source.

The improvement of the Hudson River shore line was long neglected, though there was no real necessity for it, the East River front affording ample dockage for all the shipping of the port. This neglect was en-

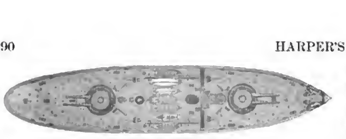
ADDITIONS TO THE UNITED STATES NAVY.—Drawn by Frank H. Schell.—[See Page 390.]



DECK PLAN OF "PURITAN."

OUR NEW NAVY.

Our naval illustrations this week show five types of vessels upon which nine of the new ships authorized to be built by Congress prior to its present session are to be constructed. Of these eight have been contracted for, and are now building. For one—the 5500-ton protected cruiser—bids have been asked, and will be opened at the Navy Department on the 10th of June. There are still to be contracted for, under authority already conferred, an 8100-ton armored cruiser, a practice vessel for the Naval Academy (bids for these will also be opened June 10th), a ram, another dynamite cruiser, and the submerging vessel, better known as the Thomas monitor. Of those shown in these plates the *Puritan* is the only coast defender. She is heavily armored, carries a powerful battery, and is intended for either offensive or defensive operations in and around our harbors. In the other ships speed, coal endurance, concentration and rapidity of fire, a defence against high explosives, and the maximum of safety against accident (by means of a large number of water-tight compartments), have been the aim of the designers. They are commerce destroyers, scouts, the "cavalry of the seas," rather than an aggressive or defensive fighting force. All the new naval vessels have been designed in our own Navy Departments by Chief Constructor Wilson and his assistant, Constructor Philip Hichborn, U.S.N., and the machinery has been planned by Chief Engineer Melville. Advantage has been taken of every improvement known to naval science; and in its class, and for the purpose for which it is built, each vessel is believed to be the equal if not the superior of any afloat.

DECK PLAN OF CRUISER NO. 6.

DECK PLAN OF GUN-BOATS NOS. 5 AND 6.

Protected Steel Cruiser No. 6—all the new vessels being designated by numbers until they are named by the Secretary—is the largest unarmored vessel yet designed for the navy. She is termed "protected," because a rounding steel deck extends the whole length of the ship, intended to deflect an enemy's shot, ranging in thickness from 4½ inches on the slopes over the machinery space to 2 inches on the flat of the deck forward and aft. She will be 330 feet in length—15 feet longer than the *Chicago* or *Baltimore*—53 feet in breadth, 5500 tons displacement, 13,500 horse-power, and have a speed of 20 knots an hour, or about 24 miles, when pushed to her utmost. With a full coal supply—1300 tons, at 20½ knots speed, and under forced draught—this vessel would travel 2191.86 knots in nearly four and one half days; at a 10 knot cruising speed, under natural draught and full coal supply, her radius of action would be nearly 13,000 knots, with an endurance of 55 days. Her main battery consists of two 8-inch breech-loading rifles and ten 4-inch. The heavier guns are mounted on the centre line in barbette turrets (the guns revolving in the turrets instead of the whole turret turning, as in turreted vessels like the monitors) four inches thick, one at the forward and one at the after end of the superstructure, and train from directly ahead or astern to fifty degrees on each side abaft or before the beam respectively. The 4-inch guns are protected by fixed segmental shields 4 inches thick. The fire of all the forward and after guns respectively can be concentrated upon an object the length of the vessel directly ahead or astern. The secondary battery consists of eight 6-pounders, six 3-pounders, and fourteen machine-guns mounted, to be clear of the smoke and fire of the main battery, and for efficient action against boat attacks. The torpedo outfit consists of six launching tubes for Howell automobile torpedoes. When in commission she will carry 441 men and 25 officers, and is to be fitted as a flag-ship, with Admiral's cabin, etc. Electric lights, improved ventilating and drainage apparatus, and, in fact, all the conveniences that have been suggested by experience, will be placed in this formidable-looking craft, whose plans were made a special study by Secretary Tracy himself. The authority for her construction was given in an act of Congress approved September 7, 1888.

The *Puritan*, when completed, will be an exceedingly powerful man-of-war. She was originally designed as a double-turreted monitor, and her keel was laid in 1875 at Roach's yard in Chester, Pennsylvania, where her hull and engines were completed. Work was commenced on her under the altered plans June 26, 1889, and is being pushed very rapidly at the Brooklyn Navy-Yard. The changes made consist chiefly in increasing her armament and armored protection, substituting for the four 10-inch guns in roller base turrets four 12-inch guns in barbette turrets, thus bringing the axes of the guns 10 feet 6 inches above the water, which will permit their being fought in much heavier weather than was possible with the roller base turrets. A superstructure is also built between the barbette turrets. The length of the *Puritan* is 291 feet; extreme breadth, 60 feet 1½ inches; mean draught, 18 feet 2½ inches; displacement, 6060 tons; horse-power, 3000 under natural draught, and 4000 with forced; speed, 12 and 13 knots, according to the horse-power used. The barbettes have a thickness of 14 inches of steel, backed by 8 of wood, and the armor belt is 5 feet 7 inches deep, 14 inches thick to a point 1 foot below the water-line, and thence tapering to 6 inches for a length of 160 feet, protecting the engines, boilers, magazines, etc. Forward and abaft these points the belt is reduced to 10 inches in thickness for a length of 20 feet, and at the ends it is reduced to 6 inches. The mast, which is also an exhaust ventilating shaft for the engine-room, has two tops or platforms, one for search lights and the other for revolving cannon.

DECK PLAN OF CRUISERS NOS. 9, 10, AND 11.

DECK PLAN OF CRUISERS NOS. 7 AND 8.

Cruisers 7 and 8, each of 3000 tons displacement, are being built by the government, the first at Brooklyn and the other at Norfolk. They are twin-screw steel cruisers, with protective decks, great speed, and heavy batteries of rapid-fire guns. The act authorizing their construction was passed September 7, 1888. They have poop and forecastle decks, with open gun-deck between. Their length is given in the Chief Constructor's report at 300 feet; breadth, 42 feet; mean draught, 18 feet; horse-power, 10,000; speed, 19 knots, and displacement, 3183 tons. At full speed, with a coal supply of 556 tons, they could run 1243 knots in 2.59 days, and at 10 knots' speed 8652 knots in 36.5 days. The main battery consists of one 6-inch and ten 4-inch rapid-fire breech-loading rifles. The secondary battery comprises two 6-pounders, two 3-pounders, one 1-pounder, and two 37 mm. revolving cannon. The amount appropriated for these two ships was $1,100,000. As all the bids when opened were found to be in excess of this sum, Secretary Tracy decided to build them at the navy-yards in which a ship-building plant had been authorized and provided.

Cruisers 9, 10, and 11 are each of 2000 tons displacement. Two of them are in process of construction at the Columbian Iron-Works, Baltimore, and one by Harrison Loring at Boston. These are twin-screw, coal-protected cruisers, and have about 300 tons more displacement (27 feet longer) than the *Yorktown* class. Their length is 257 feet; breadth, 37; draught, 14½; maximum horse-power (forced), 5400; and speed, 18 knots. Their main armament consists of eight 4-inch and two 6-inch rapid-fire breech-loading rifles. The secondary battery is composed of four 6-pounder rapid-fire, four 3-pounder rapid-fire, and two 37 mm. revolving cannon.

Gun-boats Nos. 5 and 6, authorized by Act of March 2, 1889, are a little larger than the *Petrel* now in commission. They are in course of construction at Bath, Maine, and are small twin-screw steel cruisers, carrying on a small displacement a very powerful battery of heavy rapid-fire and machine-guns, a large supply of coal, and a complement of 150 men. Their principal features are—length on load-line, 190 feet; breadth (extreme), 32 feet; mean draught, 12 feet; displacement, 1000 tons; horse-power, 1600 tons; speed, 14 knots. The main battery consists of eight 4-inch 33-pounder rapid-fire breech-loading rifles, one on the poop, and one on the forecastle. The secondary battery consists of 47 mm. revolving cannon, two 37 mm. revolving cannon, and one 1-pounder rapid-fire, and one Gatling. The bunker capacity of coal is 250 tons, and on this, at a speed of 14 knots, she can steam 2432 knots. At 10 knots the horse-power required is 600, and she can steam 4068 knots at this speed. The rig is that of a two-masted schooner, with a foreyard and square foresail, spreading 6506 square feet of canvas.

OUR TRADE WITH SOUTH AMERICA.

BY THEODORE CHILD.

During my stay in Lima, where everybody is indolent and everything more or less slovenly, one of my chiefest joys was to escape from the insipid horrors of the hotel restaurant, and to accept the hospitality of the French chargé d'affaires, whose gastronomic felicity was watched over by one Abdul by name, an Egyptian colored man, who possessed a rare talent for preparing macaroni in savory styles. At one of these little feasts, I remember, a consul from some equatorial town, who wore waxed mustaches twisted into long and menacing horizontal spikes, addressed me with Gallic fulsomeness and said, "You, who are this and that and the other, tell me how it is that the North Americans do not invest capital in this country?"

"Do you mean by this country Peru alone?"

"No," he replied; "Peru and the other South-American republics."

These were terrible questions to put to a man who was for the moment wholly absorbed in the enjoyment of Abdul's macaroni *à la Khedive*; but still, as the excellent consul had applied to me several flattering qualifications, I felt bound to improvise some generalities. The North Americans, I told him, did not know these republics enough, and from another point of view they knew them too well. The credit of Peru, for instance, was not of a nature to make the North Americans anxious to volunteer capital to that country. Hitherto the North Americans had found an abundantly large field for investments at home. As regards South American loans, England had almost a monopoly of their issue, and there had therefore been no inducement for North American capitalists to go out of their way to pay commissions to London bankers, so long as the New York bankers had plenty of good affairs to offer them. As regards trade with South America, I added, the case is similar, but more complex. The North Americans have until recently been fully occupied with the home markets, although individuals have gone abroad all the time and established themselves in various parts of the world, witness important business houses; witness also many railway and mining enterprises in Peru, Chili, the Argentine, and Brazil. But such efforts as these have always been isolated, they have excited no particular sympathy in the mother country, they have not resulted in the formation of any series of common commercial conveniences such as England, Germany, and France have created for their merchants and traders; in short, they have not given North America a definite position in the international commerce of the world.

It is needless to continue the transcription of my informal talk with the consul. His questions, however, suggested to me that it might be useful to sum up the few commercial notes that I made along the Pacific coast with the very inadequate lights of a non-commercial man. First of all, in cruising from port to port all the way from Valdivia up to Callao, from latitude 12° S. to latitude 39° 50' S., say 27½°, I only saw one American ship, a lumber boat from San Francisco unloading at Callao. Any one accustomed to travel in these waters will tell you that the flag of the United States flying at a mast-head is a rare sight in the Pacific ports. The foreign flags to be seen are English, German, French, Italian, and Spanish. In his December message to Congress, President Harrison alluded to this fact in the following words:

> "There is nothing more justly humiliating to the national pride, and nothing more hurtful to the national prosperity, than the inferiority of our merchant marine compared with that of other nations whose general resources, wealth, and sea-coast lines do not suggest any reason for their supremacy on the sea. It was not always so, and our people are agreed, I think, that it shall not continue to be so."

Further on in the same message President Harrison said:

> "I recommend that such appropriations be made for ocean mail service in American steam-ships between our ports and those of Central and South America, China, Japan, and the important islands in both of the great oceans, as will be liberally remunerative for the service rendered, and as will encourage the establishment and in some fair degree equalize the chances of American steam-ship lines in the competitions which they must meet. That the American states lying south of us will cordially co-operate in establishing and maintaining such lines of steam-ships to their principal ports I do not doubt."

The above words suggest several comments which we will leave for a later paragraph. For the moment let us state a few plain facts about maritime communications along the Pacific coast, and more particularly with Chili, which is now the most progressive if not the most interesting of the republics on the western side of the Andes. At present there are seven lines of steam-ships plying between Chilian and foreign ports. These seven lines own seventy-five ships, with a total carrying capacity of upward of 200,000 tons, and trade to Panama, Liverpool, Hamburg, Havre, Bordeaux, Glasgow, Southampton, London, Genoa, and Barcelona. The steamers vary in size from 2400 to 6000 tons, averaging about 2600 tons. Most of them carry passengers as well as merchandise, and the combined fleets make 176 voyages each way every year. Besides the ships of these regular lines there are a few "tramps" coming from foreign ports to those of Chili, and, of course, a considerable number of ships employed in the coasting service of the South-American continent.

Two of these lines are subsidized by the Chilian government. The Compañia Sud-Americana de Vapores, founded with Chilian capital, receives annually the equivalent of $125,000 gold currency of the United States on condition of carrying the mails free, and government stores and officials at a reduction of twenty-five per cent., while in time of war these ships are at the disposal of the state for use as transports. The Compañia Sud-Americana is a very active and enterprising line, doing business all along the coast from Panama to Corral in competition with the Pacific Steam Navigation Company, which fact reduces its dividends to a very modest figure. The crews of this line are Chilenos, but the captains are all English or American, and the other officers all foreigners, and mostly English. The reason of this, I am informed, is that Chilian officers could not be found who would do the work and be content to sacrifice their regular comfort and interminable cigarettes to the irregular exigencies of busy coasting service. The Chilians shine rather in the easy and luxurious career of the navy. The Pacific Steam Navigation Company, which has a fleet of ten vessels plying in these waters, also receives from the Chilian government an annual subsidy of $50,000 gold for mail service alone; but the ships may not be used in time of war for transports, although in time of peace they are bound to carry government stores and officials on the same conditions as the Chilian line. Apropos of the Pacific Steam Navigation Company, it may be interesting to mention that nearly fifty years ago Mr. William Wheelwright, of Newburyport, Massachusetts, who was captain of a trading vessel on this coast, conceived the idea of a regular line between Panama and Valparaiso, obtained the necessary concessions, and went to New York to propose the business to the merchants there. But he labored in vain. No North American capitalist would look at his project. In presence of this inexplicable indifference, Mr. Wheelwright went to London, and in a few weeks' time the Pacific Steam Navigation Company was formed, and in due course its ships opened a vast new field to English commerce.

The Chilian and the English lines appear to suffice for the business of the whole Pacific coast, both for lighter merchandise and passengers, the latter being sacrificed to the former. I do not mean that the passengers are badly treated. On the contrary, the cabins are most comfortable, and the table good; but the waits in small ports to load or unload cattle, wheat, flour, vegetables, and other cargo are terribly long and frequent. From Valparaiso to Lima, for instance, takes twelve days, whereas in point of distance it might be done in half the time. It appears, how-

Google

ever, that a direct and rapid passenger boat, even once a fortnight or once a month, would not pay. For that matter, people are never in a hurry in these parts; everybody is content to wait, smoke, talk politics, and drink *copitas*—that is to say, little glasses of "something to take."

To return now to the steam-ship lines on which international trade depends, let us consider first of all the time required for voyages between Chilian and foreign ports. From New York to Valparaiso by sailing-ship takes from 90 to 130 days. Communication between New York and Valparaiso by steamer *viâ* Panama takes at least 30 days, and often 40 days, according to the more or less speedy connections at the Isthmus. On the other hand, the voyage from Liverpool to Valparaiso by steamer takes from 35 to 40 days; from Hamburg and Havre to Valparaiso, 40 to 50 days, from Genoa and Barcelona to Valparaiso, 50 to 60 days.

As regards the time of the voyage it will be seen that New York is at no disadvantage so far as the Panama route is concerned, but this route itself has insuperable disadvantages. In the first place, freights *viâ* Panama are very high; in the second place, heavy goods cannot be handled across the isthmus; and in the third place, fine and fragile goods meet with sure destruction at the hands of the Panama wharf hands. In the actual state of communications the North Americans are entirely out of the running, and Chili remains as she has been for the last forty years, a European, we might almost say an English, province. A glance at the freight rates will make this statement clear.

From New York to Valparaiso, *viâ* Panama, the freight is from $31 to $35 gold, United States currency, per ton, some abatement being obtainable on large shipments.

From New York to Valparaiso, *viâ* Liverpool, the freight is from $22 to $28 dead weight, and $23 to $24 measurement.

From New York to Valparaiso, *viâ* Hamburg, the freight is from $21 to $22 dead weight, and $22 to $23 measurement.

From New York to Valparaiso by sailing vessel the rates for freight are $8 50 to $9 50 dead weight, and $9 to $10 measurement.

On the other hand, the freights by steamer from Liverpool, Glasgow, Hamburg, Havre, and Bordeaux on rails, pig-iron, and other heavy goods vary from $5 50 to $6 75 per ton; on bar-iron, galvanized iron, and other similar goods $6 25 to $7; on measurement goods $10 to $13, according to the class. Recently some special lots have been carried from Liverpool to Valparaiso at $5 for dead weight, and $7 50 to $9 for measurement. On sailing vessels from Liverpool or Glasgow to Valparaiso the freights range from $5 to $6 25 dead weight, and $5 50 to $7 for measurement. From Hamburg special lots have been carried by sailing ships at $4 50 per ton dead weight, and $5 to $6 measurement.

The above figures require no comment. At present almost all the goods sent from the United States to Chili are of the rougher kind, while the fine goods are all ordered from Europe. The United States goods are carried eighty per cent. by sailing vessels direct, ten per cent. *viâ* Panama, and ten per cent. *viâ* Hamburg or Liverpool.

President Harrison, it would appear, has indeed good reason to regret the humiliating "inferiority of our merchant marine." The intermediary of England imposes itself in an equally humiliating manner in the matter of mails likewise. Whenever the State Department at Washington sends a book or report to the Minister at Santiago, for instance, it reaches him *viâ* Liverpool. Again, the letters which are carried from New York to Colon by the ships of the Pacific Mail Company are transferred at that port to the care of an English consul, who forwards them from Panama on the ships of the English Pacific Steam Navigation Company, although it is notorious that the ships of that company, almost every trip, take two, three, and even four days longer than those of the Chilian Compañía Sud-Americana, which leave Panama at the same time.

Another "humiliating" point not mentioned in the President's message is the absence of banking conveniences between North and South America. For instance, a firm of agricultural machinery makers, established in Boston, Massachusetts, we will say, is represented in the Argentine Republic by a Scotch importing house, and in Chili by an English importing house. The firm sells in a year more than half a million dollars' worth of machinery through their agents in the two republics, and this sum is remitted to them through a London bank, which takes a higher commission than North-American banks would charge for a similar operation. The American houses themselves in Peru, Chili, the Argentine, Brazil, and other parts of the continent, are obliged to have recourse to the intermediary of the English banks to pay such balances as cannot be covered by exchange of merchandise. Indeed, it has been calculated that at the present day, for their business with the United States alone, the South American republics pay one million dollars gold a year to the London banks as commission on drafts and exchange. Thus it appears that the United States, in all commerce with the republics of the South, must necessarily remain the tributary of England so long as there are no American banks at the other end of the hemisphere.

Unprovided with means of transport and with facilities for banking, the commerce of the United States with South America is most heavily handicapped in the competition with England, Germany, and France. But this is not all. It is not enough to have arms, unless you have good champions to handle them; and it is useless to disguise the fact that, compared with that of England, the commerce of the United States has hitherto not been represented, on the Pacific coast, at least, in as brilliant a manner as could be desired. There are exceptions to be made in favor of a few old-established houses; but these are very few indeed. As for the railway and mining pioneers who have gone to South America to seek fortune, and often to find her, they have not helped to establish international commercial relations of a durable nature, and in some cases they have contributed largely to diminish the prestige of the country from which they came. A case in point is the recent fiasco of the original promoters of the North and South American Construction Company.

This affair has dealt a blow to American commercial prestige in Chili which it will take years to efface, and its failure is to be attributed almost wholly to the personality and conduct of the men who came to Santiago to attend to the business of the enterprise. This contract for the construction of ten railway lines of a total length of nearly 1000 kilometres, at a cost of £3,542,000 sterling was signed with great expectation and satisfaction on the part of the Chilian government and its President with the representatives of the American company. It was hoped that it would be the beginning of closer and more extensive relations with the United States; and, given the attitude of the government and the importance of the contract, the Chilian banks were all ready to back up the contractors with as much money as they wanted. Unfortunately the representatives were badly chosen; certain incidents scandalized the Chilian bankers and the public also; and the end of it was a fiasco and the transfer of the whole contract from the American company to Don Julio Bernstein, a most intelligent and capable business man, who shares the opinion of Pindar in thinking that water is the best of drinks—*ἄριστον μὲν ὕδωρ*. The consequence of the transfer is that the bridges, locomotives, and rolling stock for these new railways, instead of being ordered from the United States, as they would have been had the contract not been transferred, are now being made in France at the Creusot Works. Doubtless the North Americans could have made some if not all the bridges as well and as cheaply as Schneider & Co. "But that is not all," says Don Julio. "The bridges have to be put up after they have been sent out here in pieces, and I have no confidence in North American fitters. I am convinced from past experience that the men sent to do the work from the States would be half of them drunkards, whereas the five hundred fitters that the Creusot Works will send will be picked men, sober, thrifty, and orderly, as the French workmen are."

In a question of such importance as that of the extension of foreign commerce no evidence is to be neglected, even such as may at first sight appear trivial. The reputation made for a nation by its individual representatives in other countries is most important, and there can be no doubt in the mind of any impartial observer that the prestige of North-American business men at the other end of the hemisphere, and particularly in Chili, is not such as we could have hoped to see. Indeed, a philosopher of a sarcastic turn of mind might write a curious chapter on the influence of the invention of the "cocktail" on the development of the foreign commerce of the United States. However, we need not dwell any longer upon these regrettable details. The point we wish to make is clear. If the United States wish to compete seriously with England and Germany in South America, they must send out some of their best business men and some of their most polished and cosmopolitan "drummers."

One of the first conditions of doing business with people is to study their wants, and sell them what they need on terms that suit them. This is where the English, and more especially the Germans, excel, and this is the reason why the Germans are year by year gaining a more solid hold in the South-American markets. The flaxen-haired, bespectacled, and irrepressible Teuton, armed with three or four foreign languages and a selection of homely virtues, plods through the country, studies the inhabitants, learns their ways and wants; and if he has not in stock wherewithal to supply them, he asks the home manufacturers to produce a special article. This, it appears, the North-American manufacturers will not do. Time after time and town after town I have asked the same questions, and received the same answers. Apart from all details of price, it is said to be difficult to do business with North-American houses, because they refuse to attend to little details and modifications which are essential in the interests of the Peruvian or Chilian importers. Another complaint universally made throughout South America against the North-American exporters is that their packing is very poor, and their goods arrive in bad condition. This detail of packing is of the utmost importance in shipping goods to any country in the world, and even in despatching a box to the nearest town; but when it comes to shipping goods to South America, good packing is more than ever necessary, for the reason that both the Atlantic and the Pacific ports are, with few exceptions, unworthy of the name. At Montevideo the steamers anchor some two miles from shore, and lighters are indispensable. At Buenos Ayres there is not yet any port ready for the ocean steamers, which anchor some twelve or fifteen miles out, thus necessitating transshipment by means of steamers and lighters, and finally by means of carts, which carry the cases ashore through the last shallow stretch of water. At Valparaiso lighters are used for the ocean steamers, although there is a mole. At Callao alone there are docks and quays of a more or less inadequate nature. As for the other ports, they are of a most primitive description so far as moles, quays, and wharf accommodations are concerned, and everywhere the cargo is handled in the roughest way. As for cargo sent by way of Panama, we have already referred to the disasters which await it from ferocious handling.

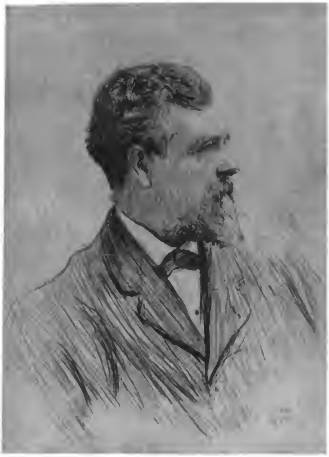
Yet another complaint made against North-American houses is that they are less accommodating in the matter of credit than the Germans and English. As things are managed at present, the traders of the United States often ship their goods by sailing vessel and their invoices by steamer, requiring payment by sight draft. The invoice and draft reach Valparaiso, we will say, in thirty-five days, while the goods arrive some sixty or seventy-five days later, perhaps in bad condition, giving cause for dissatisfaction and claims of various kinds. The Chilian customer naturally finds this system undesirable, and prefers to deal with the German or English houses, which grant reasonable credit, or, at any rate, do not demand payment until after delivery. All this is simply due to the fact that the North-American houses are not familiar with the commercial conditions of their would-be South-American customers. An easy way to overcome this difficulty would be the substitution of a banker's acceptance for the sight or time draft, and so far as Chili is concerned international commerce can place confidence in such establishments as the Banco Nacional de Chile, the banks of Valparaiso, Santiago, and Concepcion, and the private banks of Matte & Co. and Edwards. But if American capital and commerce intend to enter the lists of international trade in South America, the first and most obvious necessities are the creation of the same facilities as the other nations possess, namely, means of communication and of financial transactions at cheap rates and in convenient ways. Until this is done, the United States will go on losing South-American business, as happened in a case in point at the beginning of the present year (1890), when the Chilian government, although most anxious, both in the person of the President and of many of the leading men, to open and extend relations with the great sister republic of the North, nevertheless found it expedient to order *in England* some forty locomotives and some eight hundred cars to be built *on North-American patterns*. I am aware that the administration of the Chilian state railways is largely in the hands of English and Scotch men, who never neglect opportunities of favoring their respective countries when any contracts for rolling stock and material are to be given out; but it was not on account of such small considerations as these that the order referred to was given to England, but rather on account of the questions of freight, of want of adequate direct communications, and of imperfectly organized commercial relations which we have above touched upon.

In reply to the implicit arguments of the few facts just stated, it may, of course, be answered that it is useless to trouble about these countries, and that American trade, enterprise, and capital have enough to do at home. This may be true, although it is perfectly well known that American capital is accumulating so rapidly that remunerative home investments are becoming less common than they formerly were. As for American manufactures, there is undoubtedly a market for them in these South-American republics, provided they can be brought there at prices that will compare favorably with those of German and English goods.

In agricultural, milling, and mining machinery and in all kinds of tools there is an immense business to be done. Already in agricultural machinery the United States share the market about equally with England, but that market is increasing rapidly, and might be increased still more rapidly by introducing more energetic business methods. Take, for instance, the great importing houses in Buenos Ayres and Valparaiso. In these establishments the chiefs, as in the old patriarchal days, sit at their desks and wait for customers, whom you will often see standing and waiting for their turn, and seeming to esteem it a favor to get goods in exchange for cash. This system is too good to last. There is a field here for the Yankee "drummer," only he must be a very smart "drummer," and he must speak Spanish, and be in all respects a first-class man. The "drummer" who cannot speak Spanish may as well stay at home, for if he goes out to the South-American republics he will be obliged to do all his business through existing import houses, and never be able to get into direct relations with the customer. And this is what is wanted. The import houses have their agents in the various provincial centres, but these agents have not either the time or the energy to "push" any particular article. They do not hunt up the customer, visit him on his farm, see his machinery at work, talk with him about modifications and improvements, submit to him new machines, and prove to him that it is to his interest to buy what they have to sell. In Brazil and in the Argentine, and in a less degree in Chili, there will be for many years to come a fine market for agricultural machinery; for these countries are as yet only in formation: all the processes of culture are more or less primitive. One of the very few really intelligent and thoroughly capable Yankee "drummers" whom I met in the Argentine, where he had obtained brilliant results for his firm of machine manufacturers, said to me: "The Argentines are forty years behind the States, and if they had not the finest soil the sun shines on, they would never be able to live, farming as they now do. Why, sir, they sow maize broadcast, and then simply loaf and suck *mate* until the time comes to take in a splendid crop, which they have never even looked at since they put the seed in the ground. With fine machinery farming in the Argentine would be nothing but pleasure. Take alfalfa, again, the great cattle fattener. In the Argentine the soil will give five crops a year for six years in succession. In Chili you can only take three crops a year on most of the ground. Now on some of the large Argentine farms they use American cutters for this crop, but they are still slow and primitive in turning, drying, stacking, and binding. We have yet to teach them to buy and use our finer machinery, and then they will do a colossal business. But they are quick at taking up a new thing. You have only to put it before them."

The prospects of the sale of other American manufactured articles cannot yet be judged from actual results, the experiments being still on a small scale compared with what they might be, and the loyal or disloyal competition of the Germans being a terrible enemy. For instance, sewing machines are greatly demanded; you often see a sewing-machine away up in the Sierras in an Indian or Cholo cane hut. Well, it appears that about eighty per cent. of the sewing machines imported into South America are German, although they bear the Singer and other American marks. The Germans also counterfeit American agricultural machinery, and every product of nature and of art, from the coffee-berry up to a steam-engine. As for deleterious liquors bearing counterfeit labels, all of German origin, South America is inundated with them. In all the towns German fancy goods predominate in the shop windows, and are bought for the want of something better. I do not mean to say that the Argentines and Chilians are longing for artistic products, or that they are remarkable for good taste. On the contrary, they prefer that which is showy and apparently expensive. I am, however, convinced from a careful inspection of the shops in Montevideo, Buenos Ayres, and Santiago that North American general stores, brass-work, house-fittings, furniture, wall paper, jewelry, and silver work would sell readily. In all of these towns whenever any American furniture happens to be brought to auction it invariably sells at a premium. The Argentines and Chilians in particular are fond of ostentation and novelty; they are rich, and given to liberal expenditure; above all, they have great aptitude for imitation, and I believe that even chewing-gum would find a market if it were only "pushed" a little in the *confiterias* and candy stores, and "pushed" by the right man with reasonable maritime and financial facilities at his disposal.

The recent Pan-American Congress has awakened renewed interest in the Southern continent, and a certain number of enterprising "drummers" have visited the country. In the course of my wanderings I have met several, but few of them seemed either very capable of working this special Hispano-American ground, or very favorably impressed with the prospects of developing business, given the actual commercial relations between North and South America. As I have said before, those who go to South America to do business must speak the language. In the second place, they must be prepared to deal with people who are still a little slow in their methods and administration, and much hampered by the want of adequate ports, quays, and means of transporting goods rapidly and safely. The slowness of the administration is particularly noticeable in the port and custom-house service. The captains of the ports are slow in receiving ships and slow in clearing them, and waste much time in smoking cigarettes, sipping "copitas," talking politics, and swaggering to no purpose. The custom-house officials have similar defects. At the principal port of Chili, namely Valparaiso, the office hours of these gentlemen are from eight to four, and no cargo can be landed after three o'clock, because the last hour of the daily service is required for preparing to go away. The lightermen again are lazy, and can rarely be induced to work earlier than eight o'clock in the morning, or later than six at night for outgoing cargo. In the other ports of the Pacific the same slowness is found. A ship will arrive in port, and be at anchor at six o'clock in the evening; she may have electric lights all over the deck; she may be in a hurry, and anxious not to waste time and money lying idle in harbor; but this does not matter, she will not see a lighter moored alongside before eight or nine



THE LATE SENATOR JAMES B. BECK, OF KENTUCKY.
Drawn by W. T. Smedley after a Photograph by Bell, Washington.

ock the next morning. Finally, those › go to do business in South America st be prepared to find the English and mans thoroughly conversant with the nners and wants of the natives, solidly ablished with their banks and steam-ship s, their houses of long-standing reputa- n, their business connections with the old intry, and their wide ramifications in the v one.

'o return now to the President's message, read as follows: "The present situation such that travellers and merchandise find erpool often a necessary intermediate t between New York and some South- erican capitals. The fact that some of delegates from South-American states to conference of American nations now in sion at Washington reached our shores by sing that line of travel is very conclusive the need of such a conference, and very gestive as to the first and most necessary p in the direction of fuller and more bene- al intercourse with nations that are our ghbors upon the lines of latitude, but not on the lines of established commercial in- ourse."

The question is how can this more benefi- l intercourse be established. A line of am-ships with a subvention from the lted States will not suffice, even if, as is sonable to hope, Brazil, the Argentine Re- blic, and Chili also subsidized the line. ru, being poverty-stricken, is out of the stion. These steam-ships would carry the ils, it is true, and would take to the South- erican republics agricultural and other chinery, agricultural products, bread- ffs, lumber, manufactures, and some mis- laneous products, such being the articles demand south of the equator. But what these subsidized steam-ships to take back the United States? Is it Peruvian sil ? Is it Argentine wheat and hides? Is copper from Chili? With the possible eption of the hides, this country does need these products. Is it guano? This a small item, and not so fashionable it used to be. Is it petroleum from the w Peruvian wells at Talara to the north of bo Blanco? Evidently petroleum is not a duct for mail-steamers to carry any more n guano would be. There remains, then, the way of return cargo from the Pacific st, Peruvian bark and medicinal plants, nganese from Coquimbo, nitrate and io- ne from the north of Chili. But what from lparaiso, what from Talcahuano, what m Valdivia, what from Buenos Ayres l Montevideo, so long as the existing tariff ders the exportation of wool almost im- sible? On the homeward trip the ships uld have to carry ballast until they reach the Brazilian ports, with their wealth of fee, caoutchouc, and vegetable ivory.

n the preceding résumé I mention, of rse, only the most obvious products which present make the bulk of the cargoes loaded in the Pacific and Atlantic ports of South America, and at the same time I am only summing up the impressions gathered by inquiry amongst native and foreign residents in various parts of the Southern continent. Direct communication between New York and the South-American ports would be most desirable and most welcome to "our neighbors upon the lines of latitude," but these neighbors want to know what we are going to buy from them, and, above all, what our protective tariff will allow them to sell to us. The solution of the problem of establishing "beneficial intercourse" with the South-American republics is intimately connected with the vexed tariff question, about which it is not my business or intention to speak.

SENATOR BECK.

In the death of Senator James Burnie Beck Congress loses one of its most sincere, earnest, and intelligent members. Mr. Beck had been very ill for two years, and it had been generally known to all who were well acquainted with him that he would never again take an active part in public affairs. And yet with characteristic pertinacity he clung to the hope of recovery and refused to resign his seat in the Senate. Finally, on Saturday, May 3d, he fell dead in the station of the Baltimore and Potomac Railroad as he was walking from the train in which he had just come from New York. He fell within a few feet of the spot where President Garfield was shot by Guiteau. It was the sudden ending of a long career, marked by much patient industry, by conscientiousness, and great usefulness.

Mr. Beck was born in Dumfriesshire, Scotland, February 13, 1822. His father having emigrated in 1825, the boy was left to the care of his grandmother, and was taught by a Scotch school-master. When he was sixteen years old Beck joined his father, who tried to make him a farmer. He sent him West with $500, but the young man had come under the influence of Kentucky lawyers and public men, and was determined to be a lawyer. Still he learned enough of the beauties of agriculture to remain fond of the soil to the end of his days. And in his old age he bought a ranch in the far West, on which his own son is settled and prospering. Mr. Beck settled at Lexington, Kentucky, then famous for its bar. Supporting himself by employment as the manager of a farm, he studied law in the evenings, and in 1846 obtained his degree from the Transylvania University. Very soon after his admission to the bar he formed a business connection with John C. Breckinridge, which eventually became a partnership that continued uninterruptedly until the breaking out of the civil war. He was known throughout Kentucky as a sound and industrious lawyer. In his early days he was a Whig, and a devoted admirer of Henry Clay, and he did not become a Democrat until the Know-nothing excitement in the fifties.

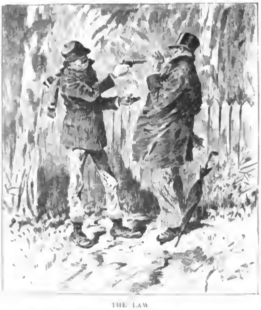
During the war he remained at home, giving himself up to his professional duties. His friend and partner had joined his fortunes to those of the South, but Mr. Beck did not follow him. He had never yet taken an active part in politics. He was a lawyer, business man, and, Scotchman though he was, a thorough Kentuckian, a keen horseman and out-of-door sportsman, and a most delightful story-teller.

In 1862 he was an unsuccessful candidate for the State Senate, and in 1867 he was chosen, at a special election, to fill a vacancy existing in the old Ashland Congressional district. The quarrel between President Johnson and the Republicans in Congress was at its height, and Mr. Beck was refused his seat on the alleged ground of disloyalty. In the following winter, however, he was admitted. He served eight years in the House of Representatives, and then declined a renomination.

He was out of public life not much more than a year, and in 1877 took his seat in the Senate, having been chosen as the successor of John W. Stevenson. When he died he was serving his third term.

In 1848 he married Miss Jane W. A. Thornton, of Loudoun County, Virginia, who was connected with the Washington family. Mrs. Beck died a few years ago. Two children were the fruit of their union, who survive. They are Mrs. Green Clay Goodloe, the wife of Major Goodloe, of the Marine Corps, and George Thornton Beck.

As a legislator Mr. Beck was a rugged, painstaking champion in the subjects in which he was especially interested. He never lost an opportunity to make a speech against the protective tariff or in favor of modifying our navigation laws. He was also an ardent silver man. Whenever he rose in the Senate, something was expected on one of these subjects, and hardly any matter came up for discussion that Mr. Beck was unable to make it an opportunity for the energetic display of his wonderful accumulation of facts and figures concerning the Treasury or the tariff policy of the country. He poured out his information in a torrent of words which came with such rapidity as to tax to the utmost the capacity of the best stenographer of the Senate. He was always pugnacious on the floor and in the discussions of the committee-room, and he invariably fought on the side of Democracy. To hear him speak on a subject in which he took great interest, one would have supposed that there could be no living with a man so intense and angry at opposition. But there never was a sweeter-tempered or more kindly man than Senator Beck. There were no politics in his friendships. He was one of those numerous living answers to Sydney Smith and Dr. Johnson—a witty Scotchman. He loved to have his friends about him, and his house in Washington was the resort of many men whose political principles the Senator was accustomed to denounce with a vigor that seemed to indicate a willingness to tear to pieces those who were guilty of holding them.



THE LAW.

"Hold on, my [illegible] don't shoot: I'm a judge."

"Wha' ye goin' ter do? Judges ain't no more 'count than de law is now-adays. Ye can't hang a feller, ye can't 'lectrify him, an' my lawyer kin appeal as fast as you kin sentence. Shell out!"

"THE WIND'S WAY."

I whisper all day to the rushes,
I ruffle the smooth-flowing stream,
And borrow from cloud-land and sunlight
Their shadow and beam.

I hurry through grain field and forest,
O'er valley and high mountain chain;
Their saltness and sweetness I gather
From meadow and main.

The secrets I murmur are many,
As sadly or blithely I blow,
Yet what I reveal to the river
No mortal may know.

William H. Hayne.

THE CLANGOR OF AN ALARM-BELL Close by, in the stillness of the night, could scarcely startle the ordinary individual more than do trifling noises the nervous invalid. But once the nerves are braced and the system invigorated with Hostetter's Stomach Bitters, this abnormal sensitiveness is succeeded by a tranquillity not to be disturbed by trivial causes. Impaired digestion is a fertile cause of nerve weakness and unnatural mental gloom, and a vigorous renewal of the action of the stomach is one of the surest means of invigorating and quieting the nerves. Insomnia, or sleeplessness, a form of nervous disease, is unquestionably benefited by sedatives, when it is prolonged, or of frequent occurrence, but its permanent removal is more effectually achieved with the Bitters. This medicine is also signally efficacious for malaria, rheumatism, constipation, liver complaint, and torpidity of the kidneys and bladder.—[Adv.]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[Adv.]

IMPERIAL GRANUM Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[Adv.]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.—[Adv.]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[Adv.]

Blood, they say, is the life. Nicholson's Liquid Bread assimilates with the food, and makes good, pure blood, which is the source of health. Try it and be convinced. Grocers and druggists keep it.—[Adv.]

Premature Loss of the Hair, which is so common nowadays, may be entirely prevented by the use of Burnett's Cocoaine.—[Adv.]

All persons afflicted with dyspepsia find immediate relief by using Angostura Bitters.—[Adv.]

DR. LYON'S PERFECT TOOTH POWDER. Whitens the teeth and purifies the breath. 25c.—[Adv.]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits. 25c. a box.—[Adv.]

Burnett's Flavoring Extracts are invariably acknowledged the purest and best.—[Adv.]

Rheumatism is caused by an acid in the blood; therefore, external treatment affords no permanent relief. To eliminate the poison and make a thorough cure of the disease, nothing else is so efficient as Ayer's Sarsaparilla. Give it a trial. Price $1. Worth $5 a bottle.—[Adv.]

HARPER & BROTHERS, New York.

A JOURNEY TO THE LAKES OF EQUATORIAL AFRICA.

BY LIEUTENANT VÍCTOR GIRAUD.—TRANSLATED BY LAFCADIO HEARN.

ONE of the most remarkable narratives of recent African exploration is that of Lieutenant Victor Giraud, just published at Paris, with upward of 160 superb engravings illustrating his journey to the great group of lakes in central South Africa. The journey was accomplished between 1883 and 1885, and the young French officer was but twenty-three years of age at the time of the undertaking. His special purpose was to explore Lake Bangouélo, or Bemba, in whose vast marshes the illustrious traveller Livingstone succumbed to fever and died. Lake Bangouélo lies almost exactly in the centre of the southern portion of Africa, between the 10th and 12th degrees of south latitude. Lieutenant Giraud not only explored it successfully, with the aid of a portable canoe which he brought with him over the mountains from Dar es-Salam, but also several other little-known lakes and rivers,—including lakes Moëro and Tanganyika.

Apart from its geographical value, the work of Lieutenant Giraud forms one of the most interesting volumes ever written by any African traveller. He seldom theorizes or comments, but simply reflects his experiences in a straightforward narrative, written with that remarkable vividness and force which is characteristic rather of the best French writers than of any others. What he saw and felt would certainly have unnerved any traveller not possessing a will of iron and the most vigorous of constitutions. For months together he marched through regions made desolate by war and famine, through waste places strewn with skeletons,—relying for provisions almost wholly upon such game as he might chance to find; and he only accomplished the object of his journey after the most severe trials, including several revolts among his own men, and various attempts at spoliation of his little caravan by negro-kings. The pictures of African life which he draws are among the most painful ever written; but one feels they have been sketched with impartiality,—precisely as seen and felt,—and the general impression of the book has a unique power which gives it a place apart among narratives of equatorial travel. The following series of excerpts translated from its pages will serve to convey some idea of the character of the young Frenchman's journey and of his singular adventures.

BURNING A WITCH ALIVE.

Starting upon his journey from Dar es-Salam December 17th, Lieutenant Giraud's first unpleasant acquaintance with negro customs began only two weeks later. Readers of African history and travel are doubtless familiar with the custom of immolating human victims on the death of a king in certain parts of the country; but at one of the first villages where Giraud stopped, every death was followed by the murder of some person charged with causing it by sorcery. He writes:—

"Zambué, where I passed my New-Year's Day (1883), is situated on the frontier line between Uzaramo and Kutu;—the cabins are closely grouped together, and surrounded by a quickset-hedge,—thick and impenetrable.

"For a New-Year's entertainment the chief of Zambué had reserved a surprise for me,—a truly savage and African surprise. At the moment we had begun to pitch camp, about two hundred yards away from the village, there came to my ears a horrible succession of war-cries, like the howlings of wild beasts; and almost simultaneously a band of maddened savages came toward us, dragging after them a wretched old woman—quite naked, and already half dead from the brutal treatment she had received. One furious scoundrel dragged her by the neck, with a noose made of a liana-stem which had been slipped about her throat. Whenever the victim fell from exhaustion, three or four men would catch the liana and tug all together,—pulling the miserable old creature over the briers and stones.

"With great difficulty I was able to obtain the information that the old woman was believed to be a witch, who had only the evening before caused the death of two men by her magical practices;—they were going to burn her alive. In the Uzaramo country every death is attributed to the effect of some secret poison, and is in consequence always followed by the murder of the person suspected by the *Mganda* of having administered it.

"Sickened by the spectacle, I advanced with my men to meet the band in the hope of preventing this atrocious execution; but, at the very moment we came close to the negroes, I saw the executioners brandish their axes over the victim's head in such a menacing way that I gave up the idea of going any further;—since the wretched woman was certain to be sacrificed in any event, I determined it was not to be under my very eyes.

"However, I thought I might be able to effect something by delaying the execution; and with that end in view I sent for the chief of the village, who soon made his appearance,—staggering, half drunk with *pombé*. But how find a nerve to stir in that idiotic head,—a sentiment to play upon? It was a useless effort. To my indignant protests he replied by sneering like a wild beast, and declared, as the King of Dahomey is said to have done upon a similar occasion:—'Your Sultan does what he pleases in his own country;—I do what I please in mine.'

"The executioners disappeared in the underbrush, still keeping up their yells and beating their infernal tamtam. The chief would only accord to me, as an extraordinary favor, the assurance that the old woman's throat should be cut before she was burned at the stake. But my own men, who went to see the execution, afterward told me that nothing of the kind was done.

"At nightfall the abominable idiot of a chief came to see me, carrying two chickens, which he offered me as a gift of reconciliation. In spite of his earnest pleadings, however, I refused to accept them,—which refusal is considered in Africa as a grave insult. He went off furious, muttering between his teeth:—'What is the matter with that *Msungu* [white man] that he should get angry about such a trifle? There was an *Inglesa* here last year who saw two executions like that without making any such fuss!'"

CARRYING THE TRAVELLER'S BOAT OVER THE MOUNTAINS.

For hygienic reasons, Lieutenant Giraud followed the mountain route to the interior, for a distance of more than three degrees,—although this involved carrying his boat, built of steel, over abrupt heights varying from 5000 to 6000 feet above the sea. It was to some extent a journey in the clouds, and accomplished in the middle of the rainy season, amid frightful storms. But the explorer calculated that as the journey to Lake Bangouélo, which is accessible only in the dry season, would require six months, he could only thus succeed in reaching it. His narrative of the mountain journey reveals the difficulties of the undertaking, even with a force of 150 picked men. On the 28th of January the real obstacles began.

—"We have reached at last," he records, "the true mountain region. It is like the Alps. Before us Mount Para Uranga rises menacingly, to the great tribulation of my boat-carriers. A thunder-storm roars through the hills all the afternoon, with frightful crashings and deafening peals. Lightnings cross each other in every direction;—I count as many as fifty flashes per minute. Anywhere, except under my tent, it would be a grand and beautiful spectacle. . . .

—"The ascent of Para-Uranga on the 29th was a terrible effort, which brought us at once fifteen hundred metres (nearly 5000 feet) above the sea-level. Sweating and panting, my men took four hours to reach the summit,—having to aid themselves all the way by clinging to the bushes and roots on either side of the path. The boat did not reach the top before night; and I had frequently to send re-enforcements to help the boat-carriers.

—"Through a momentary rift in the cloud-mist we see beyond a huge crevasse to the east, a panorama of unsurpassable magnificence:—far off, the Uguru Mountains, whence issues the Kingani River; below our feet the vast marshes of the Makata; and, southwest, a sea-like billowing of low summits, rounded or peaked, with cloud-packs hovering above them as if hesitating just where to settle. From the sides of the mighty crevasse cascades white as snow fall leaping from projection to projection; and ravines open further down whence seething torrents rush to join the roaring stream below our halting-place.

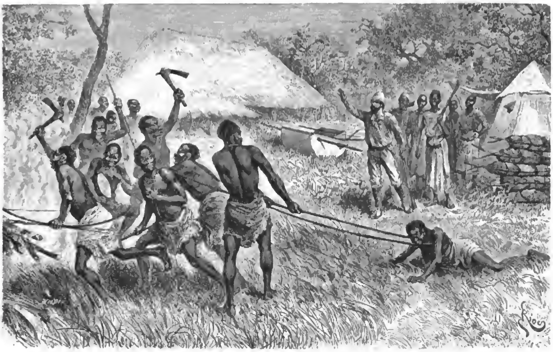
"It is all so like the Alps that it seems an illusion:—all that is lacking is the sight of some thatched cottage in the distance, the bleating of a flock, and the tinkling of a bell.

."The spot on which we camp reminds me a little of the *Grand-Son* of our Dauphiny Alps—(minus the rhododendrons),—just the same naked soil, bristling with dense rocks,—the same icy temperature,—the same cloud-fog likewise, through which our tourists used to persist so obstinately in trying to observe a mountain sunrise.

—"Our march on the 30th brings us up to a height of 500 metres more—till we reach a narrow 'neck,' whence we descend again, by an almost perpendicular path, to 1200 metres, and into a marshy plateau.

"Then for a distance of two kilometres, the path, which is only just as wide as the foot of a man, is carried along the face of a precipitous cliff 300 metres high. In my present condition of weakness I am naturally seized with vertigo; and twice I am obliged to lie flat down in order to save myself from yielding to giddiness. My Zanzibarites, as adroit in the mountains as they are strong in the plain, are quite insensible to all feelings of dizziness, and move on confidently until we reach a long flat slippery rock,—sloping out at an angle of between 60 and 70 degrees, which completely bars our way.

"It takes more than an hour to get the five sections of my boat around this obstacle;—I see them, one by one, fastened to ropes which my head-men attach to the trunks of neighboring trees; while others of my men, lying upon the rock, lower each section cautiously at the risk of being pulled over the precipice themselves if the ropes should happen to slip. I superintend this labor of giants from below with much anxiety; for the least carelessness might ruin in an instant all the hopes I have founded upon that frail skiff. But all ends well."



A SORCERESS DRAGGED TO THE STAKE.

CRAZY TERROR INSPIRED BY A LION.

The numerical strength of the explorer's force did not suffice to conjure away the peril of wild beasts; and several extraordinary cases of attack by lions and panthers were among its adventures. At one halting-place a panther entered the camp several nights in succession, killing and wounding; at another, a lion actually tried to force his way into the huts. This adventure is thus recounted:

. . . "The village in which we encamp is at least quite as miserable a place as that of yesterday—where we made our first halt after leaving the Condé country. During the previous five days a lion had been making frightful ravages in this little community. This last night also a wretched woman was seized within her own hut, and devoured by the animal only a few paces off—in the high grass. Her mutilated corpse is a horror: there remain only the head and one leg.

"To build a *boma* (fortified camp) after such a day's marching was of course impossible: I installed myself as well as I could with the greater number of my men, leaving the rest to shelter themselves in the abandoned huts. In order to protect these huts, the natives had surrounded them with a heap of thorny brambles, piled so high as to cover the roofs themselves.

. . . "About one o'clock in the morning I was just dropping off to sleep, under the *zo-zo* of the mosquitoes, when an ominous crackling sound woke me out of my doze with a start. Nearly one hundred yards away I saw a hut all in flames. Cries of distress issued from within it:—'Fire! fire! . . the lion! the lion! . . bring your rifles!'

"We all ran there. The flames, seizing the brambles, were leaping twenty-five or thirty feet in the air. The hut was an immense furnace; and the roof was already burning

"To our wild outcries the two poor stifling wretches within only replied by moans and groans.

"'Are you going to stay in there to be burned alive?' shouted Ferrouji—'jump through the fire!'

"Finally, just a moment or two before the roof fell in,

"Kétimkuru insisted that I should set a trap for the lion;—he would send two hundred men with me to construct it. I would have been only too glad to please him in this matter; but one day he told me that he was going to put one of his wives into the trap *for a bait!* I therefore reconsidered my decision, feeling sure that he would otherwise carry his project into execution as soon as I had left the country.

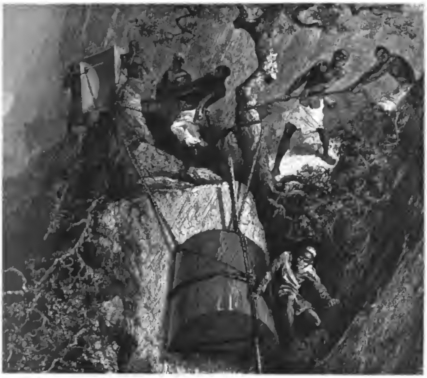
—"The justice of Kétimkuru is altogether African, and never extends beyond the limits of his *boma.* He very seldom inflicts the death penalty, except in the case of prisoners of war. As for robbery and murder, he never deigns to occupy himself with such matters. The person robbed has always the right to assemble his relatives and fall upon the robber. The murdered man has no avenger except the friend who is willing to take it upon himself to avenge him. . . .

"The real glory of Kétimkuru was that of having united all Uemba under one central government;—it had previously been divided into petty states, continually at war with each other . . . . Unfortunately he had no son capable of succeeding him,—and his death must plunge this whole country again into the wildest anarchy. . . .

—"Yet altogether the memory of this really good hearted man,—the only man of his kind whom I met during my two years' journey, often returned to me. It was not without a sinking of the heart that I heard, three months later, not only of his death, but also the news that I was charged in the Uemba country with having brought about that death by sorcery."

REACHING LAKE BANGOUÉLO.

The traveller reached the lake in July, bade farewell to the caravan accompanying him, and with a few chosen men launched his boat upon those unknown waters. His recital of the approach to the lake, and his account of what he saw during the last week of the march there, are graphic to the degree of creating a singular impression of ghastliness and desolation:—



TRANSPORTATION OF A CANOE IN SECTIONS.

. . . "The village of Combo-Combo leaves with me a souvenir of this obscure African region which will never be effaced,—a souvenir of unparalleled sadness. The inhabitants seem to have lost all resemblance to human beings: their ferocious faces and suspicious stare give them the aspect of wild beasts. Totally isolated to the number of fifty in this solitary *boma,* they would appear to be even upon their guard against each other;—they live upon the alert, like a troupe of gazelles. From the summit of a lofty ant-hill which dominates their huts they pass all their days in watching the horizon. By daylight a dead silence prevails—rarely broken by the hollow cough of the smokers of hemp, or the hammer of some weaver of bark textures. The tamtams, stoven in and covered with dirt, lie forgotten in a corner.

"All night long the voices of the blind eunuchs make answer to the howlings of the beasts of prey, the barking of the wild dogs, the yelping of the foxes. Like children, they think to conjure away, by making noise, the vague terror which oppresses them, but they only succeed in augmenting their lugubrious fear.

—"I will only be able to recall the last halt of the three days' journey to Lake Bangouélo. We journey all the morning until ten o'clock over a dried-up marsh which extends out of sight beyond the southern horizon. Here and there clumps of trees, scattered over those undulations which remain always above the floods, thicken ten miles away into a low bluish-green line which one might mistake for a mangrove swamp. The pathway, broken up by the elephants, and the torrid sun, make our march one prolonged torture.

"Turning back at last in order to encourage my boat-carriers, I find them lying down, one after the other, beside their sections,—gasping, agonizing. Not one grain of flour,—not one atom of dried meat.

"Further on, as we enter a thicket, a herd of elephants take flight;—but I miss them with two shots. About noon we encamp on a little elevation about twenty-five yards square,—after having waded one whole hour through a swamp which is full of leeches, as all these swamps are, and which seems to terminate southward before us in a high long line of thickly growing marsh reeds. To right and left behind us the blazing plain we have traversed shows scattered dark specks here and there:—a little band of elephants wandering in Indian file,—a solitary buffalo. Close to us *cobas,* motionless, are staring at us;—above our heads wild-geese, wild-ducks, and snipe fly about sportively.

"Then the guide declares that we have lost our way. After we have refreshed his memory with our ramrods, he assures us that we are really at the lake itself, and that he can show us a good place whence to launch our boat. So we are already in the basin of the lake without being able to see its waters! There can be no doubt whatever that clear horizon in the south is reflecting the light of some vast sheet of water;—but how deep is that wilderness of marsh reeds separating it from us? That is the all-important question.

"Soundings in the south gave three feet of water at a distance of 500 metres from our camp. About one o'clock we actually see a pirogue in that direction. It seemed to glide like a black speck over the prairie,—for the marsh has all the aspect of a prairie: it stops a moment,—probably because those in it have seen our camp-fire; then it enters the high reeds, and is lost to view. There is no time to be lost;—my men at once set to work to put the sections of the boat together. . . .

—"At ten o'clock on the morning of the eighteenth everything was ready and every man at his post. For some time the boat-carriers pushed us over the slime, as a sledge might be pushed over ice;—then, as we found ourselves fairly afloat, the adieux began. . . .

—"At mid-day, half sliding, half floating over this submerged prairie, we reached the wall of marsh reeds, sixteen feet high above the water,—dense, impenetrable, and extending infinitely away from northeast to southeast. It proved to be only about twenty yards in breadth; yet it took us more than an hour to force our way through it.

—"'*Bahari!*' (open water!) cried Wadi-Munié from the bow. One more effort,—and the free flood of the lake appeared at last. We were afloat on the Bangouélo.

"If I felt particularly embarrassed at any period of my voyage, it was certainly at that moment. North, east, and south, to the very horizon, the marsh reeds towered like an impassable dike: west, the vast stretch of water extended like a sea-line,—broken only by two or three far-off columns of mysterious smoke;—nowhere a trace of land; nothing but sun, water, and high reeds." . . .

CURIOSITIES OF LIFE AT MÉRÉ-MÉRÉ'S VILLAGE.

The explorer found several inhabited islands in the lake, but everywhere hunger, fear, and savagery among the inhabitants. They lived, on the whole, a far more miserable life than the wild beasts of the country, and showed superiority to animals only in the extreme cunning with which they concealed their habitations from view. Giraud traversed the lake southwardly, entered a river below it, full of cataracts, and then advanced northward to meet, if possible, the rest of his men. He waited for them at Mirambo, southwest of Lake Bangouélo, and suffered considerable ill treatment at the hands of the chief of that place, Méré-Méré, of whose settlement he gives a curious account;—(chap. xvii.):—

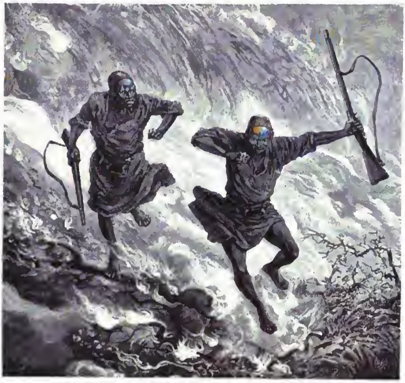
. . . "The chief Méré-Méré leads quite an active life. At the first rays of sunrise, I can hear his shrill voice arousing the sleeping population, who dread the morning chill with good reason. He goes from one hut to another with his cane in his hand, and beats unmercifully whoever shows a disinclination to go to the fields. By seven o'clock the village is almost deserted. Then he goes off himself, accompanied with an escort of armed boys, to superintend the work, sometimes in one place, sometimes in another. About three o'clock he returns from the fields, and soon after that hour I think he is always under the influence of *pombé.*

"His projects of culture are vast as the world. By whatever gate you leave the village, you can walk straight forward for a whole hour through the clearings, 100 to 150 yards in width, made through the woods and underbrush; and I keep asking myself how and where he is going to find seed enough to plant such immense extents of land.

"The women do not suffice for the work desired; and he has therefore taken it into his head to make requisitions on the smaller neighboring villages, which are each in turn obliged to furnish a certain number of men for the work. Furthermore, each of these men must bring with him a certain quantity of maize: and it is by means of this weekly tribute that Méré-Méré himself manages to live in this time of famine. . . .

—"The African mind loves exaggerations,—and its eccentricities do not always stop short of exaggeration alone. Méré-Méré came to see me one day very unexpectedly with his face all lighted up: he informed me he had just learned that one of my brothers, a White Man, was descending the river upon a boat made of stone:—he had two pairs of eyes—one pair in front, another at the back of his head,—and a monstrous gun. . . .

. . . "One evening I tried to make Méré-Méré talk about a future life, and a God better than his own. He listened to me for a few minutes and then took his departure hastily, after informing me that he desired me hereafter always to notify him when I felt inclined to talk about such things,—so that he should not have to trouble himself in coming to see me. . . .



"WE SAW THEM COME OUT OF THE BURNING BRUSH LIKE TWO DEMONS."

—"15th Sept. The remains of a young elephant, which was found dead three days ago, have just been carried into the village. Méré Méré was able to maintain order for a few moments, but as soon as he had taken his own lion's share of the carcass, the division of the quarry began with a savagery impossible to describe. The dogs themselves took a share in the scene; and during the ignoble contest which followed, I do not know whether the men or the dogs were the more ferocious and bestial. This flesh exhales a sickening odor, and the whole village will be infected by the stench for a long time to come. . . .

"From morning till night the children are busy hunting among the trees for crickets. They pull off the wings of the insects, and roast the bodies for food. This evening they come about my table and dispute with the dogs for the bones;—I cannot imagine what they can get from those bones.

—"18th Sept. A woman has just died;—two men have taken her up, one seizing her by the arms, the other by the legs,—and are going to throw her into the underbrush on the other side of the marsh. Only the chiefs have the right of burial.

"I heard that the poor creature had died in consequence of brutal treatment; and I questioned Méré Méré about the matter. He told me in effect that he had ordered her to be severely beaten because her conduct had been immoral. Almost at the same moment some of the village people came in with the announcement that the remains of a dead lion had been found in the neighborhood; and forthwith the public criers rushed into the streets shouting at the top of their voices:—

—"'How explain the death of a lion killed by a base hyena? Who does not see that this extraordinary thing has happened as a warning to you women to remain faithful to your husbands? Tremble, guilty ones, or you will all die like your sister died to-day!'

—"19th Sept. It turns out after all that the alleged dead lion was only a dead hyena,—which fact greatly embarrasses not only the public criers, but also Méré Méré, by whose orders they had been acting. Furiously angry, Méré Méré has banished from the village all those who brought in the marvellous news of yesterday."

RUN OVER BY A HERD OF WILD BUFFALOES.

Lieutenant Giraud found his way to Lake Moëro in November, and one of the party had the following strange adventure:—

. . . "About nine o'clock on the 11th of November we came in sight of a magnificent lake, the existence of which had been concealed from us by the natives. The two banks, separated by a distance of 1500 to 2000 metres, enabled me to surmise from their elevation that the depth of this basin was from thirty to forty metres. The pathway skirted the southern bank under high woods of superb appearance. For a distance of three kilometres we still had the lake at our feet: then the hill suddenly sloped down into a dry plain covered with the *Acacia horrida*, and traversed by a river which, after feeding the lake, ran southwest—probably to join the Moëro.

"From the ridge we caught sight of the finest herd of buffaloes I had ever seen. There were more than a hundred and fifty of them, dispersed over a comparatively small space of ground,—all grazing on the thin grass bordering the river. When I came in sight of them, Hassani had already alarmed the herd, which began to flee slowly to windward,—heads lowered and ears pricked up. I ordered Terrouji to run to the right of the retreating animals, and do whatever he could to turn them back in our direction. But, like an overgrown child, he could not resist the temptation to use his big rifle when within 200 yards of them; and the herd at once massed together, and rushed toward us as if impelled by some occult force,—looking much more formidable of aspect than before.

"I can still see that maddened mass of animals rushing upon us over the long dry plain and under the fierce sun at a charge-gallop. The greater number were of a dark brown color; the robe of some a dull tawny hue. But the pressure of all those heavy bodies was such that the young ones, in order to breathe, were forced to leap on the backs of their comrades, whence they rolled pell-mell down again.

"Kamna was a hundred yards in advance of us. We had only time to warn him by a shout. He flung himself on the ground, face downward; and the entire herd passed over him.

"Hassani, icily calm as usual, was kneeling down at my left; five or six of the other men were in line on my right.

—"'This is the first time,' Hassani said, 'that I ever saw a herd turn against the wind. The old bulls are angry; we may expect the worst.'

"The charge was at us. When the buffaloes came within twenty yards we all rose up together; and ten rifle-shots rang out simultaneously. Surprised by this fusillade, the front of the herd came to a sudden halt; but the rear, unable to check its rush, pressed forward on the right. Then the panic resulted in a wheeling movement which brought some of the animals within five or six yards of us.

"A moment later all were in full flight again; and all galloped over poor Kamna a second time, and disappeared in the distance. Our first movement was to run to the unfortunate cook, whom I expected to find with every bone in his body broken. To my utter astonishment he got up of his own accord, shook himself, felt himself all over from head to feet, and finally exclaimed:

—"'*Bah! they only struck my head!*'

"I knew the nature of the head in question; and that was enough to set my mind at rest.

"As for the buffaloes, I may observe that during the brief moment while the herd was wheeling, Hassani and I were able to fire six shots with our rifles almost touching the bodies of the animals. Without boasting, I can therefore affirm that every shot told; but nevertheless only one animal remained behind the herd."

PICTURES OF FAMINE.

During the journey northeast from Lake Moëro to Tanganyika the expedition traversed scenes of misery and horror exceeding even those previously witnessed. The country had been ravaged by war, and the people were trying to live upon boiled leaves. Sometimes, on reaching a village to which they were directed, the travellers found only skeletons. The following are but a few extracts from a long and very pitiful narrative:—

. . . "Of the six day's journey to Lake Tanganyika there remain to me only the memories of a cruel and incessant hunger, interminable high woods, and little villages peopled by walking skeletons, who had not even strength to utter a war-cry, and who threw themselves on their knees before me to beg for a few strips of dried meat.

"On the 14th of November we camped at one of these villages; and for the first time I had the pleasure to hear people speak of Tanganyika, the goal of all my efforts, with a certitude of detail which convinced me of the lake's existence,—for I had myself almost begun to doubt it.

"The inhabitants, who had all fled at our approach, returned at two o'clock under the leadership of their chief,—a tall fellow who tried to put on swaggering airs in the vain effort to hide the terror with which my coming had inspired him.

—"'Here is all that I possess,' he said, laying at my feet a chicken and a solitary leaf of tobacco. 'I have travelled; I have been to Tanganyika.' (He spoke of it as a far-away country, full of marvels of all sorts.) 'I saw white men there; and I know they do not eat the blacks,—so I come to you with confidence.'

"I gave him a box of caps and ten charges of powder.

"Two of the six women remaining in the village had been rendered insane by hunger. At sunset one of them approached my bed, which had been placed in the open air, and even now I can still see that long naked figure, transparently thin,—that emaciated face laughing with a weird disdainful laugh.

—"'Great Msungu,' that laugh seemed to say, 'every one here trembles before you; but I defy you. One who has reached the condition in which I am fears nothing, and I can mock your power.'

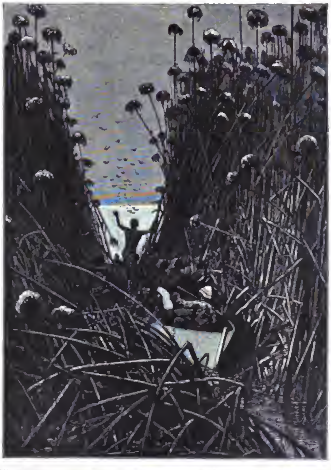
"My men wanted to take her away,—so ghastly the impression caused by her apparition. But the moment their hands touched her she sank down. I tried to make her swallow some tea; but she had reached that stage of suffering at which it is impossible even to swallow fluid.

"What we saw next day was still worse. As none of the natives were strong enough to march with us, we began to wander again at random along the elephants' tracks. In one of these we found another living skeleton lying at full length,—fully fifty kilometres away from any human habitation.

—"'What do you live upon in this *pori* (jungle)?' I asked.

"He pointed to a basket of mushrooms overturned beside him, and fell back motionless. I felt his temples and his pulse: he was dead. I had him carried into a neighboring thicket, and we resumed our march; for if we had undertaken to bury all the corpses we found, I should be still at work doing it.

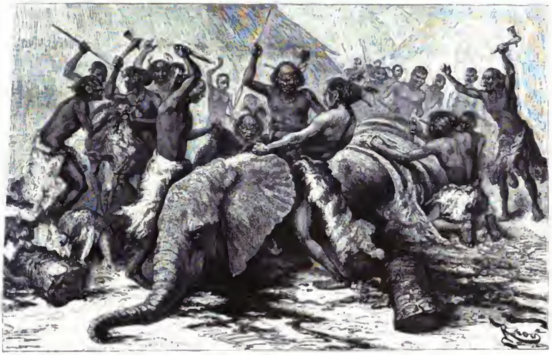
. . . "In regard to provisions, we heard the same reply everywhere. At Iendué the chief said: 'Do you not know, Msungu, that two months ago Kabunda came and pillaged everything? Our wives and children were carried away as slaves. We have not a single yam; . . . we must go for our seeds to Mlilo, five days' journey north; and even there we can only get seeds by selling our own brothers.'



IN THE GREAT CANE BRAKE. "THE LAKE!" CRIED WADI-MUNIE, FROM THE BOW.

"In the day when game shall have become rare in parts of Africa, let hunters remember the Valley of gozi; for man is the only animal not to be found there. ot count those few wandering savages who traverse mense savannas, bow in hand, watching the vultures ng in the sky, in the hope of sharing with them the n which the birds perceive and descend upon. One e encountered two of these poor wretches.

ur camp had been pitched on a bare plain; and the



CUTTING UP A YOUNG ELEPHANT.

wo savages approached within 300 yards of it to watch us, relying upon their agility, and being ignorant of the range f our fire-arms. In order to attract them, we set a coarse ait for them, as for sharks, in the shape of the head of a ebra, freshly killed, which we put as near them as possible. As soon as they discovered what it was, they rushed upon it, and devoured it on the spot,—lest some one should afterward dispute it with them. One of my men then stripped himself naked, and approached them with his arms folded. After some time, by dint of patience, he succeeded in obtaining a parley with them.

"The result may be divined;—still, it was not until night fall that the two skeletons could be induced to speak with confidence, after having made me swear over and over again that I should not cut their throats. They really believed my oath only when they saw the quantity of meat in our camp; for among some of these native tribes the sight of a white face always suggests the idea of mutual anthropophagy. These did not belong to any tribe, lived chiefly on wild honey and air, and agreed to follow us wherever we went, so long as we would kill game for them."

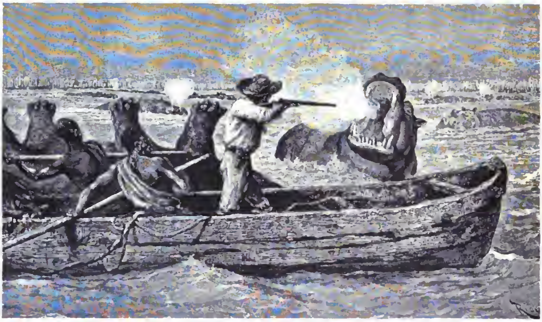
ATTACKED BY HIPPOPOTAMI.

While travelling on the river through the "elephant-marshes," in the latter part of his journey, the explorer had an adventure with hippopotami quite as dangerous and exciting as the previous adventure with buffaloes. He writes in his journal:—

. . . "A grove of palm-trees marks the beginning of the elephant-marshes. Up to this point of our voyage the banks had always remained within view—topped by a scanty growth of trees, with a few villages sprinkled along the heights. But now in the elephant-marshes we see no trace of a dwelling for twenty-four hours at a time, and no other vegetation as far as the horizon but one waste of arborescent grasses where the elephants find enjoyment at this season of the year. In this vast mass of verdure, traversed in every direction by trails, one could not see ten yards away, but there are numerous ant-hills everywhere, which serve as points for observation, and render it possible to explore the region.

"On the 3d of November, Kerr and I were separated by the forking of the river about an island; he followed the left branch while I followed the right. From either side our gunshots replied to each other all the morning until midday. Kerr had the good fortune to fall in with a fine herd of elephants; as for me, I had to fight for two hours with a herd of hippopotami, which more than once put me into a very dangerous situation. I had killed one, which, after floating down awhile with the current, grounded at last on a shallow spot; and I had moored the boat beside him in order to try to cut off his head, when we found ourselves suddenly surrounded by the entire herd, which approached within a few metres of us, uttering terrible growlings. When I had succeeded in placing about ten others *hors de combat*, at least fifty more still surrounded us, and remained within range.

"The sun scorched like fire, and the hatchets of the blacks could scarcely cut into the elastic skin,—so that I was obliged to give up the attempt, and leave the ivory to the crocodiles: it was much easier to win than to carry away. But as we guided our boat through the circle the hippopotami still formed about us, two of them attacked us with such rage that at my second shot the muzzle of my rifle entered the open mouth of the monster, as he strove to seize the edge of our canoe in his jaws. Never before had I seen hippopotami in such a state of fury. It was the suckling season;—at that time one always sees quite a number of little ones clinging to the backs of their mothers; and it is necessary to be extremely cautious about approaching them."



AT CLOSE QUARTERS WITH THE HIPPOPOTAMI.

AFRICAN CHARACTER.

The most striking effect of the explorer's narrative is that impression which it conveys to the reader of negro character and life through a startling succession of incidents or observations. The races of the region visited by Lieutenant Giraud seem to be able to live under conditions that would prove the extermination of any population not characterized by a love of life for the mere sake of living, comparable in strength only to that of the lower animals. Their existence is perpetual anarchy and starvation. In the most fertile of regions cultivation has been rendered almost impossible by war and rapine; and kingdoms seldom have a history extending beyond the death of the founder. There is no justice. there are no laws regulating society except in the relation of subject to ruler. Every village is a fortress, from which a lookout is being always kept for the approach of enemies, and even in the presence of a common danger the inhabitants are divided against each other by petty jealousy or superstitious fear. About their homes human heads, stuck on poles, or eyes torn from the socket, or skeletons unburied incessantly suggest the possible fate of each villager. Lions boldly enter these villages at night, or seize the inhabitants by day while working in the fields. And yet, in spite of this never-ending horror, the negro loves life, and strives, whenever consistent with his personal safety, to indulge in merriment. Perhaps there is no better illustration of this race characteristic in the book than the touching story told by Giraud of the sale of a girl to some slave-dealers by her father and mother, in exchange for an old flint-lock musket.

"At Manda, on Lake Tanganyika," he writes, "the Vuafipa men were encamped, having come to buy slaves; and I was able to observe a number of their transactions in bargaining—one of which took place close to my tent. The subject of the bargaining was a little girl ten years old, graceful and well built, brought to be sold by her own parents. The chief of the Vuafipa had offered in exchange for her an old flint gun; but the bargaining lasted a whole afternoon; and the slave-dealer had to throw in a gun-flint, two charges of powder, and two copper balls.

"Once in possession of his prey, the owner caressed her for a moment, and examined her eyes and ears very particularly; she had fine white teeth, and her face lighted up with a smile. Then he brought forward two other children already fettered together by a leather rope passed round their necks, and he fastened the end of the long thong firmly about the little girl's neck. For the first time she understood; and tears sprang to her eyes.

—"'Now you are baptized a Mfipa, little one,' cried Kamna;—then turning to some comrades, he added:—

—"'And in ten years, when we come back to Karéma, they will show us this woman as a Mfipa of pure race! In truth, my brothers, all the races of the interior are mixed.'

"Meanwhile I felt interested in the little one: those tears had moved me; and I was actually on the point of telling Kamna to bargain for her, when suddenly I saw her laugh, rise up with her fettered companions, and begin to play in the water with them, just as she would have done with friends of her childhood. I turned my head;—the parents were already five hundred yards away,—walking off coolly, without so much as looking back.

"Those tears were the first and only ones I had seen during my voyage,—the laugh which immediately succeeded them, however, checked at once the last impulse of that compassionate pity which naturally oppresses the heart of the European traveller in the face of miseries which he is totally helpless to alleviate."

island paradise over the sea. After the wretched and almost fatal consequences of this enormous deception, they struggled back to France, and Daudet was greatly impressed by the testimony at the investigation, which revealed to him a capacity for humbug which promised the richest comic results to imaginative treatment. The justice of his prevision is attested by this narrative. It is a bright and rollicking extravaganza, as such schemes viewed from the humorous side always are. It is a droll and plausible burlesque of actual experience, and the movement is so brisk and gay that the graver aspect is constantly hidden, and the enjoyment is not disturbed by sympathetic pity. Those who are accustomed to associate doubtful pictures of morbid passion with the French novel will be surprised and delighted to discover that the French novel also includes such fresh humor, and sparkling and good-natured satire, and the play of so fresh a fancy, as they will find in *Port Tarascon*.

A SOUTHERN VIEW OF "THE SOLID SOUTH."

The Birmingham *Age-Herald*, in Alabama, says of the late book *Why the Solid South?* that while it is useful and timely as a history of the facts of carpet-bag and negro domination, it really does not touch the chief point at issue. The *Age-Herald* says that the work does not answer the Republican complaint that the negro is a constitutional voter prevented from voting by those who are allowed full representation for his vote. The book, it thinks, while approving the fifteenth amendment, attempts to justify its nullification.

This is an important and very suggestive criticism from a leading journal of opinion in its part of the country. It deprecates the tone of appeal to "Northern sympathy" which it finds in the work. The remedy for the trouble, the *Age-Herald* thinks, lies solely in the action of the States interested. "There is but one way in which the South can ward off the danger of negro rule, and in so doing put itself on secure ground and square before the country. That is, to provide such qualification for suffrage as will disfranchise the illiterate and irresponsible." This should have been the course pursued, it says, as soon as the rule of the carpet-baggers was overthrown. It must be adopted, it adds, before there will be honest and satisfactory politics in the Southern States, and immunity from Republican federal interference.

Whether the vote of the States in which the negro vote is largest could be procured for such a disfranchisement, the *Age-Herald* does not say. But that the suggestion is of great importance is undeniable. The division of the colored vote between the white parties seems to be conceded to be contingent upon open bribery, which would not promote the honest politics of which the paper speaks. The fact of the suggestion made by the *Age-Herald* as a solution of the problem is, however, very interesting as a sign of the disposition to look at the question practically, and to consider it in a candid spirit.

THE INDIAN SCHOOLS.

The Indian Commissioner has asked for an increase of about $800,000 over the appropriation for the current year for the maintenance of Indian education. For eight years, beginning with 1876, there was an annual average increase of 75 per cent. in appropriations for this purpose, but for the last five or six years there has been practically no increase, and in 1887 even a reduction. It is the plain duty of the Commissioner to insist upon his request, because he, more than any other person, knows the actual requirements of the policy upon which the government has deliberately entered.

The "Indian problem" of course may be abandoned, if the country desires. The Indians may be left a permanent and costly disgrace to the national humanity and intelligence. But it would be foolish to assume that this is the public wish until it is unequivocally demonstrated. The legislation of recent years has revealed the public policy of absorbing the Indian population by wise and practicable means in the great body of citizens. The severalty law and the system of Indian education are vital measures of this policy. They contemplate the training of the Indians in the elements of education and of civilized industry.

To be thoroughly effective, the educational work must be greatly enlarged. New schools, ampler equipments, repairs, and the obligations incurred in our late purchase of eleven million acres of the land of the Sioux, demand imperatively increased resources, not to try experiments, but to do upon a necessarily greater scale and even more effectively what has been already done so well. The Indians of school age, excluding the New York Indians, or the five civilized tribes, are thirty-six thousand, but the present school accommodations are sufficient for less than a third of them. The Commissioner is but doing his duty in reminding us that if the Indian children are to be made self-supporting citizens, and not continued as dependent pauper wards of the government, this educational work must be done, and Congress ought not to hesitate to provide for it adequately.

THE POLICY OF PEACE.

At the annual meeting in Washington of the Christian Arbitration and Peace Society, Mr. Justice Harlan presiding, the Rev. George Dana Boardman, of Philadelphia, President of the society, made an earnest and eloquent plea for national disarmament as the most effectual preventive of war. He does not question the right of self-defence; but it must be always self-defence, never assault or military conquest. A national police of armed men there may rightfully be, also, upon land and sea. But it must be a police, not the nurse of a national admiration of false glory.

Dr Boardman holds that we are strong enough, and ought to be brave enough, to propose to other nations disarmament and arbitration. His speech was made before the recommendation of arbitration by the Pan-American Congress. That recommendation and Dr. Boardman's speech, like the Geneva arbitration, are signs of the ripening opinion of civilization of which Charles Sumner's Fourth of July oration on the "True Grandeur of Nations" forty-five years ago in Boston was a harbinger. Dr. Boardman, with Tennyson, anticipates

> "The Parliament of Man, the Federation of the World."

But it is not yet clear that the most Christian pilgrim through a territory of savages is not safer with a gun than without it; and although it is hard to compare the state of Christendom to a savage realm, it is not unfair to suppose that in a community of armed states a truly peaceful state enjoys greater certainty of peace if it is known to maintain an adequate armed protective force. When we abandon the doctrine of absolute non-resistance, force is but a question of degree. Dr. Boardman will agree that our army is only a police. It is plain that we are not dazzled by military glamour, and it would be very difficult to stir the country to an ardent demand for an aggressive navy. Indeed, our condition, both in fact and in spirit, shows that we have heeded Sydney Smith's warning seventy years ago: "David Porter and Stephen Decatur are very brave men, but they will prove an unspeakable misfortune to their country if they inflame Jonathan with a love of naval glory, and inspire him with any other love of war than that which is founded upon a determination not to submit to serious insult and injury."

DU CHAILLU'S NEW BOOK.

In England Stanley is the hero of the hour, and London, which at this season asks only a "lion," is happy to have one fresh from the African jungles. But our old friend Paul du Chaillu has claims the importance of which the heroism and notable exploits of Stanley do not efface, and he has just condensed into one popular and abundantly illustrated volume, with maps, the story of his African travels, which will be found even more interesting in the compacter and connected form. There is room enough in Africa for many original explorers, and fame is like love or the sunshine. There is enough for all, and "to divide is not to take away."

Du Chaillu claims to be the first white man who penetrated the vast and unbroken African forest extending two or three degrees on each side of the equator, sparsely inhabited by man and the characteristic animals of Africa, but by great numbers of venomous serpents, formidable species of ants, and strange varieties of apes, of which the gorilla, which Du Chaillu calls the King of the African forest, is chief. Thirty-five years ago, in 1855, Du Chaillu left New York upon his first voyage, returning in 1859. He travelled alone, making friends with the tribes, and passed peacefully from one to the other. He discovered the gorillas, the cannibals, the dwarfs, and the mountains. Upon his return his story was assailed with bitter incredulity; but Sir Richard Owen and Sir Robert Murchison, with other men of the highest authority in science, befriended him, and now Mr. Stanley and other travellers confirm his narrative.

The popular interest in his African story is very great, and it will be stimulated and renewed by that of Stanley. He gives to his new volume the title, *Adventures in the Great Forest of Equatorial Africa and the Country of the Dwarfs.* It is published in London by John Murray, and will be issued in a few days by the Harpers in New York, and if the love of fresh and heroic adventure be as strong as it was a generation ago, and indeed as it is always likely to be, the public will take great satisfaction in this renewal of an old and proved pleasure.

MR. ABBEY'S "MAY-DAY MORNING."

The English papers, with one accord, warmly praise the oil-painting exhibited this year in London by Mr. Abbey—"A May-day Morning." The charm of the work is plainly reflected in the notices which describe a blithe freshness in the picture as if the artist had thrown a strain of Chaucer upon the canvas. The *Athenæum*, however, is reminded of another poet. It says of the work by "the renowned book illustrator of New York," "It is an original and charming exercise in tone, tint, and line, cast in a low key, and all as beautifully harmonized as we could wish them. In 'A May-day Morning' we catch a glimpse of what Herrick saw when he went 'a Maying' with his Corinna." And again, "the grace and spontaneity, the broad, soft, and yet luminous effect, with its diffused light and softened shadows, and the charms of tone and color distinguishing this work, are such as Herrick himself would delight in, and for it thank a painter possessed by his very spirit."

This poetic character of Mr. Abbey's work, the subtle play of imagination suffusing it with pure sentiment, and with the Boccaccio charm which belongs to Giorgione's drawings and sketches, or more precisely, perhaps, the old English "pleasance," is its most characteristic quality. It is familiar in his "black and white," and it is delightful to learn that it is not less observable in his painting. The subject, indeed, is of the kind to which he naturally inclines. A pair of young lovers, he with a mandolin, dance along a garden space in the bright May morning in a flood of sunshine, fruit hanging upon the wall, and chanticleer with flapping wings saluting the day. Youth, beauty, love, and the morning are all touched by the tender skill of genius into a song of harmonious color.

Mr. Abbey, doubtless full of the happy feeling of his picture, is just crossing the sea again, and among the good gifts that he will send back to us, let us hope, will be the opportunity of seeing this work. For,

> "While Time serves and we are but decaying,
> Come, my Corinna, come, let's goe a-Maying."

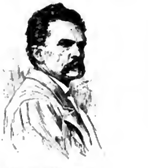
PERSONAL.

Charles Butler, of this city, who has recently given the University of the City of New York and the Union Theological Seminary each $100,000, has long been connected with these institutions. He studied law with Martin Van Buren, and began its practice in Geneva, New York. In 1834 he moved to this city, and soon became interested in the building of Western railroads and cities, Chicago and Toledo being among the young towns which received his attention. He made money, but used it justly, and helped many deserving persons and objects in their struggles. Mr. Butler has enjoyed the friendship of many famous men, among them Thomas Carlyle and James Anthony Froude. It is said that years ago a farmer in western New York asked Mr. Butler for a loan to publish some writings which he called a "New Bible." The loan was refused, but the book came out, and proved to be the celebrated Mormon Bible.

—Prince Bismarck possesses over a hundred decorations, some of them very valuable. One, a diamond star, given him by the late Czar of Russia when the German statesman was made a member of the Order of St. Andrew, is worth $50,000.

—Hamilton Grange, the house which Alexander Hamilton built when, after his political defeat in 1802, he bought a farm at the upper end of Manhattan Island, still stands. It is near 142d Street and Convent Avenue, and is used now as the chapel of St. Luke's Protestant Episcopal Church. The room on the first floor which Washington is said to have occupied during his visits to the Grange is preserved, with much of its furniture. The thirteen gum-trees which Hamilton planted in commemoration of the original colonies are in a flourishing condition. A few hundred yards away stands the Colored Orphan Asylum, occupying the site of the house where Aaron Burr once lived.

—Another colored man has come to the front in the Senior Class at Harvard College. He is William Edmond Burghardt Du Bois, and he divided the Boylston prize of $120 for declamation with a white competitor the other evening. He was born at Great Barrington, Massachusetts, was fitted for college there, and after being graduated with high honors at Fisk University, in Nashville, he entered the Junior Class at Harvard. He is fitting himself to be a teacher in the South, and supports himself by teaching, lecturing, and winning scholarships.



—Jorge Isaacs, the author of *María*, a translation of which was recently made by Rollo Ogden and published in the "Odd Number Series," is of mixed race—the son of an English Jew married to a woman of Spanish blood. He was born at Cali, in the beautiful vale of Cauca, where he has laid the scene of his story. Early in life he lost his father and mother by death, and since then has found a home in Bogotá, the Colombian capital. His first work, a small volume of verses, was enthusiastically received by the Bogotanos; and in 1867, when still a young man, he published *María*, which has come to be considered in South America as the most original and characteristic work yet produced in Spanish-American literature. The accompanying sketch is taken from a photograph recently received from him.

—General George von Caprivi, the new German Chancellor, is, like his predecessor, a man of huge stature and soldierly mien. He has seen service in both the army and navy of his country, is a fine speaker, and is now in his fifty-ninth year.

—Miss Belle A. Smith, twenty-three years old, and a Michigander both by birth and education, has been made resident physician at the women's prison in Sherborn, Massachusetts.

—Reuben R. Thrall, called the oldest practising attorney in the United States, has just died at Rutland, Vermont, at the age of ninety-five years. He was an old-time Abolitionist, and co-worker with William Lloyd Garrison.

—Mr. Charles T. Cunningham, who was for many years connected with the Manhattan and Brighton Beach hotels, will be associated this season with the management of the fashionable Hotel Kaaterskill, in the Catskill Mountains.

—M. Catacazy, once a Russian diplomat of unusual prominence and brilliancy, died in retirement at St. Germain, France, not long ago. He was Secretary of Legation at Washington in 1848, and became Chargé d'Affaires when only twenty-four years old. After that he served with distinction at different European capitals, receiving rapid promotion, and when he returned to this country as Russian Minister his well-known sympathy with the cause of the North during the war and his brilliant reputation insured him a warm reception. An unfortunate scandal led to his recall, and when, soon afterward, he was dismissed from the Russian diplomatic service, he became one of the editors of the Paris *Figaro*.

—Oliver Bell Bunce, who died in New York May 15th, was born in New York February 8, 1828. Mr. Bunce had been associated for many years with the Messrs. Appleton, and was editor of *Appleton's Journal*. As an author his works include *The Opinions and Disputations of Bachelor Bluff*, *Timias Terrystone*, *Don't*, *My House*, *an Ideal*, and *The Story of Happinolande*. He was among the first who paid marked attention to illustrated works, and it was at his suggestion that *Picturesque America* was published by the Messrs. Appleton. For many years Mr. Bunce had been in delicate health, but yet accomplished a great amount of literary work. Endowed with a fine taste, and holding high the sentiment of honor, his influence has helped in no small degree to advance the intellectual development of the United States.

THE DRY-GOODS DISTRICT OF NEW YORK.

ILLUSTRATED BY W. A. ROGERS AND FRANK H. SCHELL.

FEW people know the enormous amount of business done and the wealth represented by the business men situated within something less than a square mile of the lower part of New York city. This region is known as the dry-goods district, and extends, roughly stated, from Thomas Street, three blocks above the City Hall, to Bleecker Street, and from West Broadway to Elm Street. There are, of course, a few straggling houses outside of these limits. Into this district is received the great bulk of all the merchandise imported into the United States; here is represented about seventy-five per cent. of the enormous textile manufacturing interest of the country. Every great cotton-mill, woollen-mill, or silk-mill; almost every great linen house in the north of Ireland and in Dundee; numerous large English woollen houses and lace manufacturers; the great velvet and velveteen houses of a half-dozen foreign countries; the extensive lace houses of Switzerland and "Luft-stickerei" houses of Germany—all these have agents in that small piece of territory. Here likewise are represented all the large houses of Philadelphia, Chicago, Boston, St. Louis, Minneapolis, St. Paul, and a score of other prominent cities, by agents who have offices, and in many cases large display rooms, in the dry-goods district. Every movement in the trade is usually felt there first, and the branch house is, perhaps, in a majority of cases, of more importance, because its transactions are larger, than the house it represents. It is the great distributing point for all imported goods; it is the place to which merchants from the Atlantic to the Pacific, from Maine to Louisiana, come to buy their goods and select their samples. In short, the total amount of dry-goods business done in this district in the year is not less than $1,200,000,000. Nowhere else in the world, in so small a space, is there so much traffic done in fabrics, or in any other commodity.

Before the civil war the centre of the dry-goods business was Fulton Street, now devoted to oil, paint, drugs, and general merchandise; the upper limit of the district was opposite City Hall Park on Broadway. The dry-goods business, like all other branches of commerce, is, and has been for many years, steadily creeping up town.

THE COTTON DISTRICT.

This is the greatest textile industry in the country, for cotton is a fabric worn by rich and poor, is used for almost every conceivable clothing purpose, and takes the place largely of linen. We grow our cotton here, we spin it, and we weave it; we do not grow our flax, and we do not manufacture the flax fibre. Year by year cotton has been driving out numerous fabrics made of other materials, because greater skill has been acquired in spinning, designing, weaving, and printing. The skill in manufacture, as well as in the art of deceiving, is such that sometimes cotton fabrics are bought for linen and for silks, and cloths with only a small percentage of wool are sold as all-woollens. This is true, of course, to the greatest extent of dress goods. Cotton goods are oftenest sold as linens, and it requires the borax and other tests to determine the one from the other. Of late, however, the purchasers of what are called linen goods adopt all the means that the science of chemistry can supply to determine whether articles sold as linen are genuine. The method is this: a piece of cloth is immersed in a strong solution of borax, the liquid being hot. If the fabric is composed of cotton, it retains its color, if it is linen, it becomes a straw-colored yellow, if it is part linen and part cotton, it is checkered in yellow and white.

The cotton district may be said to extend from Duane Street to White Street, and from Broadway to West Broadway. Within this space is represented the bulk of the cotton manufacture of the country. The stranger going into a commission house here, where so many millions of business are done in the year, might easily believe that transactions there were very small. There are no shelves on the sides for holding goods as you find in a retail store; there is often nothing more than counters, or, more properly speaking, show tables, upon which are displayed samples of the goods made by the mills which the commission house represents. Sometimes persons from the country who want to do some shopping while in town get into the dry-goods district, and reading the signs, go in to make some purchases. A man and woman from the country went a few days ago into the largest commission building in Worth Street to make some small purchases. After looking around for a few moments, and seeing only four or five salesmen and hardly any goods, the man turned to his wife and said: "This place is no good, Jane. Come to the Bowery, where they got some goods." Then, taking a survey of the establishment, he added: "I don't wonder they have so many large failures in New York. Look at all these big premises, and no business a-doin'."

Cotton manufacture, as has been stated, is increasing enormously, and year by year a higher standard of excellence is being reached. Every cotton fabric made by a mill of any note in the country has an agent in the district. The great Pepperell Mills, the Laconia, making brown and bleached sheetings, satines, and corset jeans, and the Pepperell Dragon and "Chop"—the two latter fabrics being manufactured for export to China—have all commission houses here. And the bulk of the manufacture of the great Amoskeag Mills is disposed of by one commission house. The cloths made by this huge corporation are brown sheetings, drills, bags, cotton dress goods, and other stuffs. No other mills in the world come near them in capacity for the production of such goods. They have no less than 250,000 spindles and over 7000 looms. Then comes the Goddard Corporation, with its 340,000 spindles, making all manner of bleached cottons, from 64 square to 250 threads to the square inch. The number of looms corresponds to the spindles.

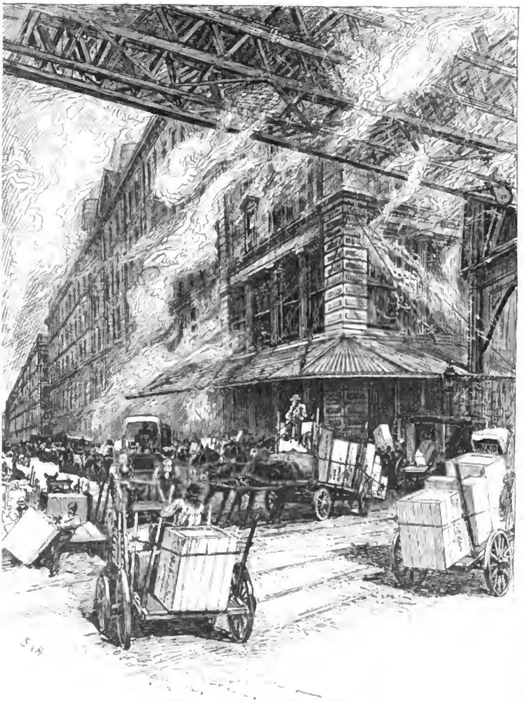
Nearly all the great and little cotton-mills sell their goods through agents, but the wealth that belongs to this enormous industry is not to be found among the mills as a general rule, but in the little patch of ground known as the cotton district in New York city. There are two noted exceptions, however. The Wamsutta corporation sells its own goods, as do also the Knights, of Providence, who are the largest manufacturers of plain cottons in the world, running several mills of 300,000 spindles. Of course their great basis of operations is in the dry-goods district of this city.

Of late there has been a tremendous activity and no little foreboding among dealers in cotton goods, owing to the fact that a large amount of capital has recently been invested in cotton manufactures in the South. The great bulk of the new Southern corporations, of course, have established agencies in New York. Just imagine what the increased capacity for cotton production next year will be over that of this year with over sixty new corporations for the manufacture of cotton goods organized in the South in the past eight months! A very wealthy and prominent cotton man, who has, besides several New England cotton-goods accounts, two from the South, said to the writers:

"There is going to be a heavy smash in our business right here, just as sure as the heavens are above us. It doesn't pay us now to make cottons as it did. The thing is overdone. Look at all these stately buildings," pointing across the street; "they did make money once; now they are little better than genteel pawn-shops. These houses round about us are carrying the mills they represent. Why, bless you, there are a hundred and more of cotton-mills in the New England States the owners of which haven't money enough to buy the dyes for the orders they receive. The commission men have to furnish the money for the raw material and for the labor, and then trust to luck and Providence that our commissions will recoup us. This Southern movement, I repeat, is alarming."

Such views are regarded by other merchants as pessimistic.

The cotton goods exhibited in the spacious and splendid floors of the commission houses embrace almost every description of cotton fabric known to the most persistent shopper. Looking through the almost infinite variety of articles, however, one reaches everywhere the limit to domestic skill in some respects. For example, no domestic mill represented in this great district can turn out a piece of Nottingham lace to compare with the imported. Our lace curtains are fifty years behind the times. Then, owing to temperature, we cannot spin cotton as fine as they can in England, in Switzerland, and other parts of Europe. This is why one can go into certain importing houses on Greene, Franklin, and White streets and find massed together mill-



A STREET CORNER IN THE DRY-GOODS DISTRICT.

"I'll see that it is returned," Thompson volunteered, quite eagerly.

"All right; much obliged." And Warner, having swallowed the remainder of his coffee, rushed away, leaving his friend, who never hurried his breakfast, to finish that repast in peace.

"Yes, I'll return it," mused Thompson. "But," he concluded, a bright thought suddenly striking him, "not to Marlowe—no, not to Marlowe."

And so it came about that soon after breakfast he might have been seen directing a small, neat bundle, with which he entered the post office a little later, wearing the same mischievous smile which usually illuminated his comely face.

Forrester Wells returned the next afternoon in high spirits, having left his sister on the fair road to recovery. His time at home had been so fully occupied that no ghost of the silver spoon had troubled him until it recurred to his mind as he opened the door of his own room once more. He put down his bag, and looked about. "George has been arranging things here," he commented, mentally; then he reached up to the swinging shelf for the spoon. It was gone. In vain he looked everywhere about the room; it was not to be found.

While he was still occupied in this way Marlowe appeared, and he called out, gayly, "Hello, George, here I am again!"

"So I see," remarked his friend, without his usual enthusiasm. "How is your sister?"

"Oh, much better. By-the-way, did you see a silver spoon around here after I left?"

Marlowe eyed him sternly before responding. "Yes, I think I did see one here. Where did it come from?"

Wells resisted his first inclination to explain the full particulars, and replied, carelessly, "Oh, I picked it up somewhere. It is a very convenient thing to have about, you know. It was a pretty one, with a fancy handle."

"Not the kind that you pick up in the street, eh?" put in George, scornfully.

"I hope that no one has walked off with it," continued Wells, without noticing the other's tones. "It was an old-fashioned one, and I couldn't get another like it, you know."

"Not where you got that one," broke out Marlowe, with such vehemence that his friend suddenly turned and faced him in astonishment.

"What do you mean?" he demanded.

"Just what I say," returned the other, excitedly. "I never believed you capable of such a thing. I thought that you were a very different sort of fellow. Oh, Forrester, how could you? Is it a joke to carry off silver from a house where you are being entertained for the first time? That would be disgraceful enough; but if, still worse, you are merely pursuing a craze for trophies to be satisfied at any cost, please remember that when I present you to my friends, I hold myself responsible for your ungentlemanly conduct."

During this outburst Forrester's face was an interesting study of rapidly changing expression. First of complete astonishment and surprise, followed by incredulity, and then grieved amazement, as his friend's suspicions dawned upon him, and ending in a flash of haughty anger at the close.

As Marlowe paused, he strode to the door and threw it open. "You have said enough to convince me of your friendship," he exclaimed. "Now, be kind enough to go."

Beneath his clear, penetrating glance, Marlowe's suspicions melted away, leaving him most [illegible] for his hasty words, and only [illegible] for the injustice which they [illegible]

"Indeed, I shall not go until everything is explained. Forgive me, Forrester, for doubting you. I know that you are and always have been the soul of honor. When you hear my side of the story, you will see that there is some excuse for me."

Forrester's anger gradually subsided under this earnest appeal. "First," he said, "you must hear my terrible confession of guilt." And he briefly recounted his experience, and his vain attempt to return the spoon that night. "And, of course, you know that I was telegraphed for the next morning," he concluded.

George, who was by this time contrition itself, then told his story. How he borrowed the spoon; all about the dinner party; when he had seen the spoons just like it; and last, and worst, how the spoon could not be found. Forrester whistled thoughtfully.

"I am responsible for it," Marlowe insisted. "I borrowed it, and I shall go and explain to the Marylands all about it, and see if I can't have another one made like it."

"Nonsense!" replied his friend; "you shall do nothing of the kind, and I believe we shall find the spoon yet. Suppose we go into your room, and have one more thorough search?"

With this the two friends went manfully to work. Forrester carefully turned over, scrutinized, lifted up, and shook everything; while George kicked things over, emptied out drawers, and never paused in his mad career until the room looked as if it had been suddenly struck by a cyclone. Every now and then one of them remarked, "Oh! here is that match-safe you lost so long ago"; or, "I've just found that pearl scarf pin of mine."

George finished up by emptying the contents of all his bureau drawers upon the bed, where collars and handkerchiefs, neckties, cigarettes, and stockings, tennis caps and scarf pins all mingled in glorious confusion.

"What did you do that for?" remonstrated Forrester. "I had just looked carefully through all those drawers, and now you've mixed things up finely."

"Oh, that's all right!" exclaimed George, cheerfully. "I just like to make sure, you know. It is the strangest thing where that spoon went to," he added, inspecting the coal-hod. "I declare, I've looked in every place I can think of, and found everything else that I ever lost, and I'm afraid we shall have to give it up."

It was with a step less elastic than usual that Forrester Wells mounted the Marylands' steps late that afternoon, while George Marlowe, by his side, assumed an air of extreme gayety, which nevertheless failed to disguise the fact that he was just a little nervous and uncomfortable; the whole affair seemed so ridiculous and unnecessary, and so strongly recalled his very juvenile days when his father made him ring the gentleman's door-bell, and tell him that he had broken his window, but would be most happy to pay for it.

Miss Maryland was at home and welcomed them most cordially. They talked on all imaginable subjects, from music to foot-ball, none of which seemed to lead toward the subject which both young men were so anxious to introduce, not too abruptly, but in an easy and off-hand way.

Wells was cudgelling his brains for just the right sort of introduction, though it seemed to Marlowe that he had forgotten all about the spoon, and was going to talk on forever about some canoeing trip that he took the previous summer. Marlowe himself grew so abstracted as to actually jump when Miss Maryland unexpectedly addressed a remark to him. Why under the sun doesn't Wells begin about that spoon? he was mentally ejaculating, when his attention was arrested by a portion of Miss Maryland's conversation.

"It was really very singular, and quite like something you read of in stories," she was saying. "You may remember, Mr. Marlowe, that we told you about a missing teaspoon that disappeared the night of the cotillon?"

"Why, yes," murmured Marlowe, faintly.

"Well," she continued, "do you know, it came back to us through the mail this very morning? It is the most mysterious thing I ever heard of, and we have racked our brains in vain for a solution of the problem. Now, Mr. Wells, I am anxious to hear your theory on the subject?"

Wells, who had hitherto been unusually quiet, found his animation suddenly returning. "How very interesting!" he exclaimed; "and how much more delightful not to solve the mystery! Mysteries are apt to prove so very prosaic when some one steps in and explains them, spoiling the story and taking away the romance. Come, Marlowe, we must be going. If we stay any longer, Miss Maryland will never want to see us again."

When the door closed behind them, Wells restrained his wild desire to execute an Indian war-dance on the sidewalk, while Marlowe could not find words to express his satisfaction and delight at the turn affairs had taken. "I'll wager that Thompson will tell me something about that spoon when I see him," he broke forth.

"Since I know that it's returned, I don't care a rap how it got there," gayly responded Wells. "There was something really providential in our beating about the bush all that time before we introduced the weighty subject. George, old man, I tell you it pays to own up like a gentleman. Be good, and you'll be happy, even if your friends don't have a first-rate time in consequence."

"Forrester," exclaimed his friend, putting his hand impressively on his arm, "you not only possess most unlimited cheek, as I've told you before, but you have more confounded luck than any fellow I ever saw."

Caroline Ticknor.

THE RENAISSANCE OF AN OLD CITY.

If the plan for a great South-American railway system, having its northern terminus at Cartagena and its southern one at Buenos Ayres, ever, in the fulness of things to come, grows to a reality, it will revive the life of one of the most interesting and romantic cities on the continent. Charles V. one night looked westward at sunset from his palace windows.

"What seeks your Majesty to see?" asked a courtier of an inquiring turn of mind.

"Those walls of Cartagena," replied the great king. "They have cost so much money that I am sure they are of gold, and will reflect the setting sun."

Those same walls for whose glitter Charles watched across the Spanish hills still encircle the ancient city, and against them for over three centuries has beaten again and again the waves of battle. Cartagena was the metropolis of South America, and here were the great storehouses where were collected those stores of precious metals which made it possible for the returned adventurer from the western world to enter Madrid with trains of mules shod with silver, and bearing panniers laden with gold.

The treasure-houses are empty and deserted now; the glory of Cartagena has departed, and its former population of 25,000 has dwindled to a population of 9000. In its narrow streets lean and hungry dogs and despondent-looking burros dispute the right of way with the languid citizens, who occupy the great, mouldering stone houses, whose paved floors once resounded to the tread of Spanish cavaliers and hidalgos. Outside the great walls of the city stretches away to the south the great bay, with a series of islands dividing it from the ocean. Here fleets of galleons used to lie at anchor, and if the railway project is carried through, here will be abundant anchorage room for merchant navies. Nature provided two entrances to this bay—the Boca Grande and the Boca Chica. Now only the latter entrance exists, for in the days of the buccaneers their ill-omened vessels so frequently came swooping through the Boca Grande to pillage and destroy that it was rendered unnavigable by the sinking of obstructions across the entrance. At the narrow entrance of the Boca Chica a great fort of masonry frowns on either side. Defying storm and battle and time and change, these two great forts, with their walls in some places sixty feet thick, stand to-day the finest specimens of sea-coast forts of their type and day in the world. But before the Boca Grande was closed up, how the buccaneers did pour themselves upon the golden city, and how often the flaunting of the "jolly roger" in the offing called the garrison to arms! Sometimes the rovers took the city too; and in all the annals of piracy there is no more thrilling story than that of the day when they descended in force upon the place, and accomplished that sacking of Cartagena, the story of which gleams lurid from buccaneering annals.

In the cathedral of Cartagena is a beautiful white marble pulpit of Carrara marble. It was sent by the pope as a present to a church in Mexico, but the ship on which it was sent was captured by the buccaneers, and the pulpit found a lodging-place in the hold of the piratical vessel. The pirates then set sail for Cartagena, and obtaining considerable booty, and having no especial use for a pulpit, they left it behind when they sailed away.

After days of the pirates came Sir Francis Drake and old Dundonald, and then independence for Columbia, and revolutions and wars to shake the city. At one time Cartagena formed herself into a short-lived nation all by herself, and it was under a commission from this government that the celebrated Lafitte, indignantly repudiating the term of pirate, always claimed to be sailing.

The last time that the walls of Cartagena were called upon to withstand the waves of war was in 1885. The greatest, and it is hoped the last of those revolutions which have so retarded the progress of the United States of Colombia, was in progress. The city had been besieged for months, and the inhabitants were starving. Cats and dogs and handfuls of rice were their only means of sustaining life. Still they held out, with a revival of that fortitude which had characterized their ancestors in the old day.

The success of the rebellion depended on the capture of Cartagena. At midnight on May 7th, General Gitan, who commanded the rebel forces, led two thousand men in an assault on the walls, while from his fleet drawn up before the town and from the fortified hill of San Phillipe and the neighboring mountain of La Popa a storm of shot and shell was poured into the city. The attack failed, and the attacking party, being caught by an enfilading fire, lost eight hundred men in a fifteen minutes' attempt to carry the southwest bastion. The story of Cartagena might be expanded to volumes. Every street has its history, every house its legend. "The old order changeth, giving place to new," and it is within the limits of possibility that the treasure city of Charles and Philip may become a great commercial centre.

THE SONG OF THE WORLD.

At the foot of the Caucasus tipped with snows,
Through the Cossacks' valley the Terek flows,
And the Cossack on guard at the water's edge,
As he watches each shadow of bush and sedge,
Sings to himself a sweet love song,
"*Douchinka, doutchinka,*
The night is long.
But my eye is bright, and my rifle light,
And I wait for the day that follows night."

Where the rippling Po through the valley wends,
And the earth with the sea in harmony blends;
Where life is in living, and love never old,
The shepherd keeps watch o'er the straggling fold,
And sings, with the touch of a sigh,
"*Anima mia,*
Bright is thine eye.
I long for the time when the church bells' chime
Shall echo for thee like thy lover's rhyme."

The wild billows break o'er the rock-sheltered coast,
The spray in the moonlight is faint as a ghost,
And the Brittany fisher before his shrine bows
In prayer for his love, and a candle he vows,
And whispers in solemn refrain
"*Bien aimée*
I come again."
The gulls sweeping by hear the lover's cry
And the winds call back the words with a sigh.

Through the Roman valley, by Caucasus snows,
By the Icelandic shores the melody flows;
It is ever the same that the lover sings,
He is lost to the world and to mundane things.
While wonderful visions are wrought,
"O Soul of mine,
Thou art my thought!"
The days come and go, Time's sands slowly flow,
But the Love that is planted forever will grow.

Flavel Scott Mines.

THE STORY OF A PRODUCTION.

BY RICHARD MANSFIELD.

Fagged out by a season of hard work, I had gone to Bournemouth to regain my strength and health, and to find vigor to commence a new attack upon the bulwarks of popular favor. I took with me the half-formulated plans and ideas of a regenerated *Richard III.*, and a production of the play which should be thoroughly sound without being ostentatious.

I found Bournemouth a much over-rated sanitarium. Pine-trees had been the principal inducement—and pine-trees there were, but few and far between; nor had they any of the fine resinous and pungent perfume which invigorates the vocal chords and soothes and heals the mind. The weather was damp and foggy, the people stiff and stupid. Occasionally somebody would intone the first notes of a song, but the voice died away in a gurgle, and all that remained was a distant echo and the creak of chairs as people turned with an air of gentle reproach. I once, and only once, raised my voice in conversation, and then fled with precipitancy to my room, and bolted the door. My chief and only pleasure was found in the companionship of an old Welsh mare; barring a corn on the off forefoot, a sound and noble specimen of the good old English cob.

Rain or shine I mounted this tawny-colored steed, and trotted toward Christchurch. After all, there is no road like an English road, and no lane like an English lane; and if at the end of it there be a ruined abbey, a quaint old hostelry, and the downs stretching along the sea line as far as a keen eye can reach, there may be hope for enjoyment.

I never ask my way, or inquire regarding sights—sight-seeing in itself is my abomination—so I came upon Christchurch one fine morning in a hap-hazard sort of manner, and rode into the old cobblestone street, and passed the ivy-grown abbey without a suspicion as to where I might be. It was fine—that was all. I liked it, it was a place for the painter. I saw an inn, and, as is usual, by its side a stable, and I was back again with Mr. Pickwick and Sam Weller in a moment. My crop was on my hip as I rode through the gate and gave the call for the 'ostler; and when he came limping out, he was the same old 'ostler, lame from a kick, with the same red hair and the same knowing eye, and the same touch of his forelock, and with the same old, very old striped waistcoat. If anybody else had come forward, looking in anyway different, I should have awoke and fallen off my cob; it wasn't in the nature of things to expect anybody else, and nobody else came. We had never met; but the man knew me, and I knew him. "Oats!" I said, and he touched his greasy cricket cap, threw the reins over his arm, and as I moved up the steps to the side entrance of the house, the broad hind quarters of the mare disappeared behind the stable door—not, however, without one hind hoof slipping a little on a stone.

I knew where the coffee-room was, and knew I'd find a good fire. I knew that if I pulled a rope by the mantel-shelf I should hear the sound of a bell clanging through the house. I knew that a more or less good-looking girl would answer the summons. Here my first doubt set in—she might be good-looking, and she might not. I did not desire to have my senses in any way shocked by the sight of an ill-looking person. I was in too soothed and comfortable a frame of mind. She came, I knew it, although I was hanging over the fire with one spurred boot on the fender. I waited a while in order to nerve myself for the shock, then I turned. I was very grateful; she was well-favored. We, too, had encountered one another before. It required no introduction. I had chucked her under the chin in every part of England, and she expected it just as much as she expected the shilling, and I expected her to say, "Lor', sir!" Some bread and cheese and a pint of ale—old ale. There *is* some old ale here, I know it, as mild as milk and as powerful as Hennessey.

It rained, it pattered on the window-pane, and the room became darker and the fire more cheerful. I lolled in the shiny brown chair, threw my head far back, and there was shortly a fragrance of tobacco smoke. I knew there was a very old man in the house, who had lived here for generations, and in due time he entered. He was part of it all, so was the rain, and the mare in the stable scrunching her corn, and the hostler "sished" as he rubbed down a horse by the door, and the yellow-white Scotch whiskey, too, in the short, round tumbler, with a foot to it, by the host's elbow. He droned about crops and visitors and the season and the curate (he knew I knew them all). "Salmon was coming in fine." "I'd better stay and have a slice crimped." I shook myself, went out and looked at the weather, got on to my cob and rode home thinking, but I was away back all the time in the forties and—how perfectly contented! I rode out that way every day, and never sought for anything different; it satisfied me, sometimes with a wild gallop on the downs and a jump or two over a low hedge.

I had mapped out everything before I left London for Bournemouth. Back in the old days, when I led a from-hand-to-mouth existence much more delightful than anything I have since experienced, my occupations, of which I had a few, threw me into the society of painters. I am bound to confess it was no fault of their doing; I was simply *thrown* amongst them, and they gently refrained from throwing me back again, Heaven knows where to, and I have entertained a kindly feeling and a sort of hankering after them and their likes ever since. They have remembered me, too, kindly, through no fault of mine, but simply out of their gentleness. When I voyaged to London recently to play, with all that assurance which is bred of ignorance, in a large theatre there, the painter of the "Derby Day," whom all men know is Frith, wrote to inquire if I by chance be the same man who painted pictures awhile back in London? I made answer that I presumed he meant myself, and was much flattered that I should be remembered by him. Whereupon he came to see me, and said he was glad I had relinquished the profession of a painter, although I had some fine streak of merit in me at that, like Somersetshire bacon.

Probably the man I remembered best of all in studios was Seymour Lucas,* for cause that he had one day offered to pledge his only table ornament, a silver cup, to relieve my necessities; and I would have done the same by him, even to my evening boots built of fine patent-leather, with silk bows very near the toes to make the feet appear small. It was, then, to Seymour Lucas I applied for direction in the matter of a historical production of *King Richard III.;* and the man was very deep in his element at once. There should be real armor. If we could not obtain the armor from the Tower of London, at least it should so closely resemble it that no man should tell them apart. It was proposed to reproduce upon the stage, with absolute fidelity and observance of detail, the costumes of that period, and all the manners and dresses, the architecture and household furniture, as a correct accompaniment to the speech of Shakespeare. Colley Cibber was to be entirely discarded, and Shakespeare enthroned once more.

Lucas was busy making designs; Mrs. Lucas was helping him and me with all the gracious kindness in the world; orders were issued to dress-makers and boot-makers; armorers were at work, and scenic artists. These things were all moving. I had arranged a version of the play. The supers were being drilled in the art of ancient warfare by Captain Edgerton Castle. I could go to Bournemouth, study, receive communications and reports, and issue instructions. The greater part of the work had been done. The plans had been laid for the building of the ship; let it be built. I would study and rest. German† travelled down to me to talk about the music; and I hired a piano, and with locked doors we strummed and hummed and whistled and sang until that portion of the idea had taken form. In the mean while I was making up my mind more and more every day, either on the downs or in the coffee-room at Christchurch, as to what sort of man Richard o' Gloster was, and *now* no one can make me think he was otherwise than I am when I wear his coat and cap. You may not like him, but he is a "being," which is more than the ranting, raving, sulky monstrosity you have been accustomed to was.

It was with something akin to a wrench that I left the sleepy Bournemouth and returned to London. I found everything going well. All seemed easy now, for in the country each movement of king, queen, or pawn had passed in my mind. I knew where every one should go, where every one should work. I had fought the battle over a hundred times. When Catesby appears to Richard after his evil dream, I had mistaken him for another phantom, and thrown my sword away and crossed myself, and touched him and found him human, and thrown mine arms about him in an ecstasy of relief a thousand times in the parlor of Christchurch, with the mare chewing the oats and the sun glinting in through the wire blinds of the window. I go over these things always in my imagination in everything I play. I act them out and see myself doing them just as fully as if I actually moved my body and wagged my tongue. It was a *pleasure* to handle the men Captain Edgerton Castle‡ had gotten together. Soldiers all, I think, of a regiment of Grenadier Guards.

The supers, too, were excellent, obedient and attentive and silent, with no tobacco-chewing propensities, or dependent independence, or hangdog, sulky insolence and muttered asides, as we find them here sometimes. The actors, too, all willing and obliging, which much changes after a season in this country. The scenes will not be ready until the last moment, but as I have made the sketches for nearly all of them myself, they are as good as built upon the stage; I can see them well in my mind's eye, and can arrange my people accordingly. My stage manager, Norman, writes down everything as it occurs to me. He is a man well able to carry out obediently instructions, albeit he has a small fault of extravagance, and does not bargain over prices with workmen as "He" should and "*I*" cannot. Some difficulty with old and experienced actors, notably one, who is an elderly man of fine presence and great volubility, but much hesitation in learning correctly the words, and the bad fault of discussion and argument in preference to passive obedience. One ancient mariner, who has sailed the very stormy theatrical ocean for fifty years and shouted himself hoarse, at the very first rehearsal gives a capital example of the old-line player, who impressed the groundlings with noisy, inarticulate, and unmeaning sound and superabundant action, and being called upon for a simple and gentle delivery, vehemently throws his book upon the stage, and struts out to walk in the Strand and button-hole acquaintances upon the outrageous arrogance of mushroom actors. We practise the fight diligently, and I visit, with Edgerton Castle, the fencing club, and indulge in ancient modes of warfare with sword and buckler, very unlike the bodkin encounters to which we have been accustomed.

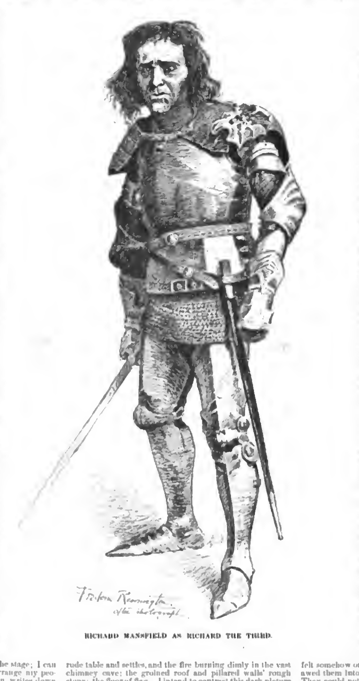
There is as much delight in producing a play as in building a great house with many rooms in it of original design and adornment. The first scene is complete, being the Tower of London. It strikes me as splendid. I trust others will be of my opinion. We call for calciums, and throw lights upon it. Shall it be seen in the broad glare of day, or by evening, or by night? Both Lucas and I decide upon early morning—that pale white light that gives atmosphere and mystery, and lifts the towers higher, throws deeper shadows into angles, and helps the eye to imagine the black waters of the moat, the grim teeth of the portcullis, the little door in the warden's tower, and walls and yards, draw-bridge and battlements—real, all real. It is a delight. I revel in it. I mean to show in the next scene the room in which Henry VI. lost his life. The bed in the recess, with the motto, "Jamais," above and below, in golden letters on the deep scarlet velvet; a little window at the back of the bed, with a feeble ray of light struggling through on to the King's book; the oratory, with a large stained-glass window and the prie-dieu and crucifix, and an ancient lamp flickering above; an all-prevailing idea of gloom and approaching horror; the rude table and settles, and the fire burning dimly in the vast chimney cave; the groined roof and pillared walls' rough stone; the floor of flag. I intend to contrast this dark picture with one of dancing life and light; the road to Chertsey, the flowers all abloom, the fields intersected by hedges white with May blossom, a bank where the silver birch bend their graceful limbs over tangled grass and fern that hint of hidden violets and primroses, and the bold brush flashing a patch of brilliant yellow here and there. This in the middle distance: the fields stretching back in the blue summer haze to the roofs and towers of old London in the background. Further forward a farm-house, with straw-thatched roof, green with lichen and ivy, as is the broken wall in the near foreground, a carpet of grass at its foot and another birch nestling up against its back, buttercups and daisies growing at its foot, and the deep rutted road winding across between farm-house on the right and cottage on the left. All shall be brilliant with an atmosphere that vibrates in the summer sunshine, and makes you long to lie back on the grass, and hark for the note of the lark out of sight up in the gray blue. I am wondering all the while whether anybody else feels all this—perceives it and likes it—or whether I only imagine the suggestion is there, when it is not.

I know very well that I often wonder people do not comprehend what I wish to convey to them without long explanations, and perhaps it's the same with my stage pictures. I generally understand what people are going to say when they *commence* speaking, and in most cases I find listening exceedingly tedious; but I always *do* listen, if I can afford the time, because I have learned how much pleasure they derive from talking. I fear I myself am wandering away a little with exuberant verbosity. The "Crosby Hall" scene and that of the throne-room are largely intrusted to Telbin and Hahn, with the advice of Seymour Lucas and Blomfield, although I am opposed to Mr. Blomfield's suggestion that the balcony (from which Gloster is seen, prayer-book in hand) should be to the left, holding strongly for a musician's gallery at the back. I gave way, however, to the superior judgment of Blomfield.

I am not as deeply interested in these interiors as I am in Richard's camp, the sanctuary of Westminster, and the scene of the battle. Especially shall the camp by night be a departure from accepted and traditional handling. I have long thought of this, and discussed it. I can only see it in one way, and thus others shall behold it. The tent on the extreme left (not occupying the entire stage), a low-lying, bleak country, broken here and there by storm-torn willow and pools fringed with reeds, visited by the drifting clouds and the uncertain moon, the brown tents in the dip of the land, and the glow of the red camp fires here and there; far beyond, the watch-fires of Richmond's army by the line of indigo hills, and over their brow the lingering remembrance of the sun that has set in a long pale yellow ribbon of light that quivers and waves with summer lightning on the horizon. All to deepen to utter blackness as Richard seeks his couch. Richard to be discovered, when the curtain rises, seated by the camp fire on the stump of a tree, lost in thought, moody, and pregnant with the ill omen of the hour as the scene and the very air. (I should have liked some ravens perched upon the bough of the willow.) Around the fire, motionless, the figures of some knights, armed cap-a-pie, and the fire-light caressing the burnished steel. The "hum of either army" and "the clink of hammer closing rivets up gives dreadful note of preparation." It seems to me, when all this is done, nothing can be more perfect, but it may not thus impress others. The great day of trial is approaching. I sleep little, and eat less. I shall be weak and tired. My voice is hoarse, and becoming more so every day, shouting directions, talking with much anxiety from morning until night.

The excitement of a first night is actual suffering; the nervousness absolute torture. Yet as I walk down the Strand on my way to the theatre that night and note the impassive, imperturbable faces of the passers-by, I must confess to myself that I would not change places with them—no, not for worlds. I have something that is filling my life brimful of interest; every nerve is dancing, every muscle quivering. It's like a battle. I shall win or die. I'm in my dressing-room at last, and at last it's the first night of tragedy. My first night of tragedy! I begin to realize it all at once. It comes upon me with the most stunning force. I do not believe I have thought of it before. I'm afraid my servant, my devoted John Metzger, will see my hand tremble as I draw the lines under my eyes. I have donned my first dress. I am ready. Lucas has been to see me. He says I look look like the pictures of Richard. That is well. There is an uproar in the house. Hark! they are shrieking and yelling. John is in a ferment of terror, and says, in his broken accent, that "they vas wrecking the house." I wonder what it is all about. Presently the news comes. First one and then another pale-faced emissary. Somebody has blundered. Men have been allowed to take places in the pit before the doors were regularly and properly opened.

Augustus Harris comes panting and very red, "You must go out and speak to them." Lucas, Castle, and Walter Pollock* stand friendly and anxious in the door. I have become calm. I have drawn up another chair, and I am resting my legs on it. "Augustus," I said to Harris, "you are very popular. Go, speak to them for me." He went, but did not speak, and the uproar became greater and greater, and still I sat quietly in my room. Somehow or other all this did not seem to concern me. It was not in any way part or parcel of my production of *King Richard III.* It was there all ready for them, I reflected, and if they did not wish to see it, well and good. I was sure that I should not raise the curtain nor my voice until they were silent and attentive. I think my stage manager harangued them to little purpose, and the curtain rose on the first scene. I do not know how it came about. I think the demons felt somehow or other that it was beautiful. *I* always say it awed them into silence. At all events, they were very still. They could not hiss their own dear old Tower of London, standing there so grim and majestic in the twilight—the bells tolling, and the guards slowly patrolling the court before the warden's gate. Elizabeth, attended by her train, had passed across the drawbridge. The moment had come. I opened the little door in the tower and stepped out. I was quite calm. A great storm of applause swept over me, and I looked at the house. The storm came rushing at me again and again, and still again. It seemed as if it would never tire, and I wished so that it would, for it was beating me down surer than cudgels and hard words could have done; and I felt the fatal lump rising in my throat, and the quiver of my underlip. (I have never been able to overcome certain traits of my childhood. I am as easily moved to laughter and tears, to anger and to sympathy, as I was then, and beyond a certain amount of added knowledge, I feel just as I did then. I run, jump, eat, sleep, and comport myself in most ways as I did when I was a boy.) The silence, the interest in the play throughout were remarkable, and the scenes which seemed to please the most were the wooing of Lady Anne, the rejection of the crown, the dismissal of Buckingham, the dream scene, and the battle; but I will not weary you. The ship had been well and safely launched. Would she float?



RICHARD MANSFIELD AS RICHARD THE THIRD.

AMHERST COLLEGE, AMHERST, MASSACHUSETTS.—From Photographs.—[See Page 410.]

"O SHY, WILD THRONG!"

The sweetest things in all this wide-sunned earth
Are shyest of beholders, and do hide
In woody hollows or in pastures wide,
Till ne'er in stilly places is there dearth
Of cinque-foil blossoms or of thrush's song.
Heed how that silver-throated bird of June,
Whose chime on chime down-falling seems attune
With its own birth mouth, babble amid the throng
Of clover blossoms, and then shields its nest
In sweet-breathed forests, dim and cool with rain.
No golden cage may know a wild bird's strain,
In fenced garden will no wood flower rest.
Hide an' ye will it so, O shy, wild throng!
A sweet-blown breath is with us, and a song.

Lucy E. Tilley.

AMHERST COLLEGE.

The approach to the town of Amherst from Northampton, from Palmer, or from the new railroad route which makes a direct connection with Boston, is through a section of country that gives no indication of the higher interests that the town has served for nearly seventy years. Central Massachusetts has the character of a rural district. The settlements are small, and one wonders how the railways by which he enters Amherst can pay a respectable dividend; but when one looks around for the college, and regards Amherst from the college point of view, the place acquires distinction and importance. So far as the town has outgrown its characteristics as a farming district, it is indebted to the college and to neighboring institutions of like nature; for within a short radius of the town there have grown up Mt. Holyoke Seminary and College, Smith College, Williston Seminary, and the State Agricultural College; so that, as an educational centre, Amherst stands perhaps unequalled, with the exception of Boston and New York. The reasons for this pre-eminence may be traced to two sources—first, the sturdy character of the people of central Massachusetts, who, by their sacrifices for the education of their children, builded better than they knew; and, second, the rare beauty of the location, "with encircling hills on the east, north, and south, and that fair stretch of landscape toward the west, with a shimmer of the Connecticut here and there, and Northampton in the middle distance, and the remote horizon giving sunsets which I have certainly never seen surpassed in splendor in any part of the world," to use recent words of the Rev. Dr. Storrs.

Amherst College began as an institution in September, 1821, and its earliest buildings, of which the college dormitories are now the chief survivors, were conspicuously plain and unattractive. In this they were not different from the barracks at Harvard and Yale. The college was founded at the time when the third great uprising of the people against class rule was well under way, and under the leadership of Jackson was about to triumph. It began as a college of the people, and to this day and throughout its career has maintained the closest relationship to them. In all the movements in which the people have participated Amherst has shared, and in a sense led. The missionary movement is one of the most striking features of the nineteenth century. With this missionary and religious movement Amherst early became identified, and won for herself the unique position in this field which she still holds, and which enables her to name such graduates as Mr. Beecher, Dr. Storrs, President Roswell, Dr. Hitchcock, Bishop Huntington, and Father Hewett. Another indication that Amherst is a college of the people may be seen in the efforts there made to prepare students for citizenship. The need of the country that its educated men should be good citizens is indescribably great, and this need grows daily. Many other studies besides history and political science bear upon preparation for citizenship, but none more directly; and the record which Amherst graduates have made as teachers of these subjects, and as writers upon them, is one which has not been equalled by any college in the country. In this connection it is only necessary to mention such men as General Francis A. Walker; Dr. John W. Burgess, of Columbia College, the founder of the first school of political science in America, seven of whose faculty have degrees from Amherst; Dr. H. B. Adams, of Johns Hopkins University; and the professors of history and political science at Smith College, Brown University, Hartford Theological Seminary, and Vanderbilt University.

The purity of Amherst, the simplicity of life, the severe and high tone of society, and the charming environment are the distinguishing features of the community; and the college is what it has grown to be quite as much from the character of its surroundings as from the direction which it has received from its successive leaders and guardians. The students bear the marks of this environment quite as distinctly as the college is witness to it in its outward appointments and social character.

For the direct purposes of education, for manly discipline, for thoroughness of work, for getting at the secrets of power, colleges like Amherst have advantages which perhaps more than offset all the limitations which belong to them. The great lack in American education is thoroughness, and whatever may be wanting in the Amherst surroundings, the college has the reputation of giving a more thorough academic education than almost any other institution of its kind in the country.

The make-up of the students here is unusually good. The fast and rich young man is the exception and not the rule. The students have no money to throw away; they have been well brought up; they bring character and a certain amount of maturity to their work, and their four years at Amherst are a ripening and advancing of principles which have been already laid down in their lives. They represent the best material that a college can have to work with. There is plenty of brain as well as brawn; but, above all, there are character, manhood, self reliance, the power to put forth one's whole strength; and one who watches the transformation from the Freshman to the Senior at Amherst will see that the material which is placed in the hands of the college professors is worked over to the immense advantage of each individual during the four years' course of study. Finer specimens of manly bearing, mental strength, and all the elements that go to form a right character are seldom seen than in the Senior classes at Amherst.

Much has been said of the method of discipline inaugurated by President Seelye some few years since, by which the students have been admitted to a share in the government of the institution. Dr. Seelye brought to his task at Amherst a wonderful insight into the character of young men. He has been able to take the students into his confidence in the management of the institution. Each class has its chosen representatives, who confer with the President, under regulations which have been mutually consented to, for the direction of all that pertains to the discipline of the institution. The entire undergraduate life comes within their supervision, and the President reserves no right to himself except that of final veto. The method of government, at first received with doubtful favor, is winning the respect and confidence of all the students, until it has become a lively instrument for the direction and control of college life. It has been at once the guidance of a moral instinct and the recognition of a regulative principle; it has brought out the manhood of the students; it has given them some sense of the wholeness of conduct; it has done something to break in upon the close environment of the Amherst township; and its success is evidenced by its adoption in other institutions.

The gymnasium at Amherst is as important in its relation to the physical health of the students as the college discipline is in the direction of their mental life. Dr. Hitchcock, the son of President Hitchcock, of geological fame, has had charge of this department since its establishment. Athletic exercises are a part of the college work, and proficiency in these is as indispensable as is anything set down in the college course. The student is examined on his entrance into college in his Freshman year; a record is kept of his physical condition; he is frequently tested by the college physician; physical defects are overcome; and he is treated from the beginning to the end of his academic course as if he were a moderate athlete. He breathes a moral and physical atmosphere that is quite in keeping with the blue ether that is shut in by the surrounding hills. The Amherst student, almost without exception, improves in manly vigor from year to year. The gymnasium has been recognized for at least twenty-five years as an indispensable part of college life, and to Dr. Hitchcock should be awarded the praise of having given his life to the initiation of a method of physical training which is now considered a necessity in every similar institution in the country.

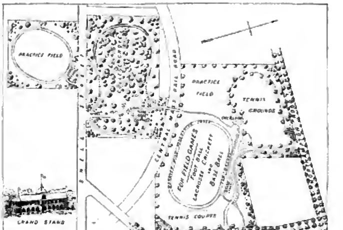
Amherst has worked out another problem in American education; it has made use of the Greek letter societies as a basis for the establishment of students' homes. A considerable majority of the students join one or the other of several Greek letter societies, each of which has its club-house, where a large part of its members have their rooms, and where the student has nearly all the comforts of his own home. Members of different classes here associate on equal terms, and men find the way to each other's hearts and souls under this form of social life as they could in no other way. The intellectual and social life thus stimulated is of the greatest value, and when joined to the manly spirit developed by the college senate, it gives Amherst a rare advantage in the cultivation of the best life of its members. These society houses occupy the best building positions in Amherst; they are houses of fine architecture; here the students have parlors where receptions may be given to the students from Mt. Holyoke or Smith College, and the social interchange thus brought about between Amherst and these neighboring institutions is one of the pleasantest incidents connected with the life of an Amherst student. It is reported that one of these Greek letter societies has established a college fellowship open to general competition.

The secret society, the college senate, the college pastor, President Seelye and his associates, work together to bring about conditions at Amherst which are almost unrivalled at any American institution. The chief attributes of Amherst collegiate life are its wholesomeness, its robustness, its sincerity, its manliness, its honesty of conviction, and the manifest desire of the faculty to awaken individual investigation—a desire which is fostered by a library of over 50,000 volumes, carefully selected, so as to supplement the work of the class-rooms. Nor should the influence of the art gallery, with its exceptionally choice and complete collection of casts and photographs, be overlooked.

The man best known in connection with Amherst is President Seelye. His distinguishing mental quality is to see things as a whole. The world to him has unity, and his administration at Amherst has been marked by a comprehensive, liberal, earnest, and upbuilding policy. His purpose in life is to make men, and it can almost be said of him, as was said of President Hopkins during his long administration at Williams College, that he has made the institution in later days what it is. The Nestor of the Amherst professors, Dr. Tyler, vigorous in mind and in body, kindly in spirit, and carrying much of the beauty and flower of youth into old age, is certainly among its alumni the most distinctly marked and influential man. He has most of the Amherst traditions. He commands the reverence of all who have ever been connected with Amherst College. Delightful in reminiscence, accurate in scholarship, as interesting, as strongly individual as any one who can be named in the whole circle of American college professors, his life, if written by a Boswell, would be as charming in its way as the great Englishman made that of Dr. Johnson. Of its other professors and instructors nearly all are comparatively young men, many of them its own graduates, who are each and all making their mark in the intellectual brotherhood of the country. It is said that Amherst men make the best teachers in America. If this be so, it is explained in no small measure by the interest and animation which the professors throw into their lectures and class-room instruction. Enthusiasm of study prevails here. It is a part of the new life of the institution. Amherst does not profess to be a university. It simply aims to prepare young men, by a severe and thorough course of training, to enter upon professional life, or to undertake with earnestness and intelligence their life work.

The college grounds at Amherst are upon a slight eminence just out of the village, and command a fine view of the surrounding country. To the north are the lessening peaks of the Green Mountains, between which the Connecticut sweeps down into the valley. Across this valley westward lies Northampton, where Smith College is located. To the southwest are Mt. Tom and Mt. Holyoke, between which the Connecticut cuts its way southward, and there is still another range of hills extending eastward that shuts in the view. The morning sunrise seen from the college grounds reveals daily a new world, and the evening sunset bids it farewell with royal glory every nightfall. The location is one of great beauty and healthfulness. It is charming in summer, and furnishes facilities for botanical and geological excursions which Amherst students are not slow to utilize. The buildings themselves are not all up to the modern standard. One of the best sites is still occupied by the college dormitories, which unfortunately are not so comfortable or convenient as to be very popular places of abode for the students; the astronomical observatory does not equal the reputation of its professor; but the college library building, which is fire-proof, is of pleasing and effective architecture; Walker Hall could hardly be improved in its facilities for recitation and lecture rooms; the new college church is ecclesiastically a fine structure; the Pratt Gymnasium is thoroughly appointed in every respect, and quite adequate to the needs of the institution; and the Woods Cabinet, where the great and unrivalled geological collections of the college are properly arranged, is not only fire-proof, but a structure of solid character. Interspersed throughout the village are the professors' homes and the students' club-houses, which are the most notable buildings outside the college grounds in the town.

The students are thrown very largely upon themselves for their more joyous and exhilarating life, and here the club-houses, the gymnasium, and the athletic field, together with the excursion element, which is prominent in Amherst life, come into use, and serve a good purpose. The Amherst students are as gay and happy a company of young men as can be found anywhere, and if the ruder element has never prevailed here, or has been transformed into the behavior that belongs to gentlemen, it will scarcely be considered derogatory to the institution. Taken all together, Amherst is an institution where one may miss certain things at the outset, or even through the whole college course, but where he will be sure to receive advantages which quite compensate for what he misses. It is impossible for an institution thus located to cover the whole ground of American education, but in the way of solid attainments, thorough work, and self-mastery, Amherst can hold its head high among the colleges of the country. It needs larger equipments and more professors, but these are sure to come where honesty and fidelity in every branch of instruction is the characteristic of college work.



AMHERST'S ATHLETIC GROUNDS.

The new athletic grounds for Amherst contain about thirteen acres, and were the generous gift of Mr. Fred B. Pratt, of Brooklyn, an alumnus of the college, and now supervising, as superintendent, the diversified activities of Pratt Institute. This new area will be added to other property of the college, which includes the old ball field of modest proportions, to be reserved as a practice field, and the college grove of stately pines, familiarly known as the Blake Woods, the three areas to be connected by a sightly iron bridge over the intervening cut of the Massachusetts Central Railroad. When completed, these will comprise one of the largest and most efficiently equipped athletic and recreation grounds of any college in this country.

That Amherst should thus continue to lead in this good work is in entire harmony with the record, since it was one of her professors—the genial Dr. Hitchcock—who established physical culture as a part of the work of the student, formulated, no doubt, by the far-sighted doctor on that model theory of exercise of the Romans, which Gibbon tells us comprehended whatever could add health and strength to the body, activity to the limbs, and grace to the motions.

The work of improving these grounds is now in progress, in accordance with the designs and under the direction of Colonel John Y. Culyer, landscape architect of New York, and contemplates the entire regrading of the new area, the construction of a commodious quarter-mile running track on the most approved lines, a short run for dashes and hurdle races, and a fine in-field of capacious proportions for all purposes of base-ball, lacrosse, and foot-ball. Adjoining areas will be laid out for tennis-courts, of which there will be twelve to fifteen in number, and a cricket field, with space to spare possibly for tennis and archery grounds for fair Amherst, such at least as may secure the password. A substantial grand stand is to be erected, to seat five hundred persons, and provisions will be made for dressing and bathing rooms, etc.

The grounds are being thoroughly underdrained and sewered, and an ample water supply is provided for. The grounds are within a few minutes' walk of the college and society buildings, and are situated on the beautiful Northampton road, with which they are connected by drives and walks, and from interior "coigns of vantage" may be viewed the picturesque Northampton valley, whose long vista over green fields and wooded knolls dies away in the summer mist.

A particular feature of the design comprehends appropriate landscape treatment, a drive, and walks and ornamental plantations calculated to make the grounds attractive in themselves at all seasons of the year. In the adjoining grove shady walks and a summer cottage are to be provided, which will furnish the means for recreation to many students remaining at college during the vacation.

OLD SCHOOL-BOOKS.

NOT precisely a waste heap, nor refuse, but rather a scrap pile of books, and these books by the hundreds, the thousands, by the ton. Just as from the scrap pile you may extract the old nail, the twisted horseshoe, the rusted bit of steel, which may still serve a purpose, so from this litter of books you can withdraw useful material. This is a dump of school-books—a jumble of primers, spelling-books, readers, geographies, arithmetics—and for purposes of business some one has brought them all together in a dark, dingy room; and you may buy them for so much a hundred, either as pedagogic matter or as stock for the paper-mills.

Undeceive yourself if you hope to find in this mound a Comenius, an Orbis Pictus, the first of all sensible school-books. There are no discoveries of a horn-book character possible. You will see no geography with that fine old wood-cut of the noble ship going, prow down, into the seething vortex of the maelstrom. There is no book here over thirty years old. Some may bear a date prior to 1860, but they are reprints of old editions, and were fresh from the press but a few years ago. Conservative school boards of the "good-enough kind" have insisted on having exactly the same text-books as they used when they wore pinafores; and so the old forms have been repeated over and over again, the respected heads of educational departments in the United States caring more for the form or body of the book than for the soul or spirit.

I have nothing to do with the respective claims of any particular school-books as the only short cuts to instruction. Some one has taken the trouble to present what about were the school-books Shakespeare studied, just as a great American collector once brought together with infinite pains the exact volumes Christopher Columbus carried in the cabin of his ship, the *Santa Maria*, when he made the discovery. I would not slight the matter, only this in regard to the most approved of modern school-books, looking at them in a purely utilitarian sense: If I can teach a boy or a girl to spell and read in six months with good books, sharpening young wits with proper tools, why not adopt such at once, and throw away the blunted chisels, which have to be driven by main strength so as to remove the rough bark? Think of the time, the patience, and the money, the whimperings saved! I occupy myself only with the physical conditions of this puddle of books. What is the life of a school-book? About two years. Three and a fraction of a girls' class, it is said, may use the same book, and then it is badly gone. One book per boy for a year would be a fair average.

Picking up a book at random, at once a clean and well-kept look determines who used the book. You need not turn to the first page, that bears the name of "Cora" or "Etta" or "Mary" inscribed on it. Its character at once tells the story as to whether a boy or girl owned the book. If you flutter the leaves of the girl's book, it is likely that a pressed flower or a fern leaf will fall from it; and here is an atlas that has a nice bit of crazy quilt in it. The colors of the silk lozenges are faded, but the stitching is very neat and nice. Here is a fragment of some cotton lace, perhaps the trimming of a collar. It came loose, and was put in the atlas and forgotten. Here is another geography, and in it is a description of France, the Bay of Biscay being frequently referred to. Many are the small Bible cards given at Sunday schools forgotten in these old books.

The destructive instinct is wanting in girls, for their books are rarely torn. Sometimes they are decorated, but never overmuch. Now and then decalcomanie appears, and there are some birds flying in the books, and a flower or two blooming there. There is some little mania shown for cutting out pictures, indicative of early practice with scissors. In one girl's reader (she may have done very wrong in defacing her book: that is, the teacher would have so considered it) she has colored the prints in the book, and put on the paint in a very neat manner, and she has given life to what were very poor and inanimate engravings. Now and then there are faint tracings of sums, the numerals drawn evidently by a girl. They must have been set down by a girl, for the additions are generally wrong. Some of these books are covered with calico, and you see the queerest old fashioned patterns. Leaves of books are quite clean, and no grease marks cloud the pages. This must have been a sentimentalist, for she wrote

The grass is green
The rose is red
Remember me
When I am dead

And all that without a sign of punctuation! There might have been cause for this—an explosion of temper—for some one unknown writes, in a school-girl hand, "Elsie is a bad girl, and ef she doan behave, she will be gittin smakes." Evidently smacks was in the mind's eye of the vengeful one. Here is a pretty little invitation. Evidently it was passed surreptitiously to another girl under the lid of the desk: "Jule, come to the spring during recess. I will show you a new croshay (*sic*) stitch. Got some lovely candy. Billy came home yesterday." As this writing is in a book of natural history, it perhaps presupposes young ladyhood. One young person must have had some difficulties of a geographical and historical kind, for she writes, "The West Indes was disclvired in 1793"; but as to her uncertainty in regard to the spelling of Popocatepetl, that must be forgiven her, for she writes it "Cocopatakittle" and "Papo-koatapettels." Probably she got a headache over it, for, having finally written "Popocat," which was in the right direction, she stops short, and apparently gives it up. There is one little bit of sentence which was puzzling until its elucidation was had from a lady Champollion. The sentence read: "They just ain't. You can see the ——" Here followed a rough hieroglyphic drawing looking like a comb. "Oh, that's plain enough," said the lady of whom information was asked. "It don't require much ingenuity to solve it. The teacher had curls or a frizz which were not her own, and this little girl declared they were false, and told the secret of the store hair to the other girls. The comb makes it clear. At school we girls always picked our teacher to pieces. She couldn't stick in a pin anywhere that we didn't see it. She wore three rings. We found out the history of two of them, but the source of the third is yet undiscovered; and even to this day I try to find out the secret of that poor amethyst ring which I noticed twenty-five years ago on one finger of that sad school-marm's well-shaped hand."

Boys' books! They are dilapidated, maimed, unhinged, crippled, rickety, crazy, shattered things generally, in the last stages of dissolution. But only think what accidents they have gone through! That book had to travel five or six miles every day. It may have been dissolved by the thunder-storm, or may have been dropped in the snow-bank, and so became as a book "gone to the dogs." When the owner went in to swim, he hung the satchel with his books to the bough of a sapling overlooking the creek, and the swaying wind tumbled satchel, books, and all into the water. He may have gone into a fight, with the books under his arm, and in the suddenness of the attack dropped them in the mud puddle at his feet, or taking his books, secured by a strap, belabored the other fellow with them. Many of these books show distinctly strangulation from the strap. How can a boy, unless through long experience, acquire an exact acquaintance with the resistance of paper? Or was there ever a leather strap made that had a hole punched in it to the exact requisite fraction of an inch? Suppose a boy lost a book because he had not properly secured it, what then? Why is it that molasses candy is sticky, or a sausage or a cake greasy? Why do not school boards provide boys with finger-bowls or napkins? What is a fellow to do with his fingers, anyway?

The destructive qualities of the boy are a godsend for the school book publishers. The little male animal quickly thumbs or claws the book out of existence. He defies wire stitching. Sometimes the little strands of wire, now taking the place of flax thread, call on him for the closest investigation, and so with his jack-knife he works into the binding of the book.

Some of the lad's ways are highly amusing. Here is one of his dodges to catch the unwary: On the first page is written, "If you wish my name to see, turn to page 53; if it there you cannot find, shut up the book and never mind." He is not aware that he is making verse. All he is intent on is laying a trap. You look at page 53, and are referred to page 106, and from 106 back to page 27, and from 27 to page 96, where you read, in a perfectly legible hand, "You are a fool." There it is, short and sweet, and you are fully convinced that the boy was correct.

School-books being general school property, private ownership is not much insisted upon, and so it is rare to read, "Stolen from Billy Brown." Those choice verses,

"He who hooks what isn't his'n,
When he's cotched, will go to pris'n,"

are no longer common. School-boys' minatory and cautionary verses have always existed. Before books were printed the volumes in the monastery libraries bore on them warning inscriptions addressed to those who should dare to purloin the sacred treasures. It was but natural, then, that the boys should be imitative. Dry-as-dusts have preserved some of these school-boys' rhymes of the sixteenth century, which, having a Latin flavor, always threaten the thief with hanging.

A boy who is the lucky possessor of a rubber stamp with his name on it uses it indiscriminately. He is profuse in his ornamentation, and he prints his name in red ink, as often upsidedown as not, all over his book. As he improves in manipulation he indulges in the perfecting of wheels with many spokes, his name being often repeated in the circumference and in the radii. Thumb marks in red ink increase general effects. Sometimes a boy shows a strange desire to advertise his father, and, proud to see his sire's name in print, will cut from the country newspaper the announcement that his father has just received "a splendid new stock of the most fashionable goods," or that "M——, our well-known crockery merchant, has the best selected dinner and breakfast sets in town." Circus bills neatly folded up in atlases attest the presence of the owner of the book at the last great "moral entertainment." Occasionally a fish-hook has been found embedded in the leaves of a book.

There are some strange uses a boy's atlas can be put to. In many, on the last cover is an improvised checker-board. A neat dodge is the putting of a little bit of soap on the cover; and so, pressing the blank leaf down, it holds fast, and the board is not seen by the teacher. Many tit-tat-toe games are played in the books. Interrupted sentences are frequent, such as "Frank is a mean—." There it stops. Probably the teacher's eye was on the boy just here. Here is one quotation which shows the prevailing vice of to-day: "Got a cigaret. Make believe to get coal, and fetch a match." This is another: "Uncle Pete's millions is ded ripe. They plugs good. Whose afeerd of his old dog." This is most suggestive. Reading between the lines, Uncle Pete's "millions" probably suffered some little.

There is no uniformity in boys' handwriting, whereas the girls seem to write all alike, showing how imitative is the gentler sex. The boy creates his own chirography, or discovers it, and a very independent kind of fist he has. If he uses a pencil, he prefers a stubby one, and to make a visible stroke with the lead he invariably moistens it; hence his scribbling sinks in furrows into the leaf. He has a liking, too, for what archæologists in search of inscriptions call "squeezes." Give him a penny, and no time to spend it, and he puts it under the leaf of his book, and by rubbing on it reproduces the coin as a kind of bass-relief. Well, what of it? School-books are not "tall copies." They were made to be used up, and they are. Providing primers with leaves of fine steel held together by a bronze cover were put on the market and given to school-boys, it is not certain that even such adamant would defy them. So the boys learn, the book itself, as a material thing, is of secondary importance. Sheer wanton destructiveness with books is a crime. A boy who purposely walks through a mortar bed, and with malice prepense ruins his clothes, deserves punishment; but then there are many bright lads who wear out their trousers more rapidly than the stupid ones.

B. P.

UNDER THE CHICAGO RIVER.

MORE than twenty years ago, when Chicago began to attain its wonderful dimensions, the troublesome question was, what could be done to facilitate transit from one portion of the town to the other, which were separated by the river? Drawbridges were erected every two blocks, but the passage of vessels up and down the stream, necessitating the opening of the draws, was a great loss of time to the people on land, and it became clear before long that some mode of transit must be contrived to obviate and do away in great part with such delays. To this end tunnels under the river were devised, and the first one was made at Washington Street, which connected the west side with the south side. This tunnel was opened in the early part of 1869, after costing over half a million of dollars. Two years later the La Salle Street Tunnel was built, connecting the south and north sides of the city. This tunnel cost a little over $566,000, and was opened to the public on the 1st of July, 1871. It is 1854 feet in length, and is traversed by the cable cars of the north side. The interior is lighted by electricity. The illustration on our front page shows the entrance to the tunnel and views of the cars while in transit. A view of La Salle Street, looking south from the tunnel entrance, was given in HARPER'S WEEKLY for May 3, 1890.

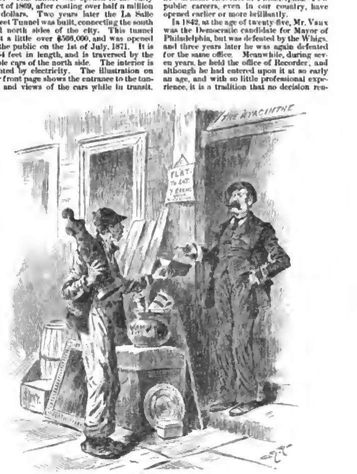
The Washington Street tunnel was given up a few years ago, owing to its dangerous condition from crumbling walls, which admitted of the entrance of water through the breaks. A railway syndicate, however, to whom the city granted its use upon condition of its restoration, which amounted practically to its rebuilding, took the tunnel in hand, and have now reopened it. The top of the new tunnel is now four feet lower than before, and will allow the passage above it of vessels drawing eighteen feet of water. It is 1608 feet in length, possessing a double driveway and a road for foot-passengers. The interior is well lighted and ventilated, and also wide and lofty. The west-side cable road runs through it.

A new tunnel running under the river from Market to Clinton Street is now in course of construction, and is expected to be finished within two years. The water above it will be seventeen feet deep, and its length 1513 feet. It will be used, upon completion, for cars of the west division, whose western termini are south of Madison Street.

HON. RICHARD VAUX.

THE Democratic Convention of the Third Congressional District of Pennsylvania has nominated ex-Mayor Richard Vaux to fill the vacancy in the House of Representatives created by the death of Congressman Samuel J. Randall. A unanimous nomination to succeed a man of Mr. Randall's celebrity and character is itself a distinguished honor; and Mr. Vaux, who has been a round half-century in public life in his native city of Philadelphia, is conspicuously worthy of it. Born in Arch Street, above Second, December 19, 1816, the son of Roberts Vaux, one of the leading men of the city, whose mother was a daughter of the first Hugh Roberts, of Philadelphia, he studied law under William M. Meredith, and at the age of twenty was admitted to the bar. Before becoming immersed in his profession he made a journey to Europe, taking with him despatches from the Department of State to Mr. Stevenson, then our Minister to England. The Minister appointed him as temporary Secretary of Legation, to fill a vacancy created by those despatches; and, subsequently, after he had finished his tour of the Continent, he made him his private secretary. On his return to Philadelphia young Mr. Vaux was nominated for the State Legislature; the following year he was a delegate to the State and the National Democratic Conventions; in the succeeding year, 1841, when only twenty-four years old, he was made Recorder of Philadelphia. Few public careers, even in our country, have opened earlier or more brilliantly.

In 1842, at the age of twenty-five, Mr. Vaux was the Democratic candidate for Mayor of Philadelphia, but was defeated by the Whigs, and three years later he was again defeated for the same office. Meanwhile, during seven years, he held the office of Recorder, and although he had entered upon it at so early an age, and with so little professional experience, it is a tradition that no decision ren-



A HARD TASK.

EXPRESSMAN. "This feyer's the last artockle, sor, an' wud ye plase sign the raceipt?"
JANITOR. "How did ye break it?"
EXPRESSMAN. "Sure an' it's not broken at all. The missus handid it ter me jist as it is, and says be very keerful av the Vause."
JANITOR. "See here, young feller, d'ye take me fur a chump? It's meself as is responsible fur everything as comes to the house, an' it's no raceipt et sign till [illegible] is found, Vause or no Vause!"

HON. RICHARD VAUX, OF PHILADELPHIA, THE SUCCESSOR IN CONGRESS OF THE LATE SAMUEL J. RANDALL.—From a Photograph by Gutekunst.—[See Page 411.]

HON. JOHN G. CARLISLE, SENATOR-ELECT FROM KENTUCKY. From a Photograph by Bell, Washington.

dered by him was ever reversed by a higher tribunal. At all events, the volume called *Vaux's Recorder's Decisions* is still authority. In 1856 his fourth nomination by his party to the Mayoralty of Philadelphia resulted in his election. His term of office fell in a busy and important period of the history of the city, which had been consolidated only two years before, and his municipal policy was broad and far-seeing. For the following term he was defeated, largely because the Lecompton question in national politics affected local elections. In 1872 he was also defeated as a candidate for Congressman at large.

Politics, however, did not wholly absorb the attention of Mr. Vaux. As early as 1842 he was appointed by the Supreme Court an Inspector of the Eastern Penitentiary, having inherited a zeal for prison reform from his father. During more than forty years he has been President of the Board of Inspectors of that institution, and has prepared about fifty volumes of its reports and many treatises on penology, on which subject he is an authority. For more than thirty years he has been President of the Board of Directors of Girard College; he has been Grand Master of the Masonic Fraternity of Pennsylvania for three years, is President of the Philadelphia Club, a prominent member of the Board of City Trusts, and of the American Philosophical and the Pennsylvania Historical societies. His social reputation even antedates his political, as his witty conversation, grace, and polished manners were recognized at the Court of St. James even in his youth. He is to-day, in his seventy-fourth year, one of the most picturesque and striking figures in Philadelphia. Nearly fifty years ago he married Miss Wain, and his handsome Chestnut Street house is supplemented by a suburban place at Chestnut Hill.

DR. CARL KOLLER.

It is probable that to no living man does humanity owe a greater debt of gratitude than to Dr. Carl Koller, the discoverer of the application of hydrochlorate of cocaine as a local anæsthetic.

Of this important event one of the most distinguished American ophthalmic surgeons, the late Professor C. R. Agnew, said he "would rather be the discoverer of cocaine anæsthesia than President of the United States." In fact, it marks an epoch in surgery only second to the introduction of ether and chloroform. It is difficult for one not in daily contact with those suffering from injury or disease to fully comprehend and appreciate the benefit realized in the prevention of pain by the employment of this wonderful remedy. A few drops of a weak solution (two to four per cent.) dropped into the eye robs it of sensibility to such an extent that operations otherwise causing most excruciating agony are not in the least painful. The pain caused by the presence of a foreign body in the eye disappears under its local use, and the removal of the foreign substance is greatly facilitated. The muscles of the eye may be exposed and divided, as in correcting squint, or "cross-eye," and the extraction of cataract no longer requires the employment of general anæsthesia with ether or chloroform. Cocaine solution purified by boiling has even been successfully instilled into the anterior chamber of the eyeball, in order to completely deaden sensibility in the iris, or curtain which contains the pupil in its centre.

In painful afflictions of the throat, mouth, nose, and larynx, and in all minor surgical operations upon these portions of the body, cocaine, properly applied, produces insensibility and gives relief from pain. Injected into and beneath the skin, any small operation, such as the amputation of the fingers or toes, or the removal of small tumors, etc., may be painlessly performed with the perfect consciousness, and even with the assistance of the patient. Such is the dread of ether or chloroform that many will bear with or conceal surgical maladies easily curable in early development, until, after months or years of suffering, they submit too late to a heroic operation. One of the greatest benefits to be derived from this wonderful remedy is the inducement it will offer to early operative interference.

It may be of interest to know how near others came to winning the laurels so justly yielded to Dr. Koller. A recent surgical writer says: "It is true that the anæsthetic effects of cocaine had been discovered before Koller's researches secured its wide application. In 1855 an alkaloid had been extracted by Gaedcke from the leaves of *erythroxylon coca*. Two years later, and independently, Dr. Samuel R. Percy, of New York, exhibited an alkaloid he had isolated; and as far back as 1868 Schroff had discovered that cocaine produced insensibility of the tongue when held in the mouth; while Morena y Maiz discovered, by hypodermic injections of the acetate, distinct loss of sensibility over a circumscribed area. And yet it was left to the brilliant young Austrian to make the application and win immortal renown," for in September, 1884, at the Ophthalmological Congress in Heidelberg, a young man hitherto unknown, born in Bohemian Austria in 1857, who had finished his course of study at the Vienna Gymnasium in 1867, graduated from the Medical Department of the University of Vienna in 1882, and served for two years as *interne* at the General Hospital, announced his important discovery. It soon became known that in experimenting upon his own person as to the constitutional effects of various alkaloids, he noticed that cocaine taken into the mouth produced loss of sensation wherever it touched the tongue or mucous surfaces. He at once concluded that the sensory nerves in other parts of the body would in like manner be affected, and within two weeks his results, which were to be of incalculable benefit to mankind and win for him undying fame, were given to the world.

DR. CARL KOLLER.

WHEN ON THE HIGH SEAS,

On the rail, on a steamboat, aboard a fishing-smack, or yachting on the coast, Hostetter's Stomach Bitters will be found a reliable means of averting and relieving ailments to which travellers, mariners, and emigrants are peculiarly subject. Sea-captains, ship-doctors, voyagers or sojourners in the tropics, and all about to encounter, unacclimated, an unaccustomed or dangerous climate, should not neglect to avail themselves of this safeguard of well-ascertained and long-tried merit. Constipation, biliousness, malarial fever, indigestion, rheumatism, and affections of the bladder and kidneys are among the ailments which it eradicates, and it may be resorted to not only with confidence in its remedial efficacy, but also in its perfect freedom from every objectionable ingredient, since it is derived from the purest and most salutary sources. It counteracts the effects of unwholesome food and water.—[Adv.]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[Adv.]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[Adv.]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[Adv.]

Editors, bookkeepers, and people of sedentary habits need an invigorating tonic. Nicholson's Liquid Bread overcomes the debilitating effect of close confinement. Try it. Ask your grocer or druggist for it.—[Adv.]

Burnett's Cocoaine.—A perfect dressing for the hair. The Cocoaine holds in a liquid form a large proportion of deodorized Cocoanut Oil, prepared expressly for this purpose.—[Adv.]

Angostura Bitters is known all over the world as the great regulator of the digestive organs.—[Adv.]

DR. LYON'S PERFECT TOOTH POWDER. Whitens the teeth and purifies the breath. 25c.—[Adv.]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[Adv.]

Burnett's Flavoring Extracts are the best, the strongest, and most healthful.—[Adv.]

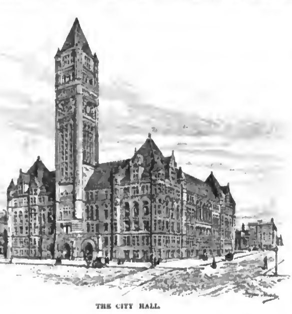
Dyspepsia causes depraved blood, which, in time, affects every organ and function of the body. As a remedy for these troubles, nothing can approach Ayer's Sarsaparilla. It vitalizes the blood, strengthens the stomach, and corrects all disorders of the liver and kidneys.—[Adv.]

THE CITY OF MINNEAPOLIS.

BY WILLIAM WILLARD HOWARD.

THE influence of circumstances on centres of population and the accumulating strength of a movement once successfully set on foot have rarely been more plainly shown than in the growth of the city of Minneapolis. The change of fortune by which an unobtrusive mill town ten miles from the prosperous city of St. Paul became the largest city of the Northwest may be looked upon as an instance of the apparently causeless magic of frontier development; yet in reality it was no more than the natural result of local circumstances. Minneapolis began life in a small way as the rival of St. Anthony, a saw-mill town at the Falls of St. Anthony, ten miles above the head of navigation on the Mississippi River. St. Anthony set out to be the milling centre of the Northwest, and for several years it had practically a monopoly of all the business above St. Paul; but after a time, when the lumber industry grew stronger, and when the farmers of the newly settled country roundabout began to seek a market for their grain, Minneapolis built mills of her own. At first, the flour-mills, locally known as grist-mills, were not of much account. They did well enough to grind wheat for local use, but they were hardly fitted to make flour for other markets. At that time wheat was a rather uncertain crop in the Northwest owing to the late spring frosts. The sowing of grain was a sort of gambling venture, with the chances largely in favor of the frosts. The Scotch Fife variety of wheat was then tried, with queer results. The Scotch Fife would grow well enough, even in frosty weather, and the farmer was always reasonably sure of a good crop, but the millers despised it beyond measure. They were, in fact, so loath to handle it that they placed a price upon it that made it a very undesirable crop indeed. The pioneer farmers were compelled to raise something, however, that would not shrivel up with the first spring frost, and so they continued to grow Scotch Fife. In time an inventive person built a machine for the purpose of making good flour from Scotch Fife, and then it was discovered that the despised Scotch Fife, when properly handled, made the best flour in the Northwest. It may be said within reason that the foundations of Minneapolis are built upon Scotch Fife. It may perhaps be too much to say that Scotch Fife is absolutely the best wheat in the world, but it has built up the largest milling industry on earth, which is a pretty conclusive test of its quality. Scotch Fife is known to the trade as No. 1 Hard Wheat, and as such it is quoted in most of the markets of Europe. The soil and climate of Minnesota and Dakota seem to be peculiarly adapted to the successful growth of this variety of grain, and so long as these conditions hold good, the Northwest may expect to prosper.

It should be noted that up to the time of the proper treatment of Scotch Fife the city of Minneapolis had not made much of a stir in the world. St. Anthony, on the opposite side of the river, was looked upon as the coming city, and the sawing of lumber was deemed to be the chief industry. St. Paul did not so much as think of Minneapolis as a future rival, because at that time St. Paul was nearly twice as large as the community of the Falls of St. Anthony. The water power was then the only reason for the existence of Minneapolis. With the development of the latent qualities of hard wheat, however, Minneapolis began to grow. The farmers of the new Northwest, finding a market for their best crop, sent hard wheat to the Minneapolis mills in a steadily increasing volume; and when farmers in other parts of the country heard how their friends in Minnesota and Dakota were growing rich, they became Northwestern farmers themselves, and so helped to swell the new business at the Falls of St. Anthony. The wonderful growth of the Northwest followed. The wide and lonesome prairies blossomed thick with farms, and land that was brown and gray in the early spring became yellow with ripened grain in the autumn. Towns sprang up here and there, and when the railroads crept across the great prairies to reach them and bring in the grain, the young city of Minneapolis began to throb and glow with a new life. Very quickly the output of flour became greater than Minneapolis and St. Paul combined could take care of, and then the products of the mills went out to all parts of the United States. That was only a dozen paltry years ago, and yet to-day Minneapolis is claimed to be the greatest wheat and milling centre in the world; Buda-Pesth, in Hungary, is said to be second; and St. Louis, Missouri, third. For the work of a dozen years this is little short of the phenomenal, yet it is only a fair indication of the future greatness of the Northwest, the resources of which have been hardly explored, much less made use of. When the millions of acres of good land now lying just as they lay a thousand years ago shall come under the domination of the plough and harrow, the milling outputs, the wheat sales, and the trade statistics of the present day will be things to smile at.



THE CITY HALL.

In making this prediction I am taking the rather broad ground that the productive capacity of the soil will not be diminished by constant cultivation. I am aware that this is at variance with the facts attending the cultivation of Northwestern fields during the past ten years, for the most carefully prepared statistics show that the yield of wheat per acre on ground more than two years old has steadily decreased. The decrease is due to the reluctance of Northwestern farmers to recognize the value of rotation in crops. With most farmers of Minnesota and Dakota, wheat-raising seems to be a habit that cannot be shaken off. The constant demand of the Minneapolis mills for wheat at reasonable prices, and the uncertainty of a market for any other kind of product, explain to a considerable extent the formation of this habit, although the too common tendency of farmers to do the same thing this year that they did last year and the year before, may have had something to do with it. Newly broken land in Dakota and elsewhere in the Northwest will raise from twenty-five to thirty bushels of wheat to the acre in fairly good seasons. The farmer who harvests this amount of grain naturally thinks that he has a very fine piece of wheat land; but instead of taking care of it, as he would a fine horse, he plants it to wheat year after year without giving it a chance to rest, to the end that in a few years the average yield per acre has fallen to ten or twelve bushels. Wheat-raising at ten bushels to the acre is not profitable, as many a discouraged farmer knows only too well. If wheat be raised on a piece of land every third, fourth, or fifth year, a good average yield will be maintained. Wheat is so exacting a crop that it requires all the native strength and freshness of the land to produce the best results, and when its nature and peculiarities are disregarded, failure is inevitable. Judging solely by trustworthy statistics, I am of opinion that the average Northwestern farmer has much to learn about successful farming. So long as his land was new and strong he was a good enough farmer. He could plough and sow and reap the harvest quite as well as any one, and certainly as well as the graduate of the agricultural college; but when his land began to wear out through stress of constant work and no recuperation, he became a very poor farmer indeed—so poor, in fact, that the commonest of graduates could surpass him in the results of a season's harvest. He blamed his lack of success upon the weather, upon the quality of the seed, or upon the full or the dark of the moon, as the case might be, but never in his most discouraged moments did he think of blaming himself. Why should he blame himself? Had he not worked at farming all his life? Had he not raised splendid crops on this very land only a few years ago? He knew what his land had done, and he knew what he himself had done; so it naturally must be the weather or the full of the moon that did it. His situation is somewhat similar to that of the carpenter who lent a file to a neighbor.

"Here," said the neighbor, after a half-hour's unsuccessful attempt at using the file; "this thing is no good. It won't bite into anything."

"No good!" demanded the indignant carpenter. "That's as good a file as you ever saw. Why, I've used that file steady for thirty years come next Christmas Day, and I know it's good!"

So it is with the average unscientific Northwestern farmer. He has grown wheat on the same piece of ground for ten years, and he knows that he is doing right. Moreover, he has such an overmastering confidence in the richness and wonderful producing character of the soil that he rarely considers the possibility of its wearing out. So far as that part of it is concerned, he has been assured so often by the glowing circulars of interested land agents that the soil was exhaustless in fertility that he believes it himself. It was partly for this reason that he left the barren lands of the East, where the liberal use of fertilizers was necessary, and took up his home on the rich uplands of the Northwest. Having found a blessed spot of land where all manner of things, and particularly wheat, would grow without fertilization, he settled down to a long life of comfort and ease. He did not work so hard as he had done on the churlish land in the East, because hard work was not actually imperative after the first year. There was no digging of stumps or blasting of rocks to worry him, and he could ride on his plough and his wheat drill from morning until night without a thought of weariness. This luxurious sort of farming caused him to grow lazy and unwilling to work, with the result that he would plant the same field to wheat year after year rather than make the exertion of breaking up a new field from the hard sod. Then when the fertility of the soil broke down under this unnatural strain, the lazy fellow blamed it on the weather.

The farmers of Ohio, Indiana, and Illinois passed through this sort of experience years ago. There was a time when the soil of those three States would raise crops in prodigious quantities, but after a period of hap-hazard farming a day came when the only thrifty crop was buckwheat or white beans. Many discouraged farmers went further west to the newer lands of Kansas, Iowa, and the Northwest, while those who remained lived to learn successful agriculture from chemists and college graduates. In the hands of enlightened farmers the soil of Ohio, Indiana, and Illinois will now grow in abundance anything that the climate favors.

I do not mean to say that the Northwestern farmers can become scientists, or chemists, or even expert agriculturists, all in one season; but they can make a good beginning toward successful farming by putting into practice the principle of the rotation of crops. When that is done intelligently, it will not be long before they understand the chemical properties of the soil, and also of the grains and vegetables that they wish to raise. No one would think of practising surgery without a knowledge of the human body, or of running a locomotive without a reasonable familiarity with its working parts, yet men become farmers who know little about soils and the properties of earth products, and who care less. For the most part, agriculture as a science capable of high development is known only to men who practise it for pleasure, and not for profit. It is usually the case that men who raise beets at a cost of a dollar a pound really know more about farming than the practical farmer, who scoffs at him for doing it. The day will come in American farming when the only prosperous farmer will be the man who studies and thinks as well as labors with his hands. That day must come very soon to the Northwest, for the time is not far off when there will be a decreased area of new land to maintain the general average of the wheat crop. When there shall be no rich, fresh soil to assist the farmer in making a living, he will be compelled to depend upon what he really knows about farming, and not upon the unheeding prodigality of nature. In that event, the value of special agricultural training and a knowledge of soils and crops will be established beyond all question.

The lively and enterprising citizen of Minneapolis will perhaps wish to know what all this has to do with the city of Minneapolis; and in reply I hasten to say that it has everything to do with Minneapolis. The busy and ambitious milling centre of the Northwest is as absolutely dependent upon the wheat fields and farms of her tributary country as the city of Denver is upon the mines of the Rocky Mountains. Should the wheat fields cease to yield crops in paying quantities, Minneapolis could only fall back upon its slowly declining lumber interest, and so lose its importance as a leader of Western cities. If Minneapolis is to be kept at its present high-pressure state of existence, it must look to the condition of its wheat fields; and if it is to continue its wonderful growth, it must take into consideration the education of its farmers.

I believe that Minneapolis will do this eventually, as a matter of self preservation. It is upon the actual necessity for doing it that I base my prediction of the city's future wealth and greatness. When the people of Minneapolis become convinced that there must be a change for the better in the method of farming, they will take the matter in hand with all the energy and intelligence that have characterized the building of their city. They will not be alone in this movement, nor will their supremacy as grinders of grain remain uncontested. Duluth will one day enter the field as a maker of flour. As a shipper of wheat, Duluth has already caused grave fears and misgivings among Chicago business men; and as a maker of flour, what may she not do to Minneapolis? Duluth ought to be able to grind wheat at less cost than Minneapolis can, because the coal for grinding-power comes there as return cargoes in grain vessels, and therefore is cheaper than at Minneapolis. This article has nothing to do with the rosy prospects of Duluth, yet I mention them as a means of showing that Minneapolis will be able to hold her leadership and increase her population only by earnest efforts in the face of active competition. Duluth may grow great, yet that need not prevent Minneapolis from solidly maintaining her position, for the empire of the Northwest is capable of supporting cities twice as large as the St. Paul, Duluth, and Minneapolis of to-day. In the event of commercial union with Canada these three cities of the Northwest would have still a second empire to draw upon, as they are the natural outlets for Manitoba and the British Northwest.

Should the overland grain route from Manitoba to Montreal ever come in open competition with the buying capacity of the Minneapolis mills or the shipping facilities of Duluth, the result would not long be in doubt. Canadians are patriotic enough in theory, but in reality few of them would care to sell their wheat at eighty cents a bushel in Montreal when they might get a dollar for it in Minneapolis. All possibilities of a nature with this should have due consideration in making up an estimate of the resources and future condition of Minneapolis, for it is not beyond the range of reason that the people all along the Canadian border shall some day make a concerted effort to bring about commercial union between the two countries. I fancy that one of the strongest forces to advocate this plan will be the St. Paul, Minneapolis, and Manitoba Railway, which looks to Manitoba for its field of operations nearly as much as to the American Northwest. Commercial union is certainly something well worth working for, and I feel sure that the Canadians would see the matter in the right light could the facts be placed before them in a proper manner.

Until commercial or political union between Canada and the United States can be established, the people of Minneapolis will do well to extend their influence with the farmers of the Northwest. There are several ways in which this can be done, the most feasible of which seems to me to be the formation and intelligent encouragement of farmers' clubs and agricultural associations, which shall seek to make popular the now awesome features of scientific farming, and devise practical ways of growing Scotch Fife successfully on old land. Any such movement as this should, of course, be free

from any attempt to advertise patent fertilizers, or even to glorify the achievements of the city of Minneapolis. The incontestable value of Minneapolis city lots as a permanent investment need not necessarily be made part of a discussion on the rotation of crops. The Minneapolis Exposition might be made useful as a teacher of the best methods of farming instead of a mere exhibitor of especially large or unusually excellent products of individual farms. In the common rut of its kind, the exposition has been reasonably successful, I believe; but should it so far depart from the conventional agricultural exhibit as to offer prizes for the best results obtained from certain methods of farming, instead of hap-hazard premiums for large potatoes and tall wheat, it would do something rational toward checking that continuous decrease in the average yield of Northwestern wheat fields. If the Minneapolis Exposition would lift itself out of the dead-level of mediocrity, let it devise some new system of agricultural exhibit whereby the farmer may be instructed in his calling as well as filled with an ambition to excel his neighbor in the growth of prodigious beets or phenomenal wheat.

I have dwelt at some length upon the subject of farming in the Northwest, for the reason that an article on the city of Minneapolis would be incomplete without it. Men may build cities on the Northwestern prairies with little other resources than glowing prospects and printer's ink, yet when the enthusiasm has reached its limit, and the boom has begun to grow stale, the wheat fields must take up the burden of proof. Just now Minneapolis is glorying in her success and smiling at her rivals, as well she may. Her short history is a story of achievement such as few cities in the world can show. There is no secret of her success. Her prosperity is due to the one fact that she has controlled the product of her tributary country.

It must not be supposed that since the city has grown so marvellously in a dozen years her business methods are unstable or her social features crude and raw, nor should it be thought that her architecture is not fully equal to that of cities of a similar size. The life of Minneapolis has not been a matter of growth so much as a process of transplanting. People with their business habits well defined, and their social ideas fully formed, came to Minneapolis from all parts of the country, and took up anew the broken threads of their daily lives very nearly the same as they had left them in New England, New York, or the older States of the middle West. Practical men of affairs from New York or Ohio found in Minneapolis the same systematic and liberal way of doing business that they had been accustomed to at home, and careful mothers of families found as good schools and as desirable churches as those in which they had been interested in Massachusetts or Pennsylvania. To many it seemed as though some thrifty Eastern city had been lifted bodily, inhabitants and all, from its old foundations, and set down beside the Falls of St. Anthony. The broad streets were as well built, as carefully paved, and as thickly lined with creditable buildings as the thoroughfares of any city of the same size in the country. Even the look of newness, which one would suppose to be inseparable from a new city, was toned down by the soft-coal smoke from the numerous mills, so that in the undesirable grimy appearance of large manufacturing places Minneapolis was in no way behind her rivals. This smoke is a nuisance only in the mill district, but in this respect Minneapolis is no worse off than St. Paul, Kansas City, Cincinnati, or Chicago, where the soft-coal smoke hangs above the buildings in clouds, and filters down through the streets like mist. Such a state of things is not at all creditable to Minneapolis or any of the other cities mentioned, for the reason that the coal-smoke nuisance is a thing that can be prevented. Plenty of coal smoke is said to be a good advertiser for a small and ambitious city, but in places as large and as firmly established as Minneapolis it is looked upon as an indication of carelessness on the part of the people. When a handsome city like Minneapolis gets her fine buildings tinged with grime, it reminds the disappointed visitor of a pretty woman with a sooty face. Minneapolis has done so well toward making herself attractive that it seems a great pity that the excellence of her architecture should be marred by soot and smoke. There are a large number of imposing structures in the city, chief among which, when finished, will be the City Hall and Court-house. The characteristic feature of this building will be the tower, which will rise to a height of three hundred feet above the level of the street. The building itself will occupy an entire city block. So far as the plans may be taken as representing the finished building, it must be acknowledged by even residents of rival cities that Minneapolis will have a City Hall and Court-house that many older and larger cities would be glad to imitate if they could. In this, as in most other things, Minneapolis builds quite as much for the future as for the present.

Another illustration of this tendency to look forward is the new Public Library building, which has recently been finished, after having been in process of construction for several years. It is a massive structure of Duluth brown sandstone, and is in all respects a fitting home for the excellent library that the people of Minneapolis have built up. It is not always an easy matter to carry on a library enterprise in a newly settled community, and for this reason alone the fact that Minneapolis has spent $150,000 for a library building should have due consideration in the minds of persons looking for new homes in the West. The library movement may be said to have originated with the late Bayard Taylor, who gave a lecture in Minneapolis for a library fund two years after Minnesota became a State. With this as a beginning, the people formed the Minneapolis Athenæum, which had a rather struggling existence until 1884, when the City Council came to its assistance with a library act and an appropriation of $100,000. This amount was increased to $150,000 by private subscription. Prior to this the Athenæum had received from a citizen a gift of real estate, which now is worth about $200,000, and which yields an income of $10,000 a year. With all these resources combined, the Public Library, into which the Athenæum was merged by act of City Council, took rank as fifth among the libraries of the country in point of annual receipts. To persons seeking educational advantages for their families, the organization of a library on so liberal a scale is a significant indication of the intelligence and culture of Minneapolis people.

Another and perhaps more direct educational advantage to residents of the city, and also to the inhabitants of the entire Northwest, is the Minnesota State University, which stands on a tract of rolling meadow-land about a mile below the Falls of St. Anthony. Like many public institutions and private enterprises in the West, the University has had its days of financial gloom and its moments of despair; but it has overcome all of its difficulties, and reached a highly creditable place among the universities of the United States. Its number of students has increased from 278 in 1884 to about 800 in 1889. The increased attendance made necessary the erection last year of a large and handsome stone building for the use of the department of science, literature, and arts. From an architectural point of view the new building is one of the best in the State. Considering the purposes for which it was designed, there is little about it to which serious objection could be made. So few American institutions of learning have shown any disposition to include in their curriculums object lessons in architecture, that a really creditable building such as Science Hall in the Minnesota State University should have all the recognition that it is entitled to. Persons who judge of the value of an educational institution more by the size and cost of the buildings than by the quality of the instruction will have their estimate of the University much enhanced by a visit to the new structure.

While the disposition to measure the quality of intellectual training by the quantity of the architecture is in the highest degree fallacious, especially in the new West, where school buildings are almost necessarily behind the demands of a rapidly increasing school population, yet were this standard to be applied to Minneapolis in the matter of public schools, the result would be in every way satisfactory. I fancy that it has been a difficult thing for Minneapolis to provide adequate school-room for all the new pupils during the past few years; but she has not only done that, but has in addition introduced new features into her educational system, and maintained in all the schools a standard of excellence as high as that in any city of her size in the country. Surely this is evidence enough that Minneapolis is a good place in which to rear a family. If more evidence is needed, there are plenty of churches ready to add their testimony. To conservative people of the East it seems to be rather an anomaly that any new community of the West should claim to be a "city of churches," and yet Minneapolis does this with statistics that can hardly be contradicted. In the East churches grow slowly, and oftentimes reluctantly, while in the West they keep step with the rapid march of every other kind of enterprise. In Minneapolis, and, in fact, elsewhere in the Western half of the continent, the church element largely predominates. The picturesque but murderous border ruffian of other years no longer shoots out the kerosene-oil lights of the casual saloon, and the bad man from the head waters of Bitter Creek no longer mounts his frantic broncho and swoops down upon the main street of the town in a cyclone of pistol-shots, Indian whoops, and profanity. The churches have driven him away, and only at long intervals is he heard from at remote mining settlements in New Mexico and Arizona. Probably three-fourths of the inhabitants of Minneapolis never saw an Indian outside of a circus, and the other fourth have so long forgotten the artistic management of a revolver that they would hardly be able to hit a barn door at thirty paces if they tried. The churches have made the West so prosaic and matter-of-fact that the hungry seeker after border romance and Indian uprisings is compelled to look for them behind the footlights of Bowery theatres.

With churches, schools, and educational organizations of one kind or other as a foundation, Minneapolis has built for herself a social fabric that is in every way creditable to the high standard of Western civilization. A city of churches is invariably a city of homes. Minneapolis is beyond all question a city of homes, many of which are rich and beautiful, and some even sumptuous and imposing. Fine dwelling-houses necessarily imply the possession of good streets and, as in all Western cities like Minneapolis, broad building plots and carefully kept lawns. Minneapolis takes great pride in these things, and in her parks, her public enterprises, and in all her other material manifestations of wealth, culture, and progress. She has pride in many other things, out of the mass of which I may mention the Young Men's Christian Association, which is at work on a new and handsome building; the Masonic organizations, which have recently finished one of the finest Masonic Temples in the West, and the daily and weekly newspapers. Apart from the natural resources of the Northwest and the water-power of the Falls of St. Anthony, the newspapers are most to be credited with the success of Minneapolis. It was the newspaper that called attention to the undeveloped wealth of the Northwest and induced settlers to come in and build homes, and in times of drought and bad crops, such as come to all agricultural communities, it was the newspaper that cheered and encouraged the despondent farmer until better seasons were at hand. Unlike St. Paul, Minneapolis has only one morning newspaper of her own. The deficiency is made good, however, by the Minneapolis editions of the St. Paul *Globe* and the St. Paul *Pioneer Press*, each of which has a separate staff of editors and reporters to handle Minneapolis news. In addition, the *Globe* has a handsome building of its own in Minneapolis for the accommodation of the editorial and business departments of its Minneapolis edition. The one morning paper that Minneapolis calls her own is the *Tribune*, which, in point of enterprise, ability, and influence, is the peer of any paper west of Chicago. Its special field of effort is the Northwest, and there it acknowledges no superior. Not content with one of the largest newspaper buildings in the West, it now has in process of construction a new building that is expected to be one of the most conspicuous architectural ornaments of the city.

The evening papers are the *Journal* and the *Star*. The *Journal* claims to have the largest circulation of any paper published in Minnesota. The success of the *Journal* is said to be due wholly to its enterprise in collecting news and the ability of its editorial conduct. To journalists this tends to prove the theory that evening newspapers would be quite as successful and influential as morning newspapers if managed with equal ability and sagacity. The time of publication is rather in favor of the evening paper. In the next few years the people of this country may see some radical changes in the publication of newspapers, one of which may be the elevation of the evening paper to its proper place.

There seems to me to be a chance, moreover, that a decided change may be made in the manner in which matter is prepared for publication, and also an improvement in the quality of the matter itself. The inherent faults of the present system of making a great daily newspaper are so apparent to the trained journalist that they may not be permitted to outlive the century. With competition as an incentive, the larger newspapers of the country may outgrow these faults, which are now deemed virtues, just as Minneapolis has outgrown the cause of her early prosperity. The milling interests, which were first brought into existence through the water-power of the Falls of St. Anthony, have now become so extensive that the water-power has given place to steam.

By the impetus of the early local advantage, however, the city has continued to grow until the benefit of location is rather more of a tradition than a reality. The material greatness of Minneapolis is now the magnet that draws trade from the Northwest and capital from the East. Until some grain-buying and flour-making rival shall arise to dispute the power of this magnet, Minneapolis will remain the milling centre of the Northwest. At present the secretary of the Chamber of Commerce is able to say to visiting strangers, as he said to me, in almost reverential tones, "You stand now in the room where more wheat is sold than in any other room in the world." It is not much of a room from an architectural point of view, but to the awe-stricken visitor, under these circumstances, it has its associations. A frequent and natural inquiry of visitors is: "Will this wonderful prosperity continue? Will Minneapolis maintain her leadership? Will the Chamber of Commerce keep its control of the product of the Northwest?" Minneapolis answers by pointing to the great lines of railway that find here a common centre with St. Paul; to the energetic work of her Board of Trade; to her mills and manufactories; and to the massive and costly business blocks that show the faith that men of means have in her future.

THE BEST PERIODICALS FOR FAMILY READING.

The American people ought to be proud of the four periodicals issued by Harper & Brothers.—N. Y. Sun.

HARPER'S MAGAZINE.

"THE GIANT OF THE MONTHLIES."

A novel feature of the Magazine for 1890 will be a humorous serial story by Alphonse Daudet, the great French novelist, entitled "Port Tarascon: the Last Adventures of the Illustrious Tartarin." It is through the medium of Mr. Henry James's exquisitely sympathetic translation that this story is to appear complete, in successive numbers of Harper's Magazine, in advance of the publication of the French original. The June number will contain the first instalment. The story will be illustrated by Rossi, Myrbach, and others. Among other attractions for 1890 will be short stories from the greatest living masters of fiction in America and Europe; illustrations of Shakespeare's Comedies, by E. A. Abbey, with comments by Andrew Lang; American Universities—Yale, Harvard, and Princeton—by Chauncey M. Depew, Charles Eliot Norton, and William M. Sloane; "English Writers in India," by Bishop Hurst; "Impressions of Berlin," illustrated by Thulstrup; fresh articles on timely topics; and other entertaining sketches. The Editorial Departments—faithfully reflecting the current movements of literature, art, and society—will be contributed as at present—the "Easy Chair" by George William Curtis, the "Study" by William Dean Howells, while the "Drawer" will be conducted by Charles Dudley Warner.

Subscription Price, $4 per Year.

HARPER'S WEEKLY FOR 1890.

"A PICTURE HISTORY OF OUR OWN TIMES."

Harper's Weekly continues, with steadily broadening scope and larger aims, to justify its title as "A Journal of Civilization." It touches on every side the varied phases of human progress, and presents a carefully studied record, in pictorial and literary form, of the notable incidents and movements of our time. The special Supplements given with each number are equally remarkable for variety and excellence. The addition of a cover for advertising purposes is equivalent to a permanent expansion of the reading space of the Weekly.

In politics, the influence of Harper's Weekly will be, as heretofore, directed to the end of securing a higher standard of public duty and an abler and purer administration of public affairs. It will continue to hold partisan advantage as merely a means to the end of good government.

In Literature, Harper's Weekly for 1890 will be liberally supplied with contributions from representative American authors in the departments of fiction, poetry, science, and miscellaneous writing. The remarkable excellence of the short stories published in the Weekly is widely known and generally acknowledged.

In art, the publishers of the Weekly expect to maintain a continuous advance in the quality and interest of its illustrations.

Subscription Price, $4 per Year.

HARPER'S BAZAR FOR 1890.

"NO FAMILY SHOULD BE WITHOUT IT."

Harper's Bazar as a popular fashion journal is without a peer, giving every week numerous and beautiful illustrations of the latest Paris and New York styles, with well-fitting patterns and ample descriptions of materials and modes, perfectly adapted to the needs of the lady who is her own dress-maker, while furnishing trustworthy help to the professional dress-maker and milliner.

In the domain of art the Bazar challenges comparison with all competitors. In addition to the abundant illustrations specially prepared for its stories and sketches, the resources of the publishers enable it to give frequent copies of beautiful and world-renowned creations in foreign galleries.

A great deal of attention will, as heretofore, be paid to home decoration in its several branches.

Harper's Bazar is the conceded arbiter in the niceties of etiquette and ceremony, and in everything which belongs to the conventional usages of good society.

The editorials of the Bazar are vigorous, sensible, and timely; its short stories are noted for vivacity and brightness; and the humorous cuts and quips have won for the last page the name of the American Punch.

No pains will be spared to maintain the character, and extend the deservedly high reputation, of Harper's Bazar.

Subscription Price, $4 per Year.

HARPER'S YOUNG PEOPLE.

"THE BEST PERIODICAL FOR JUVENILE READERS."

Harper's Young People always aims to present to its readers something new and good. It is not content to amuse its readers; it aims to interest them, by appealing alike to their intelligence and their imagination—to stimulate the one in a healthy direction, and to nourish the other by facts and suggestions. Fiction, poetry, and anecdote, history, biography, and travel, natural history, and other interesting topics make up its contents.

Mr. W. D. Howells's serial, "A Boy's Town," is attracting a great deal of attention, as well by reason of its autobiographical character as for its intrinsic interest. This serial will be followed by "Camp-Mates," by Kirk Munroe, author of "Dorymates," etc. Other short serials to appear in the current volume are "Prince Tommy," by John Russell Coryell; and "Mother's Way," by Margaret E. Sangster. There will be short stories by Howard Pyle, Thomas Nelson Page, Hjalmar Hjorth Boyesen, Mary E. Wilkins, Nora Perry, Harriet Prescott Spofford, David Ker, Hezekiah Butterworth, Sophie Swett, Richard Malcolm Johnston, etc., and a series of delightful short papers on various phases of natural history by W. Hamilton Gibson, with illustrations from his pencil.

Subscription Price, $2 per Year.

Booksellers and Postmasters usually receive Subscriptions. Subscriptions sent direct to the Publishers should be accompanied by Post-office Money Order or Draft. When no time is specified, Subscriptions will begin with the current number. Postage free to all subscribers in the United States, Canada, and Mexico.

SUPREMELY DROLL

Serial Story by

ALPHONSE DAUDET.

"Port Tarascon: the Last Adventures of the Illustrious Tartarin," relates the "hugely laughable" adventures of the inimitable hero in a colonial enterprise in Polynesia.

TRANSLATED BY HENRY JAMES.

The translation of "Port Tarascon" will appear in serial form exclusively in Harper's Magazine and in advance of book publication. A novel by Daudet has never before been first published outside of France.

ILLUSTRATED BY FRENCH ARTISTS.

The leading illustrators of France—Rossi, Myrbach, and others—will lend the charm of their art to "Port Tarascon." The first instalment contains 24 illustrations.

OTHER ATTRACTIVE CONTENTS.

THROUGH THE CAUCASUS. By Vicomte Eugène Melchior de Vogüé. Illustrated.
THE ENEMY'S DISTANCE. By Park Benjamin, Ph.D. Diagrams.
THE AMERICAN BURLESQUE. By Laurence Hutton. Illustrated.
FÜRST BISMARCK. By George Moritz Wahl. With Portrait.
THE BEST-GOVERNED CITY IN THE WORLD. By Julian Ralph. Illustrated.
THE YOUNG WHIST-PLAYER'S NOVITIATE. By Professor F. B. Goodrich. Diagrams.
CHAPBOOK HEROES. By Howard Pyle. Illustrated.
SHORT STORIES, SKETCHES, POEMS, ETC.

Published by HARPER & BROTHERS, New York.

HARPER'S WEEKLY,

with cover, and

Supplement containing Illustrated Article of the Leaders on the Turf.

TERMS: 10 CENTS A COPY.—$4 00 A YEAR, IN ADVANCE.
Subscriptions may begin with any Number.

DECORATION DAY.

One of the most interesting celebrations of Decoration Day this year is the ceremony of laying the corner-stone of the Washington Memorial Arch in New York. The idea of the arch and the temporary form given to it last year were both so happy that the propriety of a permanent memorial was instantly perceived. It is, indeed, a little singular that there has never been a distinct monument of the most important event in the annals of the city. This is a reproach of its public spirit which will now be removed, and in the fittest and most satisfactory manner. Decoration Day itself has taken its place among our pleasantest holidays. There was some fear at first that it might serve to prolong the memory of the tremendous controversy which first alienated the Northern and Southern sections of the Union, and then ended in the great civil war. But that has not proved to be the result. The undisputed courage and tenacity of both sides and the enormous common sacrifices of every kind prevented any belittling taunts of inferiority. It was a conflict of Americans to determine what could not be otherwise decided, and it ended without purpose or hope of renewal.

Moreover, it settled forever a question which would have become steadily more menacing with time, and which must have convulsed and divided the Union until it was settled. The sense of relief in the mere fact of settlement was profound and universal. The cause of the war is plain, but there is no doubt that both parties to it rejoice that the cause is removed. That it has left some perplexing public problems is undeniable. They are made subjects of party contention, but in that way only in a popular government can such problems be solved. This fact may seem to dispose patriotic men to regard the dispute with equanimity, sure, as they may be, that there is a wide and deep sympathy everywhere in the Union for those who are most immediately involved in the difficulties of settlement, and an equally diffused desire that the settlement shall come through the accepted and proved methods of our system in the adjustment of such troubles. The inevitable sectional feeling which attends the situation is to be regretted. But the imperative necessity of a wise adjustment arising from the national Union is in itself fortunate, because it will prevent the evils that would certainly follow permanent neglect.

There is one habit of speech which tends to perpetuate the old sectional jealousy which is worth some pains to correct. It is the habit of speaking of "the South" as if it were in some way the legitimate name of a distinct part of the country. There was some cause for it when the Southern States were distinctively slave States, for in that system and the theory of the Union, which was believed to make the system more secure, they had a common and separate interest. But now its significance is not only gone, but as a distinctive name it is merely mischievous, because it fosters the idea of a kind of separateness which is prejudicial to a true national sentiment. The old cry, "no North, no South, no East, no West," was raised for a purpose which destroyed its value. But that situation has passed away, and as a legend of such a union as now exists it is fit and true. When the graves of the gray and the blue are decorated indiscriminately, when the living veterans of both colors meet as friends upon old battle-fields, and when in Mississippi there is a League of the Blue and the Gray, it is time to disuse the words North and South, except as geographical expressions.

A NATIONAL UNIVERSITY.

Senator Edmunds has introduced a bill to establish a national university at Washington. The Methodists already propose one there, and the Roman Catholics have begun one. How many universities is it supposed will flourish there, and why should the government provide one? Would it not be better for Congress to found a university in every State, which would be much more convenient for the pupils? Would it be well to provide not only that instruction should be free, but that during the course of study the pupils should be maintained at the public expense? Is the government to take charge of every interest of the people? The government maintains a military and naval school to train soldiers and sailors for the public service. While we have an army and a navy, such schools are reasonable. But why should the government provide a university for general literary and scientific instruction, rather than a school or schools of trade? The disposition of rich citizens to found colleges and universities is one of the happiest characteristics of American prosperity. It is in strict accord with the distinctive American principle of self-help, and there is no reason to suppose that a national university would be of a higher grade than many which already exist.

The States support a system of public schools combined often with a compulsory law. The principle of State action is that its own welfare requires such a kind and degree of education, and that the money expended is spent for itself. Therefore in every State the people tax themselves to maintain primary schools, and elect the trustees to control them. The higher institutions, colleges and universities, are founded generally upon private endowments. Could there be a better system—a system which, besides furnishing special instruction, develops the self-reliance and generous independence of the citizen? The project of a national university like that contemplated by the Edmunds bill is not new. In 1872 two bills for the purpose were presented in the Senate, one by Mr. Sawyer, the other by Mr. Howe. In 1886 Mr. Ingalls introduced one which was substantially that of Mr. Sawyer. The scheme has been often and earnestly advocated in meetings of educational associations, and it has a certain fascination for those who regard government as a *deus ex machina* to produce desirable results. The plan of the bills we have mentioned was the subject of an admirable report by President Eliot, of Harvard, to the National Educational Association in 1873, which was reprinted the next year by request of a number of gentlemen interested in the subject, when the President called the attention of Congress to the project.

All the plans contemplate a Board of Regents to be appointed by the President, or Governors of States, or Congress, and certain *ex officio* members, and all forbid sectarian or partisan teaching. They all, we believe, also provide for an appropriation of five millions of dollars for the maintenance of the university. We see no reason to believe that public opinion is more favorable to the scheme of a national university under the control of Congress than it was seventeen or four years ago. This feeling is not due to indifference to education, because on all sides the standard of education is rising and its opportunities are increasing. It is due to the feeling that the interests of higher education may safely be left to local care, and that the government of the United States is not a well-chosen agency for their management. Should Mr. Edmunds offer an argument for his bill, however, we may be sure that it will say for it cogently all that can be said.

MR. THURSTON'S APPEAL.

Mr. R. H. Thurston, of Cornell University, writes an earnest and sincere appeal to the *Tribune* for patriotic civil service reformers and tariff reformers and lovers of honest government to unite with the Republican party, for the general reason that it was once a party of great and beneficent achievements, and that the few demagogues who now "seem for the moment to control" it are but flakes of foam upon the surface of the wave. The appeal expresses a natural feeling of tender attachment to the party name under which noble results have been accomplished. But why is such an appeal necessary? Those to whom it is addressed were generally original Republicans, and they were always until recently proud of the party name. Why are they, as Mr. Thurston implies, out of the party? Are a "handful of demagogues" in control of it because those old Republicans are out, or are they out because the demagogues got control while they were in? If the party sentiment and drift were opposed to the demagogues, how did they get control? Mr. Quay is the chairman of the national party committee. Who elected him? The representatives of the party from every State. "A handful of demagogues" did not control the party thirty years ago. How did they "happen at the moment to come to the front"? By the consent, not indeed of honest Republicans, but of the Republican party as an organized body.

Mr. Thurston naturally protests that those who agree with him are really the Republican party. So, twenty years ago, did the old Republicans to whom he appeals. But they found that they were mistaken. Antislavery Whigs insisted that they were the true Whig party. But the event proved them to be in error. In New York the Republican party, as shown in the Legislature, acknowledges the leadership of Mr. Platt. Would the party probably depose Mr. Platt if the old Republicans should, in Mr. Thurston's phrase, "come into the ranks of the better of the two parties"? But if they are there no longer, it is because it was evident to them that they could secure the ends of good government by coming out. Have they done so? Undoubtedly. If Mr. Thurston is of opinion that reform in the civil service, for instance, would be advanced, even so far as its present stage, except for the action which he deprecates, we differ. Indeed, except for that action we doubt whether the Civil Service Commission would be constituted as it now is. If all Republican civil service reformers had acquiesced in whatever the party might do upon that subject, on the ground that it held sounder views than the Democratic party, or, as Mr. Thurston says, was "the better of the two parties," the reform would have been as effectually baffled as many Republican leaders still desire to see it. When Mr. Arthur was a Republican leader in New York he used to say, "Oh, let the reformers sputter; they'll all vote the ticket." The reform bill passed Congress only after the defeat of the party at the polls.

It is lost time for lovers of honest government to come back into "the better of the two parties," "and there fight continually for its purification." The only way to fight for the purification of a party is to correct its wrong tendencies by defeat, not to support them in the foolish hope that if you strengthen them by approval they can be more readily overthrown. The better way is to fight for the purification of the government, and let party take care of itself. The veteran politician who wished his epitaph to be "Here lies Richard Roe, who for sixty years always voted the regular Democratic ticket," was, in the phrase of Artemus Ward, "an amoosin' cuss," but he was neither a good patriot nor a wise man.

THE COURTS AND A QUORUM.

In the debate upon counting a quorum we do not remember to have seen the case in Zanesville, Ohio, cited, in which the Supreme Court of the State ruled some years ago in accordance with Speaker Reed's view. At the election of the clerk of the City Council, the Republican members being present refused to vote. A legal opinion was given by Republican counsel that a quorum being actually present when the vote was taken, the Democratic clerk was elected by the vote cast. The case was taken to the Supreme Court of the State, composed of four Republicans and one Democrat, and the court held unanimously that the Democratic clerk was legally chosen. This, we believe, is consonant with the rule laid down by the courts whenever the question has been raised. The Constitution of the United States authorizes less than a quorum to compel the attendance of absent members. This power is given for the very purpose of making a quorum, and it is held to be useless if the member, when his presence has been compelled, cannot be counted if he refuses to vote. A member's presence can be compelled, but not his vote. But if the refusal to vote annuls the presence, what, it is asked, is the object of constitutionally authorizing his presence to be forced?

General Garfield and others have laid stress upon "participation." Admitting the power to force attendance, they urged that as participation or voting could not be forced, no quorum was legally present. But the legal ruling has been that all members actually present and free to vote, and knowing that a vote is being taken, are considered in law as assenting that the voice of the body may be expressed by a majority of the actual voters. It would follow, of course, that if a quorum be actually present and free to vote, and aware that a vote is taking, but when the roll is called

Google

refuse to vote, one member voting speaks for the whole body, and the measure is either adopted or lost, unless some constitutional provision or rule of the body has established a different rule. The Constitution of New York, to prevent the enactment of a law by such a vote, provides that no bill shall become a law except by a vote in each House of all the members elected, and for laying taxes and certain other purposes a vote of three-fifths is required. But there is no such provision in the national Constitution. It is further urged that as the law does not recognize in any member of a Legislature a *right* actually to absent himself from its sessions, it will not recognize a constructive right of absence by refusing to vote. A member may be silent, but in the presence of a quorum his silence gives consent to the actual voting.

The question thus legally presented is very interesting, and it is unfortunate that Mr. CARLISLE did not carry it up to the courts as he and his friends were understood to intend. If they could have made a case, the Speaker's position would have been fatally injured in the public mind if the court had decided in substance against him. As it is, the decision of the House will doubtless stand, because no other party majority is likely to divest itself of the power to carry its legislation even in the culpable absence of its own members. It is certainly an extraordinary situation that when, for instance, less than a majority of members elected to pass a high protective tariff are present in their places, enough of the members elected to oppose such a tariff may be counted to enable less than the majority of protectionists to pass the bill. The party majority in a party assembly ought to be compelled to assume its proper responsibility, and it is a serious omission in the Constitution that it does not require for the passage of every law not the presence, but the vote of the majority of members elected to each House.

THE STING OF THE BUTTERWORTH SPEECH.

MR. BUTTERWORTH's speech has naturally attracted great attention. It is repudiated as a statement of the Republican doctrine of protection, but it is a vivid and forcible expression of the doctrine of HENRY CLAY. It is indicative also of a sentiment which prevails largely among Republicans. This is privately well known, and the telegram to Mr. BUTTERWORTH from Republicans in Chicago, and the remarks of Senator DAWES, of Massachusetts, show that there are other Republicans besides Mr. BUTTERWORTH who are not unwilling to avow it. "So far as the McKINLEY bill is concerned," Mr DAWES is reported as saying, "if it should be found to impose anything else than exactly an equalization of the conditions of protection, it would go beyond any point that he would be able to support. Long since these opinions of his had been on record."

Meanwhile Mr. BUTTERWORTH has been in substance warned that he must stand or fall as a Republican by the McKINLEY bill. Yet he said deliberately and strongly that protection "is the wisest and most beneficial economic system which could have been devised," and that it had scattered blessings through the land. He reiterated that he was as thoroughly devoted to the protective system and as fully opposed to free-trade as any man on the floor of the House. This seems to be an explicit and unmistakable adhesion to protection. But it is apparently not enough. It is his doctrine of protection which is unsatisfactory.

Yet what is that doctrine? In his own words, "The preservation of the equality of opportunity in this country." It is to give every laborer an equal chance to get his fair share of the product of his labor. To give a chance to some industries which is denied to others, is, in Mr. BUTTERWORTH's opinion, not only unjust, but outrageous. If this does not deserve the name by which HENRY CLAY used to describe his views—the American system—nothing deserves it. It is American, because America means fair play. The sting of Mr. BUTTERWORTH's speech is his plain exposure, which is irrefutable, that the tariff is not fair. It does not protect every industry equally. It does impose, in the words of Mr. DAWES, something "else than exactly an equalization of conditions of protection." Does Mr. BUTTERWORTH cease to be a Republican because as a protectionist he declares the original and fundamental Republican doctrine of equal rights?

AN IMPORTANT QUESTION.

MR. EDMUNDS says in the Senate that the late judgment of the Supreme Court in regard to State prohibition of the sale of liquor asserts that neither the State nor the national authority can deal with the subject. Mr. EDMUNDS says that the judgment holds substantially that there is an inherent right in the citizen of any State to carry into another State and there to sell what that State regards as injurious, and that Congress cannot prevent it, nor can the State prevent it except by authority of Congress. There is a flaw in somebody's logic, says Mr. EDMUNDS. He thinks that this judgment is a great step toward centralization of power—somewhere, and probably in the Supreme Court. Mr. EDMUNDS contends that when once intoxicating liquors are in a State, whether in the hands of its citizens or not, they are subject to State laws, and he thinks that the Supreme Court will so decide within twenty years. The power of the United States to levy taxes and regulate commerce is no greater within its sphere than the power of the State within its sphere to deal with commodities and the conduct of its citizens. Both powers are supreme, and each must be exercised within its own order.

When Mr. HOAR took the same ground, Mr. HISCOCK asked whether Congress could delegate its power to regulate inter-State commerce to a State which wished to exclude, not liquors, but manufactures of wool. Mr. HOAR replied that he did not go so far. It is evident that the question is between the police powers of the State and the power of Congress over inter-State commerce. The regulation of the sale of intoxicating liquor is held to be a primary power of the State. But if the opinion of the minority of the Judges as to the scope of the judgment of the Court be correct, that power is controlled by Congress. It would follow that Congress could authorize the State regulation of the sale of manufactures of wool as well as of intoxicating liquors.

The Supreme Court has already decided that the State may regulate or restrict as it pleases any traffic within its borders which it holds to be noxious to the public health or morals. It is not easy to see why this decision does not authorize State prohibition or high license despite the power of Congress to regulate commerce among the several States.

SOCIALISM IN PARLIAMENT.

LORD SALISBURY's recent reply to Lord WEMYSS's deprecation of the tendency of Parliament toward what he called grandmotherly, usually known as paternal, legislation was characteristically English. JOHN STUART MILL pointed out the indifference of the English mind to logic in politics. It wants not a symmetrical system, but one that will work. EDMUND BURKE was its orator when, in his speech on conciliation with America, he insisted that Parliament should not discuss the abstract point of right to tax the colonies, but the practical question whether it was expedient to tax them.

Lord WEMYSS declared that the present tendency of Parliamentary legislation is socialistic. Lord SALISBURY did not deny it; but he said there is nothing more socialistic than the Post-office and the Mint, yet nothing more justifiable. It is not practical politics, he said, to label legislation as socialistic or otherwise; but every question should be considered upon its own merits. "The public could be trusted to find out what practical good lies behind the socialist doctrine. Nobody not absolutely blind could deny the existence of great evils from which arose the socialist proposals and action. Industrial and other causes produced great centres of misery. We are bound to do all we can to remedy these evils, even if we are called socialists, knowing we are undertaking no new principle or striking out on no new route, but are simply pursuing the long and healthy tradition of English legislation."

This is undeniable. All state aid to industrial or private enterprises is open to the charge of socialism. The modern English measures for the relief of Ireland are of this kind. A protective tariff, by its very terms, is of the same kind. It is not designed merely to secure a revenue for the government, but to "protect," to favor and sustain, a certain class of citizens. It is unequal in its operation, but it is socialistic in its essence and purpose. Lord SALISBURY defines socialism as "the state doing something that might be done by private persons for the sake of gain." Carrying letters, lighting the streets, conveying passengers, are illustrations of projects that fall under Lord SALISBURY's definition. Every wise government is socialistic in some degree. The safety-valve of the tendency is the English practice of deciding practically, not theoretically. It is England, not France, which has advanced liberty.

SECRETARY STANTON.

AMONG the monuments to the great men of the epoch of the civil war there is as yet none to Mr. STANTON, and the House Committee on the Library recommend the passage of the bill providing for such a monument. In support of its recommendation the committee say: "To perpetuate by enduring monuments the memory of the great few who are thus raised in great crises for the salvation of a nation is a duty and a privilege sanctioned by custom and demanded by the natural feelings of grateful patriotism." No one will deny the great claims of the immense services of Mr. STANTON to the grateful and perpetual acknowledgment of his countrymen.

We speak with just honor and gratitude of Mr. LINCOLN, of Generals GRANT and SHERMAN, of FARRAGUT and PORTER, and their associate heroes, and of the boy in blue, who is commemorated in statues of the Union soldier on many a village green. But among the great men and leaders of the war Mr. STANTON must be always included. It was most fortunate for the President that at his right hand stood a man so wise, so constant, so inflexible. In the War-Office at that time, and under all the complicated and inconceivable difficulties of the situation, the qualities of STANTON were indispensable. The leaders in Congress, says the report of the committee, had unbounded confidence in his wisdom and integrity.

It is impossible to recall the spotless patriotism of the great leaders of the war, whether in council or in the field, without feeling that they were indeed providential men. If among them all we think less frequently of STANTON, it is because the conditions of his service withdrew him from public view, and because its necessary rigor invited hostility and calumny. But with what indomitable force and ceaseless energy he did his duty! How in the complete exhaustion of the steady and prolonged strain upon his faculties he gave his life for his country as truly as any brave boy who fell in the blazing lines at Gettysburg or Shiloh! As became an American patriot, "he was the impersonation of honesty, and after controlling the expenditure of $3,000,000,000 he died poor as he had lived." Congress need not doubt that the grant for STANTON's monument will be approved by the country.

A MISSTATEMENT.

THE Boston *Daily Advertiser* says that HARPER'S WEEKLY claims ballot reform and civil service reform as Democratic measures, but does not say when or in what words the claim was made. On the 10th of May, which was the latest date of the WEEKLY that the *Advertiser* could have seen, the WEEKLY said, in accord with its uniform remarks upon the subject:

> "The approval of the bill by the Governor would show the force of public opinion, for, however imperfect the law may be, it will work unquestionably a reform which the Governor does not like, and which is naturally repugnant to his school of politicians."

This has always been the opinion of the WEEKLY, and it has never thought or said that ballot reform and civil service reform and temperance reform are Democratic measures, or that they are demanded or supported by the general opinion of the Democratic party.

PERSONAL.

THE romance which has resulted in the marriage of WALTER JOHN DAMROSCH, the well-known musical conductor, and Miss MARGARET ISABELLA BLAINE, daughter of Secretary of State BLAINE, was begun during Mr. CARNEGIE's famous coaching trip through the Scotch Highlands in 1888, both the young people being members of the party. It was continued the following summer at Mount Desert and at Ellsworth, Maine, where Mr. DAMROSCH and Miss BLAINE were the guests of Senator and Mrs. HALE. Now that it has reached so happy a conclusion, the bride and bridegroom are going abroad for their wedding trip, during which they will again visit Mr. and Mrs. CARNEGIE in their Scotch home.

—Rev. Dr. JOSEPH D. WICKHAM, of Manchester, Vermont, who was graduated from Yale College in 1815, is her oldest living alumnus, and the only surviving member of his class. He is ninety-three years old, but in excellent health, and has recently been visiting friends in Derby, Connecticut.

—The coming marriage of HENRY M. STANLEY to Miss DOROTHY TENNANT, the clever London artist, seems to indicate that the intrepid explorer has grown tired of a life of adventure, and will stick more closely to the bounds of civilization in the future. Miss TENNANT, while not a young woman, is said to possess beauty of a noble and high-bred type, and is prominent in the literary and art circles of London.

—Ex-Secretary of the Navy WHITNEY and his family have gone to Europe for a prolonged stay.

—The late JAMES H. WORTH, of this city, a wealthy bachelor eighty years old, had a taste for collecting scarf-pins, and when he died left a large assortment of them. Some of these he gave to friends, while others, according to his will, are to be disposed of, and the proceeds given to charity.

—The DORR rebellion in Rhode Island is recalled by the death of ex-Governor ELISHA DYER at Providence. During the little insurrection he was Adjutant-General, and had entire charge of the State forces and plans. Later he was Governor for two terms. He was President of the first national musical congress, held at Boston in 1869, and President GRANT made him honorary Commissioner to the Vienna Exposition.

—Those who attend the Commencement exercises at Smith College, Northampton, Massachusetts, this year will be given an unusually ambitious entertainment by members of the graduating class. This will be the presentation of a musical composition based upon the book of Job, which has been arranged by Dr. BLODGETT, the Professor of Music. The work is mostly recitative, with choral elements, based upon a symphonic orchestral structure, which will be rendered by leading Boston musicians.

—JOHN ELLIOTT CURRAN, who died at Englewood, New Jersey, on the 18th of May, was one of the most promising of the younger writers of American fiction. His contributions to the leading magazines were read with interest, and a novel from his pen met with marked success. Among the best of his short stories were "Joe Gilfillan" and "Polly Winslow," published in HARPER'S MAGAZINE within the past year.

—ARTHUR ORTON, the "TICHBORNE claimant," tried to emerge from his obscurity and run for Parliament as a home-ruler recently, but could not pay the election bills, and was dropped.

—The author of the London *Times* articles on "Parnellism and Crime," a Mr. FLANNAGAN, was blackballed when he sought admission to the Athenæum Club in London recently.

—The English Countess of Carloty died recently in Paris, where she lived alone and apparently in poverty. After her death $10,000 in gold and $40,000 in notes were found in her room.

—ROBERT LOUIS STEVENSON has bought four hundred acres of land near Apia, Samoa, and will build a home there for his wife and himself.

—MICHAEL DAVITT, the Irish leader, is to edit a new weekly labor paper in London.

—A Berlin antiquary has come into possession of the dagger with which RAVAILLAC assassinated HENRY IV. of France. It was stolen from the Palais de Justice in Paris in 1815.

—The youngest man in the United States holding a regular Colonel's commission is NICHOLAS P. HARTMAN, of Brooklyn, twenty-two years old. While a boy in the Williamsburg schools he displayed unusual taste for military matters, and perfected himself in the sword drill. In 1886 his military attainments won for him an appointment to a special course in tactics at West Point, defective eye-sight preventing his admission to the regular course. There a company composed of officers from the various classes, selected for their proficiency in drill, was organized, with HARTMAN as Captain, and it soon became the best-drilled military organization in the United States. Captain HARTMAN has now been commissioned Colonel of the Washington military company, the crack organization of seventy-two men which forms the body-guard of the President. He is also regarded as the champion swordsman of America.

LANDING DRILL OF THE NAVAL BRIGADE WITH THE SQUADRON OF EVOLUTION AT CORFU.
DRAWN BY T. DE THULSTRUP FROM PHOTOGRAPHS TAKEN FOR "HARPER'S WEEKLY."—[SEE PAGE 430.]

ervice. 2. Artillery landing. 3. Throwing out a Company for Deployment—Artillery moving in Rear of Line to the Right Flank. 4. Climbing the Hill from Landing. 5. Marine Bugler.

tard. But they told their wives too much, and all my plans got known, till I learned to give false marching orders overnight, and take the men to quite a different village in the morning. Then we used to catch the simple *daku* before breakfast, and make him very sick. It's a ghastly country on the Hlinedatalone; all bamboo jungle, with paths about four feet wide winding through it. The *daku* knew all the paths, and used to pot at us as we came round a corner; but the mounted police knew the paths as well as the *daku*, and we used to go stalking 'em in and out among the paths. Once we flushed 'em—the men on the ponies had the pull of the man on foot. We held all the country absolutely quiet for ten miles round in about a month. Then we took Boh No-ghee—Hicksey and I and the civil officer. That was a lark!"

"I think I am beginning to understand a little," said Cleever. "It was a pleasure to you to administer and fight, and so on."

"Rather. There's nothing nicer than a satisfactory little expedition, when you find all your plans fit together and your conformations *tick*—correct, you know—and the whole *sub-chiz*. I mean when everything works out like formulæ on a black-board. Hicksey had all the information about the Boh. He had been burning villages and murdering people right and left, and cutting up government convoys, and all that. He was lying doggo in a village about fifteen miles off, waiting to get a fresh gang together. So we arranged to take thirty mounted police and turn him out before he could plunder into the newly settled villages. At the last minute the civil officer in our part of the world thought he'd assist at the performance."

"Who was he?" said Nevin.

"His name was Dennis," said the Infant, slowly; "and we'll let it stay so. He's a better man now than he was then."

"But how old was the civil power?" said Cleever. "The situation is developing itself." Then, in his beard, "Who are you to judge men?"

"He was about six and twenty," said the Infant; "and he was awf'ly clever. He knew a lot of literary things, but I don't think he was quite steady enough for Dacoit hunting. We started overnight for Boh No-ghee's village, and we got there just before the morning, without raising an alarm. Dennis had turned out armed to the teeth—two revolvers, a carbine, and all sorts of things. I was talking to Hicksey about posting our men, and Dennis edged his pony in between us and said: 'What shall I do? What shall I do? Tell me what to do, you fellows.' We didn't take much notice, but his pony tried to bite me in the leg, and I said, 'Pull out a bit, old man, till we've settled the attack.' He kept edging in, and fiddling with his reins and the revolvers, and saying: 'Dear me! dear me! Oh, dear me! What do you think I'd better do?' The man was in a blue funk, and his teeth were chattering."

"I sympathize with the civil power," said Cleever. "Continue, young Clive."

"The fun of it was that he was supposed to be our superior officer. Hicksey took a good look at him, and told him to attach himself to my party. Beastly mean of Hicksey, that. The chap kept on edging in and bothering instead of asking for some men and taking up his own position, till I got angry. The carbines began popping on the other side of the village. Then I said, 'For God's sake, be quiet, and sit down where you are! If you see anybody come out of the village, shoot at him.' I knew he couldn't hit a hay-rick at a yard. Then I took my men over the garden wall—over the palisades, y' know—somehow or other, and the fun began. Hicksey had found the Boh in bed under a mosquito curtain, and he had taken a flying jump on to him."

"A flying jump!" said Cleever. "Is that also war?"

"Yes," said the Infant, now thoroughly warmed. "Don't you know how you take a flying jump on to a fellow's head at school when he snores in the dormitory? The Boh was sleeping in a regular bedful of swords and pistols, and Hicksey came down *à la* Zazel through the netting, and the net got mixed up with the pistols and the Boh and Hicksey, and they all rolled on the floor together. I laughed till I couldn't stand, and Hicksey was cursing me for not helping him, so I left him to fight it out and went into the village. Our men were slashing about and firing, and so were the Dacoits, and in the thick of the mess some ass set fire to a house, and we all had to clear out. I froze on to the nearest *daku*, and ran to the palisade shoving him in front of me. He wriggled clear and bounded over to the other side. I came after him, but when I had one leg one side and one leg the other of the palisade I saw that my friend had fallen flat on Dennis's head. That man had never moved from where I left him. The two rolled on the ground together, and Dennis's carbine went off and nearly shot me. The *daku* picked himself up and ran, and Dennis buzzed his carbine after him, and it caught him on the back of his head and knocked him silly. You never saw anything so funny in your life. I doubled up on the top of the palisade and hung there yelling with laughter. But Dennis began to weep like anything. 'Oh, I've killed a man,' he said—'I've killed a man, and I shall never know another peaceful hour in my life! Is he dead? Oh, *is* he dead? Good God! I've killed a man.' I came down and said, 'Don't be a fool!' But he kept on shouting 'Is he dead?' till I could have kicked him. The *daku* was only knocked out of time with the carbine. He came to after a bit, and I said, 'Are you hurt much?' He grinned and said no. His chest was all cut with scrambling over the palisade. 'The white man's gun didn't do that,' he said. 'I did that myself, and I knocked the white man over.' Just like a Burman, wasn't it? Dennis wouldn't be happy at any price. He said: 'Tie up his wounds. He'll bleed to death. Oh, my God, he'll bleed to death!' 'Tie 'em up yourself,' I said, 'if you're so anxious.' 'I can't touch him,' said Dennis, 'but here's my shirt.' He took off his shirt, and he fixed his braces again over his bare shoulders. I ripped the shirt up and bandaged the Dacoit quite professionally. He was grinning at Dennis all the time; and Dennis's haversack was lying on the ground, bursting full of sandwiches. Greedy hog! I took some and offered some to Dennis. 'How can I eat?' he said. 'How can you ask me to eat? His very blood is on your hands, oh God! and you're eating *my* sandwiches!' 'All right,' I said. 'I'll give 'em to the *daku*.' So I did, and the little chap was quite pleased, and wolfed 'em down like one o'clock."

Cleever brought his hand down on the table-cloth a thump that made the empty glasses dance. "That's art," he said. "Flat, flagrant mechanism. Don't tell me that happened on the spot!"

The pupils of the Infant's eyes contracted to two points. "I beg your pardon," he said, slowly, and a little stiffly, "but I am taking this thing as it happened."

Cleever looked at him for a moment. "My fault entirely," said he. "I should have known. Please go on."

"Oh, then Hicksey came out of what was left of the village with his prisoners and captives all neatly tied up. Boh No-ghee was first, and one of the villagers, as soon as he saw the old ruffian helpless, began kicking him quietly. The Boh stood it as long as he could, and then groaned, and we saw what was going on. Hicksey tied the villager up and gave him half a dozen good to remind him to leave a prisoner alone. You should have seen the old Boh grin. Oh, but Hicksey was in a furious rage with everybody. He'd got a wipe over the elbow that had tickled up his funny bone, and he was simply rabid with me for not having helped him with the Boh and the mosquito net. I had to explain that I couldn't do anything. If you'd seen 'em both tangled up together on the floor, like a blaspheming cocoon, you'd have laughed for a week. Hicksey swore that the only decent man of his acquaintance was the Boh, and all the way back to camp Hicksey was talking to him, and the Boh was grumbling about the soreness of his bones. When we got home, and had had a bath, the Boh wanted to know when he was going to be hanged. Hicksey said he couldn't oblige him on the spot, but had to send him to Rangoon. The Boh went down on his knees and reeled off a catalogue of his crimes—he ought to have been hanged seventeen times over by his own confession—and implored Hicksey to settle the business out of hand. 'If I'm sent to Rangoon,' said he, 'they'll keep me in jail all my life, and that is a death every time the sun gets up or the wind blows.' But we had to send him to Rangoon; and of course he was let off down there, and given penal servitude for life. When I came to Rangoon I went over the jail—I had helped to fill it, y' know—and the old Boh was there, and recognized me at once. He begged for some opium first, and I tried to get him some; but that was against the rules. Then he asked me to have his sentence changed to death, because he was afraid of being sent to the Andamans. I couldn't do that either; but I tried to cheer him, and told him how the row was going up country. And the last thing he said was: 'Give my compliments to the fat white man who jumped on me. If I'd been awake I'd have killed him.' I wrote that to Hicksey next mail, and—and that's all. I'm 'fraid I've been gassing awf'ly, sir."

Cleever said nothing for a long time. The Infant looked uncomfortable. He feared that, misled by enthusiasm, he had filled up the novelist's time with unprofitable recital of trivial anecdotes.

Then said Cleever: "I can't understand it. Why should *you* have seen and done all these things before you have cut your wisdom teeth?"

"Don't know," said the Infant, apologetically. "I haven't seen much, only Burmese jungle."

"And dead men and war and power and responsibility," said Cleever, under his breath. "You won't have any sensations left at thirty if you go on as you have done. But I want to hear more tales—more tales." He seemed to forget that even subalterns might have engagements of their own.

"We're thinking of dining out somewhere, the lot of us, and going on to the Empire afterward," said Nevin, with hesitation. He did not like to ask Cleever to come too. The invitation might be regarded as "cheek." And Cleever, anxious not to wag a graybeard unbidden among boys at large, said nothing on his side.

Boileau solved the little difficulty by blurting out, "Won't you come too, sir?"

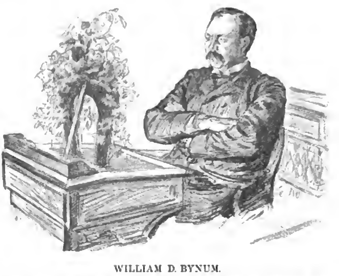
Cleever almost shouted "Yes," and while he was being helped into his coat, continued to murmur "Good heavens!" at intervals, in a manner that the boys could not understand.

"I don't think I've been to the Empire in my life," said he. "But, good heavens! what *is* my life, after all? Let us go back."

So they went out with Eustace Cleever, and I sulked at home, because the boys had come to see me, but had gone over to the better man, which was humiliating. They packed him into a cab with utmost reverence, for was he not the author of *As it was in the Beginning*, and a person in whose company it was an honor to go abroad? From all I gathered later, he had taken less interest in the performance before him than in the boys' conversation, and they protested with emphasis that he was "as good a man as they make, knew what a man was driving at almost before he said it, and yet he's so dashed simple about things any man knows." That was one of many comments made afterward.

At midnight they returned, announcing that they were highly respectable gondoliers, and that oysters and stout were what they chiefly needed. The eminent novelist was still with them, and I think he was calling them by their shorter names. I am certain that he said he had been moving in worlds not realized, and that they had shown him the Empire in a new light. Still sore at recent neglect, I answered, shortly, "Thank Heaven, we have within the land ten thousand as good as they!" And when Cleever departed, asked him what he thought of things generally.

He replied with another quotation, to the effect that though singing was a remarkably fine performance, I was to be quite sure that few lips would be moved to song if they found a sufficiency of kissing. Whereat I understood that Eustace Cleever, decorator and color man in words, was blaspheming his own art, and that he would be sorry for this in the morning.



WILLIAM D. BYNUM.

The present session of the House of Representatives has been marked by many manifestations of bitter feeling. Such manifestations are not unprecedented in parliamentary bodies, but they are not common. If it were possible to lay down a general rule that would invariably explain these outbursts of human passion, it would be that they occur when the minority believes that it is oppressed by a tyrannical majority. Then there flashes out that wild rage which comes from the realization of injury and wrong and of utter powerlessness.

The House of Commons has been torn with wild disorder many times in the course of its long and eventful history—when the Stuarts, in their assertions of prerogative, threatened invasions of the rights of the people; when the king attempted to arrest the protesting members; and, later, when the Conservatives adopted closure for the purpose of taking away the ancient right of unlimited debate.

In recent years in our own House of Representatives there has been intense excitement on several well-remembered occasions—when the small band of Democrats of those days were resisting reconstruction legislation, when the Electoral Commission bill was pending in 1877, and oftener during the present session than at any other time except immediately after the war.

The cause of all the excitement and disorder that has obtained in the present Congress is perfectly well understood. The Democrats insist that the Republican Speaker has despotically assumed unconstitutional powers, that he has so restrained the minority as to deprive it of all part in the work of legislation, that he persistently ignores Democrats who are trying to secure recognition, that he passes bills by his own volition, and that he subverts all laws under which in representative governments the minority of a deliberative body enjoys important rights. The answer to this is, of course, that Mr. Reed is doing only what the Constitution gives him the right to do, and that his motive is praiseworthy, because he is simply endeavoring to facilitate business. This is the issue; but it cannot be discussed in the House, because Mr. Reed carries out his purpose without regard to the angry protests of the minority, and because he exercises the almost arbitrary powers of the Speaker, being sustained in his position by a thoroughly well disciplined majority.

The men who have been most conspicuous in a noisy opposition to the Speaker are Mr. Bynum (whose portrait is given), Mr. Springer, and Mr. Breckinridge, of Kentucky. All these gentlemen have openly defied and resisted Mr. Reed's authority, and have denounced him as a despot, and even as corrupt. Mr. Reed himself has preserved a dignified exterior during the trying ordeal, but inwardly he has raged against the restraints of his office which have compelled him to quietly submit to reiterated insults. It is known that he has even contemplated asking the Republican leaders to move the expulsion of some of the more outspoken of the Democrats. Such a motion could not have succeeded, for a member cannot be expelled except by a two-thirds vote; but if it were made, it could not fail to include Mr. Bynum, who during the debate on the rules, in the early part of January, insisted on shouting his disapproval of the Speaker and the majority, and, with the possible exception of Mr. Springer, was the most conspicuous figure among the disorderly Democrats. His most recent appearance was before the bar of the House to be censured by the Speaker for words spoken in debate which were insulting to Mr. Bayne, of Pennsylvania. On this occasion the House witnessed a singular scene, Mr. Bynum being accompanied to his punishment by as many of his Democratic fellow-members as could crowd into the semicircular space in front of the Speaker's desk. Mr. Reed himself seemed to be overcome by the extraordinary demonstration; for when he had ordered the Democrats to take their seats, and Mr. Springer had shouted, "We won't," he failed to do what any of his predecessors would have done at once—order the Sergeant-at-arms to carry about the mace, the symbol of the power of the House, and to compel obedience to the Speaker's orders. The comment of a competent critic on the episode was as follows: "Mr. Bynum's resentment has been justified by Mr. Bayne's admission of the worthlessness of Campbell's accusations, and his punishment, which he was fully justified in regarding as a decoration, could be very properly atoned for by expunging the order for censure upon a motion to reconsider."

Mr. Renouard's picture was drawn immediately after Mr. Bynum had made a striking speech on the tariff. It will be seen from his face that he is a very intense and earnest man. He is still young, having been born in Indiana nearly forty-four years ago, and has been in public life since 1871, when he was elected City Attorney of Washington, Indiana. He was first nominated for Congress in 1884, and his campaign attracted the attention of the country, for it was conducted almost exclusively on the tariff issue. It was supposed that Mr. Bynum would be defeated, because Indianapolis, the chief city of his district, was a centre of manufactures as well as of railroads. A band of young lawyers, chiefly mugwumps, made a vigorous and aggressive fight, holding meetings of working-men, and preaching the doctrine of revenue reform in the very factories. Mr. Bynum was elected. Since his advent in Congress he has been an outspoken and prominent member, intensely partisan, and always ready to assert his own and his party's rights.

the sight of the flag stirs
with the sound of martial

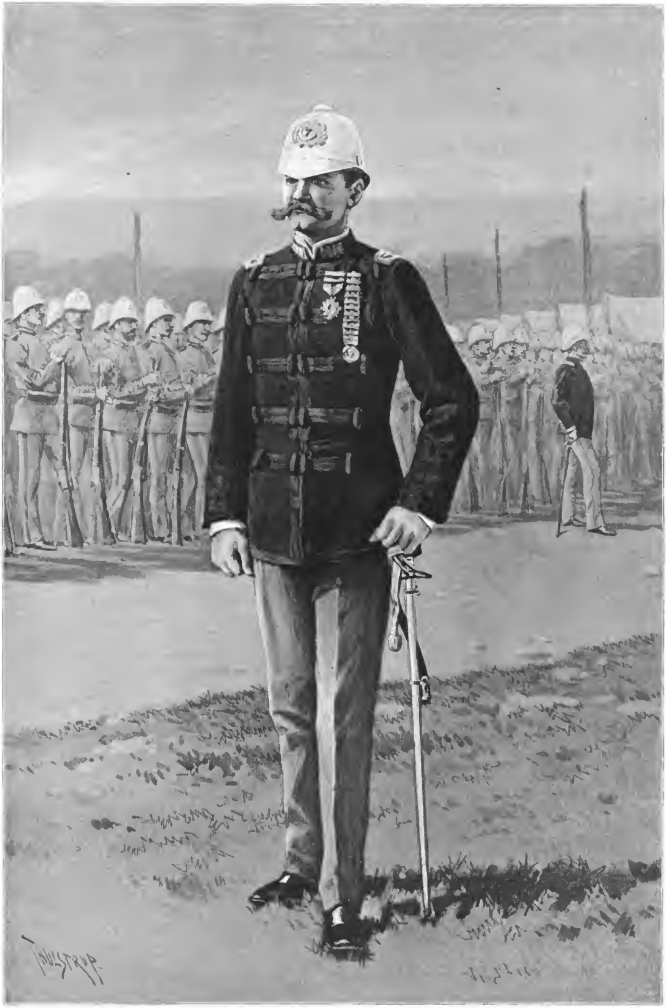
music—the brisk tunes to which troops march off to the war, and the more sonorous battle hymns. "The shrill trump, the spirit stirring drum, the ear piercing fife," have a place no less than the plumed troop and the royal banner in Othello's memory of the quality, pride, pomp, and circumstance of war, and unnumbered are the instances of the cheering effect of patriotic music in the din of combat.

It is this appeal through the eye and the ear to the heart of the soldier that Mr. Gilbert Gaul depicts in his canvas "Encouraging the Line." The movement and life of the picture instantly strike the observer—the worn but sturdy color-bearer; the fifer with eyes intent on the battle as he moves on; the apprehensive glance of one of the drummer-boys in the same direction, while his comrade has already the courage of a veteran, the cheering throng of officers and men, set off here and there with a grim and stolid figure, and over all the flag, with the stars on its azure field and its inscriptions of past victories on the stripes, a triumphant spectacle.

Such a picture suggests the sentimental value of martial adjuncts, which the modern utilitarian spirit has sometimes proposed to abolish. A few years ago a French Minister of War, General Farre, tried the experiment of prohibiting drums, because they employed the services of men who might otherwise wield rifles and often in battle are lost or destroyed. But drummers have also shown their ability to use rifles in case of need, and above all, they, like the color-bearers, carry appliances that stimulate a martial bearing in others. Philosophers may argue against the folly of worshipping a bit of bunting, but while human nature remains what it is the flag will continue to be an object of patriotic adoration for the sake of what it typifies.

Especially appropriate is the sketch from Mr. Gaul's picture given in the present number of the Weekly to the week which includes the annual celebration of our Memorial Day. It is an occasion consecrated to the memory of those who died in the defence of the flag and of the Union it symbolizes.

"Never more as dead, never more as lost,
Are they held whom nations guard and keep."



DANIEL APPLETON, COLONEL OF THE SEVENTH REGIMENT, N. G. S. N. Y.—Drawn from Life by T. de Thulstrup.—[See Page 430.]

ANDING DRILLS" WITH THE SQUADRON.

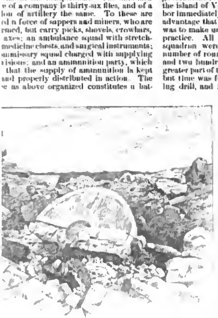
mong the manifold duties which our na- fficers and men of wars' men may at any be called upon to perform, one of the t important is that of landing under arms r for the protection of the lives and prop- of American citizens threatened by riots ncivilized or half-civilized countries, as lexandria in 1882; for the attack of for- l positions on shore, as in Corea in 1871; r more extensive operations involving a iderable tract of country and prolonged upation, as at Aspinwall in 1885. As a aration for work of this kind, a "landing e" is organized on every ship and in every dron, and advantage is taken of all op- unities for drilling this force in order the men may be, as far as possible, iliarized with duties which, when all been done, must still remain foreign to their habits and traditions. The very that it is foreign to these habits and tra- ons gives it an interest for the average jacket, which, with the element of pic- squeness that always attaches to a sailor hore, makes this the most attractive of all drills in the routine of a man-of-war.

he landing force of an individual ship, ists of a certain number of companies of ntry and pieces of artillery, varying with size of the complement. The standard e of a company is thirty-six files, and of a ion of artillery the same. To these are ed a force of sappers and miners, who are rmed, but carry picks, shovels, crowbars, axes; an ambulance squad with stretch- medicine chests, and surgical instruments; ommissary squad charged with supplying visions; and an ammunition party, which that the supply of ammunition is kept and properly distributed in action. The e as above organized constitutes a battalion. It is complete in itself, as will be seen. When several battalions are combined they form a naval brigade, in which the various artillery forces are united in a single battalion of artillery; the companies of marines in a single battalion of marines; the sappers and miners, the commissary, ambulance, and ammunition squads in much larger forces acting for the brigade as a whole. The equipment of the individual sailor or marine varies with the service to be performed. In landing for distant service, or for more than a single day, he carries a knapsack and blanket, haversack with a day's rations, canteen, ammunition, and of course a rifle. The ammunition carried on the person consists of a hundred cartridges, these are carried in little pockets in a woven belt about the waist. This includes two magazines ready charged, which are worn in the belt ready for instant attachment to the piece; for the rifle carried by the sailors is a magazine arm of the latest and most improved type, except in the one important particular of calibre. This is just one-third greater than it should be.

The uniform worn in landing consists of a blouse and trousers of coarse white material, with a skull cap knitted of blue yarn. Leggings are worn to confine the trousers about the ankles. The whole costume is neat, comfortable, and business-like. The marines wear their usual fatigue dress, and carry practically the same accoutrements as the blue jackets. They are armed, however, with the army pattern of Springfield rifle instead of the Lee, and they have not the same supply of ammunition as that carried in the web belts of the sailors. As has been said, advantage is taken of every opportunity that can be found for landing drills; but such opportunities are rare on foreign stations, as very few governments will give permission for the landing on their territory of the armed forces of another power. No European government probably would give such permission to any of its neighbors; but an exception is sometimes made in favor of our squadrons on this station. We have often been allowed to land at Port Mahon, and it was hoped that permission to land there would be granted to the Squadron of Evolution; but when the request was made, it was very courteously refused. This was a serious disappointment at the time; but in the end it made no difference, as the privilege refused by the Spanish authorities was afterward granted by the French. Two weeks were spent in Port Mahon, and although no landing could be made, the time was well occupied in other drills, for which that quiet harbor presented many advantages not usually found. Through the kindness of the French authorities the opportunity for landing was found at Villefranche, and the three weeks spent by the squadron in that port were occupied with this drill to the exclusion of all others. The officers went ashore as often as is the time-honored custom at Villefranche; but their time was spent not at Nice and Monte Carlo, but in clambering about the rocky promontory of Cape Ferrat. A landing was made every day except Saturdays and Sundays. The different ships landed and drilled their battalions separately, and no attempt was made at brigade organization or drill, the time being fully occupied in the simpler movements of the "School of the Battalion." A steady improvement marked the landing and drilling from day to day. The time required for equipping, embarking, and landing the whole force was reduced by more than one-half in the course of little more than a week of drilling.

Upon the arrival of the squadron at Corfu permission was readily given by the Greek government for the landing of our forces on the island of Vido, a large island in the harbor immediately opposite the city. The first advantage that was taken of this permission was to make use of the island for rifle target practice. All the officers and men of the squadron were required to fire a certain number of rounds at ranges of one hundred and two hundred yards. This occupied the greater part of the three weeks spent at Corfu, but time was found at the end for one landing drill, and for this the battalions of the ships were combined in a brigade of eight hundred and fifty men, under command of Commander F. E. Chadwick, of the *Yorktown*. As the ground on the island is very irregular, it was difficult to carry out any very formal tactical evolutions, and the time was principally devoted to skirmishing, this being regarded as the most important work that a naval force would be called upon for in the event of a landing for actual business in any of the wild countries where such a landing would be likely to be made. The boats of the various ships pulled in successively to a little cove on the south side of the island, which presented the only favorable spot for landing, and having disembarked their men, were towed off by steam launches and anchored well clear of the beach, leaving the landing clear for the boats of the next ship. The men fell into ranks, and were marched off with a promptness born of much practice at Villefranche. Line was formed along a ridge which runs the length of the island, and from which the land falls suddenly toward the landing-place on the south side, but slopes more gradually to the northward, forming an undulating tract nearly a half mile square, on which the manœuvres took place. These, as has been said, consisted principally of the deployment, advance, and retreat, and assembling of skirmishers. An enemy was supposed to occupy certain high ground at the northern end of the island, the line of his intrenchment being indicated by markers' flags. Toward this position two lines of skirmishers were thrown out. All movements were made by signal sounded on the bugle, the skirmishers advancing or retreating, lying down, firing, rallying, etc., at the call. In the end, having approached close to the enemy's position with such shelter as the ground afforded, the first line was re-enforced by the second, and the signal given both to charge. This was the moment for which the men had been impatiently waiting, for there is a great deal of the school-boy spirit in a blue jacket, and he delights in nothing so much as in a chance to "charge with a cheer," whether in earnest or in make believe. The enemy's position was carried in gallant style, though not without casualties, for one officer got a tumble, resulting in a badly sprained ankle, and two sailors also fell and were considerably bruised, one of them requiring to be sent off the field on a stretcher.

The drill closed with a review. Line was formed and inspected, and then at the order the companies wheeled into column, and marched past the reviewing stand with the steadiness of veterans to the tune of "Marching through Georgia." Then came the march to the landing, the embarkation, and the return to the ships. The brigade organization, although tried for the first time, worked without a hitch, and the officers, although very few of them had seen a brigade drill, went through their work as if they had been brought up in the "School of the Brigade." The Admiral, who witnessed the manœuvres from the top of the ridge which overlooked the ground, was much gratified with the precision and the spirit manifested.



UINS OF FORTIFICATIONS ON VIDO, DESTROYED BY THE ENGLISH IN [illegible]

"MRS. BRER JONES."

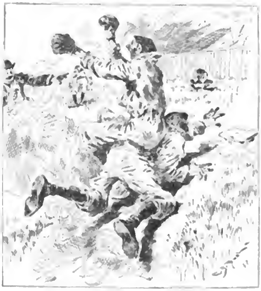
THE Zion M. E. African Church of Dixville was in a ferment. Conference was over. The Rev. Solon Bulger and family had departed to Paddy Run, and the Rev. Cato Jones, who had filled two appointments in Chicago with great acceptance, was expected. Dixville was becoming an important manufacturing point, and felt it deserved, if it could not support, as capable a preacher as there was to be had. Moreover the Baptist African had become a formidable rival. After repairing their meeting-house and hanging a loud-tongued bell in their new tower, the colored Baptists had called Mr. Bushwhack from Cincinnati, and his eloquent appeals had resulted in a great revival and an energetic stirring of the "baptismal waters."

"We's saved by faith, an' not by wrastlin' awfter de pomps and wanities ob dis wicked an' transitory worl'," Uncle Jupiter Phipps had always said when repairing the Zion meeting-house had been under discussion. "Ef dar's one t'ing I'm mo' agin dan anoder, it's pride." But when he saw the young waiters from the National House and other hotels deserting to the Baptists, and Uncle Noah Hill, who, though he did not belong to Zion, called himself "a hoper," and gave generously, for his means, to its support, not only sneaking off to see Mr. Bushwhack immerse candidates for church membership in Goose Creek, but actually going to Baptist meetings, even he admitted that something must be done. So, after much controversy, Zion meeting-house was painted a fine greenish yellow outside and an equally fine yellowish green inside, and Sam Buckles was authorized to apply a certain sort of paper to the windows which, it was said, would make them as handsome as if they were of the most costly stained glass.

Just before conference sat, Uncle Jupiter, who was energetic when started, persuaded his employer, Mr. Brill, to write for him to the bishop. "Fo' all, in course, we mus' hab a man as can lif' de ha'r plum offen de haids ob sinners w'en dey hears him a launchin' out. Den he mus' hab mannahs—dem dar takin' mannahs, like de gum on fly paper as sticks what touches it. An' las' an' p'intedly, he mus' hab de sense ter sashay round dem pitfalls de debbil is so handy at diggin' in dis yer town roun' preachers," dictated Uncle Jupiter. "Tell him, sah, ef he done sont us a 'postle as can't git along wid ole Unc' Pete Lummis, who's allus a argyfyin' an' wid de w'ouman, he'll made a fizzle ob it, no mattah what else he is."

It was supposed that the appointment of the Rev. Cato Jones was the result of this epistle.

Having a lively sense of "benefits to come," the sisters determined to give Mr. and Mrs. Jones a grand reception. (It was taken for granted that there was a Mrs. Jones.) So the parsonage was made as clean as hands could scrub it; and the day before the new-comers were expected, a dozen or more of the older women met at the house of Aunt Serena Paradise to quilt an elaborate bed cover, which was to be pre-



SARCASM

"How's that, Umpire?"

sented to Mrs. Jones with an appropriate speech.

As in some other churches, heavy financial burdens fell upon the female half of Zion membership. Sewing societies, taffy-pullings, jug-breakings, and home talent concerts eked out the subscriptions of the brethren, and these oftener than not were scraped together by the women of the several households.

"'Pears like dar's mons'ous little wuk in de bredderin," complained Aunt Dinah Lummis, when, at the end of the year, the treasury being empty, the usual appeal was made to the sisters to "come up to the help of the Lord against the mighty." "It do look like ter me dey jess reckon dey's done dere pa't by holdin' office an' talkin' in meetin'."

Naturally, under such circumstances, the pastor's wife was expected to lend a zealous hand to all church undertakings, and not only to make bread for herself and family, but literally to earn it. Unhappily a pastor's wife has her share of human weaknesses and limitations, and the position is notoriously difficult. So it is not wonderful that the ladies whose husbands had ministered at the M. E. African had been found more or less below the ideal of the more exigent of the sisters. But hope rose with each new appointment; and though nothing was known of the expected Mrs. Jones, much was anticipated, and she had been made president of everything and responsible for everything in advance.

"I rickon, Sis Pa'adise, dis yer Sis Brer Jones are a 'ooman as is a 'ooman, er he wouldn't noways be 'pinted twict at Chicago," reasoned Aunt Judy Phipps, who was the first to arrive at the quilting. "I rickon dem folks at Chicago wouldn't be what dey is ef dey 'lows foolishness when dey's payin' out dere money fo' sumpin' diffunt. Senct ole Mis' Perry died, de fus' year she war here, ebery pawster's wife we'n had's been triflin', er lazy, er had a mis'ry, er sumpin'. Dar was Sis Bulger, wid two pa'r ob twins when she come hyar, an' she mus' go an' hab anoder set! 'Pears like she rickoned she cud 'dulge herself in all de twins she wanted. An' Sis Humpy's mis'ry, fus' in one place an' den in nurrer place! Um-m-m-m! I was plum wo' out waitin fur her to die er git well, an' she di'n't do neder. Ef dis yer Sis Brer Jones tu'ns out wuff her salt, let alone her bread an' meat, I'll be thankful ter glory."

"We'll fin' out by waitin'," said Aunt Serena, pushing her spectacles up on her forehead. "But, Judy, I's ben studyin' bouten de pawster's wife lately, an' it's ben boun in on my mind dat de Scripter doan say a wo'd bouten *her* bein' called. She air chosen. Dat's de way it looks ter me. An' dat's all dere is to it."

Aunt Serena lived on the interest of her money, could read, and was altogether the most influential person in the Zion connection. In her youth a slave, her tiny fortune was the gift of her old mistress, who had been a great lady in her day, but friends dead and wealth gone, Madam Paradise had died in the arms of Aunt Serena, and the chief mourner at her grave had been the whilom slave. It had been a bitter trial to leave Oak Hill and the South; but Aunt Serena's one tie on earth was John Brill, Madam Paradise's nephew, and him she had followed into the North, and at last to Dixville, and her neat white cottage next the Zion parsonage had become the social apex of colored society in that enterprising town, in spite of the fact that more than one colored family enjoyed a larger income. Few ventured to differ with Aunt Serena, and no one to disregard her opinion.

"My land ter gracious!" exclaimed Aunt Judy, distressfully, but most respectfully. "But yoo mussent fo'git how dem Babtises is a totin' off de young folks, an' a cussarin' da ole ones like Unc' No', de ole sinnah. Mighter jined de a'k mo'n twenty year, but he wouldn't." Then anxiety getting the better of the habitual awe in which she stood of Aunt Serena, she added: "An' w'ut a body t'inks to deirselves dey ain't noways 'bleeged ter tell on, an' I hopes yoo won't tell yoo 'pinion roun' permiscuous, 'ca'se wid dese repuirin's an' Brer Bushwhack a-takin' a nip at us ev'y side, we has ter hab all han's in de fiel'. Moreovah, we is boun' ter git de wuff ob our money outen somebody, an' dis Sis Brer Jones orter make up ter us fo' some ob de triflin' on 'counts we's had afo'."

When the quilt was surrounded by workers, and had been rolled twice, who should enter but Mrs. Sally Skittles, the great lady of the Baptist society, and with her was a gay young creature she introduced to the company as "Miss Ann-er-liza Dixon, ob Chicago."

Mr. Jonah Skittles was the manager of a prosperous steam laundry, and Mrs. Skittles wore a silk gown and a watch that appeared to be gold, and held herself very haughtily indeed.

"I jist drapt in ter fotch yoo a bokay, Miss Paradise," she said, flouncing up to Aunt Serena, and giving her a huge nosegay. "'Tain't no gre't, but our gardinº is scraped 'most clean fo' Brer Bushwhack's tin weddin'. I hopes yoo all 'll come. De chu'ch is gwin ter gib him a comme'tary dat Jo Lossing sez weighs nigh onter fifteen pound, an' Miss Bushwhack is gwin ter hab a wheelbarry load ob tin."

Aunt Dinah Lummis raised her head in indignation. Not only was Mrs. Skittles patronizing Aunt Serena, but she was affecting ignorance of an event that all Dixville—at least colored Dixville—was looking forward to with the keenest interest.

But Aunt Serena, with that dignity which curiously discomfited Mrs. Skittles, took the flowers, and said, gently, she was much obliged. "But as ter de tin weddin'— Ob co'se yoo knows our new pawster is comin' fum Chicago!" Unconsciously her voice took a lingering pleasure in the name Chicago. And Aunt Dinah, unable to contain herself, muttered audibly that "ye cud buy a wheelbarry load ob tin fo' fifty cent at de dime sto'."

"Aw—yas; I's hearn ob dat pawster yoo's lookin' fo," admitted Mrs. Skittles, her little eyes twinkling with malice. "I reckin yoo's feelin' pooty jubersome bouten him. I's sorry fo' yoo, shorely."

"Sorry!" exclaimed impetuous Aunt Judy Phipps. "Sorry! Whater yoo mean, Mis' Skittles? I kin hear all yoo knows, yoo needn't spen' time a-hintin'."

"I knows some t'ings," admitted Mrs. Skittles, tossing her head, "an' fo' a fac', I knows nuttin' good."

"Ye doan mean it!" groaned Aunt Dinah, quite overcome. And the other women set up an echo of lamentation.

"Tell 'em, chile, w'at yoo'n done tole me bouten Sis Jones," said Mrs. Skittles to her friend.

Miss Dixon giggled behind her Japanese fan, and shook her head until entreated to tell her secret by Aunt Judy.

"Waal, 'twas disorway," at last began Ann-er-liza, twirling her rings. "My cousin Tilly ma'id Jim Clay, an' dey libs outen ter Tyburn Place, an' nex' do' to de deacon ob dis yer Mr Jones's chu'ch. An' I've hearn Tilly say dat dis Mis' Jones nevah do a lick fo' de chu'ch, no 'um, an' when de membahs come ter tea er drap in, stid er whulin' in an' makin' waffles er sumpfin, she jes struck a trot roun' de neighborhood an' borr'ed, an' borr'ed, an' borr'ed; an' ef she cuddent mek out dat way, she jes went to der bake shop. An' onct I went ter one ob dere sociables, an' I had a sand-ridge"—Miss Dixon's face drew up in retrospective disgust—"waal, it war like sawdust, an' dey said as dat was Mis' Jones's cookin'! But clothes! My king, yoo orter see that 'ooman's clothes!"

Aunt Judy groaned and almost wrung her hands, and there were sorrowful exclamations on all sides. But Aunt Serena did not forget the dignity of her Church, and her usually placid soul was moved out of its habitual calm.

"I reckon de Methodis' bettah wait till dere po' sheep is on de scales afo' dey weighs 'em," she said, as a sort of general remark addressed to the company. "An' ef de wust is afo' us, it air time enuff ter wrastle wid it when it hab come ter town."

At this moment, between the two snowball bushes that guarded the gate, and which were now white with blossoms, Uncle Jupiter Phipps appeared, hat in hand, his broad face beaming, and his body describing a series of wonderful if short curves, which was his way of indicating a high degree of satisfaction. Beside him walked a young colored man, comely, though inky black.

"Laws a mussy, Aunt S'rena," cried Uncle Jupiter, delightedly, "who does ye t'ink dis yer gemmun is? My, I's ben dat flustrated sence he come dat I's all tore up. Yas, 'm. Dat's so. An' Mr. Brill, yoo jist orter see him! 'My Moses!' sez he. He allus sez dat air when he all doubled up wid s'prise. 'My Moses! Cato!'"

Uncle Jupiter mopped his brow with his red bandanna, and his wife broke in, impatiently: "Tell us de news, Jupe. Yer keepin' us yere gapin' at ye, like a dozen hoptoads at a fly."

But Uncle Jupiter was past fear of Aunt Judy now. He was born on the plantation adjoining the Paradise estate, the property of Major Brill, his present employer's father, and shared Aunt Serena's devotion to Oak Hill and the past. "Yoo neber can t'ink who he are," he went on, with an admiring gesture toward the stranger, who stood waiting, self possessed and smiling. "He are—ole Jo's boy's—boy. Jo's boy Sam come Norf an' called heself Sam Jones. Dar yoo is. An' he's our new pawster."

Old Joe had driven the Paradise horses when Aunt Serena was young. Memories tender and memories sad stirred within her. She seemed to see the long avenue of live-oaks that led to Oak Hill, and heard the soft exultant song of the mocking-birds. But a rustle of Mrs Skittles's gown brought her back to the present, and with a swift movement she laid her hand upon the new pastor's arm. "What's yoo wife?" she asked, solemnly.

"I have no wife," said Mr. Jones, with modesty; but something, a shade—perhaps—passed over his face, and one wise in the art of reading his race might have guessed that he had matrimonial anticipations.

"No wife!" echoed Aunt Serena, turning upon Mrs. Skittles and her friend. "Yoo heah, Mis' Skittles. No wife 'tall."

"What chu'ch did dat Mis' Jones b'long to yoo's tell us dat story 'bout?" asked Aunt Judy, severely. She wanted the fact for future use in case another Mr. Jones was appointed to Dixville. Moreover, her curiosity was insatiable about ministers of every sect.

"I dun'no'," said Miss Ann-er-liza, blankly. "Cousin Jim he are a Christian Campbellite, and his wife she are a fawty gallon Baptis', but I's a 'Piscopal. I on'y tole ye what I done heard. I dun'no's a body's ter blame fer hearin'. Ye can't noways close yer ears. An' I nevah 'flected as how dar ar Sis' Brer Jones mout not be a Methodis'. I's mighty fo'gitful."

"Ye can't noways make somefin outen nuffin'," said Aunt Serena to herself, as with darkling brow she watched Mrs. Skittles and Miss Dixon disappear round the corner, and quite unconscious that she was, in a way, quoting Shakespeare. "Fo'gitful! Ahum-m-m-m!" Then she turned to the company, now buzzing in a perfect ecstasy about Mr. Jones. "You all riccolec' what I say, folks as hears so much hears mor'n happens. Dey heahs what ain't so. Dar's nuffin' easier den bein' mistaken. Specially 'bout folks."

ELIZABETH CUMINGS.

RIPLEY ROPES.

Of late years a great deal has been said of the delinquencies of business and professional men in our cities with respect to their political duties, and at their doors has been laid much of the responsibility for corrupt and loose municipal governments. It is an entirely safe proposition that if the counting-room took as much part and interest in public affairs as the saloon does, the situation would be vastly improved. The respectable business men who do their whole duty as members of a self-governed community are comparatively few. It is due to this unfavorable condition of things that the record of the subject of this sketch is a peculiarly bright and edifying one. The search must be far and wide to find a man who comes nearer to the ideal American citizen than did Ripley Ropes, who died at his residence, No. 40 Pierrepont Street, Brooklyn, on May 18th. He was a merchant and financier of exceptional ability and energy, social, sympathetic, unselfish, charitable, and keenly alive to the demands of a popular form of government upon the individual. His business and his political morality were cast in the same mould. The latter, like the former, did not stop at sentiment, but was put into effective practice with marked results. His example plainly said to the great number of men of good standing who complain of political degeneracy, "If you wish for a better state of things, this is the way to go about securing it."

Mr. Ropes was born in Salem, Massachusetts, in 1820. His father, Benjamin Ropes, was a Captain in the war of 1812. When a boy of ten years he carried and delivered to its subscribers the Salem *Register*, an occupation in which each of his four older brothers had preceded him. Subsequently he was cashier of the same newspaper, and remained so until, at fifteen, he began to learn a trade. At the age of twenty he went into mercantile business with his brother Reuben, in Salem. The firm removed to New York some twenty years later, in 1862, where the two brothers prosecuted a large and successful South-American trade, and both accumulated fortunes. Mr. Ropes was interested in various banks, insurance corporations, railways, was director of the Union Ferry Company, member of boards of benevolent institutions, trustee of Packer Institute, etc. In 1873 he accepted the Presidency of the Brooklyn Trust Company, which office he held at the time of his

Though Mr. Ropes entered politics as a Republican, he was essentially independent. One of his first acts in office was to vote for the Democratic candidate for President of the Board of Aldermen, on the ground that he was a better man than his opponent. He voted for Cleveland in 1884 and 1888. The good of the community was his first consideration. In religious belief he was a Unitarian, and he was helpful in church matters as in everything else he was connected with. Above all, he was a full-rounded citizen in all the term implies—a high type of the material out of which the saving political leaven of this country must be composed.

AMOS W. WRIGHT.

THE LATE RIPLEY ROPES.—From a Photograph. [illegible]

FLETCHER HARPER.

FLETCHER HARPER died at his house in East Sixtieth Street, New York, on the 23d last, in the sixty-second year of his age. He had been for many years in precarious health, though he did not die of any specific disease, but of that general waste and decay of the system which is known to physicians as marasmus.

Fletcher Harper was born October 7, 1828, and was the second son of Fletcher Harper, the youngest of the original members of the firm of Harper & Brothers, the first and the only other child being the late Joseph W. Harper, Consul-General of the United States at Munich. The younger Fletcher, who has been best known in New York as Fletcher Harper "Junior," was born and passed his boyhood in New York, with the exception of a voyage to China before the mast, which he made at the age of sixteen. This was not exactly an escapade, but the result of a caprice, of which his father thought he would be more thoroughly cured by gratifying it than by thwarting it. The result approved the paternal wisdom, for the experience sufficed for the son. After finishing his Junior year at Columbia, and before entering upon his practical apprenticeship to the work of the house of which his father was a member, young Fletcher spent a year travelling in Europe with his parents. Soon after the founding of the New York *Times* his father bought an interest in the paper for him, and in April, 1858, the style of the proprietorship of the *Times* became "Raymond, Harper, & Co." The copartnership lasted only for a year or so, when Mr. Harper's interest was transferred to the other owners. The young man thereupon resumed his place in the house of Harper & Brothers.

He became a member of the firm in 1869, upon the death of Mr. James Harper, and for some time took special charge of the Harper Periodicals. He had married, nearly twenty years before, Miss Margaret C. Durbin, daughter of the Rev. John P. Durbin, D.D., then a well-known Methodist minister, and the issue of this marriage was one daughter, now Mrs. Hiram W. Sibley. During all these years Mr. Fletcher Harper was a familiar and welcome figure in New York society. He was an adept in many manly sports, and his strikingly handsome presence in his youth and in his prime conciliated the regard which was confirmed by his genial manner and his kindness of heart. He was an early and interested member of the Union League Club, and was a member of the building committee under the direction of which the present club-house was erected. He was an active Freemason, a member of Kane Lodge, and attained the dignity of Senior Warden. He was warmly interested from the time of its formation in the State Homœopathic Asylum for the Insane at Middletown, to the trusteeship of which he was appointed by Governor Dix in 1873. He was at once chosen President of the board, and continued to occupy that position until his death. His personal tastes were strongly æsthetic, and for many years he interested himself in gathering a valuable collection of pictures and bric-à-brac.

Mr. Harper's connection with the firm of Harper & Brothers as an active member lasted not much more than twelve years, although his membership continued until it was terminated by his death. Soon after 1882 his health became feeble, and for several years he had been forced to abstain from active business, and had spent much of his time abroad. During the summer of 1889 he visited Aix-les-Bains, in the hope of deriving benefit from the waters, but his condition became rapidly worse. On his return to New York last autumn he was so enfeebled that it was necessary to carry him on shore, and since then he has not been able to leave his room.

Before the death of the first Fletcher Harper, in 1877, there was a Fletcher Harper in each of four generations of his branch of the family. Of these the youngest alone is now left, the great-grandson, although the venerable widow of the first Fletcher and the great-grandmother of the last survives in a green old age.

SUPREMELY DELIGHTFUL

To the emaciated and debilitated invalid is the sense of returning health and strength produced by Hostetter's Stomach Bitters. When that promoter of vigor is tested by persons in feeble health, its restorative and vitalizing potency soon evinces itself in improved appetite, digestion, and nightly repose, the sole conditions under which strength and nerve quietude is vouchsafed to the human system. A gain in flesh of course ensues upon the restoration of digestion and assimilation. As surely as winter follows the fall of the leaf, does disease shadow the footsteps of declining strength, when the premature decadence of vitality is not arrested. Marasmus, consumption, and other wasting maladies are prompt to fasten upon the enfeebled. Avert disease, therefore, with this grand revivifying tonic, which not only renews failing strength, but mitigates and counteracts the infirmities of age and those of the gentler sex. Rheumatism, malaria, liver and kidney troubles yield to it.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

IMPERIAL GRANUM

Is the safest, most reliable, and wholesome Food for Infants and Children. The most nourishing, strengthening, and delicious Food for Nursing Mothers, Invalids, Convalescents, and the Aged.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures
Cramps, colic, colds, all pains. 25 cts. a bottle.—[*Adv.*]

THE popular verdict seems to be that Nicholson's Liquid Bread fully meets the demand for an absolutely pure malt extract. Have you tried it? Grocers and druggists keep it.—[*Adv.*]

BURNETT'S COCOAINE allays irritation, removes dandruff, and invigorates the action of the capillaries in the highest degree.—[*Adv.*]

JUDGE LAWRENCE, of the Supreme Court of New York, has just decided that Dr. J. G. B. Siegert & Sons have the exclusive right to the trade-mark and name of ANGOSTURA BITTERS, and has granted them an injunction against C. W. Abbott & Co., of Baltimore, restraining them from using that name or putting up goods in imitation of the ANGOSTURA BITTERS.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

THE Best Worm Lozenges for Children are Brown's Vermifuge Comfits. 25c. a box.—[*Adv.*]

BURNETT'S FLAVORING EXTRACTS are invariably acknowledged the purest and best.—[*Adv.*]

THE prevalence of scrofulous taint in the blood is much more universal than many are aware. Indeed, but few persons are free from it. Fortunately, however, we have in Ayer's Sarsaparilla the most potent remedy ever discovered for this terrible affliction.—[*Adv.*]

HARPER & BROTHERS, NEW YORK.

LEADERS ON THE TURF.

BY HARRY P. MAWSON.

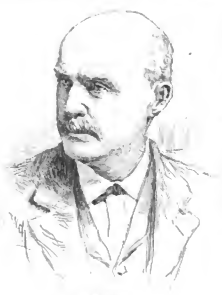
THE American race-horse owes his pedigree to his English progenitor, and a sharp competition has always existed between American breeders to secure English race-horses of high merit to breed to their "native" thorough-bred mares. Among the most famous of these in latter years are Glencoe, Bonnie Scotland, Australian, Billet, Prince Charlie, Leamington, Mortemer, Glenelg, St. Blaise, and Rayon d'Or.

There never has been as much money "hung up" to race for as at the present day, nor so many horses to contend for it. The origin of "stakes" lies in the old-fashioned and now almost obsolete form of subscriptions by various owners, who thus practically raced for their own money. Prior to the establishment of the Futurity, the greatest race in money value ever run in this country was the Peyton Stakes, run at Nashville in 1843, and worth $43,000, made up from subscriptions of owners; and in this manner was also arranged the famous so-called Dinner Party Stakes, run at Baltimore in 1870, and worth $18,500 to the winner. Nowadays the great stakes are made up of the entrance fees, forfeits for declarations, starting fees, and the huge sums of "added money" by the various jockey clubs. Of course the public contributes to this by the entrance charges, the sums derived from the restaurant privileges, the tax on the bookmakers, and the percentage on the French mutuals. The number of races run in 1889 "on the flat" in the United States was 4930, and the amount of added money the enormous total of $2,879,192, an increase over 1888 of $541,917.

LEONARD W. JEROME.

Of all those who have engaged in horse-racing, whether for pleasure or for profit, there is no more familiar figure upon the turf than this gentleman. Although Mr. Jerome has not raced for years, he has through a ceaseless activity done more for horse-racing in this country than any other man in America. Mr. Jerome is best remembered on the turf by his celebrated horse Kentucky, who after a great career died before he had a chance to distinguish himself at the stud. Mr. Jerome is well known in New York society, in Wall Street—where he was a member of the once famous banking firm of Travers & Jerome—in political life, and on all occasions where there is an opportunity to prove his public spirit and good citizenship. The American Jockey Club, organized in 1866, was one of the notable results of Mr. Jerome's keen business foresight; Jerome Park, famous for twenty years as the rendezvous of the *élite* of the racing world, was created by him; he built and laid out Jerome Avenue, one of the most superb driveways in the country; and more than all this was his splendid endeavor for the "sport for kings" when, in 1879, Mr. Jerome proceeded to organize the now famous Coney Island Jockey Club, of which he is President at this writing, ably seconded by J. G. K. Lawrence, Esq., as Secretary and official handicapper, and J. H. Bradford, Esq., as Treasurer.

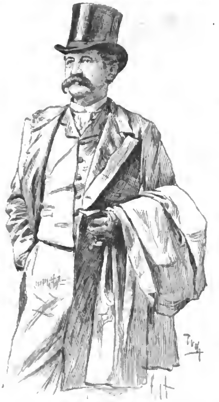
In 1878 the interest taken in racing in and about New York and Brooklyn was enormous. This led Mr. Jerome and others to believe that a race meeting between the spring meeting of the American Jockey Club and the summer meeting of the Monmouth Park Association would be appreciated. A temporary organization was effected, and the trotting track then known as the Prospect Driving Park was leased (the same grounds now occupied by the Brooklyn Jockey Club), and a three-days' meeting was begun June 21, 1879. The success of this meeting was so great that it led to a permanent organization, and during the winter Mr. Jerome was enabled to purchase 112 acres at Gravesend, about three-fourths of a mile from the Manhattan Beach Hotel. The inaugural meeting was begun June 19, 1880, although the first Suburban—now the most famous race in the United States—was not instituted and run until 1884, when it was won, after a grand struggle, by General Monroe (6), 124 lbs., in 2.11¼; War Eagle, 102 lbs., second; Jack of Hearts, 114 lbs., third. The first Futurity was run in 1888, and resulted in the memorable duel between Proctor Knott and Salvator. One of the best safeguards to the public in reference to the conduct of the affairs of the Coney Island Jockey Club is the irreproachable character of its officials. Some of these are Mr. W. K. Vanderbilt, General Butterfield, Mr. C. Fellowes, Mr. R. C. Livingston, together with the famous trio of gentlemen in the judges' stand, Messrs. Bradford, Kip, and Lawrence. Mr. Jerome has also been largely instrumental in the creation of the superb Westchester track of the New York Jockey Club, of which he was also the first President, which, with its splendid straight course, noble grand stand, and perfect appointments, has founded a new era in American racing.



D. D. WITHERS.

D. D. WITHERS.

Mr. Withers's connection with and experience on the turf carries you back to the great contests between Lexington and Lecomte, and Mr. Withers has managed to remain in harness longer than any of his contemporaries. Mr. Withers was years ago connected with the well-known South-American house of Howland & Aspinwall, but for as long as the memory of the man of to-day runneth he has devoted himself to the interests of the turf. He is, in truth, an encyclopædia of facts connected with racing in this country, and his extended experience in France, upon which he justly prides himself, enables him to bring to bear upon his favorite recreation an amount of turf lore that is not equalled. Horse-racing with him is not a business; his ambition lies in the direction of breeding his own horses and winning with them; he rarely ever buys a yearling. In the winter-time he resides quietly at the Brevoort House, with a weekly trip to his stock farm near Red Bank, New Jersey, where he passes much of his time during the summer. At Brookdale Mr. Withers has about forty selected broodmares, many of them imported, and the following stallions: Uncas, Kinglike (a colt of his own breeding), imp. King Ernest, imp. Mortemer (French), imp. Stonehenge, imp. Macaroon, imp. Eothen, and Ventilator. His great hobby is to reach the perfection of breeding; and with this end in view he is continually breeding his mares to different stallions, not only to his own, but to those of his neighbors, when he thinks he has a chance to get a better colt by so doing. The season of 1888 was a great one for Mr. Withers; his two-year-olds were the best out, and he bred them all at Brookdale. In that year Mr. Withers won $77,000; but the season of 1889 was not so propitious, the total being much less. Undoubtedly Mr. Withers's greatest triumph of late years was the day Laggard, bred by himself, by Uncas (son of the great Lexington), out of imp. Dawdle, won the memorable race for the Omnibus Stakes at Monmouth, August 20, 1887, defeating Firenze, and lowering Hanover's colors for the second time. One of his peculiarities with his horses is that he rarely names them until they have won a race, and often not even then; witness his great colt by Sensation—imp. Fuverdale.



LEONARD W. JEROME.

Mr. Withers is Treasurer of the Monmouth Park Racing Association, whose historic old circular track is being replaced by a new one of imposing dimensions and proportions. In this great transformation Mr. Withers has been the ruling spirit.

He has designed and superintended every detail connected with it; he has designed the grand stand, the stables, the track itself; in fact the new Monmouth track is the effort of Mr. Withers's life; and if all accounts are true, when its gates are thrown open on the Fourth of July next, the public will be called upon to inspect and enjoy the privileges of one of the greatest race-courses in the world.

AUGUST BELMONT.

Mr. Belmont is a native of Alzey, Germany, and came to New York in 1836. From 1844–50 he was Consul-General for the Austrian government at New York; was appointed in 1853 Chargé d'Affaires for the United States at The Hague, and in 1854 Minister Resident. Mr. Belmont has always taken an active interest in the affairs of the Democratic party; was a delegate to the Convention of 1860, and until 1872 Chairman of the National Democratic Committee. In all public movements Mr. Belmont has proven himself a public-spirited and benevolent citizen. In social circles, in art matters—he has one of the best private collections of pictures in New York city—in music, in club life, he has always borne a prominent part. Mr. Belmont was educated in Frankfort, where his earliest experience in commercial life was in the parent house of the great banking firm of Rothschild. The firm of August Belmont & Co. is known all over the world as their American representative ever since Mr. Belmont first came to this country. But it is not only as a leading citizen and financier that Mr. Belmont is highly esteemed, but as one of the best-known and most popular turfmen in America. Mr. Belmont's connection with racing began about the time Jerome Park was established, and the first race-horse he owned was a filly named Maid of Honor, by Newminster, which Mr. Belmont imported from England. Mr. Belmont retired in 1881 for a short period, but eventually came back stronger than ever. Like Mr. Withers, his chief pride is to breed his own horses, and he would rather win a common purse race with a colt of his own raising than a stake worth thousands with a horse he had purchased. Mr. Belmont originally began breeding on his farm at Babylon, Long Island, but this is now used only by his horses in training. He purchased some two to three hundred acres in Kentucky, named it the Nursery Stud, and removed all his broodmares and stallions to the Blue Grass region. The stallions now in service at the Nursery Stud are: Kingfisher, Fiddlesticks, Magnetizer (of his own raising), imp. The Ill-Used, and his last and greatest acquisition, the Derby winner, imp. St. Blaise, sire of St. Carlo, St. James, and many others. Mr. Belmont was President of the American Jockey Club for twenty years, from the date of its organization until 1888, when he resigned. Mr. Belmont's presence upon the turf is for enjoyment and from a keen love of the sport; he thus represents the best element upon it.

Prince Royal is a chestnut colt by Kingfisher—Princess. Mr. Belmont bred this colt, and he thinks as much of him as he does of any horse he owns; in fact, he claims he is a better horse than Raceland. The colt's career has undoubtedly been a fine one; as a two-year-old he started ten times—first twice, second once, third twice, and unplaced four times. But it was in his three-year-old form that he distinguished himself, proving himself a thoroughly game and speedy colt, and for one of his size a remarkable weight-carrier and stayer, starting sixteen times and eleven times winner. He had the Withers won, and only lost it to Sir Dixon by Godfrey's carelessness, and although defeated again by Sir Dixon in the Belmont, he turned the tables on the son of imp. Billet in the Coney Island Derby, 1½ miles, in 2:39½; he was then third to Sir Dixon and Los Angeles for the Lorillard Stakes at Monmouth, but was not afterward beaten, his Jerome Stakes, 1¾ miles, 128 lbs. up, in 3:10½, being a splendid achievement. At four, Prince Royal made his first appearance in the Brooklyn Handicap, and was defeated by a scant length by Exile, to whom he was conceding many pounds in weight. Shortly after this he struck himself while in exercise at Jerome Park, and was then retired for the season. Mr. Belmont seems to think his injuries only temporary, so that if he should come to the post sound after his long rest he may renew the triumphs of his three-year-old form, and carry the maroon with the red sash in many of the great handicaps.

J. B. HAGGIN.

Mr. Haggin is not only a great breeder and racer of thorough-bred horses, but he is also a great financier and merchant. The firm of Haggin & Tevis, bankers, of San Francisco, is too well known to dwell upon here, and Mr. Haggin's almost exclusive interest in the great Anaconda Copper Mine at Anaconda, Montana, has earned for him the title of "The Copper King of America." Mr. Haggin's début upon the turf in the East began in 1885, when Tyrant (by imp. Great Tom—Mariposa) made his appearance at Jerome Park, winning the Belmont and Withers, and also the Emporium at Coney Island, besides the Stockton and Hopeful stakes at Monmouth. Other good ones that Mr. Haggin showed that spring were Hidalgo (commonly known as the "Black Spaniard"), Preciosa, Ben Ali, Fortuna, etc. In the season of 1888 Mr. Haggin is said to have had one hundred horses in training, three trainers, three high-priced jockeys on "first call," and an army of stable-boys; but this was a disastrous season for Mr. Haggin, for although his winnings footed up nearly $136,000, that sum hardly equalled the expenses and the forfeit list. But it is as a breeder of race-horses that Mr. Haggin stands unequalled in the world.

he lead and keep it. It is this kind of out-
h gives the Rancho del Paso yearlings their
moscular development."
n of the season of 1888 was the first appear-
aggin's yearlings for sale in the East. Over
re brought over 3000 miles across the conti-
d here in perfect health and condition. The
rated by Mr. William Easton, the well known
America, at the old Madison Square Garden,
le for the price fetched ($38,000) by King

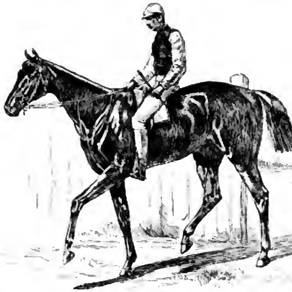
Thomas, a full brother to King Fox and Ban Fox. King Thomas ultimately passed into the hands of Senator Hearst, and has not yet earned his oats. The second sale of the thorough-breds was held at the Blood Stock Sale Paddocks, July 1, 1889, and the first sale of the trotters in the American Institute building in March last, both by Mr. Easton.

Mr. Haggin had a very successful season on the turf in 1889, with a comparatively small number of horses, of which the principal winners were Salvator (second in the first Futurity, and winner of the Realization Stakes in 1889, value $34,100) and the Queen of the Turf Firenze. Firenze is a bay mare about 15.1 hands high, and on rather a small model, but for all that one of the greatest mares ever bred in this country. Firenze was foaled in 1884, at the Elmendorf Stud, near Lexington, Kentucky, bred by Mr. D. Swigert, and purchased by Mr. John Mackey, of California, for Mr. Haggin, at a cost of $2600. She is by imp. Glenelg (he by Citadel by the great Stockwell), out of Florida by Virgil, full sister to Hindoo, the sire of Hanover. Her full brother was sold last spring to Messrs. J. A. & A. H. Morris for $7000. As a two-year-old Firenze made her bow to the public in a purse race at Saratoga, August 2, 1886. In that year she started eight times, with five firsts. As a three-year-old she started fourteen times, being eight times first. At four she made her first stake appearance in the Suburban, being third to Elkwood and Terra Cotta. Then, after a series of defeats, she "rounded into form," and then scored the most notable victory of her life, when she defeated The Bard for the Freehold Stakes, August 2d, at Monmouth, 1¼ miles, 118 lbs. up, in 2.34, thus equalling Luke Blackburn's famous record made eight years before. After this Firenze was practically unbeatable, and closed that season the equine heroine of the year, starting twenty-two times, being fourteen times first. As a test of her superb powers, witness her race for the Great Long Island Stakes at Coney Island, September 15, 1888, 1¼ mile heats, 125 lbs. up, winning the race in straight heats without urging in 1.56, 1.56¼. Considering the weight carried, this is one of the superlative performances in turf records, and in reality far superior to Gabriel's record of 1.56 for two consecutive heats with only 112 lbs. up. In 1889, at five years old, the daughter of imp. Glenelg–Florida did not appear at her best, as compared with her form of the year previous, for while she started twenty-one times and won twelve of her races, they were usually not so high a class as those she conquered in the year before.

A. J. CASSATT.

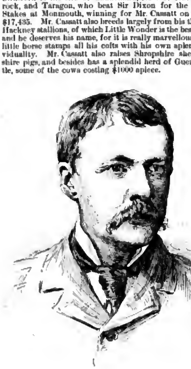
The master of Chesterbrook began life as a civil engineer. Taking service at an early period of his career as an ordinary "rod-man" on the main line of the Pennsylvania Railroad, as did also ex-Presidents J. Edgar Thomson, Thomas A. Scott, President George B. Roberts, and many others of this great corporation's most successful officials. Mr. Cassatt remained continuously with the Pennsylvania Railroad, and rose step by step in its service, to be second vice-president. He then resigned, being desirous of devoting his whole attention to his private affairs, in which he has been extraordinarily successful, being reputed a millionaire several times over. Mr. Cassatt enjoys the reputation of being one of the brightest railroad men this country ever produced, and his successful career and rapid advancement in the Pennsylvania Railroad fully justify this verdict. Mr. Cassatt, together with the Hon. William L. Scott, built and equipped the New York, Philadelphia, and Norfolk Railroad, thus providing an air line to Old Point Comfort, a great convenience to the travelling public, and, as it has proved, a most fortunate investment for its projectors. Mr. Cassatt is president of the company. Mr. Cassatt resides during the winter months on South Nineteenth Street, Philadelphia, and for the summer has a beautiful country seat at Haverford, a station on the main line of the Pennsylvania Railroad. Mr. Cassatt has recently had himself appointed superintendent of the county roads, and such has been his well-directed energy that the farmers have been obliged to turn out and keep the roads in repair, the result being the best roads that section of the country has ever known. This has been done largely at Mr. Cassatt's personal expense, but this is a trifle to this gentleman when the general welfare is under consideration. Mr. Cassatt's first appearance on the turf was in 1881, under the name of Mr. Kelso, which he, however, soon relinquished for his own. Mr. Cassatt is a devoted admirer of the equine race—in fact, of animal life in general—and races for the pure love of the "sport," and, if possible, to breed and raise his own race-horses. Mr. Cassatt succeeded the late Mr. George L. Lorillard as president of the Monmouth Park Racing Association, being elected to that office June 30, 1886. Last season Mr. Cassatt determined to retire from actual racing, and with the exception of Eurus and The Bard, he sold at auction all his horses in training, and also all his yearlings, at the American Horse Exchange, October 29, 1889, under the management of Mr. Sanders D. Bruce, author of The *American Stud-Book* and editor of *The Turf, Field, and Farm*. Mr. Cassatt, during his short stay upon the turf, has the proud distinction of having won both the great spring handicaps—the Suburban with Eurus, the Brooklyn with The Bard. This is a feat no other turfite has yet accomplished. It is earnestly to be hoped that Mr. Cassatt will at an early date reconsider his determination not to race. The turf can ill afford to lose so high a type of the gentleman. Few people who have once engaged in this alluring sport are ever able to remain away for good, the fascination of it is too great. It is certainly desirable that this may hold good in Mr. Cassatt's case, and that he will soon return to the "fold" with a formidable "string" of thorough-breds to carry the red, white, and blue to the front.

Mr. Cassatt established this beautiful stock farm in 1881. It comprises 640 acres of superbly undulating farming country in Chester County, Pennsylvania, about five miles from Berwyn, a station on the Pennsylvania Railroad, eighteen miles from Philadelphia, and derives its name from the creek that flows through it. It was my privilege quite recently to visit this beautiful place. Mr. Colgan politely met me at the station, and we were soon on our way to the farm, behind a five-year-old by Stratford out of a farm mare, over a splendidly macadamized road, built and maintained by Mr. Cassatt. As you enter the farm gate, the half-mile track stands to the left, and the buildings on a piece of rising ground right at the head of the lane. A short distance on we met old Eurus, Cottrell up, and Huggins, on their way to the track to give the Suburban winner of 1887 a gallop. On arriving at the buildings, Mr. Colgan turned me over to Mr. William Steel, the stud groom, in whom I found a thoroughly entertaining and highly competent man. Mr. Cassatt is fortunate in possessing his services. The first horse shown was Bend Or, by imp. Buckden, a fine specimen of the thorough-bred and a good race-horse in his day; he is closely allied in blood to the great Tremont. Then Stratford, by imp. Leamington, out of Susan Beane by the great Lexington, a full brother to Onondaga and the unbeaten Sensation. Stratford is a deep bay about 15¼ hands high, and splendidly developed



FIRENZE.

and muscled all over; his legs and feet are particularly fine, and these he transmits to his "get" with marked uniformity. Stratford is the sire of Connemara, Now or Never, Shamrock, and Taragon, who beat Sir Dixon for the Omnibus Stakes at Monmouth, winning for Mr. Cassatt on that day $17,435. Mr. Cassatt also breeds largely from his three imp. Hackney stallions, of which Little Wonder is the best known; and he deserves his name, for it is really marvellous how the little horse stamps all his colts with his own splendid individuality. Mr. Cassatt also raises Shropshire sheep, Berkshire pigs, and besides has a splendid herd of Guernsey cattle, some of the cows costing $1000 apiece.



A. J. CASSATT.

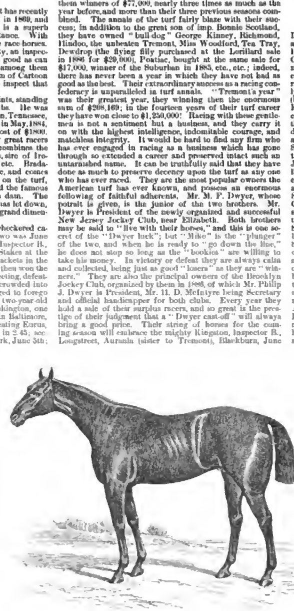
Another thorough-bred horse that Mr. Cassatt has recently acquired is imp. Uhlan, by The Ranger, foaled in 1869, and imported into New Mexico in 1876. Uhlan is a superb brown horse with a fine back and lots of substance. With a good show at the stud he ought to get some race-horses. After a long tour all over this splendid property, an inspection of the yearlings, in excellent shape and as good as can be seen, with a glance too at the recent foals, among them Dry Monopole's first colt, out of imp. Clara, dam of Cartoon and Reclare, I returned to the stallion stable to inspect that most famous of race-horses, The Bard.

The Bard is a bright bay horse with black points, standing full 16 hands high, and weighing about 1050 lbs. He was bred by Mr. Charles Reed, Fairview Stud, Gallatin, Tennessee, and was foaled in 1883; purchased as a yearling in May, 1884, for Mr. Cassatt, by Colonel S. D. Bruce at a cost of $1800. Longfellow, his sire, was one of the few really great racers in the category of horse-racing. The Bard combines the great blood of his grandsire, imp. Leamington, sire of Iroquois, Harold, Powhatan, Parole, Eolus, etc., etc. Bradamante, The Bard's dam, was a good race-mare, and comes from one of the richest breeding "families" on the turf, viz., War Dance, by Lexington out of Reel, and the famous mare Levity, by imp. Trustee out of Vandal's dam. The Bard is not a "pretty horse," but now that he has let down, lengthened, and spread all over, he is a horse of grand dimensions.

The Bard had what may be aptly called a checkered career upon the turf. His first appearance at two was June 25, 1885, at Coney Island, running unplaced to Inspector B., was second to Portland for the Great Post Stakes at the same meeting, and scored his first winning brackets in the Red Bank Stakes, July 25, 1885, at Monmouth; then won the Bouquet Stakes at the Coney Island autumn meeting, defeating Inspector B. and other good ones, but was crowded into the rails and so badly scraped that he was obliged to forego his Jerome Park engagements. He closed his two-year-old career by winning the Capital Stakes at Washington, one mile in 1.48. At three he opened his season in Baltimore, May 21, 1886, winning the Preakness Stakes, beating Eurus, Elkwood, Eolian, and Rock and Rye, 1½ miles, in 2.45; second to Inspector B. for the Belmont, Jerome Park, June 5th; unplaced for the Grass Stakes to Dry Monopole, Coney Island, June 10th, second again to Inspector B. for the Stud Stakes, Coney Island, June 25th; second, with 118 lbs., to Winfred, 108 lbs., for the Emporium, Coney Island, June 24th; dead heat with the peerless Dewdrop, and walked over for the Spindrift Stakes, Coney Island, June 30th; won Barnegat Stakes, Monmouth, July 16th, second to Dewdrop for Stevens Stakes, Monmouth, July 20th; second, with 118 lbs., to Charity, 106 lbs., Monmouth, July 24th; won Freehold Stakes, Monmouth, July 27th; won Omnibus Stakes, beating Dewdrop, Ben Ali, and others, Monmouth, August 12th; won Choice Stakes, again defeating Dewdrop and Ben Ali, Monmouth, August 17th; and from then on was unbeaten, winning September Stakes at Coney Island, the Jerome Stakes at Jerome Park, the Dixie and Breckinridge Stakes at Baltimore, closing his season by winning the Potomac Stakes at Washington, October 30th, defeating Elkwood, in 2.27. At four, made his initial bow at Brooklyn, June 14, 1887, winning the June Special, one mile and a furlong, in 1.55; then, on June 18th, won St. James Hotel Stakes, 1¼ miles, 2.09¼; next first met and defeated that great son of Lisbon, Troubadour, in the Coney Island Stakes by three lengths, 1⅛ miles, in 1.55; won the Coney Island Cup, 1½ miles, June 25th, beating Elkwood, Barnum, and Rataplan in 3.08. On July 4th suffered his first defeat in his four-year-old form, being second to Troubadour for the Ocean Stakes at Monmouth, 1⅛ miles, in 1.56¾; and again second to Troubadour for the Monmouth Cup, 1¾ miles, 3.04; then came round to his old speed, winning the Freehold Stakes, 1½ miles, beating Barnum and Troubadour, in 2.39¾; won Eatontown Stakes, 1 mile, in 1.43¼, defeating Preciosa, Climax, and Osceola. On top of these brilliant victories came his sudden and almost fatal illness. People went to Monmouth to the races, but never forgot to ask after The Bard. The original trouble was simply a stoppage of the bowels, and in using a syringe to give the horse an injection the delicate tissue of the bowels was unfortunately injured. For days The Bard's life was despaired of, but finally, by great care, he was saved, and sent back to Chesterbrook to recuperate. He came forth in 1888, five years old, and signalized his return to health by winning the Brooklyn Jockey Club Handicap, May 15th, 1¼ miles, 125 lbs. up, over a track like a sheet of water—time, 2.13—the great Hanover second, Exile third; then, for the second time, won the St. James Hotel Stakes, 1¼ miles, 122 lbs., in 2.08, defeating Sir Dixon, 3 years, 102 lbs., and Banburg, 115 lbs.; May 26th, won Brooklyn Cup; May 30th, walked over for the Second Special; June 16th, walked over for the Coney Island Stakes; June 21st, won Coney Island Cup, beating Hidalgo and Elkwood, 1¾ miles, 3.06¾; then, July 4th, won Ocean Stakes at Monmouth, 120 lbs., 1⅛ miles, 1.55; Kingston, 118 lbs., second; Firenze, 113 lbs., third. The next race, the Freehold Stakes, August 2d, proved the Waterloo of his turf career. Firenze, 113 lbs. up, won the race; and The Bard, 120 lbs. up, pulled up lame, and has not since been seen at the post, and has now been definitely retired to the stud. The Bard was one of the most honest race-horses that ever stood on iron in America. He did not finish like Terra Cotta, nor display the vim and fire of Luke Blackburn or Hanover, but he raced from "end to end," as the saying goes, and his numerous accidents, coupled with the horse's undoubted "gameness," caused him to be the turf idol of his time.

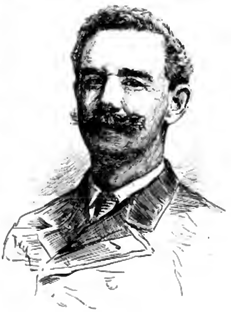
M. F. DWYER.

Dwyer Brothers! There is not a race-goer in America but what is familiar with the red with blue sash of the "Brooklyn Stable." The Dwyers began racing in 1876. At first they followed the trotters with a few nags of their own, but the first running race they saw converted them, and they have clung to the "bang tails" ever since. The first horse they ever owned was Rhadamanthus, who under their tutelage won them some remarkably good races and a lot of money; beginning in 1876 with three horses, they wound up in 1889 with thirty-five in training, heading the list of winning owners with $166,000, Longstreet leading their string with nearly $39,000. In looking back over their career, their first great winning season was 1880, Luke Blackburn's year, the first really great horse they owned; that year saw them winners of $77,000, nearly three times as much as the year before, and more than their three previous seasons combined. The annals of the turf fairly blaze with their success; in addition to the great son of imp. Bonnie Scotland, they have owned "bull-dog" George Kinney, Richmond, Hindoo, the unbeaten Tremont, Miss Woodford, Tea Tray, Dewdrop (the flying filly purchased at the Lorillard sale in 1886 for $29,000), Pontiac, bought at the same sale for $17,000, winner of the Suburban in 1885, etc., etc.; indeed, there has never been a year in which they have not had as good as the best. Their extraordinary success as a racing confederacy is unparalleled in turf annals. "Tremont's year" was their greatest year, they winning then the enormous sum of $208,169; in the fourteen years of their turf career they have won close to $1,250,000! Racing with these gentlemen is not a sentiment but a business, and they carry it on with the highest intelligence, indomitable courage, and matchless integrity. It would be hard to find any firm who has ever engaged in racing as a business which has gone through so extended a career and preserved intact such an untarnished name. It can be truthfully said that they have done as much to preserve decency upon the turf as any one who has ever raced. They are the most popular owners the American turf has ever known, and possess an enormous following of faithful adherents. Mr. M. F. Dwyer, whose potrait is given, is the junior of the two brothers. Mr. Dwyer is President of the newly organized and successful New Jersey Jockey Club, near Elizabeth. Both brothers may be said to "live with their horses," and this is one secret of the "Dwyer luck"; but "Mike" is the "plunger" of the two, and when he is ready to "go down the line," he does not stop so long as the "bookies" are willing to take his money. In victory or defeat they are always calm and collected, being just as good "losers" as they are "winners." They are also the principal owners of the Brooklyn Jockey Club, organized by them in 1886, of which Mr. Philip J. Dwyer is President, Mr. H. D. McIntyre being Secretary and official handicapper for both clubs. Every year they hold a sale of their surplus racers, and so great is the prestige of their judgment that a "Dwyer cast-off" will always bring a good price. Their string of horses for the coming season will embrace the mighty Kingston, Inspector B., Longstreet, Aurania (sister to Tremont), Blackburn, June Day (brother to Bessie June), Kingsbridge (brother to Kingston), Sir Dixon, Extra Dry (brother to Dry Monopole, winner of the inaugural Brooklyn Handicap in 1887), Bella B. (sister to Inspector B.), Blue Bird (brother to Blue Wing), Flatbush (brother to Firenze), and an army of maiden two-year-olds, and the well-known horse Hanover.



THE BARD.

Hanover is a chestnut horse, standing close to 16 hands, by Hindoo, dam Bourbon Belle by imp. Bonnie Scotland. He was bred by Messrs. Clay & Woodford at their Runnymede Stud, Paris, Kentucky, foaled in 1884, and sold at their spring sale, May 12, 1885, to the Dwyer Brothers for $1350. He started as a two-year-old four times, winning all his races.



M. F. DWYER.

In 1887, at three, his career has never been equalled, retiring at the end of the season with nearly $90,000 to his credit. Hanover's first appearance as a three-year-old was in the Carlton Stakes at the Brooklyn meeting, winning easily, 1 mile, in 1.43¼; next, the Brookdale Handicap, then the Withers at Jerome Park, May 30th, 1 mile, 1.46¼; and in his next race had a practical walk-over for the Belmont; won Brooklyn Derby by fifteen lengths; at Coney Island—Swift Stakes (beating Kingston and Firenze), Tidal Stakes (again defeated Kingston in "a walk"), Coney Island Derby (winning "pulled double"); and then the greatest race of his life, winning the Emporium, 1½ miles, 128 lbs. up, in 2.35¾; also the Spindrift Stakes, 125 lbs., 1¼ miles, 2.11¼; the rich Lorillard Stakes at Monmouth, worth $13,080 to the winner; the Stockton Stakes next, value $6080; Barnegat Stakes, 1½ miles, 125 lbs., track heavy, in 2.44¼; the valuable Stevens Stakes; then, on July 30th, met his first defeat, in the Raritan Stakes, with 128 lbs., being second to Laggard, 111 lbs. His next race, however, was for the Champion Stakes, easily defeating Volante and Firenze, 1½ miles, in 2.38. At Saratoga won the United States Hotel Stakes. Then came that terrific battle for the Omnibus Stakes: Laggard, 118 lbs., first; Firenze, 120 lbs., second; Hanover, 128 lbs., third; noses apart only dividing this equine trio at the finish. Then succumbed in the Choice Stakes to Banburg, 110 lbs. He was then given a long rest, but ran unplaced for the First Special at Brooklyn; but won Second Special with his old time dash. He now became more or less unreliable, the trouble being in one of his forefeet, and ultimately underwent successfully the delicate operation of nerving. The lameness showed itself at Baltimore, October 31st, after he had won a mile dash in 1.41¾. He was then retired for that season, having started in all twenty-seven times—twenty firsts, unplaced but once, and winning more money than any three-year-old yet shown in America. At four Hanover was second to The Bard for the Brooklyn Handicap, and won some fair races; but neither in that year nor in his five-year-old form did he recover the great speed he had at three. He is, however, a "magnificent cripple," and liable to win glory for himself and his owners in the future. The Dwyers also own Houston, a full brother to Hanover, for whom they paid $8400, but who does not as yet promise as well as his mighty brother.

HON. WILLIAM L. SCOTT.

Among all the celebrated self-made men of this great country none has had a more brilliantly successful career than the Hon. Mr. Scott, of Pennsylvania. As a boy he served as a page in the House of Representatives, and eventually saw himself elected a member of that body in the Fiftieth Congress, representing the Erie district of his State. Mr. Scott was also a prominent member of the Democratic Central Committee during the Presidential campaigns of 1884-8. During his term in Congress Mr. Scott was practically the leader of his party in the House, and a trusted and confidential adviser of President Cleveland, but subsequently declined a re-election, preferring to return to private life. Mr. Scott is one of the largest operators in and miners of bituminous coal in the country, being one of the so-called "coal barons" of Pennsylvania. He is also largely interested in various railroads, and occupies a prominent place among the financiers of this country, and is well known and highly respected as a public-spirited citizen. Mr. Scott makes his home at Erie, but has also a palatial residence at Washington, which he established at the beginning of his Congressional term, and has maintained ever since.

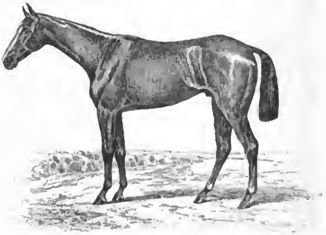
started ten times in all last season, winning prior to the Futurity a purse of $1000 at Brooklyn, May 21st, and the Carteret Handicap at Monmouth, August 17th. In the Futurity he carried 109 lbs. to St. Carlo's 123 lbs., and had the latter, who ran in blinkers, not sulked in the last few "jumps," Chaos might have been obliged to content himself with second place. After winning the Futurity, Mr. Scott then retired his horses for the season. It is a remarkable coincidence that the first two Futurity stakes should both have been won by geldings, thereby depriving their owners of the prestige of placing at the stud a Futurity winner.

CASTAWAY II.

The Brooklyn Handicap marks the opening of the regular racing season, the betting law, or the Ives Pool Bill, as it is commonly known, prohibiting racing in New York earlier than May 15th. It is therefore nothing remarkable that this event should call forth an enormous outpouring of people to the popular Brooklyn course. This year, although the weather was disastrous, the crowd was greater than ever, and the race for the Handicap furnished a stunning and disagreeable surprise to the racing world in general. It was won by an extreme outsider—popularly called a "sleeper"—in the hollowest possible style. This horse bears the highly suggestive title of Castaway II. He is now four years old, having been foaled April 22, 1886, at the farm of Rufus Lisle, Esq., near Lexington, Kentucky. He is by Outcast, he by imp. Leamington out of Oriana, by Deucalion, out of Nina, by the great four-miler Boston, her dam the celebrated imp. mare Frolicsome Fanny. Lucy Lisle, the dam of Castaway II., is by Virgil, he by Vandal, by imp. Glencoe, out of Alarac's dam, etc. Ella Jackson, dam of Lucy Lisle, is by Lightning, a son of the great Lexington, out of Blue Bonnet. Castaway II. is somewhat curiously "lobred." He has two crosses of imp. Yorkshire—Hymenia, Virgil's dam, being by this horse, and Louisa, dam of Ella Jackson, being by imp. Yorkshire, out of a daughter of American Eclipse. Then again he has practically two crosses of the renowned Boston, as seen above.

These are blood lines, and make Castaway II. as well bred as any man's horse. In color he is a light bay, about 15 hands high, bears no resemblance to the highest type of Leamingtons, favoring rather the Virgils or Lexingtons in looks and conformation. "A Vandal in the mud" is an old turf phrase, and this, with the ability of the Leamingtons to run on any kind of a track, should have attracted more attention to the horse. His career has, however, been somewhat erratic. At two years old he started for the first time at the Lexington spring meeting, May 7, 1888, and ran unplaced. In all started that year twenty-seven times, scored his first winning brackets, 4½ furlongs, June 2d, at Latonia. At three began by winning the Pickwick Stakes at New Orleans for the Beverwyck Stable, 7 furlongs, 115 lbs., in 1.30¼; also the Cottrell Stakes at the same meeting, 1 mile, 118 lbs., in 1.47¾; and he subsequently won seven other races, among them the Fort Schuyler Stakes, at Morris Park, August 29th, 1 mile, 101 lbs., in 1.41, and Brooklyn, October 11th, purse, mile heats, 106 lbs., 1.42 and 1.40, Maid of Orleans winning second heat. After running second for the Okolona Handicap at Guttenberg, he was retired for the season. Previous to the Brooklyn Handicap he has run eight races this year, of which he won three, but all at shorter distances than 1¼ miles. The time—2.10—is very fast for such a sloppy track. The Beverwyck Stable is principally owned by ex-Mayor Nolan. Castaway II. is trained by James Campbell, and on the day of his victory was ridden by Bunn. There is yet another Castaway also by Outcast, but out of Utopia.



CHAOS.

More than any other of the brute creation, the horse possesses the power to transmit to his progeny all his characteristics of conformation, endurance, speed, power, and temperament. In some "families" they "train on," or are "stayers"; in others, they like a short distance best; again, some can gallop on a heavy track, and are of little account on a hard one, these are often facetiously called "mud larks." In some families "temper" is a distinct feature, and the members of such families are liable to "sulk" in their races, and to "turn rogue." Some horses win their races at the start, by going out in front and breaking the hearts of the field behind them by the pace they set; others are great "finishers," and come with a burst at the end, and win on the post. *Courage* is the highest characteristic the horse inherits. Some have been known to race on, bleeding from a bad quarter crack, but never knew when they were beaten. Again, the horse that flinches under punishment, or cries "enough" when hurt, somewhere back in "his family" he had an ancestor not "dead game."

My thanks for courtesies received in the preparation of this article are due to Mr. Lawrence, Mr. Keck, Mr. McIntyre, Mr. Westmore, Mr. Brudda, to the Messrs. Goodwin Brothers and Mr. Colgan, and especially to Mr. H. G. Crickmore, the well-known journalist, and the present Secretary and official handicapper of the Monmouth Park Association.

HOWELLS'S NEW ROMANCE.

THE SHADOW OF A DREAM. A Story. By W. D. Howells. Author of "A Hazard of New Fortunes," "Annie Kilburn," etc. pp. 220. 12mo, Cloth, $1 00. (Uniform with W. D. Howells's stories published by Harper & Brothers.) Also Cheap Edition, Paper, 50 cents. (No. 672 in Harper's Franklin Square Library.)

The appearance of a new story by Howells is a distinct literary event.—*Philadelphia Inquirer.*

A strong, powerful, and artistic study of life.—*Boston Transcript.*

The dream is such a one as Poe or Hawthorne might have employed in weaving a weird tale. . . . The story is of absorbing interest throughout.—*Louisville Post.*

DU CHAILLU'S EQUATORIAL AFRICA.

ADVENTURES IN THE GREAT FOREST OF EQUATORIAL AFRICA AND THE COUNTRY OF THE DWARFS. By Paul Du Chaillu. Author of "The Land of the Midnight Sun," etc. *Abridged and Popular Edition.* pp. xviii, 476. With Map and Illustrations. Post 8vo, Cloth, $1 75.

The heroic exploits of Stanley and his followers have aroused a fresh interest in African exploration, and my former works on Equatorial Africa being out of print, I have been encouraged by my publishers to condense into one popular volume and to reissue the narrative of my journeys. I may claim to be the first white man who penetrated into that vast and unbroken forest.—*Extract from Preface.*

McCARTHY'S FRENCH REVOLUTION.

THE FRENCH REVOLUTION. By Justin H. McCarthy. Author of "Outlines of Irish History," "England under Gladstone," etc. In Two Volumes. Volume I. now ready. pp. viii, 668. Post 8vo, Cloth, $1 50.

Mr. Justin H. McCarthy, who has been for some years an enthusiastic student of the period of the French Revolution, now publishes the first instalment of the results of his researches. Since the appearance of Carlyle's work, more than half a century ago, a vast mass of information upon the subject has been steadily accumulating, and Mr. McCarthy's history will be the first presentation of the French Revolution in the light of the important new evidence.

PRESIDENTIAL SPECULATIONS.

SPECULATING upon the chances of the Presidential nomination in 1892, a Western journal thinks that the Democratic division in New York will probably lead to the nomination of a candidate from some other State than New York, and mentions Mr. Gray, of Indiana. It would not be difficult to mention in every State some person whose nomination would be agreeable to his friends, and it is often true of the Presidential nomination that the unforeseen happens. But it is by no means a rule. The renomination of Mr. Lincoln in 1864 and that of General Grant in 1872 were foregone conclusions; this was true in great part of the nomination of Mr. Blaine in 1884. There are two reasons why the nomination of Mr. Cleveland by the Democrats in 1892 is equally probable. The campaign of 1888 and the course of Congress at the present session have identified the Republican party with the policy of high, and in some cases prohibitive, protection. Whether the McKinley tariff be approved by the Senate and the President or not, and whether any Congressional action upon the subject be taken or not, the chief question of the next election will be apparently that of the last. By universal consent, the especial representative of the Democratic position upon the subject is Mr. Cleveland.

But not only by his course in making the tariff the party issue of the campaign did he identify it with a national policy, and prevent the election of '88 from turning on the mere personal question of approval of his administration, but he did very much more than any Democrat in the country had been able to do in dispelling the profound distrust with which his party was regarded. He was in honest sympathy with honest politics. His interest in political progress and in wise reform was evident; and although his official course was often inconsistent with principles which he was believed to approve, it seems to be undeniable that his hold upon public confidence and upon the respect of his political opponents was much stronger at the end than at the beginning of his administration. This feeling has certainly not changed since he left the Presidency. He is probably more popular to-day than he has ever been. Sympathy with the tariff views declared by the Democratic party is by no means always strong enough to overcome the influence of what seems the almost insuperable power of its traditions, and its instinctive opposition, as a party, to political reform, and the personality of the candidate is therefore of very great importance.

To set aside Mr. Cleveland as the Democratic candidate in 1892 would be to proclaim the triumph of the reactionary spirit in his party. It would be the announcement that the very qualities and views which commend him to the confidence of multitudes of patriotic and intelligent citizens who are not distinctively of his party are not approved by the party nor representative of its aims. Undoubtedly the "regulation vote" of the party would be given to the candidate, whoever he might be. But he must be a Democrat of a very sanguine disposition, or singularly ignorant of the deeper forces that influence elections, who supposes that the defeat, as a candidate, of the man who has been of more real service to his party than any other Democrat of the last generation would either unite the party more closely or win more votes beyond the party lines. Nothing so certainly as the success of Democratic opposition to Mr. Cleveland would revive the doubt and distrust which so long excluded it from power. It is true that our government is not one of men, but of laws; not of persons, but of parties. Undoubtedly also, as Senator Morton said in Philadelphia in 1872, when Mr. Sumner and Mr. Trumbull and other conspicuous Republicans broke with the party, the party is greater than any man in it. But it is equally beyond doubt that men are accepted as representative of party convictions and tendencies, and that a party is estimated by its chosen candidates. If the Republican party in 1860 had nominated Simon Cameron instead of Abraham Lincoln, it would have been a great party misfortune. Nothing could strengthen the Democratic party in 1892 more than the nomination of the representative of its best spirit and purpose.

BRIGHT PROSPECTS OF COPYRIGHT.

The most gratifying fact in connection with the recent defeat of the international copyright bill in the House of Representatives is the very general protest of the press, and its plain speech in describing the act. This shows a public awakening and interest which are entirely unprecedented. Hitherto when the project of a copyright treaty has failed, or a report recommending a law has been quietly dropped, or a bill defeated, a copyright club or association may have expressed its regret and indignation strongly, but the public mind has been profoundly indifferent, and this indifference has been the apparent justification of the failure. But the present expression of dissent from the action of the House has been so general and emphatic that many a member of Congress would undoubtedly reconsider his vote if an opportunity should be offered. The argument was wholly with the friends of the law. Some of the opponents of the bill insisted vigorously that there can be no property in ideas. But they were beating the air. If they were informed upon the subject they knew two things which Mr. Lowell mentions in his recent letter.

One is that if the assertion be an argument against copyright, it is an argument against patent-right. A lawn mower is as much an idea as a book. The other thing is that copyright, like patent-right, does not allege a property right in an idea, but in the form given to ideas by genius and labor, by which alone they are made serviceable to mankind. Those who betake themselves to the assertion that property is made by law do not help their cause until they show why law should not protect the form of Bryant's or Irving's idea as well as McCormack's or Hoe's. Moreover, if law makes property, it may do it in every case which promises a public advantage. That is evidently the view of the Constitution, which, to promote the progress of science and useful arts—thus admitting them to be of public benefit—authorizes granting a property right in their works to authors and inventors. Can any man truthfully deny that Mrs. Stowe's *Uncle Tom's Cabin* was a public benefit by arousing the public conscience? and that great poets and historians and story-tellers and artists of high degree are public benefactors as well as the inventors of street-sweeping machines?

Great stress was laid in the debate upon the benefits of cheap reading. But how is that argument relevant? Cheap reading is good, certainly, but so is cheap bread. Our law maintains the right both of our baker to his bread and of our author to his book. But the right of property in both is practically denied if it is not acknowledged wherever it exists, as in the foreign baker and author. We do in effect steal that property when we refuse to acknowledge it in order to appropriate it more cheaply to our own use. The argument practically is that if we refuse to recognize in the foreign author precisely the same right of property in his work that we recognize in the American author, we can procure the foreign work more cheaply. But why do we recognize any such right in the American author? The Constitution answers, because his books are useful. Why do we want foreign books to be cheap? Because they are useful. Then there is the same reason for recognizing the right of property in the foreign as in the domestic work. This is the fact which is becoming very much clearer, and it explains the general and strong protest against the vote in the House. It would now seem to be probable that reconsideration of the bill in a full House might produce a result more in harmony with the American sense of fair play than the recent action.

THE INEQUALITY OF A TARIFF.

If the tariff were what its theory and the speeches of its supporters assume, a fair and equal protection of all the industrial interests in the country, it would appeal more strongly to the national sense of justice. But it is because a tariff is the result of a conflict, not of all but of some interests, each grasping for the most that it can get, and relying upon every kind of personal and selfish motive to succeed, that it is practically obnoxious class legislation. The late debate in the House revealed the utter difference of opinion as to the practical operation of the proposed scheme, and a radical difference as to the proper purpose of any tariff. The farmers are now apparently the especial care of the friends of a tariff. The old argument for the farmers is that they are the especial beneficiaries of protection because it multiplies home industries and gives agricultural products a home market. If, in fact, farmers are equally protected with everybody else, the argument as an argument is sound. But Mr. Butterworth said, deliberately, and his assertion was not questioned, "I can name upon my ten fingers men whose combined profits in the last decade have exceeded those of all the agriculturists of any State in this Union." The friends of a tariff, indeed, are not yet bold enough to assert in terms that farmers and other citizens ought to pay a tax for the benefit of preferred industries which are essential to our independence of other countries. But they lay the tax, nevertheless. When a tariff is made upon the principle of equal protection and by men solely intent upon justice, it will be relevant to the discussion to lay the faults of a tariff upon selfish individual legislators.

That tariff protection is utterly unequal and a scheme of favoritism is a familiar fact. It will not be pretended that the wages of workmen, whom the tariff is also said especially to protect, bear any equal proportion of increase to the profits of the proprietors of the industry. The new tariff lays a duty upon tin plate for the alleged purpose of establishing that industry, which will employ laborers and pay them high wages. This is the assertion. What is the fact? The workmen already employed in other industries must pay more for their dinner pails upon the chance that rich men will invest money in a business which depends upon a tax that would certainly be repealed as soon as the opposition party acquires control. This is the fair play of an unequal tariff. But how many of the Representatives who voted for the new tariff know what it is? How many can explain to their constituents what changes have been made and how they will affect their constituents' interests? The tariff will go into a conference, and come out with changes which only diligent study will reveal, and which again will be the result of a selfish conflict of interests, and not of a desire to provide equal protection to every industry.

The action of the majority in the House prevented adequate knowledge and full discussion of the bill now pending in the Senate. Whatever may be the necessity of a provision to prevent wanton filibustering, the practical suppression of debate upon a measure which profoundly affects the entire industry and business of the country was extraordinary. But Senator Plumb, wishing to enlighten both Congress and the country upon the actual changes increasing and decreasing duties, and the reasons for such changes, introduced the following resolution, which has been adopted:

> "*Resolved,* That the Finance Committee be directed to report to the Senate in connection with House bill 9416, commonly known as the tariff bill, a statement showing the duties levied by the present law, the duties as they would be according to said House bill, and the duties as proposed by said (Senate) committee, all said duties to be stated in parallel columns or otherwise as may be most convenient for examination and comparison; and said committee is specially instructed, in the event it shall recommend the levy of duties not now provided by law, or shall recommend the increase of duties beyond those now imposed, to furnish to the Senate in writing the reasons in each case which have led the committee to recommend the addition of such new duties or the increase of present duties respectively."

This resolution is manifestly fair and useful. The Senate can have no just reason to conceal the changes made in the tariff, and if the reasons are sound, the more clearly they are stated, the more general and certain will be public approval of the bill. The more plain it is made that the tariff aims only at the general interest by equal protection, the more probable is general satisfaction. But the more concealment and mystery in which it is wrapped, the greater and more universal will be suspicion and distrust.

AMERICAN ARTS.

AT a late assembly of artists in Paris, the remark of our minister, Mr. REID, that Congress proposed to repeal the tax upon foreign works of art, was received with great enthusiasm. The artists must have wondered how an intelligent people could ever have laid such a tax, which instead of protecting, prevents the development of art in the country. One of the results of the repeal may be the correction of a tendency which Prince ROLAND BONAPARTE remarked in a recent interview reported in the *World*.

"I have often wondered," he said, "why America has never produced a school of artists who could content themselves with painting merely their own homes. I can never understand why American artists should come abroad to paint little corners of France which have been painted over and over again, when there is such a great field for their energy at home." In making this remark, which, however, contains a wise suggestion, the Prince forgot the truth expressed in CAMPBELL's line:

"'Tis distance lends enchantment to the view."

The mere aspect of London and Paris has a charm for the American which the native of those cities cannot understand, except as he feels the spell of Rome or Venice. Moreover, the American square white house with green blinds which annoyed DICKENS, although the home of greater thrift and comfort than the stained and thatched stone cottage of the French peasant at Barbizon or elsewhere, is less picturesque. Remoteness and strangeness have the elements of romance.

But the English TURNER shows the essential truthfulness of Prince BONAPARTE's view. One of his most famous pictures, the old "*Téméraire*," represents a famous English man-of-war in English waters—a picture whose poetic charm is pathetic and profound. The "Casting of the Statue of Wellington" and the "Great Eastern Railway" are also pictures of the most familiar local incident, but of great splendor and power. It is one of the benefits of the repeal that the more generally and readily the American artist studies great foreign works, the more clearly he will see that it is American character and landscape and life which will inspire an enduring American art.

CONSTRAINT AND THE CENSUS.

THE value of statistics of all kinds of knowledge is undeniable, and the machinery for taking a census of the population is the most convenient for obtaining a great deal of important information. This can be secured, however, only by asking and answering the necessary questions. Lists of such questions have been prepared for the census which is now to be taken, and the enumerators will propose them in the houses that they visit. If anybody should be unwilling to answer the questions, the enumerator will make a note of the fact, and if the refusals are very numerous, the value of the information will be so far reduced; and, according to the Superintendent of the Census, the census officer in the district will decide whether the refusals are of such a character as to require constraint to elicit an answer.

It is this last proposition which has excited some surprise. The Constitution provides for a census as the basis of the adjustment of representation. But it expressly forbids unreasonable searches and seizures. A large part of the questions which are asked by the enumerators are evidently beyond the contemplation of the Constitution. But they are designed to elicit much useful information, and in authorizing such questions Congress probably does not mean to subject the people to unreasonable inquisition.

But while well-disposed citizens will willingly answer many questions for the common benefit, they may decline to answer others, and the allusion of the Superintendent to the "exercise of greater constraint" to obtain answers is very curious. There is no good reason why a man should decline to state whether there are or are not insane persons in his household, because the information may be of ultimate scientific service. But if he should decline, the authority to enumerate the population can hardly be held to justify compelling him to answer. With the exercise of a little common-sense, however, all trouble may be avoided.

MR. CLARKSON'S DILEMMA.

MR. CLARKSON, the Assistant Postmaster-General, will resign on the 1st of July. He will be noted, probably, as the official agent of more changes in the postal service than have ever been made within the same time. It is therefore very interesting to remark that Mr. CLARKSON, according to the report of his reply to some comments of Mr. CABOT LODGE, thinks "that all people in the Federal service should be retained as long as they are found faithful and useful." This is good doctrine, but "the bearings of this observation lays in the application on it."

Let us look at the application. Mr. CLARKSON frankly holds to what is known as the spoils system. He uses a little circumlocution, and is "as much in favor of reform as anybody," but his practice shows what he believes. Now there are, let us say, 52,000 or 53,000 fourth-class post-offices. According to the best information accessible, Mr. CLARKSON has made probably some 30,000 changes in them in a little more than a year. But as he says that all people in the Federal service should be retained as long as they are found faithful and useful, it follows that he has found an immense proportion of the fourth-class postmasters in the country to be unfaithful and useless.

This must have been a very painful disclosure to an Assistant Postmaster-General who believes as much as anybody in civil service reform, although not in Mr. LODGE's "superfine theory." The moral of the revelation, however, is the important part of it; that is where the bearings of the observation lays. These postmasters were appointed, according to the assertion of the organs of Mr. CLARKSON's party, for political reasons. In other words, the offices had been treated as spoils. That treatment, however, has filled them with faithless and useless incumbents. Yet Mr. CLARKSON thinks that method the best. It is not surprising that he proposes to resign, and leave to some one else who also holds that postmasters should be retained as long as they are faithful and useful to turn them out for political reasons.

MR. BUTTERWORTH'S VOTE.

A CORRESPONDENT asks how we like Mr. BUTTERWORTH's vote for the tariff which he had condemned as unjust. We regret it, and for the very reason which our correspondent suggests. It was a vote evidently inconsistent with the views which he had so strongly and lucidly expressed. He is, as he said plainly, a protectionist. He thinks that much of our prosperity is due to that policy, but that the true principle of protection is the security of equal opportunity to American industry, not the creation of monopoly. He demonstrated that this principle was not that of the MCKINLEY tariff, and that it created monopolies. Then he voted for it.

The explanation which he would undoubtedly give is that the Republican party is the only protection party, and that in politics, as Mr. SEWARD said, we must take what we can, not what we would. If such should be his explanation, it would be equivalent to saying that any kind of a protective tariff, however unfair and monopolistic, is better than a revenue tariff, and that not to vote with his party would be to aid the defeat of the only party from which any kind of protection is to be expected. In other words, Mr. BUTTERWORTH would say, "the situation offered me a choice of evils, and I took the lesser."

That is not an unusual dilemma in politics. But it seems to us that Mr. BUTTERWORTH's strong statements of his protective views, with which there is strong Republican sympathy, and his demonstration that the MCKINLEY bill was not based upon the true principle of protection, would have enabled him to vote against it without exclusion from his party, unless he concedes that the principle of the bill is the Republican view of protection, in which case he does not hold the Republican view. If his object were to win over his party to his view, how could he expect to do it by showing, as a Republican, that he did not think his view worth voting for? Support of the MCKINLEY bill was not a test of Republicanism, and as a Republican he might very well have opposed it by his vote as by his speech. If the bill was a test of Republicanism, his speech had already shown that he was not a Republican.

PATRIOTISM AND PENSIONS.

THE good sense of the veteran soldiers of the Union protests strongly against the disposition to treat them as paupers and destitute of patriotic feeling. The combined efforts of pension agents and politicians to represent service in the civil war as a purely mercenary transaction, and the assumption that every soldier and sailor, however vigorous and prosperous he may be, is pining for a pension, are repelled with scorn by representative soldiers. The imputation of demagogues upon the patriotic generosity of the country that there is any indifference to the claims of the widows and orphans of honorable soldiers is wholly without foundation.

There was never more generous provision for pensions made in any country. But no intelligent American will favor a system of pensions which disregards every consideration except the fact that a man was enlisted. Such an American, for instance, would not advocate taxation of the people to-day in order to pay a pension to the deserter of a quarter of a century ago. He would not approve the payment of a thousand dollars a year as a pension to every man who was enrolled in the service, whatever his pecuniary situation.

In other words, he would have pensions determined by principles which commend themselves to every honest man. Honest men know that there is an immense amount of demagoguery in the cry for more and larger pensions, and that nothing but a strong and firm expression of public opinion will arrest the schemes of pension agents practically to empty the treasury under the plea of succor to widows and orphans. In this country poor men pay taxes as well as rich men. For the soldier who was injured in the common cause, and for his family, poor men and rich men will gladly care. But they will not regard the soldiers merely as hirelings. They were fighting for themselves as well as for others. The result was a triumph of patriotism, not of pay. Commander COSGROVE, of the Grand Army far in the West, at Ellensburg, in Washington, speaks in the spirit of the true American soldier: "When a man's country is in danger, he owes to it everything he has, even his life. When the war broke out, we owed our country the offer of our service, and when we enlisted and did our duty, we paid our country only what we owed it."

SUMMER NIGHT CONCERTS.

THE resident of New York whose occupations keep him in the city during the summer, and the stranger who finds the city, with its ample and various resources of amusement, one of the pleasantest of summer resorts, both recall with delight the summer night concerts of THEODORE THOMAS at the old Central Park Garden. All such residents and strangers will hear with no less pleasure that a four weeks' series of these concerts will be renewed this year at the Lenox Lyceum, close by the Park. The series will have begun before this paper is issued, on the evening of Decoration Day, and will continue during the month of June.

The announcement states that "in order that all tastes shall be satisfied, the programmes for the different nights will be varied, though they will all be kept as artistic and attractive as the skill of Mr. THOMAS and his wide acquaintance with the literature of music can make them. On Monday of each week the programme will be of a light and popular character; Tuesday's will be signalized by the participation of soloists; on Wednesday the music will be miscellaneous in character; on Thursday the second part of the programme will include a symphony, the other parts being of a less severe order of music; the programmes of Fridays will contain compositions whose performance has been requested by patrons; Saturday's scheme will be like that of Monday."

The conductor, the place, the orchestra, and the season all combine to secure the highest enjoyment at these concerts. It was the old series which really introduced WAGNER to the American public, and the same catholic sympathy, large acquaintance with music, and knowledge of the popular taste which have always marked the THOMAS concerts will not be wanting in the new series.

PERSONAL.

STUART MERRILL, the translator of *Pastels in Prose*, the recently published work in "The Odd Number Series," is reckoned among the most promising of the younger French poets, and from his perfect command of the French language it would never be suspected that he was not a Frenchman. He is an American by birth, but received his education in Paris. He belongs to the "Symbolistes," or, as they are called, the "Décadents," the latest school of French writers. His poems have been reviewed in the *Nouvelle Revue* and other leading journals abroad. He is a contributor to various periodicals in Paris, and a collection of his poems has been published under the title of *Les Gammes*. While living in this country he was the New York correspondent of the *Revue Wagnérienne*.

—Professor DANIEL WILLARD FISKE, the victor in the suit brought by Cornell University to recover about $2,500,000, left by will to the university by Mrs. FISKE (JENNY MCGRAW), but which, it seems, the institution could not legally hold, is about sixty years old. He was graduated from Hamilton College, and is a man of unusual linguistic attainments, while he is known as the first Icelandic scholar in the world. Chess-playing is also one of his accomplishments. He was a close friend of PAUL MORPHY, and with him published a paper devoted to the interests of the game. Early in his career Professor FISKE had journalistic tastes, and at different times edited papers in several States, numbering among his friends such writers as CHARLES DUDLEY WARNER, BAYARD TAYLOR, and United States Senator HAWLEY. When Cornell University was founded he became Librarian and Professor of North European Languages, and at Ithaca met and became engaged to Miss MCGRAW, a woman of fine intellect, and of such devotion to her father that she would not marry till after his death. Professor FISKE is abroad at the present time, travelling and pursuing researches of deep interest to him.

—Sportsmen in India and Africa have always regarded a wounded elephant as one of the most dangerous and revengeful of animals. FRANK L. JAMES, of England, a well-known African traveller and entertaining writer, had occasion recently to test this propensity of the beast, and met with fatal results. Instead of stamping his assailant out of existence, as is sometimes the case in such encounters, the enraged brute pierced Mr. JAMES's breast with a tusk, and he died soon after. The unfortunate traveller was on a yachting trip with pleasant companions along the west coast of Africa, and having entered the Gaboon River, went ashore on a hunting trip. It was during this expedition that he met his death. He leaves a brother in this city, D. WILLIS JAMES, a member of the firm of PHELPS, DODGE, & CO.

—D. EDGAR CROUSE, a rich bachelor of Syracuse, New York, is finishing a stable which is said to have cost over $700,000. It is palatial in all respects, even to the comparatively small portion which the horses will occupy. There are rooms finished in costly woods, tiled mosaics, and other elaborate ornamentations. In the dining-room is a sideboard that cost $800, while the anvil and tools of the blacksmith shop are nickel-plated.

—JAMES CARLYLE, the last surviving brother of THOMAS CARLYLE, has just died near Ecclefechan, Dumfriesshire.

—The widow of Sergeant PLUNKETT, a Massachusetts soldier, has just received a pension. Various acts of bravery made THOMAS PLUNKETT conspicuous, but the loss of both his arms by the explosion of a shell, while carrying the colors of his regiment during a charge at the battle of Fredericksburg, gave him especial prominence. He lived for twenty years after meeting this calamity.

—PHILIP BRIGHT, the youngest son of the late JOHN BRIGHT, has become a Home-ruler.

—WALT WHITMAN has chosen his burial-place in the prettiest part of Harleigh Cemetery, near Camden, New Jersey, where he lives. On the occasion of Queen VICTORIA's recent birthday he sent her a sprig of arbutus, accompanied by a few lines and a sentiment, both of which were eminently characteristic of the poet.

—The Empress of Austria has had her wedding dress, which was of white brocade embroidered with silver, made into a set of priestly garments for the Church of St. Matthew, in Pesth, and her bridal wreath encircles an embroidered picture of the Virgin.

—A familiar figure, known as the "Black Horseman," has disappeared from Berlin since Prince BISMARCK's departure. He was the Chancellor's private courier, and had been in his employ since 1866. His real name was LUDWIG LEWENSTRÖM. During the Austrian and Franco-Prussian wars he served the Prince, and was the only German witness of the meeting between his master and the Emperor of France on the morning of September 2, 1870, which completed the humiliation of NAPOLEON III., and practically closed the war. He carried important messages during the days at Versailles when the articles of capitulation were being prepared, and the same dark figure galloped incessantly between the palaces of Emperor WILLIAM I. and of Emperor FREDERICK and the home of the Chancellor during the periods, not so far apart, when the German rulers lay at the point of death. The fact that the courier was usually clothed in black gave him the name of the "Black Horseman."

TO JOHN ELIOT.

m and proved himself here as
and citizens their faults, as he
wks for their bloodthirstiness.

There is a peculiar fitness in erecting monuments to men like John Eliot and John Megapolensis, for in their day they were the only persons who had sufficient real piety to espouse the cause of savages, and enough learning to impose their authority on people released from many of the restraining influences of the Old World, and eager to amass wealth by any means in their power. Eliot and Megapolensis belong to a period when Protestant Churches gained more power than was good for their pastors, yet both of them used that power to protect the weak and withstand the tyrannical.

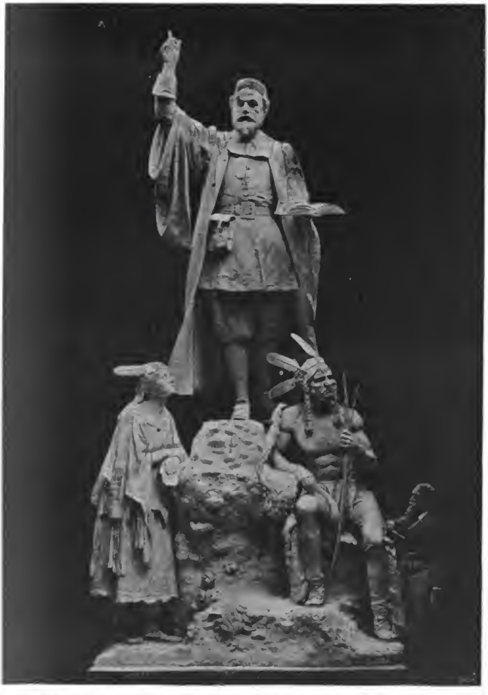
The sculptor has had no very satisfactory portraits to guide him in the figure of John Eliot, though two exist which are thought by their owners to be genuine. He pictures him in middle age, of a fair, well-balanced countenance, sturdily built, and wearing an expression of calm certainty as to the importance of his mission. He has mounted a bowlder, drawn his translation of the Bible from the leather case fastened to his belt, and with uplifted index is telling an Indian audience of a home beyond the sky. A male and female Indian represent the audience. The man wears eagle feathers in a head-dress, and has plaited locks of hair falling on his bare breast. He holds bow and arrows in the left hand, and rests his right elbow on a bear-skin, which protects him from the rock. He wears buckskin trousers and moccasins. His pose is the most graceful of the three, but his expression is discontented, if not truculent. The squaw also has an eagle feather in her hair, though it is generally supposed that Indians associate that feather with boldness in war, and confine its use to men who have slain their foe. She wears high moccasins, but no stockings or leggings, a buckskin embroidered skirt to mid-leg, and a cloak made of the skin of a doe. Whilst the warrior looks off in a gloomy reverie, the woman raises her eyes toward the Apostle, but not sufficiently to fix them on him. On the right of our illustration is a portrait of Mr. Rogers in his sculptor's apron.

John Eliot's costume is a compromise between the clothing of a merchant about A.D. 1650 and the garb of a minister. He wears the skull-cap of a student and the robe of a man in orders. The deep collar and body-coat, the short breeches, stockings, and buckled shoes represent well enough an Englishman of the lower middle class. The transverse line of his collar or "band," that of his belt and the open Bible in his left hand, but still more the crossment effected by the lower edge of the coat, give so many stoppages to the eye as it travels up from the base of the monument to the tip of the Apostle's raised right index. Among these the last is most important, and throws a deep shadow across the figure; it might be obviated very easily should the sculptor care so to do.

Taken as a whole, the three figures are distributed well. It is true that they are not knit together by one dramatic idea which brings each into active complicity with a common purpose. They are more realistically treated, as if, in the ordinary way, the preacher were expounding a text and the listeners were attentive, but not specially hanging on the lips of their teacher. But the lines of the Apostle's robe give a silhouette which is very agreeably carried down by the figures of the Indians, thus producing a composition of considerable excellence. It is indeed remarkable, when we think of the sculptor's life-long devotion to little statue groups, to find that he can do so well on a large scale, for the monument is about thirty-five feet high. Yet it is not to be denied that the training in small groups which Mr. Rogers has had these thirty years past has influenced him somewhat in the present instance. Meant for interiors where they are placed on mantel-pieces, bureaus, side-tables or whatnots, his groups are usually approached from one side only. They are intended for the same purposes as the statuette groups in clay which come from Greece and Asia Minor, though these are commonly enough quite rude and unfinished on the back. But usually a monument having the bigness and importance in other respects we find in this group is so placed as to be viewed from all sides. It generally stands in the centre of a square, where people may approach it from any direction.

But it may be noticed that such an emplacement would be unlucky for this monument. It needs the background of a great pine wood, or of a mountain, or of some big edifice. It faces one way, and concentrates its interest toward but one quarter. Seen from the extreme right or left, it would still be fine, but seen from behind, it would be unfortunate. The criticism is therefore not a radical one, but simply a limiting criticism, a warning that care should be taken not to dispose of the monument in such a way as to lose its best effect. We have in New York an example of the kind which is very prominent. The Farragut on Madison Square is not properly placed, because it has but one face, that turned toward Broadway. But it is also approachable from the square, and then turns its back on the spectator, who does not know what to make of the semicircular pedestal that looks out of all proportion to the figure, and can hardly admire the back of the gallant admiral's trousers. That handsome monument ought to be in Central Park, at the end of a flower-bordered walk, and backed closely by a solid mass of leafage.

If the "John Eliot preaching to the Indians" finds favor with New England, it can easily be placed so as to form a notable ornament of Boston, Roxbury, or some other place identified with Eliot's long and praiseworthy career. The sculptor is a native of Massachusetts, who has worked out his own artistic salvation in a way very typical and American.



JOHN ELIOT, THE PURITAN MISSIONARY, PREACHING THE GOSPEL TO THE INDIANS.
PHOTOGRAPHED FROM THE GROUP EXECUTED BY JOHN ROGERS.

happiness assured. And thy Bebee Miriam should listen to me; for she is also a woman. But then she would envy me— It is not seemly for men to worship a woman."

Holden laughed aloud at Ameera's little spasm of jealousy.

"Is it not seemly? Why didst thou not turn me from worship of thee, then?"

"Thou a worshipper! And of me! My king, for all thy sweet words, well I know that I am thy servant and thy slave, and the dust under thy feet. And I would not have it otherwise. See!"

Before Holden could prevent her she stooped forward and touched his feet; recovering herself with a little laugh, she hugged Tota closer to her bosom. Then, almost savagely:

"Is it true that the bold white *mem-log* live for three times the length of my life? Is it true that they make their marriages not before they are old women?"

"They marry as do others—when they are women."

"That I know, but they wed when they are twenty-five. Is that true?"

"That is true."

"*Ya illah!* At twenty-five! Who would of his own will take a wife even of eighteen? She is a woman—aging every hour. Twenty-five! I shall be an old woman at that age, and— Those *mem-log* remain young forever. How I hate them!"

"What have they to do with us?"

"I cannot tell. I know only that there may now be alive on this earth a woman ten years older than I who may come to thee and take thy love ten years after I am an old woman, gray-headed, and the nurse of Tota's son. That is unjust and evil. They should die too."

"Now, for all thy years, thou art a child, and shalt be picked up and carried down the staircase."

"Tota! Have a care for Tota, my lord! Thou, at least, art as foolish as any babe!" Ameera tucked Tota out of harm's way in the hollow of her neck, and was carried down stairs, laughing in Holden's arms, while Tota opened his eyes and smiled, after the manner of the lesser angels.

He was a silent infant, and almost before Holden could realize that he was in the world, developed into a small gold-colored godling and unquestioned despot of the house overlooking the city. Those were months of absolute happiness to Holden and Ameera—happiness withdrawn from the world, shut in behind the wooden gate that Pir Khan guarded. By day Holden did his work, with an immense pity for such as were not so fortunate as himself, and a sympathy for small children that amazed and amused many mothers at the little station gatherings. At nightfall he returned to Ameera—Ameera full of the wondrous doings of Tota: how he had been seen to clap his hands together and move his fingers with intention and purpose, which was manifestly a miracle; how, later, he had of his own initiative crawled out of his low bedstead onto the floor, and swayed on both feet for the space of three breaths.

"And they were long breaths, for my heart stood still with delight," said Ameera.

Then he took the beasts into his councils—the well-bullocks, the little gray squirrels, the mongoose that lived in a hole near the well, and especially Mian Mittu, the parrot, whose tail he grievously pulled, and Mian Mittu screamed till Ameera and Holden arrived.

"Oh, villain! Child of strength! This to thy brother on the house-top! *Tobah, tobah!* Fie! fie! But I know a charm to make him wise as Suleiman and Aflatoun.* Now look," said Ameera. She drew from an embroidered bag a handful of almonds. "See! we count seven. In the name of God!"

She placed Mian Mittu, very angry and rumpled, on the top of his cage, and seating herself between the babe and the bird, cracked and peeled an almond less white than her teeth. "This is a true charm, my life; and do not laugh. See! I give the parrot one half, and Tota the other." Mian Mittu, with careful beak, took his share from between Ameera's lips, and she kissed the other half into the mouth of the child, who ate it slowly, with wondering eyes. "This I will do each day of seven, and without doubt he who is ours will be a bold speaker and wise. Eh, Tota, what wilt thou be when thou art a man and I am gray-headed?" Tota tucked his fat legs into adorable creases. He could crawl, but he was not going to waste the spring of his youth in idle speech. He wanted Mian Mittu's tail to tweak.

When he was advanced to the dignity of a silver belt—which, with a magic square engraved on silver and hung round his neck, made up the greater part of his clothing—he staggered on a perilous journey down the garden to Pir Khan, and proffered him all his jewels in exchange for one little ride on Holden's horse. He had seen his mother's mother chaffering with peddlers in the veranda. Pir Khan wept, set the untried feet on his own gray head in sign of fealty, and brought the bold adventurer to his mother's arms, vowing that Tota would be a leader of men ere his beard was grown.

One hot evening, while he sat on the roof between his father and mother, watching the never-ending warfare of the kites that the city boys flew, he demanded a kite of his own, with Pir Khan to fly it, because he had a fear of dealing with anything larger than himself; and when Holden called him a "spark," he rose to his feet and answered slowly, in defence of his new-found individuality: "*Hum 'park nahin hai. Hum admi hai.*" (I am no spark, but a man.)

The protest made Holden choke, and devote himself very seriously to a consideration of Tota's future.

He need hardly have taken the trouble. The delight of that life was too perfect to endure. Therefore it was taken away, as many things are taken away in India, suddenly and without warning. The little lord of the house, as Pir Khan called him, grew sorrowful and complained of pains, who had never known the meaning of pain. Ameera, wild with terror, watched him through the night, and in the dawning of the second day the life was shaken out of him by fever—the seasonal autumn fever. It seemed altogether impossible that he could die, and neither Ameera nor Holden at first believed the evidence of the body on the bedstead. Then Ameera beat her head against the wall, and would have flung herself down the well in the garden, had Holden not restrained her by main force.

One mercy only was granted to Holden. He rode to his office in broad daylight, and found waiting him an unusually heavy mail that demanded concentrated attention and hard work. He was not, however, alive to this kindness of the gods.

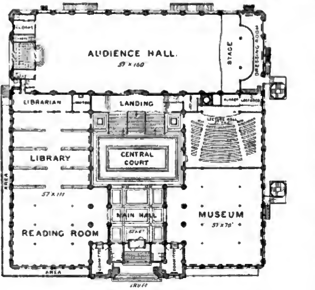
---

* Solomon and Plato.



THE DREXEL INDUSTRIAL INSTITUTE.

INDUSTRIAL training is the order of the day. It is the latest "fad" in education, if one may be allowed to use that word in connection with such a subject. The old course of study in the public schools is not satisfactory. It provides no training for the hand and the eye. It is not "practical" enough to suit the average citizen, who by "practical" means money-producing. Industrial training, it is thought, will prepare boys and girls to make a living when they come out of school.

It is a noteworthy fact that this subject of industrial training has been taken up by well-educated people, who do not regard schooling as valuable simply for the knowledge it imparts that is immediately applicable to money-making. Superintendent MacAllister in Philadelphia, the Public Education Society in New York, Principal Woodward in St. Louis, and even the Board of Education in New York, have recognized, in providing for a certain amount of industrial training in school, that it should be merely one feature of the course, and should be so taught as rather to be a means of general training than an acquirement of purely technical skill.

The scheme of instruction to be pursued in the Drexel Industrial Institute, although the details of it have not yet been elaborated, will be general, and not purely technical. The purpose of the "regular" course will be to give to young persons who have received a grammar-school education such technical instruction as will enable them to learn trades easily, at the same time affording them instruction in mathematics, book-keeping, physics, chemistry, and English. There will be special classes also for older pupils, which will be purely technical, but to enter which the pupils must have a good foundation in the ordinary English branches.

The building for the Institute is at the northeast corner of Thirty-second and Chestnut streets, and occupies three sides of a square. It is near the Powelton Avenue station of the Pennsylvania Railroad, and not far from the Twenty-fourth Street station of the Baltimore and Ohio, and there are several lines of street cars within easy walking distance. The building is to be about 200 feet square and three stories in height, fronting on Chestnut Street. The outside will be mainly of a light buff brick, with terra-cotta ornamentation.

The special feature of the interior is a large central hall, nearly 100 feet square, and reaching to a glass roof on the ceiling line of the third floor. From the northern or rear end of this hall a grand marble stairway leads to the upper floors. Broad galleries run around the inside court on the second and third floors, giving entrance to the various rooms, all of which are lighted from the outside.

On the first floor are the museum, 56 by 70 feet; the library, 56 by 70 feet, and reading-room, 56 by 40; a small lecture hall, 40 by 56, and, distinct from other parts of the building, the great lecture hall, 56 by 154 feet, which will seat about 2000 people. The floor of this hall slopes downward from the entrance on Thirty-second Street to the rear or eastern end, where the stage is placed, thus allowing sufficient height to the ceiling without carrying that above the level of the second floor.

There are twenty-four class-rooms in the building, amply provided with cloak-rooms, wash-rooms, etc., and as each of these will contain, on the average, at least 100 pupils, there will be room for 2400 in the building at once.

In the middle of the front on the top floor is the gymnasium, a room about 60 feet square, which will, of course, be fitted up with all necessary appliances. Special attention has been paid to heating, lighting, and ventilation. Steam heat and electric lights will be used throughout. There will be 1700 incandescent lamps. The interior wood-work will be of oak.

The building, for the construction of which contracts have recently been signed, is expected to be ready for occupation in September, 1891. Its cost is estimated at about $500,000. The donor, Mr. Anthony J. Drexel, of the well-known banking house, expects to provide, also, an endowment fund of $1,000,000 to keep the Institute in permanent operation.

THE TABLET DANCE AT SANTO DOMINGO

OF the annual festival held in the various towns of the Pueblo Indians of New Mexico, that at Santo Domingo on the 4th of August is one of the most important. Among the Pueblos, Santo Domingo, about thirty miles southwest of Santa Fe, on the bank of the Rio Grande, is one of the largest. The river in time of freshet menaces the town, and many years ago, during a flood, it changed its channel, engulfing about half the town. The inhabitants thus dispossessed built their residences on higher ground to the east of the old village, so that Santo Domingo is really a double village, with two distinct kinds of aboriginal architecture—the old, in which the houses are two stories high, terrace-shaped, and entered from the roof, and the new, in which the one-story houses have doors and windows.

Each division of the village has its own estufa, or circular underground council-chamber. For several days preceding the festival, Indians from the other Pueblos of New Mexico and the Navajo country gather in the town. Feathers are an important feature of the ceremonial, and several parrots kept in the village are mercilessly plucked of their plumage to decorate the dancers. For the greater part of the night before the festival the town is awake, the men performing their ancient dances in the estufas, and the women whitewashing the fronts of the houses, while from time to time cavalcades of horsemen from the surrounding country arrive in town.

At earliest dawn the people are at work sweeping the streets and plazas. During the morning many visitors arrive—Indians, Mexicans, and Americans—in carriages and wagons, on horses and burros and on foot, until the house-tops are covered. Mexican ladies in brilliant flowered silks and swarthy Indians in superb Navajo blankets help to adorn the crowded level roofs with a bouquet-like effect of rich color. Immediately after mass the dancers begin to array themselves, and precisely at noon, from the summit of the estufa in the old town, they appear in procession, men and women to the number of more than a hundred. With them are men who play on tomtoms, and one of them thumps a drum made of a hollow cottonwood log covered with a skin. A chorus of men sing verses with a refrain, which accompany the dance, and by degrees work themselves into a frenzy of excitement. At the head of the procession a man bears a standard fifteen feet high, surmounted by long orange-colored feathers and an aboriginal banner of embroidered buckskin trimmed with feathers. The men, who are painted brown and white, wear a white tunic with an embroidered stripe on each side. A fox or coyote skin hangs behind, tail downward, and a bunch of green cedar sprigs is tied on the left arm. They wear moccasins, and gaudy garters are tied about their naked calves. Their uncovered loose flying hair is adorned in front with parrot feathers. Cedar sprigs encircle their bodies from shoulders to waist, and rattles of tortoise-shell and sheeps' toes hang at the rear of the right knee. They carry in the right hand small painted gourds filled with corn, which they rattle.

The women are dressed in a dark blue single garment, consisting of a double blanket reaching to the knee. The corners are caught over one shoulder, the garment passing beneath the other arm, leaving the left arm and shoulder, and upper part of the left breast exposed, and most of the right arm; it is fastened with a wide red embroidered sash around the waist. Their long black hair, carefully prepared by washing with amole—soap-root—hangs straight down behind, shining like jet. Their cheeks are painted vermilion, and they carry a bunch of green cedar in the left hand. Upon their heads is the wooden head-dress or *tablita* of thin board, fifteen inches high, pea green or sky blue in color, with three figures cut out of each in the shape of a crescent, cross, square, and letter T; its serrated top is painted red and yellow, and its corners are decorated with eagle down. The women are bare-legged and barefooted, and each carries a bunch of cedar in her left hand. The procession moves slowly into the church plaza. The dance comprises a great number of beautiful figures, displaying more variety than Indian dances in general, and it is executed with much precision and grace.

At the end of an hour a procession emerges from the estufa in the new town; it is similar in character to the first, except that the men are painted blue instead of brown, and the feathers on the women's *tablitas* are white. As the new-comers begin their dance, the other procession retires for a season to rest, and thereafter the two parties alternate in performance throughout the day. The Indian clowns, waving small wands of cottonwood branches, rush about hither and thither, naked, except for breech cloths, their bodies, limbs, faces, striped black and white, and tortoise-shells clanking at the right knee. They wear a circle of cedar sprigs at their ankles and waists, and their hair is tied up with corn shucks. As the procession makes the circuit of the plaza, the dancers bending forward go at the bounding half-trot that characterize Indian dances. In front of the church they face each other, preserving the same step, turn round and round in place for several moments, make a few evolutions, and march away in single file, each girl falling in behind her male partner, and all giving a farewell howl as they leave.

On a temporary altar in a spacious pavilion erected in the main plaza is a wooden statue of Saint Dominick, brought from Spain nearly two centuries ago. Through the day the people come to say their prayers before the saint, and to bring offerings of candles, corn, melons, bread, and baskets of plums. About the middle of the afternoon the whole body of dancers and singers march to the pavilion, where each Indian files in turn before the image of Saint Dominick. The men bow, and the women three times cross themselves, the more devoted of them kissing the garments of the saint.

Late in the afternoon there are games and races in the outskirts of the town, which many of the people and visitors attend. The favorite sport is the cruel one of the gallinaros, or chicken pullers, in which men try, while at full gallop, to catch by the head a fowl whose body is buried in the earth. But thousands of spectators continue to cover the house-tops and crowd the plazas where the ceremonial dances are still in progress, and they remain to view the picturesque and brilliant sight until darkness shuts down upon the scene. The dance is a very ancient one, and the costumes are a perpetuation of those worn by the prehistoric ancestors of the Pueblos. The ceremonial probably partakes of the character of the cachina, the heathen religious dance so abominated by the early Spanish missionaries; and it is certain that on this occasion a great many heathen rites are mixed with their celebration of the day of good Saint Dominick.

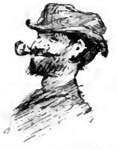
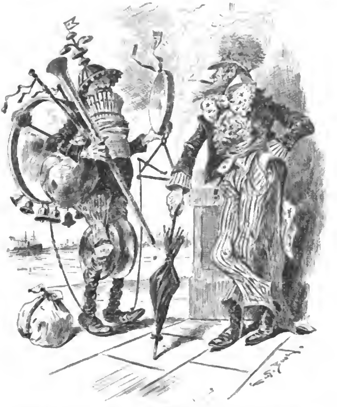
A DETECTIVE ARRESTING A LODGER

of fair character, from a police stand-point at least, and though they are watched by the police, generally keep on good terms with the captain of the precinct. They never shelter thieves from pursuit, at least when they believe the police to have definite information, and they strive to stand well in the records of the Board of Health. There are, however, numerous ugly stories told of the manner in which, at the bidding of political candidates, they influence votes at the elections, and even provide illegal voters in considerable numbers. There is also an arrangement very commonly made between the proprietor of the lodging house and the saloon-keeper, who occupies the ground floor in most cases, that is far from creditable. Drunken men from the saloon are very commonly taken as lodgers at a reduced rate, in consideration of free drinks to the lodging-house keeper and his clerks. It is the modern expression of the classic London sign: "Drunk for sixpence. Dead drunk for a shilling, and straw to lie on thrown in."

The houses, as said, are kept clean. They are also well ventilated and warmed in winter, and are, in a rude way, comfortable shelters, excepting for the company. The scene in one of them at two or three o'clock in the morning is gloomy and almost gruesome. There is only a very dim light, and though the lodgers are prohibited from walking about, they toss restlessly on their beds. Many are talking in their sleep. Drunkards here and there are snoring or struggling with incipient delirium tremens. Occasionally some wakeful sinner is moaning, and even crying aloud with expressions of remorse. Through it all, however, tired men sleep, undisturbed even by the occasional visit of a detective in search of a thief, or, as is not uncommon, the call of some distracted parent in search of a wayward son. It is at least a shelter for weary men till daybreak rouses them to another struggle with fate.



AFTER A NIGHT'S LODGING



A PUZZLER.

UNCLE SAM. "Waal, by thunder! I guess it 'll kinder rattle the boys some ter find oout which part of yer is artist an' which part artisan."

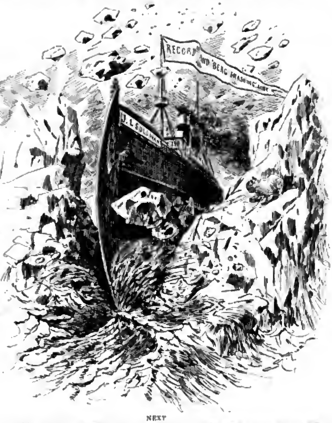
STREET SCENE IN KANSAS CITY.

The characteristic feature of the Kansas City street scene on another page is not the photographic exactness of the view, nor yet the inevitable group of moving people at the "Junction" at the foot of the hill. It is more than anything else the yellowish white glare of sunshine that pours down from the smoky sky, and makes a mirror of the unsheltered pavement. The artist has so thoroughly mastered the local feeling of the neighborhood that one who is at all familiar with Kansas City will see at a glance that the time of the picture is about half past two o'clock on an afternoon late in May. The tinge of smoke in the sky is rising from the railway yards and the big packing-houses down on the river-bottom, and the fresh breeze is spreading it over the city like a veil. The sun had not yet grown sufficiently fervid to drive people out of the street and bring out all the awnings, but it is brilliant enough to give a hint of hotter days to come later in the season. There are some rather hot afternoons in Kansas City during the summer, and the "Junction" is probably as hot as any spot in the place. In looking at the high lights of this picture one is likely to remember some particularly breathless summer afternoon down there at the foot of the Ninth Street hill, when the eyes were pained by the glare of the sun, and the feet were all but blistered on pavements from which the heat seemed to arise in waves. Kansas City is not advertised as a summer resort, however; nor do people go there in July and August when they can just as well go to the Rocky Mountains or the shores of Lake Superior.

THE LITERARY WEALTH OF ASSYRIA AND BABYLONIA.

In kind and character the Assyrian literature is unique, differing from all others on the globe. It is engraven on bricks, prisms, and cylinders of clay; on slabs of alabaster and marble, on statues, obelisks, and colossal bulls and, above all, on clay tablets of every shape and form, upon which, when soft, the wedges were pressed, and the "literary document" was then dried in the sun. No people could have chosen a more substantial material for preserving their thoughts for coming ages than did the Assyrians and Babylonians, for even the breaking of a tablet or brick does not necessarily bring with it the loss of the inscription. Even such important documents as the Babylonian account of the creation and the deluge have been reconstructed chiefly by putting together again parts of bricks which were found broken in the ruins of the libraries. The literature that has been discovered already far exceeds the compass of the whole of the Old Testament Scriptures. And yet it is growing constantly. Not only is the American expedition at work near Nippur, and systematic excavations are also being made at Tello, whence Sarzec, in 1882, secured the collection now in the Louvre, and where only recently a number of exceedingly old bricks, clay cones, and cylinder seals with peculiar Arabic signs have been unearthed. The Arabs on the ground have also learned the value of these remains. For years there has been an active trade in Babylonian antiquities, especially in clay tablets and cylinders, often of the highest scientific value, which have been dug up by the Arabs, and purchased in the East or in Europe, for museums in London, Paris, Berlin, and elsewhere.

The contents of this literature are of varied character and value. Texts of many hundred lines record with full details the wars of Assyrian and Babylonian kings, their buildings, their hunting expeditions, and unfold almost the very minutiæ of the politics, culture, civilization, antiquities—public and private—the geography, etc., not only of Babylonia and Assyria, but also of the neighboring people of western Asia. Then there are chronological lists and records of every sort, such as eponym lists, chronicles, synchronous histories, tables of kings, etc., which enable us to fix the dates of individual dynasties and monarchies as accurately as we know the different dynasties of Egypt, and which are also valuable aids in settling the vexed problem of Old Testament chronology, as a number of Israelitish kings are mentioned, and the dealings with the rulers of Assyria and Babylonia described in these documents. Indeed, we have unimpeachable chronological data dating back into the fourth millenium before Christ. Of other kinds of literature we have prayers and psalms, legends of the gods, a mythology as extensive as that of Homer, stories of the creation and the flood, lists of the gods and exorcisms of varied contents, a great epic in twelve books, curious lists of secret remedies, oracular deliverances, and calendars, astrological tablets, as also purely scientific, mathematical, and astronomical works, then long lists of words from the same or a similar stem, or having the same or a similar ideogram, lists of synonyms, of the names of occupations, persons, stars, animals, plants, clothes, wooden instruments and utensils, paradigms, collections of signs, such as were used by the priest schools, further letters and contrast tablets, reports of generals and astronomers, proclamations and petitions, deeds of purchase and sale of every description, marriage certificates, bequests, wills, house inventories, receipts, etc., revealing the social life of Assyria and Babylonia.



NEXT

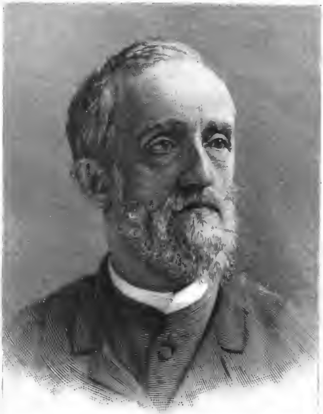
FOUR DAYS AND ICEBERG PROOF. (Passengers by this line will experience no inconvenience or other than pleasant sensations meeting with ice, and are assured of a four days' passage, or money refunded.)

is merely a place where men acquire money ry rapidly in the transaction of business. hen a man is doing a good business he can dure a hot afternoon now and then. Peo- e do not go West and build towns just for a sake of climate.

In addition to its local color, the picture ows in a striking way the rapid improve- ent in Kansas City during the past few ars. The long-haired person in the left reground, who has probably come up from e Southwest with a train-load of cattle, is doubt wondering in a dazed way just here those huge new buildings and those markable cable roads came from. They ere not there on his last visit, and it seems credible that a place should grow so much so short a time. His wonder is shared by ost people who have been passing through ansas City now and then for the past seven ars. Only a few years ago the little four- ory building at the foot of the hill was one the finest blocks in the place, but although is still an important and valuable piece of operty, it is dwarfed by the huge insurance ilding just beyond it, and other tall struc- res in the neighborhood. Nearly all of ese larger buildings have been put up with- the past two years.

It is a pity that such a fine and prosperous ty should not have a better site, but the iginal settlers, who built a few unpreten- ous frame houses at the steam-boat landing low the bluff, failed to take into considera- on the possibility that their humble settle- ent might some day climb the bluff and ver the outlying hills. As shown in the cture, the cable railway has been put to od use in carrying people up and down ese hills. The Ninth Street hill is in real- somewhat steeper than the perspective dicates. As the "Junction" is practically e heart of the city, and as the streets that ad to it all come to it on the down grade cept two, the convenience of the cable ad, in this instance at least, will be appar- t. The cable cars have robbed many of nsas City's streets of their terrors, in so r as travelling up and down hill has been ade both safe and pleasant. If only some echanical means could be devised by which erworked horses and mules would not be mpelled to struggle up these hills with avy loads of coal and merchandise, the nsitive person could walk or ride abroad in mfort.

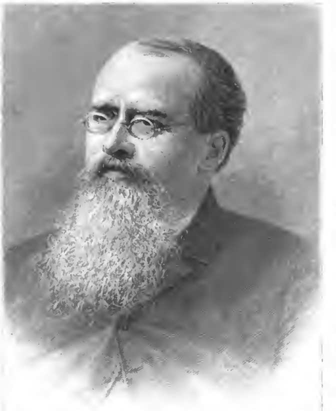
The knot of people down at the "Junc- on" is doubtless as cosmopolitan in charac- r as one might find in any city of the United ates. The student of character would find ere representatives of all classes and condi- ons of men. He would see cow-boys fresh om the cattle trails, railway laborers just from the grade, breathless business men om the buildings roundabout, well-groomed urists from the East, farmers from down e river, immigrants from all parts of Eu- pe, the typical English tourist with wide- eck suit and plaid travelling cap, and va- ous other kinds of people that one meets enest in some central railway point like ansas City. The observer would find this mixed crowd duplicated in augmented numbers if he took the trouble to walk about the Union Station for an hour when the big overland trains come in.



REV. O. P. FITZGERALD, D.D., NEWLY ELECTED BISHOP OF THE METHODIST EPISCOPAL CHURCH, SOUTH.

BISHOPS HAYGOOD AND FITZGERALD.

The General Conference of the Methodist Episcopal Church, South, has done honor to itself in electing to the episcopal office the Rev. Dr. Atticus G. Haygood and the Rev. Dr. O. P. Fitzgerald. Of the two men Bishop Haygood is best known to the country. He has devoted himself with such singleness of purpose to the interests of the freedmen of the South that he is recognized as a leader of advanced Southern philanthropic sentiment. Since 1883 he has been general agent of the John F. Slater Fund of one million dollars, established by the citizen of Connecticut whose name it bears, for the purpose of aiding the education of the colored race. Bishop Haygood was born in Georgia, November, 1839, became a Methodist minister in 1859, and was chosen President of Emory College, Macon, Georgia, in 1876. This office he held for eight years. In 1874 he was elected a Bishop of the Southern Methodist Church, but declined to serve, considering his work as an educator too important to be surrendered. Since 1883 he has had the general administration of the Slater Fund, which in 1888 gave help to twenty-nine high-grade schools established for the education of the Southern blacks.



REV. ATTICUS G. HAYGOOD, D.D., NEWLY ELECTED BISHOP OF THE METHODIST EPISCOPAL CHURCH, SOUTH.

But Bishop Haygood's claim to distinction does not rest upon the holding of public position, however honorable. He would be a man of mark without office or title. He is known all over the country for the heartiness with which he has accepted the present Southern situation, and the energy with which he has tried to meet its demands. To establish a new South better, stronger than the old South is his one aspiration. A Southerner in feeling, and devoted to the part of the Union to which he belongs, he has had the sagacity to perceive that his people must go forward, leaving "the dead past to bury its dead." In speaking and writing on this theme of Southern progress he has shown a capacity for terse expression which any speaker or writer of our day might well envy. A little volume might readily be made of his aphoristic sentences. He has the merit, too, of great plainness of speech. To show the man we will cull a few passages from an address delivered to the alumni of Emory College in 1886:

"As a Southern man it has long appeared to me that the first duty is to find out the facts of our time, and to recognize and avow them unflinchingly. He has learned much who has learned what the question is. It is not what do we wish were the facts, but what are the facts. Avoid the question as we may, it will come back to us."

"It is little short of a crime against our children to denationalize their opinions and sentiments. It may be a luxury to our prejudice, but it will be a plague to our children. It will hinder their progress and embitter their lives."

"That man is a criminal who can and will not educate those he has been the means of bringing into the world. There is need of an educational Elijah to preach repentance to the great masses of our people, who are, in the contentment of stupidity, allowing their children to grow up untaught."

His mode of addressing the colored people is as forcible as his mode of addressing the whites. He is kindly in his tone, but never blinks the truth. Speaking at the dedication of the Morris-Brown College, Atlanta, founded by the colored people themselves, he warns them of the limitations of book-learning.

"If book-learning does not increase one's earning capacity, it is a business failure; if it decreases it, it is an injury as well as a failure; if it increases wants and decreases capacity to supply them, it is simply ruin—ruin of all sorts."

Again he cheers them:

"I know what begging for a college means. Gathering $10,000 in small sums—in dollars, nay, in dimes and nickels—means more than work and patience; it means headache, heart-ache, almost despair. What underlies the gift of all this money and the collection of it is rarely significant and hopeful. *It means that it is in the colored race of this country to be self-sustaining.*"

These passages from the speeches of Bishop Haygood show his character more vividly than any detailed description can. It is greatly to be hoped that he may become as well known to the people of the North and West as he is to the people of his own sunny land. As a representative of the "New South" he will receive a hearty welcome wherever he appears.

Bishop O. P. Fitzgerald was born in North Carolina in the year 1829, and became a member of the Georgia Methodist Conference in 1854. Subsequently he went to California, where he was, in 1867, elected Superintendent of Public Instruction. He is best known as editor of the Nashville *Christian Advocate*, the chief weekly paper of the Southern Methodist Church. In the Centenary Convention of American Methodists held in Baltimore, December, 1884, he attracted attention by the evidences he gave of his sincere desire for a better understanding with his Northern Methodist brethren. In the election of these two Bishops Southern Methodists have done much to draw closer the bonds of churchly and national unity.

PROTECT THE SYSTEM FROM MALARIA.

It is possible to do this even in regions of country where miasma is most rife, and where the periodic fevers which it causes assume their most formidable types. The immense popularity of Hostetter's Stomach Bitters is very largely attributable to the fact of its efficacy as a remedy for chills and fever, bilious remittents, and as a preventive of the various forms of malarial disease. In those portions of the West and South where complaints of this nature prevail, and in the Tropics, it is particularly esteemed for the protective influence which it exerts; and it has been very widely adopted as a substitute for the dangerous and comparatively ineffective alkaloid, sulphate of quinine. Physicians have not been among the last to concede its merits, and the emphatic professional endorsements which it has received have added to the reputation it has obtained at home and abroad.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP

has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

To those looking for a delightful and health-giving table beverage, we recommend Nicholson's Liquid Bread. Physicians endorse it. Give it a trial. Druggists and grocers keep it.—[*Adv.*]

Burnett's Cocoaine soothes the irritated scalp, removes the dandruff, and affords a rich lustre to the hair.—[*Adv.*]

Judge Lawrence, of the Supreme Court of New York, has just decided that Dr. J. G. B. Siegert & Sons have the exclusive right to the trade-mark and name of Angostura Bitters, and has granted them an injunction against C. W. Abbott & Co., of Baltimore, restraining them from using that name or putting up goods in imitation of the Angostura Bitters.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c.—[*Adv.*]

Burnett's Flavoring Extracts are the best, the strongest, and most healthful.—[*Adv.*]

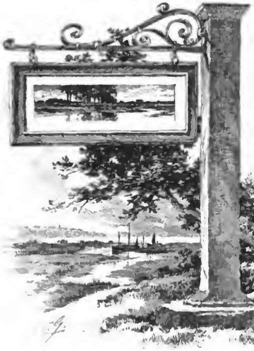
HARPER & BROTHERS, New York.

A SEAPORT WITHOUT SHIPS.

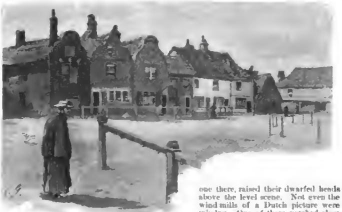
BY JULIAN RALPH.—ILLUSTRATED BY GRAHAM AND WILDER

IF we go to England to see an ancient civilization, with whatsoever monuments and relics in stone or customs, dress or speech, may still cling to it, where shall be found a richer point of view than at Sandwich? Where else do the principal features of a place witness the passage of so many centuries and epochs, or bid the mind go speeding among such strange memories, as at Sandwich? So we were asked by an Englishman, who in putting the question acknowledged that few of his countrymen ever saw or thought of the old town. Its very abandonment but enriched it, he thought, and would make us almost its rediscoverers. So came we to think as we stood on the wall of the old city. So shall you think if you stand there with us, for you shall look upon a field where man and the sea were partners before history began, were allies through all English history, and now have all but parted company, and are both drawing away from one another, and from the scenes of all their glorious labors and adventures.



As we approach it understand that it is one—perhaps the very oldest—of the so-called cinque ports, or associated seaports, that Edward the Confessor established for the protection of the south coast of England, that strangely attractive shore which so many covetous, hungry warriors looked upon and lusted for from Cæsar's time to Bonaparte's. And now the sea has left it, and it is an inland village, the wreck of a seaport stranded high and dry.

We reached there at dark, after a journey of sixty-eight miles from London through Kent. We put up at the Fleur-de-lis Hotel, whose office and bar were inextricably confused and combined, and the bedrooms celebrated the wildest deliriums in wall-paper, but where the beds and service and fare were all of the best. Advised to go out upon the "Bull Walk," we endeavored to do so, "to see the people resting after the day." But it was out of the question. The little dark streets seemed to spin around and around, and when one was found that did by chance resist the centripetal influence, it led past the yellow street lamps into such darkness that it was evident, unless the people were owls, that the resting of the town was being done in the houses. But though the crooked streets did not lead to the Bull Walk, they led to our seeing the most peculiar tavern we had yet met with. Its light attracted us, and we went in for our after-supper cigars. There was nothing very extraordinary about the bar-room, but some of the "oldest inhabitants" who were in there (as they always are in the bar-rooms all over the world, in



OLD HOUSES.

high proof of the preservative qualities of alcohol) mentioned the fact that the cellars of the place had far more than a local reputation. Should we like to see them? we were asked. Fortunately one said "Yes," and we were conducted into a long, low vault of brick-work, containing, if every pint is a pound, tons of the choicest drinkables of Britain, France, and Spain. All except the floor and roof of the tunnel was hid behind bottles, but the strange and interesting thing about the bottles was that they in turn were hid by the fungus that had grown all over them in a soft black pad that felt like damp felt. We lifted it here and there, and revealed the glossy dark arches of glass beneath. The queer growth held together, and fell back in place again like the corner of a blanket. It seemed that nothing in the great vault could have been disturbed in many years, but the man in charge said that some of the stuff was newly bottled, and that the fungus grew upon it in a few months.

That was all we saw of Sandwich that night. It was eleven o'clock when we started back, acquainted with the astonishing fact that all the places of resort were compelled by law to close at that hour, at which time the police were quite likely to put on felt shoes in order to steal upon publicans who did not keep the law. The doors of the Fleur-de-lis were closed and bolted, but when we were inside the proprietor flung down great easy slippers for us, made the standard Chicago size, so as to be too small for nobody. They were as soft and easy as any policeman in Sandwich could boast, but they spied upon no one, and if any faucet was turned or bottle was tilted in that house after hours, it never will be known.

In the morning we found the "Bull Walk," and saw that the name must be a corruption of the word "bulwark," for the walk was simply a path on top of the remains of the ancient wall, which is still serving its purpose, since all the houses of the town are within it. On the water side, facing the sea, it was built of stone, but on the other side it was made of mud. It has been lowered and covered with a tar walk between strips of grass and beds of flowers, and it is set with benches, so that it now forms one of the most charming promenades, or trysting-places, or loafing spots, according to one's needs, that we saw abroad, or that one could easily imagine. Then the view from it is exquisite, and with not a trace of English about it. It is a pure bit of Holland, as you shall judge yourself when you know that the city was a mere huddle of red-tiled roofs and green tree-tops rising like an island above a great expanse of marsh-land, where a few lazy cattle were feeding, a lazier little river was threading a hesitating route, and only a few still more lazy trees, one here and one there, raised their dwarfed heads above the level scene. Not even the wind-mills of a Dutch picture were missing. One of them perched close to an angle of the wall, gave movement to the view, but it was such leisurely, methodical movement that it emphasized the quiet and calm of the lovely picture.

This marsh was the bed of the sea once, and strange have been the keels that have swept over it. Here the savage Britons, seldom venturing far, rode their frail vessels of basket-work covered with skins. Following them came the Roman galleys under Julius Cæsar, from a point on the French coast between Calais and Boulogne. Here next rode the invading Saxons, and then for centuries the glorious navies of England, as she rose in wealth and power, found this very marsh a principal harbor whence to start upon their expeditions of discovery and conquest. Ay, and many a ship that has passed high above these now smiling meadows even in time of England's greatness boded no good to Albion. Early in the thirteenth century, in Henry III.'s time, the French sent a fleet, and all but destroyed the seaport by fire. Again, in the fifteenth century, in Henry VI.'s time, the place was invaded, despoiled, and partly demolished by the French. And again, nineteen years later, Charles VIII. of France sent 4000 men to raze Sandwich to the earth. That was a most bloody expedition, and in the severe battles that followed, Sandwich lost her best citizens. Later, in Edward IV.'s troubled reign, the Earl of Warwick ended his exile in France by coming

Some of the streets are so narrow that a man towers in them, and seems to fill them as a load of hay fills a tall gate. Often as one sees a man in a street making his way to some curve where the buildings lean out toward one another with their Elizabethan stories, it seems as though he would be wedged in and would need extricating. In another second he disappears mysteriously around the curve.

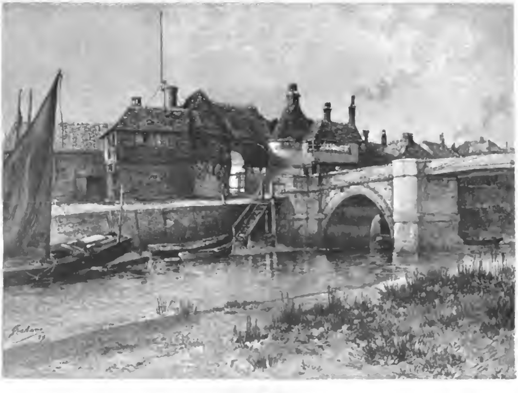
There are necessarily few views that are not principally of roofs—of steep slanting roofs of cumbrous red tiling. Often the roofs are without gutters, and drain themselves upon the streets. The sidewalks suit themselves to the streets. They are seldom more than three times as wide as the broad curbs, and then, when they are obliged to, they shrink accommodatingly until they are not wide enough to walk on. After that they sometimes disappear altogether, and then, perhaps, the street widens and they reappear. The houses strike a visitor as so many curiosities. They are nearly all what Americans would call very old. One or two are caving in, but not a new one is building, and not one looks as if any man could say when it was put up. Their outer walls are nearly all stuccoed or plastered, and nearly all are painted a drab color. When a house is seen that is not stuccoed, it is pretty certain to display beams set among the bricks, and to proclaim itself of the distant age that architects call the half-timber era. In a fair half of the buildings the upper stories project beyond the first stories. Some are plastered to conceal the manner in which they are constructed, but there are many in which the bare beams supporting the upper stories are displayed. Some of these are merely rounded or curved at the outer ends, but others are quaintly carved. The finest example of the sort is to be seen in the King's Arms Hotel, where the brackets that hold the second story up are carved to represent a man bent under the weight of the building. His hands are on his knees, his head is pressed down, and his hair streams upward as if it was that which sustained the fearful weight above.

Though all the houses are small and low, and all have high-pitched roofs, there is an extraordinary variety in the architecture. The greatest difference seems to be in the windows. There are gable windows, box windows, bow-windows, leaded windows, and distinctly modern windows, but often one will see no windows in one half of a house, while the other half is nearly all glazed. The nomenclature of the little city is quite as peculiar. It has a Strand Street, a Knightrider Street, and a Chain Street that I remember, and I copied the names of the following taverns: the Sun, the Rose and Crown, the Bell, the George and Dragon, the Admiral Owen, the Green Dragon, the Malt Shovel, the Crispin, the Bricklayers' Arms, the Old New Inn, the Fleur-de-lis, and the King's Arms.

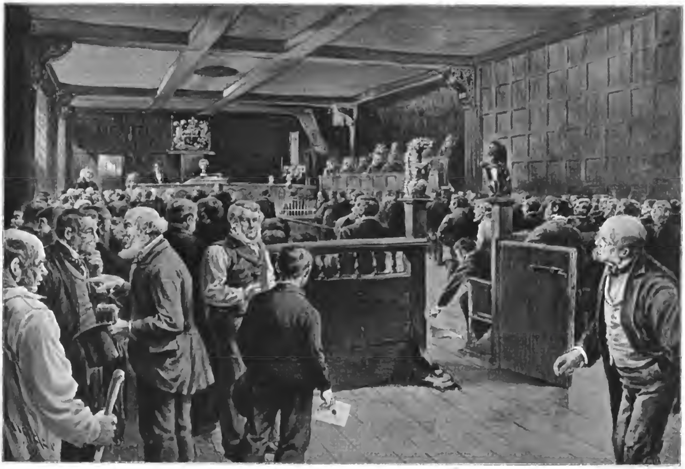
While I sat in a window of the Fleur-de-lis a boy came to the pump opposite, carrying two pails suspended from a yoke upon his shoulders. Presently a little girl came, also with two pails; but when she had filled hers, she placed them a certain distance apart, and dropped an ordinary child's hoople upon the tops of the pails so that it rested against the handles. Then she stepped into the hoople, and lifting the pails, carried them easily, without a possibility of their swinging, by allowing their weight to press them against the circle of wood. These I took to be ancient customs, and they were the most interesting things, except the town itself, that I noticed. Others were the old-time flowers in the house gardens—the hollyhocks, lavender, lilacs, and poppies—carrying one back in memory to the American gardens before the war. In the church-yards I noticed a queer custom of putting a great slab, shaped vaguely like a human or mummy form, upon each grave, where it was bolted to the head and foot stones. As for the old churches—St. Clement's and St. Peter's—suffice it to say that they are very ancient and tame, and "improved," till the best parts of them are hidden, defaced, or removed. The English guide-books, which concentrate all their genius and enterprise upon the churches to the exclusion of almost everything else, tell a great deal about these edifices, and at a price within the reach of all. What interested me most about them was that in the steeple of one the curfew is still rung at eight o'clock every night. A more interesting old building is the ancient Grammar School founded in 1564, where Richard Knolles was "third master" and wrote his *History of the Turks*, the only contribution warlike and maritime little Sandwich appears to have made to literature. Near by is a house where Queen Elizabeth was entertained in 1572. Then the streets were hung with vines and garlands, and the pavements were strewn with rushes; the brewers were commanded to brew good beer; the children were set to spinning yarn on platforms in the open air; and good Queen Bess not only witnessed a tremendous battle between men on floats, but got a present of a golden cup worth $500 besides. She is not the only great personage Sandwich has seen, though the houses the others stopped in are no longer standing. Becket fled to Sandwich and escaped thence, and Richard Cœur de Lion landed here after his imprisonment in Antwerp. Edward III. was often here, and sailed from here for France and Flanders when he made those journeys.

To-day the only grandeurs left to the place are its memories. The citizens who used to patrol the streets singing the direction of the wind at night are as totally forgotten as the ships that made the place rich and busy no longer ago than the days of the great-grandfather of any present citizen. The town has now a few more than 3000 inhabitants, who are engaged in tanning, wool-sorting, seed crushing, brewing, fruit-growing, and malting. After one of the severest of the blows the enemies of England dealt the brave little port, a band of Flemish folk renewed the population of Sandwich, and the place became famous as the seat of the manufacture of baize and woollen stuffs. These were also the first market-gardeners of England. Their descendants are in the population to-day, and their transmitted influence doubtless gives the queer, squeeze-up little city the un-English air that distinguishes it.

Fate has not been especially severe with Sandwich. I have said that it was one of the association of seaports instituted by Edward the Confessor for the defence of the



BRIDGE AND GATE.

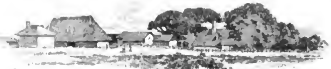


IN THE COURT-HOUSE

south coast of England, and called the cinque-ports. It was the principal and oldest of them. They were Dover, Sandwich, Romney, Hythe, and Hastings. Afterward Rye and Winchelsea and several subordinate ports were added to the chain. But all except Dover are moribund. The history of one is the history of all, except in so far as the glories of Sandwich were the highest. The sea has retired from the whole south coast. Romney is now inhabited by graziers, Hastings is a watering-place, with a navy of fishing-boats of from five to thirty tons each, and so with all of them. Only Dover remains a full-fledged seaport. But they were all proud towns in their day, and considerable privileges were vested in their inhabitants. Even to-day they are exempt from county jury duty, and from service in the militia.

It is the popular belief that the loss of her harbor to Sandwich was due to the sinking of a great war-ship in the channel, but students of the action of the sea know differently. The wreck expedited the choking up of the harbor, but the fact that a similar fate has been meted out to nearly all the other cinque-ports shows that the change was general and not to be avoided. The sea has made mighty and more damaging changes in many parts of the English coast, swallowing up villages, towns, and castles, instead of merely beaching them high and dry as in the case of Sandwich.

In Norfolk, in the neighborhood of Weybourne, there stood in 1781 a cliff fifty feet high, with houses on its crest, and in 1829 the place where it had stood was unmarked, and lay beneath a depth of twenty feet of water. In Yorkshire there have been vast changes of the same sort. I have read mention of half a dozen villages that have been slowly swallowed up by the in-reaching sea. One of these was Ravenspur, once a proud port, and the one at which Henry IV. landed in 1399 on his mission to depose Richard II. So it was with Dunwich, in Suffolk, of which it is said that 400 houses at once fell, with the earth beneath them, into the sea. Brighton itself, the famous watering-place, is not where Queen Elizabeth used to go to it. Where its houses then were the great chain pier now reaches far into the sea. Roman seaports, feudal castles, ancient fishing villages, and cliffs, fields, and houses lie in great numbers under the unconscious keels of the vessels of to-day that skirt the shores of England. Often one has to go to ancient records or the Domesday Book itself to find hint or trace of them; but the story of all is a tale of far worse luck than makes us lament over Sandwich.



GOLF-PLAYERS' CLUB.

JACK'S LIBRARY.

I AM on a visit to a small library, a collection of 3700 volumes, to be found at Sailors' Hall, Cob Dock, Brooklyn Navy-yard. These books are for the instruction and amusement—which ought to come first?—of the sailors and marines who serve the United States on board of the men-of-war or on the receiving ship.

I wanted to know what the sailor, the marine, oiler, stoker, musician, might want to read. If there was a library entirely patronized by undertakers, would they devour methods of conducting funerals, past and present, including Sir Thomas Browne's *Hydriotaphia*, with recent contributions on cremation? A man following the sea, would he always be asking for salt in his romances? The landlubber might think he did.

Questioning the intelligent naval librarian in charge of Sailors' Hall, Cob Dock, his answer did not at all surprise me.

"The men do not read sea stories."

"You never have a call for *Tom Cringle's Log?*"

"No, sir."

"And Captain Marryat's *Midshipman Easy* and *Peter Simple?*"

"No, sir; but more the pity. They are hull down, for we parted company with them many a long year ago."

"Dear old fellows! They are not water-logged, I trust?"

"No, sir, not even stranded. Some of the men, the very old ones, may read Marryat occasionally, those who used to sail on ships that buffeted their way through the sea under canvas."

"Noah's ark boys? But Russell and *The Wreck of the Grosvenor?* Your readers ought to know him. There is his last—a lunatic asylum afloat—it's thrilling."

There was no emotion visible on the part of the librarian. His answer was one chock-full of common-sense.

"Sailors who know the sea, as far as romance goes, are quite as well posted about it as those who write it up. There can never be anything novel about sea life to the actual sailor. Landsmen can go floating and swashing around in a sea story, and suffer shipwreck, and go through the deserted island business, and think it splendid, but sailors do not. The modern sea story is mostly muffled up in descriptions of the water and the clouds and the calms and the tempests. You are bound to have the doldrums or the hurricanes. The sailor gets kind of impatient until he comes to the action; and, honest now, a woman or a girl at sea is a nuisance. Jack, sir, is gallant, but women are out of their element on shipboard." Evidently the librarian had his prejudices.

"But what about practical books?" I then asked.

"Eager demand for them. There is Admiral Luce's *Text to Seamanship*, and Lieutenant Taunt's *Practical Seamanship*, and Sir Thomas Brassey's books. They are in readers' hands all the time. Everything having to do with the general, not the special history of our country is in constant demand. A sailor somehow loosens his hitch to the one particular place where he was born, so he does not read about the State of Connecticut or Maine, but what relates to the entire country. Biographies of our military and naval heroes are always read. The navy and army are closely related, and each service delights in the glorious achievements of the other. As to scientific books, those which treat of certain subjects in a clear and brief way never stay on the shelves."

"As about electricity?" I inquired.

"That's just it. Men work the search-lights, notice the illumination on board, see the dynamo machinery. They know that electricity is firing their guns, exploding their shells. They believe that some day there will be storage batteries running their launches, maybe their ships, and they want to be posted about electricity and its powers. A first-class A1 United States seaman obeys orders implicitly; but there is this about him more pronounced than in a foreign sailor—when he does something or works something, he wants to know the reason for it, and that way he raises himself beyond the conditions of an automaton."

"What does he read, however, most of the time? Does he want his books tasteless, odorless?" The latter portion of this question was to myself.

"He wants fiction. It's mostly fiction."

"Fiction! Why?"

"It's quite simple. Jack has plenty of the actualities of life knocked into him. He wants to get rid at times of the real thing on deck, and to go aloft in search of the unreal, or the undefined, or whatever you may call it. It is human nature. There, sir! you can always tell a well-read book by its looks. A deserted road is grass-grown; it has no wheel tracks on it. The book that is much read is creased and thumbed, and this, sir, is pretty well thumbed—uncommon thumbed. I do my best as to coverings, but it's no use as far as regards this book. Copper sheathing would not keep it."

The librarian held in his hand a big and dingy volume. It was the book of books, from whence there are always tumbling cascades of diamonds and rubies. It was *Monte Christo*.

"It is a chance that it is in. Know it, sir? It is always being read. Everything Dumas wrote is in demand. *The Three Guardsmen?* It never is in. I am always asked for continuations of Mr. Dumas's continuations. He ought never to have stopped writing." Unconsciously the Cob Dock librarian was repeating Thackeray's eulogy of Alexandre Dumas.

"What else is popular?"

"Sir Walter Scott. He always is steady. Cooper is more quiet than he used to be. Dickens is ever in demand. Thackeray? No, sir; our people do not read him. Wilkie Collins? He's a stayer; we are always reading him. Mr Roe? A good many admirers. Then there is a heavy pull on Ouida. Sailors—maybe it is the marines—like to read about swells. Queer, is it not? Mrs. Wister's translations from the German are always wanted. Maybe—I don't criticise books—it's the simple way these Germans have of eating sausages and getting indigestion, which

Google

in stalks the ghost. Next, the books of the Duchess are much read. Henry James and Mr. Howells? No, sir. We have them; officers read them, but not the men. They haven't got yet into the fo'castle. Are you acquainted with Bertha M. Clay's *Marian Gray?* No? Nor Mary J. Holmes's *Thrown on the World*, nor Mary Agnes Fleming's *One Night's Mystery?* Well, sir, you ought to read them. They are prime favorites."

"How about poetry?"

"Sailors delight in it. They know all Moore. Byron is slacker than he was; but Tennyson and Longfellow! Oh! the boys are always reading them. And Doctor Oliver Wendell Holmes too. He is a buster. But "Lalla Rookh," they quote her on board of ship. But, after all, it is Burns, sir—Burns that just touches a sailor's heart."

"Travels—are they read?"

"If men have an inkling of where they are likely to go to, they post themselves beforehand about the lay of the land. Some peculiar countries, such as Palestine and Egypt, the men always want to learn about. Miss Edwards's *A Thousand Miles up the Nile* never stays long on the shelf. The boys are fairly well acquainted with Africa, and all Mr. Stanley writes they read, and are wild now to go with him up the Congo. A book which has a steady run is Mrs. Custer's *Boots and Saddles*. I wonder, sir, if soldiers read sailors' books. There is Captain King's military romances. The men just wear out Captain King's stories. Jules Verne used to be read, but not as much to-day. Stevenson? We don't read him. What men are familiar with in life, as expressed in books, they like to read about. We don't follow fashions."

"Now tell me about history."

"It is Macaulay—Macaulay all the time. English history takes the lead."

My general experience has been that, taking the average of historical readers, save as far as relates to our own country, that study ends for Europe with the battle of Waterloo, and such, I fancy, is the case of the Cob Dock readers.

"American history is very much in demand, with personal narratives of the soldiers on both sides during the civil war; but for one book of facts, three or more of fiction are taken out."

There was a man who said people generally thought they could pick up historical facts in the common talk of the world, whereas what they really acquired was its fiction.

"We take all the leading English reviews, as *The Fortnightly*, *The Nineteenth Century*, and *The Contemporary*. You can see for yourself how used up they look, showing they have been thoroughly read. All the American monthly magazines are on the table. They are always being read. Special magazines relating to the service are here too, the English ones together with ours. There is *The Broad Arrow*, sir. We have the religious papers, indifferent to creed. Providing we had Jewish sailors enough, we would take a Jewish paper."

"Did you ever see a Jewish sailor?"

"Yes, occasionally; and real good ones they were, though rather rare."

"Do the marines read much?"

"I should say quite as much if not a little more than the sailors. Mind you, the United States marine is a picked man now, physically and mentally, and is mostly American. We have a good many marines in rendezvous here, which is the reason why they are so plenty. The marine reads the best of books, and, if he has been in service, he has seen a great deal of the world."

This little library is self-supporting. Excepting the room in Sailors' Hall given the men by the government, the books, or the money to purchase them, the shelf fittings, the lights, tables, and furniture are paid for by the voluntary contributions of sailors and marines. Annual subscriptions are impossible. Jack, who in January was languishing over Ouida at Cob Dock, will be off the rock at Gibraltar in February, and cannot be dunned for his dues. But Jack is liberal, and on pay-day planks down his quarter and half dollar whenever asked for it. Contributions come from officers who bring their books on shore after cruises. Ships going out of commission furnish a certain quota. The library solicits nothing, though deserving every assistance.

The rules governing the library are simple and sensible. Officers, petty officers, marines, and messengers can take out a book and keep it for a week. Anybody out of the service can come into the room and read such papers and books as are to be found there. All the New York and Brooklyn daily journals and illustrated papers and comic weeklies are there, with certain wise exceptions. Ordinary people "fool," but sailors only "skylark," and so "skylarking" in the room is prohibited. The commanding officer of the receiving ship is the potentate and Panizzi of the Cob Dock library. Appreciating most thoroughly the advantages derivable from the library, Commander Beardslee, of the *Vermont*, is now giving his most intelligent assistance to the education of the seamen. As Commander Beardslee himself is a *littérateur* of no small merit, the fostering of this library will be to him a labor of love.

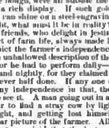
Not the incongruities but the necessities of shipboard are to be found in this room at Sailors' Hall. Where the books are stored on the shelvings, in that part of the room nearer to the East River and just over a piano, curtain slides and grooves are affixed to the ceiling. Here are canvas rolls. These are the theatrical drops. Presto! in five minutes you can convert this portion of the room into a temple of the drama. Two or more sixty-foot American flags at once drape the shrine in an appropriate manner, and with this background the lecturer, the banjo performer, are at once in their inspiring surroundings. Fronting the other end of the room is a low reading-desk, and here, on Sundays, divine service is held. H. P.

FARMING.

I.

I HAD always had a wild ambition to be a farmer, and be far from the hurly-burly of metropolitan life. Of farming I knew nothing but what I had heard from people who delighted in ridiculing its independence, as well as in looking at it from a serious stand-point, in order to prove it a comic occupation. I knew very well that Horace and Washington had tilled the soil, and that it would be nobler to farm with them than to ridicule farming with a number of well-meaning book-keepers. I had frequently stood before print-shops, and noticed the steel-engraving of the children in the impossible raiment gathering apples, which, while on the bough, were all outside the leaves to make a rich display. If such golden prosperity can shine on a steel-engraving, I often thought, what must it be in reality?

My friends, who delight in jesting on the subject of farm life, always made it a point to depict the farmer's independence by giving an unhallowed description of the amount of labor he had to perform daily—or rather daily and nightly, for they claimed his work was never half done. If any one could detect any independence in that, they would like to see it. A man going out in a thunder shower to find a stray cow by lightning at midnight, and getting lost himself, was a familiar picture of the farmer. Allusions to his boots, so rigid that the insteps were inflexible, were also freely indulged in.

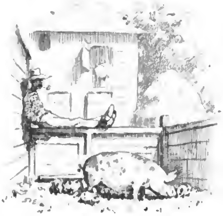


I argued that the farmer had some independence in that he was always at home under his own vine and apple-tree, that he didn't have to rise with the lark to catch a train, and that when age came along he wouldn't be thrust aside as unavailable timber by an employer who would make room for a son-in-law. "Suppose he does feed

the pigs by starlight? Is that any worse than your remaining at the office all night to find the seven cents necessary to balance the books?"

I never wanted to be what may be termed a merchant farmer. By merchant farmer I mean the man who sells all the delicacies he raises and lives on pork. My idea was to sell the pork and live on the spring chickens.

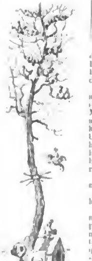
I had lived in a small country place before. Here every man was what might be called a polite farmer. He had his farming done for him, while he attended to a more lucrative business in the city. The man who owned a valuable herd of cattle, and sold milk—just to pay him for the fun he was having—was facetiously known as the banker milkman, while his neighbor was equally well known as the dry-goods rose grower. It was never my dream to farm for money. I only wanted a living, as that was all I could get out of anything else. In such a position a panic would affect me no more than a dust cloud would a hen, and I could smoke my corn-

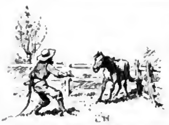


cob pipe of peace, and playfully count the spots on the pig, and never think of the momentous question, "Whither are we drifting?"

The things known as the most difficult to raise I would leave alone. I would go in largely for apples, because they are raised more by the tree than the farmer. In fact, the tree could not stop bearing if it tried. If I had more apples than I could use, I could exchange them for something else, and if I should fail in this, I could dry them; and if the trees should die, they would still be eligible for the iron dogs of peace.

The worst thing to be contended with would be the failure of the crops. But even if the crops should fail, I could still fall back on the chickens, providing, of course, they should not be stolen during the night. I could guard against such a calamity by having the hens sleep in a high tree and locating a mastiff under it. I had already learned that there are hens and hens; that the hen that is supreme on the table is

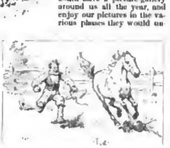




not always the most prolific layer, and that certain specimens that are famous for their laying qualities are as dry as bone on the table. I concluded that the better plan would be to keep the hens of the dry meat. Then I would have all the eggs I could eat; and when it came to the prandial part of the business, I could fricassee the chickens, with a duck interpolated for moisture.

Ah, what a peaceful, happy life! What an ideal existence! What a smooth, meandering river of rippling joy! To be able to live without dressing to look like a fashion plate. To be free to retire at 8 P.M., and not have to sit up until 11 for fear of some one calling.

Phillada was as much carried away with the idea as I was myself. To be sure, it would cut us off from the theatres and art galleries, but we could have a picture-gallery around us all the year, and enjoy our pictures in the various phases they would un-



dergo through the changes of the seasons. If a Corot cost ten thousand dollars, what a boon to have an acre of Corots for two hundred dollars, and no extra expense for frames!

The men working in the potato patch, against the gathering shadows of the after-glow, would be a Millet etching of endless joy; and when that indignitary known as the hired man should be called upon to capture the horse in the clover patch, the lively actions of the pair would be a Bonheur with pleasant variations.

"But there is one thing I must do first of all."

"What is that?" asked Phillada.

"I must have a doctor order me to try it. If we go from preference, we shall be laughed at, especially if we should return. But if it be simply a question of health, it will be self-preservation, and the sympathy of our friends will be lavished upon us. And then, should we return, we can say we were stricken with malaria, and came back for the same reason that we went, namely, health. This sound argument can be garnished with jokes, such as an account of the girl's sweeping the snow-drifts out of the farm bedroom after every storm, and of the wind careering through the knot-holes in the floor, and agitating the carpet into gentle ripples, after the manner of a theatrical ocean."

That morning I went down town dreaming of cows wading through silver brooks in the silhouette of the spreading elm, of breezes swaying festoons of golden honeysuckle on the front porch, of bees droning in the drowsy garden, of butterflies tilting on hollyhocks of every color, of the corn rustling in sunny

fields, and of the bobolink pouring forth his soul while wandering, fancy free, above the fragrant clover.

On the way up town, I dropped in on the doctor.

"I see," he said. "A sedentary occupation, and no exercise. The thing you need is not medicine, but an out-door life. If you could get out of town, where you could work in the garden an hour or two every day, you would be a new man in a month."

"I have always had a wish to be an amateur farmer," I replied, with a laugh.

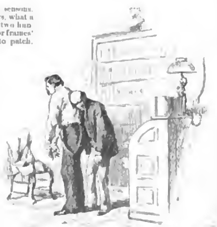
"Go and be one," he said; "and you will be all right."

I never paid more cheerfully for anything in my life than I did for that advice, and I walked home so briskly that no one would have suspected that I was about to do anything for my health.

"What did the doctor say?" asked Phillada.

"Nothing," I replied, "but I've got to go to the country for it."

We never before experienced such happiness in our flat as this prospect of getting out of it. R. K. MUNKITTRICK.



elicited letters, which are published in the New York *Times*, from two Lutheran clergymen in Connecticut, and from a Lutheran correspondent in Pennsylvania. These gentlemen say that the opposition is not taken to teaching in the English language, nor to the compulsory provision, nor does it arise from any desire of sectarian control of the public schools. The Lutherans willingly pay their school taxes. In Prussia and elsewhere their schools under the compulsory law sometimes contain ninety-eight per cent. of the school children. The statement of the ground of the present objection is this: "We believe that when we pay our taxes for the support of the public free schools of the land—we do this gladly—we have a right before God and man to put up our own school-houses, train our teachers, and support our own schools, that our children may be taught and trained in morals and religion as our consciences tell us they ought to be taught and trained."

Properly understood, that is perfectly fair. If parents prefer a private school for their children, the public authority can claim nothing more than the right to ascertain whether the education which it requires, and for which it makes provision, is adequately supplied by the private school. To that no good citizen ought to object. But, as the *Times* very well points out, this education cannot be said to be adequately supplied if the child is not taught to read, write, and speak English familiarly. This is a primary condition, and the comprehensive reason, a reason which is profound and far-reaching, is that English is the language of the country, the national language. As no American child should be permitted, upon reaching his majority, to partake of political power whose chief and instinctive language is a foreign tongue, so, as a child, he should be instructed in the English language. The State must be able to require such instruction, and of course to ascertain whether its requirement is satisfied.

The BENNETT law makes stringent regulations to secure this knowledge. But some rule is plainly necessary. In many parts of Wisconsin and elsewhere there are communities which are practically foreign. The first and imperative policy to pursue in all such communities is to assimilate them with this country, its government and customs and national life. Homogeneity must be fostered and heterogeneity discountenanced in every practicable way. The key of this position is the school language. The English tongue is not to be an accomplishment or supplementary study. The first object of the public school in the common public interest should be to supersede for school purposes any foreign language more familiar to the child than that of this country. The parents came of their own choice, and for the sake of their children, who are to be Americans, as well as that of the country, the parents should co-operate with the State in giving the children the first essential qualification of an American—the language of the country. This country has an enormous task in achieving the timely and thorough assimilation of the mass of foreign material which is constantly cast upon it. Popular institutions prosper not because they are popular, but because of the character and quality of the people who administer them. A vast heterogeneous multitude of people of every race, without common traditions, habits, life, literature, and language, merely because they were herded on a continent, could not make a nation except as they became homogeneous. We do not want a Germany, an Ireland, an Italy, a Bohemia, or any other foreign nationality anywhere in this country. But we want everywhere America.

THE COMMENCEMENT SEASON.

THE month of June opens the Commencement season. Mr. EMERSON, in greeting his old college chums at Cambridge, once spoke of the annual Commencement Day as the hour devoted to the consideration of intellectual interests by a people too busy to give to letters any more. There is certainly a delightful tone in the celebration of these days which contrasts happily with that of our usual political discussion. They call a truce to our unending controversy, and summon us to recollections and thoughts which have an interest that springs from our common humanity, not from our differing sects and parties.

The Commencement is especially the festival of youth and hope. If it abounds in preaching of every kind and degree; if the Senior departing from his college is very much wiser than his fathers were, and more experienced than he will ever be again; if his views upon the European question are more comprehensive than BISMARCK's, and his philosophy more profound than SPENCER's—it all excites a kindly interest in those who have seen many successive classes of college statesmen and philosophers, and who rejoice in the constant renewal of hope and faith and energy in the conduct of life.

It is not to be forgotten also that some of the most memorable of American discourses have been spoken at Commencement celebrations. EDWARD EVERETT's oration before the Phi Beta Kappa at Harvard in 1825 was almost the beginning of our higher literary oratory. EMERSON's, ten years later before the same society, still deeply influences American character and life. WENDELL PHILLIPS's, nine years ago at the centenary of the society, was his last great speech, and characteristically crowned his career. From the day given to letters by a people too busy to give any more have sprung the happiest results, and as the season returns it is pleasant to welcome it with the knowledge that the interest in higher education in this country constantly deepens and increases.

OUR WORLD'S FAIR.

THERE is animated discussion in Chicago over the site of the World's Fair, and some rueful apprehension expressed whether it will be a World's Fair. But the present situation must be regarded only as the natural extreme reaction from the wholly factitious movement upon the subject in New York, which was a little and amusing form of a South Sea bubble. As in that frenzy there were visions of colossal wealth and London reeled with the excitement, so in our World's Fair uproar there seemed in the newspapers to be universal and absorbing interest, while in private the subject was scarcely mentioned, and usually in the most deprecatory tone.

Such was the apparent popular current of favor, however, that men subscribed ten thousand dollars who hoped that the Fair would go to Chicago or to Guinea, and there was certainly never a more comically excited public meeting than that at the Cooper Institute, when apparently "strong men wept," or at least shouted themselves hoarse, over "a compromise" of something or other which proved to be wholly out of reach. Nothing but the touch of Diedrich Knickerbocker could do justice to the most ludicrous of recent incidents in the city.

But a World's Fair at Chicago commemorative of the discovery of the Western Continent, although a rather vague motive for such an enterprise, puts this country in the attitude of host. The present reaction from our amusing performance in New York will pass away, and we shall begin to feel sincere interest in the welfare of the commemorative enterprise. The Governors of States are appointing Commissioners, and a good-natured New York, having done laughing at itself, will very gladly help its young sister of the West to entertain the world.

BEGINNING THE CENSUS.

THE census enumeration began in the city of New York with more public attention than any previous census has excited. This was due to the remarkable questions which were to be asked, and which must apparently greatly prolong taking the enumeration. The reporters made very lively accounts of the proceedings and of the reception of the enumerators and their questions. One reported question addressed to grave and respectable heads of households, "Whether a prisoner, convict, homeless child, or pauper?" was very entertaining, and there is an amiable reliance upon the truth-loving disposition of the community evinced in many of the inquiries which is highly creditable to the good heart of the Commissioner.

Whether the answers to some of the questions would furnish a sound basis of trustworthy statistics must be doubted. They would apparently lack authenticity. The opening offered for the free play of a sportive fancy in reply is very alluring, and although there is a hint of "legal proceedings" in cases of contumacy, it is not very alarming. The returns of information about mortgages in the tenement-house districts will be valuable, and those of homeless children on Murray Hill will reward attention.

There was one tragical incident reported at the opening of the work. One of the enumerators, confined to his bed by illness, was unable to report for duty, and upon hearing that a fine of five hundred dollars would be imposed upon him, he took poison and died. In earlier times and in other countries such an incident would have been held to cast a fatal spell upon the work. But the census is an enterprise of great importance, whatever fun the newspapers may make of it. Indeed, there is nothing which the bright humor and light hand of the modern reporter will not serve up for the public entertainment in the gayest manner.

A "LITTLE GAME" BLOCKED.

SOME months ago a bill was passed in the House of Representatives authorizing the appointment of thirty medical pension examiners without the usual examination. The object was to make so much "spoils" for distribution, and also to work the men into the service and gradually supplant those already there, and thus establish a precedent to set aside the rules of appointment. It was objected to the bill that the thirty new examiners ought to be appointed under the rules like all the rest, and that their arbitrary appointment to places included in the rules would be necessarily very mischievous.

The reply was that extreme haste was essential, and there was no time for examination. Mr. ROOSEVELT answered that there was an eligible list from which to select. The answer was not permitted to be made officially in the House, and the measure which could not be possibly delayed was hurried through the House, sent to the Senate, reported back unchanged, and after five weeks or more it was taken up, amended so as to provide an examination to be approved by the President, and this, after about three months from its passage in the House, is the present end of the bill.

If the plea of haste urged even by some friends of reform in the House was valid, the service is greatly suffering, and needy veterans are outrageously wronged. But the humbug of the whole movement is evident. There was no need and no haste. If there was an actual need of more examiners, they could have been appointed from the eligible list or immediately examined. The instant, however, it became plain that they could not be appointed at pleasure, it was clear that the urgent need was not for the service, but for spoils. As it stands, this incident is a victory for reform. Senators enough have been found to "block the little game" of the Pension Commissioner.

PAINTING RED.

THE beardless vandals at Cambridge who defaced the statue of JOHN HARVARD and the chapel because the college crimson was triumphant the day before are undoubtedly heartily ashamed of themselves. A mass-meeting of the students denounced the outrage in the plainest terms, and resolved that "the athletic committee" should organize and direct all *rejoicings* of the kind hereafter, and so save the collective college fraternity from the discredit attaching to the follies of a few students unworthy of their college and their associates. The foes of Harvard, if such there be, will see that the college was represented by the mass-meeting, and not by the handful of unknown and skulking rioters.

Happening at this time, the incident may suggest to the young friends of Dr. Birch who have just entered college to consider what fun there is in daubing a statue and defacing a building. To cause a man to tumble in the gutter, or to souse him in a pail of water, is as hilarious a proceeding as to cut off his coat skirts, or to knock a hole in his hat. A young gentleman who should find this proceeding humorous would be certainly requested by CHARLES LAMB to permit an examination of his bumps.

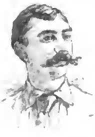
Such young gentlemen must not delude themselves with the notion that only molly-coddles object to such humors. Whoever these excellent people may be, and whatever their tastes, it is not they exclusively who do not believe that fagging is a good school of manliness, or that personal outrages, sometimes with tragical result, are to be dismissed as exhibitions of high spirits. "Painting the town red," even very young gentlemen should know, is a rhetorical phrase. But there is a good old saying which generous college men always bear in mind—*noblesse oblige*.

PERSONAL.

A NUMBER of private papers belonging to JOHN HOWARD PAYNE, the author of "Home, Sweet Home," were found not long ago in the garret of a house in Leonard Street in this city. PAYNE lived there in 1847 and 1848, and the papers were hidden away in an antique oak chest.

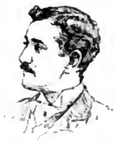
—The ballroom at Brussels which was the scene of the revels which preceded Napoleon's defeat at Waterloo, and which is now the upper story of a deserted brewery, is offered for sale for about $38,500. The price set on the original mask of Napoleon, taken after his death at St. Helena, is $30,000.

—The Siberian Cossack, DMETREA PJESHKOFF, who started November 7th to ride from Blagovjechensk, in Eastern Siberia, to St. Petersburg, a distance of 5400 miles, on the same horse, has successfully accomplished his remarkable feat. Captain PJESHKOFF belongs to a Cossack regiment, and his horse is of the tough Cossack breed, thirteen years old, light gray in color, and rather undersized. Neither horse nor rider seems to have suffered seriously from the long trip, which was attended by no very unusual adventures, considering the wild section of country traversed. The horse subsisted on oats and hay, and quenched his thirst with snow. It was noted that the animal's appetite increased with the journey, and that he ate nearly three times as much toward the close of the trip as he did at the start.



THOMAS PETTIT

—The finals of a very exciting and well-contested series of games of court tennis were played in Dublin on May 30th. THOMAS PETTIT, of Boston, and SAUNDERS, the English champion, were contestants for the championship of the world and stakes amounting to £1000. The match was held in the grounds of Sir EDWARD CECIL GUINNESS, and a large and distinguished audience watched the superb play of both men. The American champion, who was in fine form, played a brilliant game and won three out of four sets. As the players were rivals in style of play, the winner scored a double victory.



CHARLES SAUNDERS

—Mrs. JULIA J. IRVINE, who has just been appointed Professor of Greek at Wellesley College, is a graduate of Cornell, and while there won a Greek prize at an inter-collegiate competition, where there were over sixty other competitors.

—A handsome monument has been placed over the grave of General GEORGE B. McCLELLAN in Riverside Cemetery, at Trenton, New Jersey.

—Professor HUXLEY is growing very deaf.

—A midnight wedding at the Methodist church caused quite a sensation in Monroe, Wisconsin, recently. The couple married were LULU NINA BENSON and WILLIAM LEWELLYN PARRY, and the reason for their freak is not stated.

—San Francisco resembles Boston in a certain respect. She possesses a literary "atmosphere"; and it would not be a surprising sequence in the process of her evolution if she should become the home of a new school of American authors. Two poems, entitled "Meeting of Anthony and Cleopatra," and "Death of Cleopatra," published in San Francisco, have won favorable notice from Lord TENNYSON and OLIVER WENDELL HOLMES. No name is given; but it is understood that the author lives in San Francisco, and is a granddaughter of Governor DE WITT CLINTON.

subscriptions of several individuals. Of these, two men contributed over $80,000, setting, as they did so, a noble example which the others were not slow to follow. In the donation toward the building fund, every member gave according to his ability. Upon the Easter Sunday preceding the opening, $64,000 was subscribed at the morning service, and the subscriptions that followed within the next eight months equalled and even surpassed that generous collection. Dr. Buchtel had inspired his congregation with fervent enthusiasm, and the result was a golden hail storm.

A magnificent and splendidly equipped church, however, is not the only property held by the Trinity trustees. To this is added an elegant parsonage, the cost of which, including lots and furnishings, amounted to $20,000, and which was the gift of Mr. Humphrey B. Chamberlin, a prominent capitalist, who built it as a memorial to his sainted mother.

Another wonderful gift was the greatest organ in America and one of the greatest in the world. This was the donation of Mr. Isaac E. Blake, and was constructed by Frank Roosevelt, of New York, at a cost of $30,000. As a musical instrument this organ has been excelled in size and number of stops, but, taken as a whole, it is probably the most perfect specimen of the organ-builder's art that has ever been produced. In its mechanical features it is especially perfect. The key action is electric throughout. The stop of thirty-two-foot pipes is noteworthy, and seldom found in organs.

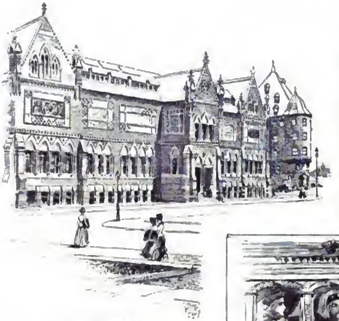
The architectural style of the building is what is known as modern

Gothic, and this is carried out in every detail, both in the interior and exterior. The walls are massive and well built, and are faced with broken ashlar, except the spire, which is of coursed stone to the base of the cross. The trimmings are of Utah purple sandstone tooled, and portions thereof are richly carved. The steps are of Colorado granite, as are also the round columns in the front entrance. The extreme dimensions of the building are 125 feet by 96 feet 6 inches. By means of a wire rope an electric light is raised to the interior of the cross, through the opening in the side of which a flood of light is shed down on the church like a benediction. The walls throughout are of stone. The roof is covered with slate. Hip and ridges are capped with ornate tile-work, and the pinnacles, terminals, the cross on the spire, and the cornice work are of copper.

The church occupies four lots on the northeast corner of Eighteenth Street and Broadway, which were purchased at a cost of $75,000. The main entrance is on Broadway. Three Gothic archways of stone, covered by a massive carved stone pediment, supported on polished red granite columns, open into a marble floored recess 7 by 55 feet. This recess, or vestibule, is faced with rubbed stone work of a beautiful purple tint. The ceiling is of panelled oak. The steps in the archways are of granite, and the arched openings are guarded by beautiful wrought-iron grills. From this open vestibule wide double oak doors lead to the basement, and at either end slate steps 6½ feet wide lead to the main entrance doors in the two towers. The auditorium is 100 by 84, exclusive of organ space, having an average height of 43 feet to the ceiling. A niche 46 by 16½ in the east end contains the organ. The choir, 13 by 56, is carpeted, and seated with folding assembly chairs set on a radiating terraced floor, and will accommodate 116 singers and musicians. The main floor of the auditorium is bowled. A gallery is carried around three sides of the room, supported on iron columns. Over the north and south vestibule entrances are boxes, situated on a level with the gallery floor, and designed for the use of invalids.

The stained glass windows are very artistic and effective, as is also the fresco. Perfect harmony has been observed in the coloring and designs of the glass and decorations, both blending well with the design and finish of the woodwork and furnishing. The acoustic properties of the room are perfect. The floor is terraced and carpeted, and seated with folding assembly chairs of the best pattern.

THE BOSTON MUSEUM OF FINE ARTS.



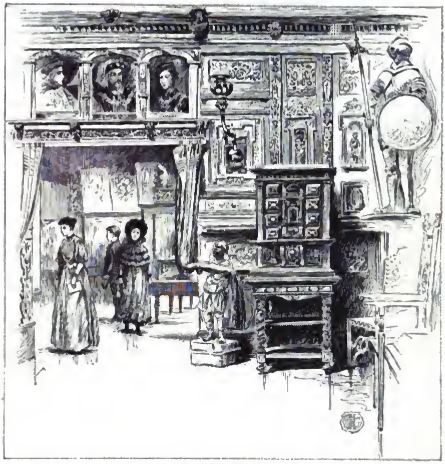
THE EXTERIOR.

The extension to the Boston Museum of Fine Arts recently completed makes an important increase of exhibition space, and greatly improves the arrangements of the art collections. The Museum is situated at the corner of Dartmouth Street and St. James Avenue, fronting upon Copley Square, an open, verdant space, about which are several noble and beautiful edifices, including the new Public Library. The Museum, a structure of great beauty of tints and decorations, and handsome architectural proportions, is built of red brick, with mouldings, cappings, and ornamental work of red and buff terra cotta. There are two large artistically executed reliefs of the façade, one typifying "Genius of Art," with illustrations of art and architecture from antiquity to the present day. In the roundels of the other bass-relief, representing "Art and Industry," are contained the heads of distinguished artists and patrons of art, the Americans thus depicted being Copley, Crawford, and Allston. White marble steps and polished granite columns with terra-cotta capitals set off the main entrance.

The land on which the Museum stands contains 91,000 square feet. It was granted by the city to the Museum trustees in 1870, in which year the corporation was formed with a fund of $250,000, raised by public subscription. The first section of the building, begun in 1871, was completed and opened in 1876. In 1878 $125,000 additional was subscribed, and by its aid the section fronting St. James Avenue was completed in the spring of 1879. The next enlargement was the present extension.

Within the Museum the rooms on the first floor are generally devoted to casts, statuary, and antiquities. Besides the many casts of statues, complete or fragmentary, there are busts and heads, reliefs, including sarcophagi and architectural details, small bronzes, terra-cottas, altars, seats, marble vases, and models, the increase in the number of all these treasures during the past year has been notable, the number of them last year being 414, while the present list is 777. In its collection of these antiquities the Boston Museum of Fine Arts now takes third rank in the world, the Royal Museum at Berlin and the University Museum at Strasburg being the only ones exceeding it in the number of these classic possessions.

Among the collections of special interest upon this floor are the Robert Hay collection of Egyptian antiquities, presented to the Museum by Charles Granville Way; the collection of Egyptian sculpture made by the late John Lowell; and the great architectural room filled with exquisite details from classic, Renaissance, Gothic, and Saracenic architecture—one of the finest collections in America. The Di Cesnola antiquities from Cyprus, and several thousand rare coins of Egypt, Italy, and Asia, electrotyped from originals in the British Museum, are on the first floor. To this classical department the extension has added 9870 square feet, making a total floor space of over 14,000 square feet, with wall space in proportion, giving proper room and light to casts that have long been at a disadvantage for want of them, and improving their disposal in every way.

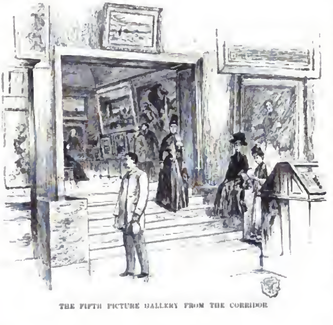


THE LAWRENCE ROOM.

Following the completion of the new building there has been no entire and radical rearrangement of the collections of casts and of original antiquities. The general arrangement is now a chronological one, with a few departures from this plan, owing to the necessity of finding available places for some of the larger and finer pieces. The first room at the right of the entrance is devoted to casts from Egyptian and Assyrian sculpture. Adjoining this is the room containing casts from archaic Greek art. Next come two rooms illustrating the transitional epoch, and so on through the various stages of the development and decline of classical art, from which the visitor passes directly to the Renaissance department, the natural sequel to the classical. Gothic art is illustrated in a room at one side of the main line of passage through the Museum. The Museum's limited funds have obliged the trustees to confine their purchases chiefly to casts, and the greater number of original works exhibited in this department are either bequests, gifts, or loans.

Broad iron staircases lead to the upper floor, which is devoted mainly to paintings, engravings, productions of industrial art, and bric-à-brac. A noteworthy feature of this upper hall is the second bronze gate of the Baptistery at Florence. The paintings occupy several rooms. Among the pictures are "Belshazzar's Feast," by Allston, and the Dowse collection of water-color drawings, chiefly copies of the old masters. The print rooms, contiguous to the water-color room, contain the Gray collection of engravings bequeathed to Harvard University. The collection of Japanese curiosities, which includes rich pottery, porcelain, and embroideries, has recently received large additions, and is a prominent feature of the Museum.

The Museum corporation is administered by a Board of Trustees, to which are added annually members chosen to represent Harvard University, the Institute of Technology, and the Athenæum, also *ex officio* the Mayor of Boston, the Superintendent of Public Schools, Secretary of the State Board of Education, trustees of the Lowell Institute, and the President of the Board of Trustees of the Public Library.



THE FIFTH PICTURE GALLERY FROM THE CORRIDOR.

The Museum is open daily: on Mondays at noon, and on other days from 9 A.M. until sunset. On Saturdays from 9 A.M. to 5 P.M., and Sundays from 1 to 5 P.M., admission is free; at other times twenty-five cents admission is charged. In the building is a very prosperous school of drawing and painting. Martin Brimmer is president of the Board of Trustees of the Museum; John L. Gardner, treasurer; Charles G. Loring, director; and Edward H. Greenleaf, curator and secretary.

HASBEEN BLAKE, MIMIC.

BY JOHN R. RAYMOND.

"STAY, by all means, and see his turn; I want your opinion of him," said Mr. Hamilton, with that engaging air and flattering insinuendo that had made him the most popular manager in the variety business west of the Mississippi. "He is due to go on in a few minutes, and I tell you the man is great, or rather he has been. There I go," he continued, chuckling in an infectious way that made his listeners chuckle too in anticipation. "You see it's impossible to speak of the fellow without using that confounded little pair of words. I try not to, but I can't help it, and that's how he got his sobriquet. His right name is Warren Blake, and there has been—hit me, somebody, if I say that again—there was a time when I wouldn't have wanted a better name to pack a house; but, d'you know, when I decided to give the old man another chance, he wouldn't hear of it on the bills. It was Hasbeen or nothing, and Hasbeen it is. See!"

He drew a programme from a sheaf, and pointed to a line with his jewelled forefinger.

LODEVILLE'S FAVORITE, THE VERSATILE VETERAN,
HASBEEN BLAKE,
The Monarch of Mimics, in his Inimitable Impersonations, including
Davy Crockett, Joshua Whitcomb, Colonel Sellers, Rip Van Winkle,
Richard III., Hamlet, and Ophelia, or the Melancholy Dane,

"There must be a good story about the fellow, Hamilton," said one of the party.

"So there is, my boy. Everybody knows it here; but it may be new to you folks over the divide. You see, he comes of a theatrical tribe, and went on first when he was just a youngster in knickerbockers—as Hamlet, I think. That was back in the Dark Ages, some time when infant prodigies were all the rage. It was a fine performance, but not the kind the divine Billy contemplated in the original invention. It was a travesty, d'you see—not a barn-storming comic Hamlet, but something that was delicately and deliciously funny without your knowing why. The boy didn't intend to; he just couldn't help it. Heavens! how such a thing would take nowadays! But it made the thick-headed manager mad, and he told Blake to go and be a shoemaker. That was the end of him until burlesque began to come to the front in this country. Let me see; it was the year, I think, that *The Field of the Cloth of Gold* made its big hit, and those two Polish dancing girls with five-act names set everybody crazy. Blake was cast for some part and gagged it in a new style. He worked in character bits from tip-top politicians, statesmen, and men about town, and, by Jove! gentlemen, you could shut your eyes and swear that the very fellows were there on the stage. The audience simply got up and yelled. He had struck his gait at last, and he was the biggest favorite of the hour—money without end, whole conservatories over the foot-lights every night, and all the papers petting him."

The manager paused for a moment, and bent his ear knowingly to a plaintive strain inside, that sounded faintly through the lobby where the group were standing. Some one was bewailing "The Sweet Summer Days Long Ago" in a voice a little the worse for wear. "That's Miss Howard," he resumed. "Blake goes on next. Well, as I was saying, he made a hit, although the fool critics did their best to ruin him. They said, as usual, that he was capable of better things, and was frittering away his talents when he ought to be in legitimate. They were all wrong. He was a mimic, and nothing but a mimic. He wasn't even an actor. He was a concave mirror, don't you know—an echo with a twist in it. But there was never anybody like him; and he'd be at the top yet if he hadn't carried the joke too far. He carried it off the stage, where it belonged, and being a convivial fellow, he first broke up financially, and then broke down physically."

"I thought professional funny people were serious in private life," remarked a mine manager from Chalk Ranch.

"That's the general impression, but it's a great mistake. A comedian is always a comedian, and the only difference is that when he gets off the stage he may limit the audience down to himself. Life was a good joke to Blake, and after a while it told on him, and holes came in his work, as the saying is. At last it was nearly all holes. But he couldn't realize it, and he scored the biggest line of consecutive failures of any man in the business before he gave up. He failed in 'Frisco, failed in Chicago, failed in St. Louis, failed in New Orleans, and then failed in spots all over the one-night circuits. He was a pretty extinct volcano when he drifted out here with the boom, and has been trying to drown his sorrows in the usual way ever since; but, pshaw! you might as well try to drown a fish. He had quit the boards, and, in plain English, was a common drunkard. Did I say how I came to give him a date with me?" he continued, after listening again. "No? Well, let's go inside and I'll tell you. One day I found him sitting in the Marble Hall, looking pretty seedy, and I said, 'Blake, you are going to the dogs.' 'Have you just now made that discovery?' says he. 'No,' I said; 'but you ought to be ashamed of yourself—a man of your ability drinking himself into the gutter and going to perdition generally.' He looked up at me like a magpie, and says he: 'Hamilton, you are the most inappreciative cuss on earth. You have before you the finest imitation of a perfect loafer ever seen upon the stage of life. It is my most artistic creation. It is exact in every detail. I defy you to pick a flaw in it; and although I scarcely hoped to take in an old-timer like yourself, I can tell you confidentially that the whole town accepts the impersonation as genuine.' His effrontery tickled me so that I made him an offer on the spot. 'There's stuff in you yet,' I said, and the long and short of it is I talked him into an engagement. I have stirred up some of his old ambition, I believe, and my private opinion is that he will make a hit. Ah, here he comes now."

Miss Howard had ogled her way to the wings, a crash of chords came from the orchestra, and a man in a dress suit strode down the stage. He was greeted with a friendly tumult. Everybody in the great mining camp knew him, and everybody clung to the tradition that he was a genius, for it is a world-wide perquisite of ruined talent to find for its flashes a quick acceptance and a profound belief in what might have been. And this, moreover, was a boon companion, a fellow of infinite jest, who had often set the table in a roar, who had cracked jokes with all of them, and caroused in every cabin. They gave him an ovation.

The mimic had dressed with care, but as he stood for a moment waiting for the uproar to subside there were times when he looked thirty, and times when he looked full sixty, and in his bearing a tremulous shifting between youth and age, like an unstable mixture quivering before it resolves itself. He cleared his throat and spoke.

"I thank you," he said. "You are most kind. But it isn't a speech you want, I know. Give me your attention for a few moments, and I'll try to show you how Mr. Mayo does Davy Crockett."

There was no denying it, the man was clever. There was a spark of fantastic genius in the portraiture he drew. It was a caricature, but, like a caricature, the more recognizable for its salient and subtle exaggeration. It was impossible to say how he did it. A touch here and there, a trick of expression, and the Crockett of drama trod the boards. "I am only a poor backwoodsman," he sighed, with a husky tremor in his voice, "and I don't know how to read or write."

There was a storm of applause, for appreciation in plenty was in the house. Half those who had rushed to the mines in that day of hectic hope and golden dreams were men of culture, men of education, and men of refinement. They quarrelled and caroused at times, and wore hip boots, and shot each other to the death across the gambling table, but they hummed the last opera between pick strokes in the shaft, and knew an artist when they saw one.

Blake paused in his heroic strain, drew up his shoulders, and slouched across the stage. "B' gosh!" he exclaimed, in the astonished tones of Joshua Whitcomb. "I've jes saw—I've jes—" Then a queer change came into his voice, and he stopped. Of all his transformations this was the most sudden and complete. The genial countryman vanished in a breath, leaving behind a worn old man, belying his curly wig and youthful paint, staring into vacancy with haggard eyes and fingering at his throat. Hasbeen Blake had added one more to his list of consecutive failures. He tottered off amidst a dead silence, the performers making way for him in the wings. He encountered Hamilton on the stairs.

"Good God, man!" cried the manager, "what's the matter? You were doing fine."

The mimic glared at him fiercely. "You did this!" he exclaimed in a choking whisper. "And you knew better. You knew I was a wreck, but you wanted to make a show out of my misery. Curse you for it! My voice is gone, my memory is gone, and you knew it. Get out of my way!"

The night outside was cold, with the dry bitter chill of winter in the altitudes. A slight snow was on the ground, and it crunched like cinders underfoot; the gas lamps shone through amber halos, and beyond the low-lying town, beyond the row of flaming smelter chimneys in the gulch and the wide desolate plateau that flanked them, a ghostly figment of mountain-tops seemed hung against the sky. The heavens themselves were black as soot, but spangled with innumerable stars that steeped the atmosphere in their frosty radiance.

Whatever was strange and whatever was beautiful in this midnight picture was lost upon the doubly ruined mimic as he hurried headlong down the street. He had left his stage attire in the dressing room, and the raw air nipped him through his shabby clothes, but he did not feel it. A blind, inarticulate rage possessed him. The scene at the theatre appeared to him like some ugly dream, of which the glittering sweep of the foot-lights, the clamorous applause, his flush of triumph, and his despair were but detached and incoherent memories. Then, as this sense of unreality passed away, the miserable tragedy of his life unfolded through his brain, and confronted him like something palpable. No one had known how high his hopes had been once on a time, no one (and he nursed this thought with surpassing bitterness) had known the possibilities that were in him. The fatuity of his habit stood revealed as by a flash of lightning; how he had hoped against hope, shut his eyes on destiny, and dreamed steadfastly of another day that would never come; and the fabric of his self-deceit fell from the bare fact as one unwinds embroidered wrappings and finds a mummy. The sobriquet he had earned revolted him like the touch of a snake, and now that he realized its full import he felt how dear his dreams had been, how he had drawn sustenance from them, and how little life was worth living without them. He groaned at the thought, and dug his nails into his palms.

He had left the business quarters of the city far behind in his mad rush, and reached the scattered cabins that lined the gulch. Here and there a light shone out, but most of them were dark and still; and a dull noise that now began to drum his ears came from beyond. He did not know he heard it, but by that curious double sense that stands guard over a troubled mind he felt that he approached the river. On pleasant days in the past he had often wandered there to muse and fish, and only idle, vagrant memories were associated with the spot; but on that night the voice of the waters was burdened with sinister suggestion. A thought struck him that chilled and thrilled him, and even as he fought against it, seized him with the force of an ungovernable impulse. He cast a distracted glance into the gloom and hurried on, stumbling and panting over the rough ground. At that moment a hand was laid upon his shoulder.

"Where are you going?" asked a voice.

"I don't know," he answered, dully, without surprise and without turning.

Upon that a firm grasp faced him about, and by the starlight he recognized a miner whom he knew—a man not much better or worse than his kind, whom he had met sometimes in rather jovial company. His name was Hobart.

"Blake," said the miner, with a certain embarrassment of speech, "I was there to-night, and the truth is, I followed you out. You did your best, and that's all any of us can do. Yes, yes, but the least said the soonest mended, and—and—see here, what I want is to take you home."

"I have no home," said the mimic, in a hollow voice. "I am a vagabond."

"Why, bless my soul! I don't mean your home; I mean mine. I have a little shanty up the gulch, nothing very stylish, you know; but then the beauty of it is that you're as welcome there as the flowers of May. Come!"

Blake shuddered in a sudden revulsion that turned his flesh like ice, and suffered himself to be led away.

The miner and his wife lived in a little cabin perched on a rocky eminence, no great distance down the gulch, and hard by a place where the stream was spanned by an old and half-dismantled bridge. The husband had an interest in an inconsiderable mineral claim that lay within gunshot, and produced with such uncertainty as to keep them in a state of middling poverty, bordering sometimes on actual want, but never quite touching it. They had no children—a fact that robbed the situation of all its grimness and half of its anxiety; and being tranquilly inclined by habit, they jested with destiny rather than railed at it. Both had seen better days, and had Hobart been alone he would probably have allowed the downward current to drift him where it would, but his wife held him in leash, mainly by a good-natured acceptance of his faults, by which she husbanded her authority for a tactful warfare on his pleasant vices. Moreover, both were largely gifted with sympathy, and as this sprang (although without their knowing it) from an admission of their own weakness, it was as simple as it was tender and true.

Into these fortunate hands the mimic floated on the back wave from suicide. The pair set directly about making him comfortable, with the effect of its being an every-day affair to have such a guest, for the fact was, they had faced the unusual so often since they adventured among the mines that it had become the customary.

Blake sat like a man in a trance that night, and next day he sorely tried the patience of his friends. He was as fretful as a sick child, and would have left at once but for a sense of shame and dread of chaff at his familiar haunts. But gradually he grew calmer, and finally, at the end of a week, settled into an apathetic state that was like the senility of old age and perhaps was so in truth, for the stormy night of the encounter by the river brink had aged him like a dozen years.

He did not seem to brood, but would sit for hours by the window, his eyes fixed with a sort of childish intentness upon the expanse of river, table-land, and mountain. Now and then he would call Mrs. Hobart's attention to some trifle that diverted him—the serried lines of early birds winging up the gulch, the play of the waters around some eddy, or the grotesque profile of the volcanic rock that towered above the stream. Often he marked the clouds as they drifted against the distant peaks, and when the wind shredded them into long vaporous veils he found resemblance to men and animals in their fantastic tangle, as one sees pictures in the coals. Altogether it was a harmless, innocent existence—a dead calm after a tempest, and it never occurred to the Hobarts that they had an encumbrance on their hands. Their hearts went out to him for his helplessness, there was room enough in the cabin, and one more mouth to feed was not worth talking about. To save appearances there was a pretence of arrangement that he board and lodge with them, but the subject, once dropped, was never again alluded to.

In proportion as his interest in affairs grew less and less his body failed. He was a little weaker every day, his hands took the color of soiled ivory, with the skin hollowed around the articulations, and new notes and quavers came into his voice, yet it was all so very gradual that he protested, upon his honor, he had never felt better in his life. In spite of the profound inertia that most of the time locked him in his chair, he was not insensible to the kindness of his treatment, and tried to show it by such means as lay in his power. But they were few, and grew less. He had once a pretty knack of drawing, and planned to make a wonderful table ornament out of egg-shells, with sketches on the surface in pen and ink; but he dozed over the design, and waited for a certain tremulousness to pass away, until the egg-shells he had saved broke in their box and were forgotten. Thus with most of his enterprises. He settled, at last, upon cleaning the lamps as the task he was best able to perform, and sat for hours every day dreamily breathing upon the globes, polishing them bit by bit, and gazing at the magnified reflection of his fingers through the convexity of the glass. In that employment summer found him.

When it first became known in town that the Hobarts had given the old man a refuge, the public was inclined to regard the matter as a joke, and waited for developments; but when the change in his condition was bruited about, somewhat colored by rumor, those who felt that they had escaped the very likely burden of his maintenance cordially celebrated the miner's benevolence. It was general talk for a while; then interest in the case died out, and months later all at once revived, for no other apparent cause than that such things come in waves. Mr. Hamilton, who prided himself, as he frequently observed, in anticipating the wishes of a discriminating public, felt this trend of feeling, and proposed a benefit, to take place in his theatre, which he tendered free of charge for the occasion. He threw himself into the cause and fanned enthusiasm to a flame.

"Here's an old fellow who has broken himself down making people laugh," he said. "He would make you cry now. He's dying of softening of the brain or something, and who do you think is taking care of him? Why, two people that could give a church mouse points on poverty! He can't last long, and let's keep him from dying on charity. Any obligation?" he added, anticipating possible objection. "None in the world, except that he had money once himself and fooled it away, just as we do; and, by Jove! I say prodigals ought to take care of their own. It's about the only assurance we have against the husks."

The discriminating public responded nobly, and a committee presented the purse, all of which was set forth with great feeling by the local press. Then having done its duty, and congratulated itself that it had done it well, the public turned its attention to more vital topics; the sudden influx of visitors to the cabin waned like a stream after a freshet, and the old man returned to his lamp chimneys uninterrupted as before.

One day in midsummer Lodeville was startled by a tragedy. Lodeville was not usually startled by anything of the kind, but this affair hinged upon a principle of such universal interest, its immediate details were shrouded in so much mystery and the subject of such diversified conjecture, that it set the town by the ears. The known facts were that one of two partners in a mineral claim that was thought to be worthless, or very nearly so, charged the other with discovering a rich deposit in the property, concealing it, and then persuading him to sell out for a song. Such a ruse was not especially interesting or original, but the new lode developed far beyond even the trickster's expectation, while the duped partner brooded over what he had lost until his wrath amounted to frenzy. While matters stood thus the men met, alone and by night, near the mine that had enriched the one and ruined the other. Some said that a single shot sounded from the darkness, some said two, but at any rate only one man came out alive. What had passed between them, no one could say; the nearest witness heard a jangle of voices—nothing more. The man who strode up from the gulch, with his pistol smoking in his hand, and as ghastly pale as his quondam partner, who lay back among the granite with a bullet through his heart, was Hobart.

Two cardinal principles underlay the rude ethics of the camp, and this case involved them both. One discountenanced the jockeying of any man out of his property, and the other sternly forbade the killing of an unarmed antagonist. The dead man's name was Calvin; he was little liked, the subterfuge by which he had obtained the mine was notorious, and there would scarcely have been two opinions in the matter had his pistol been found by the corpse. But the crowd that hurried up the gulch, drawn by the electric rumor of catastrophe, searched the scene in vain for a weapon. The stark hands that lay outstretched in the rubble, with their palms turned to the stars, were empty.

At this men shook their heads and muttered of assassination. Calvin was hard and sordid, they said; he had played a dastardly game, but he had been shot down in the dark like a dog, without a chance for the life so suddenly filched away from him. There was the keenest curiosity to hear the slayer's story, but although Hobart surrendered without resistance, and professed himself anxious for trial, he kept his lips sealed to all else, and opinion settled quickly and darkly against him. Threats that he had made in the passion of indignation were recalled and construed in the light of the deed that he had done. It was professed that he was distraught and preoccupied when last seen, and had the air of one who nerves himself for desperate things, just as the friends of suicides are prone to fancy that they were very buoyant—"fay," as the Scotch say—before they left the world behind. It was undeniable that he had gone into the gulch armed and furious, and the conclusion that he had sought the encounter was inevitable. Hobart was thrown into jail, and the slow machinery of a capital prosecution began to move.

These were miserable days in the cabin by the river. The wife, after the first shock was over, faced the situation bravely enough, but her heart sunk at the ordeal of the future and the peril with which it was fraught. She never once doubted her husband's innocence of crime. She believed that he took life in obedience to the first law of nature—self-preservation—but she shrank from the deed with all a woman's repugnance of blood and violence, and she foresaw, with clearness born of apprehension, that the circumstances would be wellnigh impossible to explain. It is proverbial that one readily believes what is hoped to be, but it is more profoundly true that the dreaded is the only surely credible possibility in life; and fear of the worst preyed on her with an overwhelming certitude of its realization.

She bore this incubus alone. Blake had heard the story in silence, and when she talked with him in her wild cravings for human sympathy and companionship, he answered her with a look of perplexed anxiety and a few assenting phrases. He did not realize, or did not seem to realize, the imminent peril that overhung the little household and threatened to sever it in grief and shame. Once or twice he asked where Hobart was, and then, as if suddenly recollecting, nodded sagaciously and returned to his lamps. The man who sat in his cell with his face in his hands bore by far the lesser burden of those days.

When the trial was called at last, the camp regarded it as a mere formality preceding a sentence, although the prisoner's lawyers cautiously averred that they would clear their client, provided nothing unexpected occurred. Hobart took the stand in his own defence. His story was that on the fatal night he determined to visit the mine and make a last appeal to Calvin's sense of honor. He chose that hour because he knew that the owner himself superintended the night shift. They met, he said, near by the shaft-house, and he was harshly ordered from the premises. He refused to go without being heard, and Calvin, at the word, snatched out a pistol and swore to kill him for a black-mailer. Thereupon he also drew, and they fired so nearly on the instant that one shot seemed the echo of the other. Whether this statement was a desperate expedient merely, or the plain unvarnished tale of the tragedy, he stuck to it tenaciously, and no amount of cross-examination could shake him in its details.

The testimony introduced in support of Hobart's story was inconclusive in piecemeal, but as a whole had cumulative force. It was shown that Calvin also made threats, that he went armed habitually, and one man swore that he saw him with a weapon a few hours before his death. Upon this the lawyers argued, with considerable plausibility, that it was incredible that he would suddenly abandon the practice of years at the very time when his safety, as he well knew, rested with its continuance. The fact that no arm was found was explained by a theory, or rather by an innuendo. It seemed—and this was held pointedly before the jury—that Calvin's foreman, a Scandinavian named Ole Hagmar, was the first man to reach the body. Hagmar was a party to the manœuvre that secured the property, and it was more than intimated that he had done away with the weapon in a sudden inspiration of revenge. In the speeches for the defence it was dwelt upon that Hobart had no motive for the crime, but that every incentive existed on Calvin's part to dispose of a possible litigant in an action for fraud. The trick by which the mine was bought was painted in colors most likely to appeal to a jury of miners, and the deep distress in the prisoner's little home was more than once alluded to. The jury were out about twenty minutes, and returned a verdict of not guilty.

It is ever the case that a defence which rests upon a chain of circumstances no one of which is vital seems weak or preposterous to the casual listener. The jury may have followed it link by link to vastly different conclusions, but the public, having missed the salient little detail, the fact here and the suggestion there, and the trifles light as air that bound the whole together, is apt to cry out, "Monstrous!" Hobart did not escape the operation of this rule. The news of his acquittal spread like wildfire, and was denounced, first tentatively and then openly. Groups discussed it on the street, and declared that it put a premium on murder; that life was no longer safe in the face of such an example. A juryman was even assaulted, and there was a vague, menacing undercurrent that was more significant than the outspoken comment, and which swelled as the latter decreased.

Hobart reached home at dusk, exalted with the knowledge of deliverance, and feverish with the reaction that succeeded the strain. He was in no condition to notice the black looks that followed him down the street, and little he cared. He was free, and a delicious sense of life reopened and peril passed lifted him out of the present and thrilled him, as returning health thrills those who have languished long in mortal travail. There was a strangeness in familiar things, and he could have wept from a tenderness that he could not name.

As night advanced the mutterings of early evening assumed form and focussed themselves about the person of the foreman, Hagmar. Such movements need a leader, and he stepped willingly enough into the breach, for his bitterness toward the slayer of his friend was doubly augmented by the theory coupled with himself during the trial. He was a cool, saturnine fellow, flat-faced, slow of speech, authoritative, dangerous. He alone had not openly counselled violence, and he alone was felt to be the man who would first execute it. The most reckless of the crowd gravitated around him, and a portentous silence fell upon this group.

Let scientists gainsay it as they may, a mob is born from the interplay of mind on mind. The angry discussions and loud recriminations had ceased, but the whole camp quivered with a prescience that something frightful was about to happen. The very idlers who dozed in the public places felt it, and stared at each other with inquiring eyes. There was a subdued hush everywhere. Hagmar and his party had disappeared, and people looked at the clock with the air of those who time an explosion.

In that way an hour passed. Midnight sounded, and by common impulse there was a movement toward the thoroughfare that formed the main artery from the centre of the city to the outskirts. From the mass of the crowd, that now held back and wavered, twelve men on horseback detached themselves and rode toward the gulch.

The little group in Hobart's cabin had sat late, and could not persuade themselves to retire. The miner's excitement had somewhat worn away, and he cast and recast the future with his wife in all the joyous exuberance of a pair of lovers newly mated, while the old man gazed on them with a pleasant fixity. Thus midnight came and went, when presently Blake turned in his accustomed chair and pressed his face against the window-pane. There was something in his movement that caused them to pause with a vague thrill.

"Hobart," said the mimic, and for the first time in months there was a note of firmness in his voice, "who is that man on the bridge?"

A black figure was projected like an equestrian statue against the gray-green background of basaltic rock, silent, motionless, sinister, the left hand holding the bridle rein, the right clutching a rifle barrel poised against the hip. Hobart stared at this apparition, and rushed to another window that opened toward the town. What he saw drove the color out of his face and sent him staggering backward. An arc of riders had formed about the front of the cabin, and over their heads, up the dark incline of the street, he saw the mottled blackness of the throng.

"My God!" he breathed, "they're after *me*!"

The woman started up with a cry and flung her arms around him, but he did not heed her, and stood, with dilated eyes, breathless and listening.

In this moment of agonized suspense a strange mutation came upon the mimic. A veil seemed to drop from his face and clarify it of its blankness and apathy. There was a sparkle of forgotten light in his eyes, and a firmness that was long a stranger mastered the trembling of his limbs. He drew the window curtain with a steady hand, and turned to man and wife.

"You must go," he said.

Hobart stared at him wildly. "How can I go? The house is surrounded!"

"Leave that to me," replied the old man, quickly. "Strategy is all that can save you now. We must throw those fellows off some way. Go and stand by the back door, both of you, and when I give the word, slip out. You can be over the divide by daylight. Hurry! I tell you it is life or death!"

In the press of peril neither noted Blake's curious rejuvenation. They obeyed like children. "But the bridge?" faltered the man.

"Heavens! Hush!" replied the mimic. "Leave the bridge to me."

"Hobart, we want you!" came an imperious voice from the darkness.

As Hagmar shouted these words his followers craned a little forward, and, after a pause, saw the curtain of the cabin window slowly drawn and the figure of a man, indistinguishable except in outline, stood silhouetted upon the square of light.

"Is that him?" the riders asked each other. The next instant their question was answered by Hobart's familiar voice:

"What do you want?"

"You know what we want," said Hagmar, sternly. "Will you come out, or will we have to go in and get you?"

"This ain't fair, boys," returned the man at the window. "I've been tried and acquitted."

"Oh, curse that farce! It's no use talking, Hobart, we have you dead to rights. But we don't want to hurt your folks, if we can help it. Now, then—last call—will you come out?"

"Give me five minutes to decide."

There was a word of consultation in the ranks, and Hagmar drew out his watch, while several rifle barrels were levelled at the window. A whistle sounded, and the sentry on the bridge galloped into the group.

"Hobart," said the foreman, "this is wasting breath. We'll give you two minutes to live. Put them in praying or any way you want to, and don't budge, or you'll draw the fire before the time is up."

The figure at the window did not stir; but before the brief grace was over, a horseman at the end of the line shouted to Hagmar that a man and woman were crossing the bridge.

"Let them cross," replied the leader, curtly. "What do we care? We have the man we're after; let the other rats run if they want to. Now, boys," he added, "when I snap my watch—"

"Say, fellows," broke in the voice of the miner, pitched in a hoarse appeal, "make it five minutes, won't you? Two minutes ain't time to—"

Hagmar made a sign with his hand, and a detonation echoed up the gulch. The window glass shivered to splinters at the sound, and the man behind it flung out his arms and fell across the sill.

Once the deed was done, the slayers were seized with a certain panic, and scattered as chaff scatters in an eddy of wind; but the terror they inspired lingered behind them, and it was dawn before the first man crossed the rocky esplanade before the cabin. He lifted the body in his arms, and started backward with a frightened oath. It was the corpse of Hasbeen Blake.

THE NEW LIBRARY OF CONGRESS.

THE building now in course of erection for a national library, or, as it is called, the "Congressional Library," will be, on its completion, the most admirably arranged, the most commodious, and the largest library building in the world. The original library was begun in 1800, but was destroyed by the British when they burned the Capitol in 1814. The purchase of the library of Mr. Jefferson, containing about 7000 volumes, was the basis for the rebuilding of the library. In 1851 it was burned by accident, and at that time it had increased to 55,000 volumes, of which all but 20,000 were destroyed. It was rebuilt in 1852, and Congress appropriated $85,000 to repair the loss, and by annual appropriations the increase has been constant. With the addition made by the transfer of the Scientific Library of the Smithsonian Institution, the purchase of the historical collection of the late Peter Force, and the constant accumulations under the copyright law of 1870, it has grown into a vast collection, embracing in its various departments 615,000 volumes, besides 200,000 pamphlets. This huge collection has overrun all the space allotted to it under the rebuilding in 1852, and has no longer any rooms unoccupied in the Capitol, and hence the floors, alcoves, and every available space it can command are piled up in a seeming chaotic state to the general visitor, but the able and accomplished librarian, Mr. Spofford, and his many assistants, extract from the mass any book, paper, or pamphlet asked for. In addition to the large number of books and pamphlets and maps and drawings, engravings, music, etc., contributed by the copyright law, there are 7000 volumes of newspapers, embracing the London *Gazette* from 1661 to 1881, the London *Times* from 1796 to date, the *Journal des Débats* from its origin (1789), the New York *Herald* from its commencement, the *Evening Post* from 1801, the *National Intelligencer* from its commencement, and many other newspapers of this and other countries. This huge mass of learning is universal in its range; no department of literature or science is unrepresented, and it is very rich in the early histories of America.

The necessity for some provision to even store this large and constantly increasing mass of books has occupied the attention of Congress for some years. Plans were submitted, and the one which met the most favorable consideration at the time was the proposal to extend the eastern centre of the Capitol 375 feet, and provide for the library in that extension. The estimates made by Messrs. Walter & Clarke put the cost of this extension at $4,500,000, and it would only provide for the library and its natural increase for the period of forty years. Such an amount to be expended for only temporary relief determined Congress to provide for a separate building devoted exclusively to the library. The priceless collections of old engravings and of modern art to be found in the Bibliothèque Nationale at Paris and in the British Museum in London have long made those cities the resort of artists from all parts of the world. Space in the new building will provide for the exhibition of the enormous quantity of engravings, newspapers, maps, music, and sketches of value which at present is unavailable to the general public.

The dimensions of the great library building will be 470 feet long by 340 feet wide, with cellars and three full stories and an attic, giving abundant room for the present and the future demands of the library for many generations. The large rotunda, which will be the general reading-room, will be 100 feet in diameter and 120 feet high. Its octagon walls, pierced with windows on every side, and the huge dome—a great skylight—render it impossible that any shadow can obscure the book of the reader in whatever part of the rotunda he may be seated. The building as at present designed provides for the contemplated and natural increase of 30,000 volumes a year for a period of 130 years, and at that far distant period it will contain 5,500,000 books.

Inside, the building when completed will contain ample provision for 4,500,000 volumes, and when the vast court-yard is required, provision can there be made for an additional 1,000,000 books. Mr. Spofford furnishes the following comparison with the great libraries of the world as the best illustration of its proportions, and the provision it affords for many generations to come:

La Bibliothèque Nationale, Paris..			2,500,000	vols.
			150,000	MSS.
The Arsenal Library		"	200,000	vols.
St. Geneviève	"	"	180,000	"
Mazarin	"	"	100,000	"
Royal	"	Madrid	450,000	"
"	"	Naples	200,000	"
"	"	Vienna ..	400,000	"
"	"	Munich .	900,000*	"
"	"	Dresden ..	500,000	"
University, Göttingen		.. ..	500,000	"
Library, Berlin		....	700,000	"
"	Strasburg	....	613,000	"
Royal Library, Copenhagen ...			550,000	"
Imperial Library, St. Petersburg..			900,000	"
			27,000	MSS.
Harvard	"	.....	291,000	vols.
Astor	"	....	230,000	"
Boston Public Library			[illegible]	"

Each of the public departments at Washington is provided with libraries, and the aggregate number of volumes contained in all were, in 1876, 656,000 volumes, and pamphlets, 116,000 volumes.

The style of architecture, which possesses all the requirements as well as the possibilities of adornment for such a great edifice, is the Italian Renaissance. The building will occupy about four acres, and when the court-yards are utilized, as time may demand, that space will be entirely under roof. The British Museum and Library occupy about eight acres, but that space is filled with separate buildings, and accommodates the very large collection contained in the British Museum. The large mass of paintings, antiquities, and innumerable objects of interest in every known department of knowledge grows so rapidly in this great national depository that enlarged accommodations are soon to be provided.

The national library of France, the Bibliothèque Nationale, occupies four acres, and the books contained in it outnumber any library in Europe; but for the student and general reader the great mass of them are unavailable, for they remain in that state of chaos, uncatalogued, as when during the Revolution and subsequent wars they were dumped, as so many bricks, when carted from the monasteries and the ruined châteaux and libraries of the despoiled nobility. No attempt seems to have been made to catalogue them, and no catalogue beyond 1870 has been made in this really great depository of learning. It has long been a subject of regret to the world in general that no attempt has been made by any of the governments by which France has been ruled since 1789 to bring order out of the literary chaos. The municipal libraries of Paris, however, meet all the requirements of her people. There are distributed throughout the city at least fifty libraries, where books, drawings, and music are loaned to those engaged in the studies needing these accommodations. In this particular mode of education it far surpasses any city in the world. Some one, writing on this subject, asked of the custodians or the librarians in charge of these municipal branches if the books, music, and drawings were not frequently mutilated and many of them never returned. They replied, the mutilation was only the usual result of handling, and never of design; and the loss of the books lent was very rare.

This great national library of America will be completed by the year 1897—fully completed—and turned over to the charge of the librarian and custodians of the vast building. The work of building the library is under the charge of the engineer department of the War Department—Brigadier-General Casey, Engineer-in-Chief, Bernard R. Green, superintendent and engineer, and Mr. Peltz, architect. Separated entirely from the grand library, in another building, erected especially for it, is the engine-room for heating the library. The coal vaults are removed from all connection with the main edifice, and therefore the entire absence of dust, heat, etc., so destructive to books, is provided for. The light will be by electricity only.

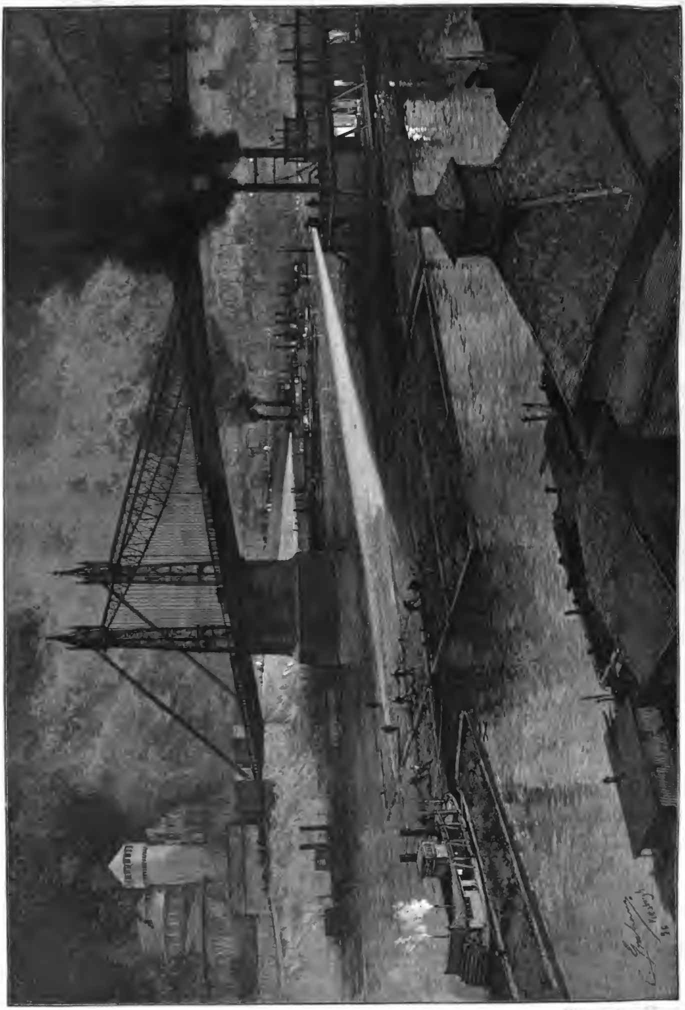
THE WAY WE CONQUER ENGLAND TO-DAY.—DRAWN BY W. H. HYDE.—[SEE PAGE 467.]



MAKING UP A TOW BY SEARCH-LIGHT AT PITTSBURGH.—Drawn by Charles Graham.—[See Page 470.]

WITHOUT BENEFIT OF CLERGY.

BY RUDYARD KIPLING.

III.

THE first shock of a bullet is no more than a brisk pinch. The wrecked body does not send in its protest to the soul till ten or fifteen seconds later. Then come thirst, throbbing, and agony, and a ridiculous amount of screaming. Holden realized his pain slowly, exactly as he had realized his happiness, and with the same imperious necessity for hiding all trace of it. In the beginning he only felt that there had been a loss, and that Ameera needed comforting where she sat with her head on her knees shivering as Mian Mittu from the house-top called "Tota! Tota! Tota!" Later all his world and the daily life of it rose up to hurt him. It was an outrage that any one of the children at the band-stand in the evening should be alive and clamorous when his own child lay dead. It was more than mere pain when one of them touched him, and stories told by overfond fathers of their children's latest performances cut him to the quick. He could not declare his pain. He had neither help, comfort, nor sympathy, and Ameera at the end of each weary day would lead him through the hell of self-questioning reproach which is reserved for those who have lost a child, and believe that with a little—just a little more care—it might have been saved. There are not many hells worse than this, but he knows one who has sat down temperately to consider whether he is or is not responsible for the death of his wife.

"Perhaps," Ameera would say, "I did not take sufficient heed. Did I, or did I not? The sun on the roof that day when he played so long alone, and I was—*ahi!* braiding my hair—it may be that the sun then bred the fever. If I had warned him from the sun, he might have lived. But, oh, my life! say that I am guiltless. Thou knowest that I loved him as I love thee! Say that there is no blame on me, or I shall die—I shall die!"

"There is no blame. Before God, none. It was written, and how could we do aught to save? What has been, has been. Let it go, beloved."

"He was all my heart to me. How can I let the thought go when my arm tells me every night that he is not here? *Ahi! ahi!* Oh, Tota, come back to me—come back again, and let us be all together as it was before!"

"Peace! peace! For thine own sake, and for mine also, if thou lovest me, rest."

"By this I know thou dost not care, and how shouldst thou? The white men have hearts of stone and souls of iron. Oh, that I had married a man of mine own people—though he beat me—and had never eaten the bread of an alien!"

"Am I an alien, mother of my son?"

"What else, sahib? . . Oh, forgive me—forgive! The death has driven me mad. Thou art the life of my heart, and the light of my eyes, and the breath of my life, and—and I have put thee from me, though it was but for a moment. If thou goest away, to whom shall I look for help? Do not be angry. Indeed it was the pain that spoke, and not thy slave."

"I know—I know. We be two who were three. The greater need, therefore, that we should be one."

They were sitting on the roof, as of custom. The night was a warm one in early spring, and sheet-lightning was dancing on the horizon to a broken tune played by far-off thunder. Ameera settled herself in Holden's arms.

"The dry earth is lowing like a cow for the rain, and I—I am afraid. It was not like this when we counted the stars. But thou lovest me as much as before, though a bond is taken away? Answer."

"I love more, because a new bond has come out of the sorrow that we have eaten together, and that thou knowest."

"Yea, I know," said Ameera, in a very small whisper. "But it is good to hear thee say so, my life, who art so strong to help. I will be a child no more, but a woman and an aid to thee. Listen! Give me my *sitar*, and I will sing bravely."

She took the light silver-studded *sitar*, and began a song of the great hero Raja Rasalu. The hand failed on the strings, the tune halted, checked, and at a low note turned off to the poor little nursery rhyme about the wicked crow:

"'And the wild plums grow in the jungle—
Only a penny a pound.
Only a penny a pound, *baba*—only'"....

Then came the tears and the piteous rebellion against fate, till she slept, moaning a little in her sleep, with the right arm thrown clear of the body, as though it protected something that was not there.

It was after this night that life became a little easier for Holden. The ever-present pain of loss drove him into his work, and the work repaid him by filling up his mind for eight or nine hours a day. Ameera sat alone in the house and brooded, but grew happier when she understood that Holden was more at ease, according to the custom of women. They touched happiness again, but this time with caution.

"It was because we loved Tota that he died. The jealousy of God was upon us," said Ameera. "I have hung up a large black jar before our window to turn the Evil-Eye from us, and we must make no protestations of delight, but go softly underneath the stars, lest God find us out. Is that not good talk, worthless one?"

She had shifted the accent on the word that means "beloved," in proof of the sincerity of her purpose. But the kiss that followed the new christening was a thing that any deity might have envied. They went about henceforward saying, "It is naught—it is naught," and hoping that all the Powers heard.

The Powers were busy on other things. They had allowed thirty million people four years of plenty, wherein men fed well and the crops were certain and the birth rate rose year by year; the districts reported a purely agricultural population varying from nine hundred to two thousand to the square mile of the overburdened earth. It was time to make room. And the Member for Lower Tooting, wandering about India in top-hat and frock-coat, talked largely of the benefits of British rule, and suggested as the one thing needful the establishment of a duly qualified electoral system and a general bestowal of the franchise. His long-suffering hosts smiled and made him welcome, and when he paused to admire, with pretty picked words, the blossom of the blood-red *dhak* tree, that had flowered untimely for a sign of the sickness that was coming, they smiled more than ever.

It was the Deputy Commissioner of Kot-Kumharsen, staying at the club for a day, who lightly told a tale that made Holden's blood run cold as he overheard the end.

"He won't bother any one any more. Never saw a man so astonished in my life. By Jove! I thought he meant to ask a question in the House about it. Fellow-passenger in his ship—dined next him—bowled over by cholera, and died in eighteen hours. You needn't laugh, you fellows. The Member for Lower Tooting is awfully angry about it; but he's more scared. I think he's going to take his enlightened self out of India."

"I'd give a good deal if he were knocked over. It might keep a few vestrymen of his kidney to their own parish. But what's this about cholera? It's full early for anything of that kind," said a warden of an unprofitable salt-lick.

"Dun'no'," said the Deputy Commissioner, reflectively. "We've got locusts with us. There's sporadic cholera all along the north—at least, we're calling it sporadic for decency's sake. The spring crops are short in five districts, and nobody seems to know where the winter rains are. It's nearly March now. I don't want to scare anybody, but it seems to me that Nature's going to audit her accounts with a big red pencil this summer."

"Just when I wanted to take leave, too!" said a voice across the room.

"There won't be much leave this year, but there ought to be a great deal of promotion. I've come in to persuade the Government to put my pet canal on the list of famine relief works. It's an ill wind that blows no good. I shall get that canal finished at last."

"Is it the old programme, then," said Holden—"famine, fever, and cholera?"

"Oh no! Only local scarcity and an unusual prevalence of seasonal sickness. You'll find it all in the reports if you live till next year. You're a lucky chap. You haven't got a wife to put out of harm's way. The hill stations ought to be full of women this year."

"I think you're inclined to exaggerate the talk in the *bazars*," said a young civilian in the secretariat. "Now I have observed—"

"I dare say you have," said the Deputy Commissioner, "but you've a great deal more to observe, my son. In the mean time I wish to observe to you—" And he drew him aside to discuss the construction of the canal that was so dear to his heart.

Holden went to his bungalow, and began to understand that he was not alone in the world, and also that he was afraid for the sake of another, which is the most soul-satisfying fear known to man.

Two months later, as the Deputy had foretold, Nature began to audit her accounts with a red pencil. On the heels of the spring reapings came a cry for bread, and the Government, which had decreed that no man should die of want, sent wheat. Then came the cholera from all four quarters of the compass. It struck a pilgrim gathering of half a million at a sacred shrine. Many died at the feet of their god; the others broke and ran over the face of the land, carrying the pestilence with them. It smote a walled city and killed two hundred a day. The people crowded the trains, hanging on to the foot-boards and squatting on the roofs of the carriages; and the cholera followed them, for at each station they dragged out the dead and the dying on the platforms reeking of lime-wash and carbolic acid. They died by the road-side, and the horses of the Englishmen shied at the corpses in the grass. The rains did not come, and the earth turned to iron lest man should escape by hiding in her. The English sent their wives away to the hills, and went about their work, coming forward as they were bidden to fill the gaps in the fighting line. Holden, sick with fear of losing his chiefest treasure on earth, had done his best to persuade Ameera to go away with her mother to the Himalayas.

"Why should I go?" said she one evening on the roof.

"There is sickness, and people are dying, and all the white *mem-log* have gone."

"All of them?"

"All—unless, perhaps, there remain some old scald-head who vexes her husband's heart by running risk of death."

"Nay; who stays is my sister, and thou must not abuse her, for I will be a scald-head too. I am glad all the bold white *mem-log* are gone."

"Do I speak to a woman or a babe? Go to the Hills, and I will see to it that thou goest like a queen's daughter. Think, child. In a red-lacquered bullock cart, veiled and curtained, with brass peacocks upon the pole and red cloth hangings. I will send two orderlies for guard, and—"

"Peace! Thou art the babe in speaking thus. What use are those toys to me? *He* would have patted the bullocks and played with the housings. For his sake, perhaps—thou hast made me very English—I might have gone. Now, I will not. Let the *mem-log* run."

"Their husbands are sending them, beloved."

"Very good talk. Since when hast thou been my husband to tell me what to do? I have but borne thee a son. Thou art only all the desire of my soul to me. How shall I depart when I know that if evil befall thee by the breadth of so much as my littlest finger nail—is that not small?—I should be aware of it though I were in Paradise. And here, this summer thou mayst die—ai, *janee*, die!—and in dying they might call to tend thee a white woman, and she would rob me in the last of thy love."

"But love is not born in a moment, or on a death-bed."

"What dost thou know of love, stone-heart? She would take thy thanks at least, and, by God, and the Prophet, and Beebee Miriam the mother of thy Prophet, that I will never endure. My lord and my love, let there be no more foolish talk of going away. Where thou art, I am. It is enough." She put an arm round his neck and a hand on his mouth.

There are not many happinesses so complete as those that are snatched under the shadow of the sword. They sat together and laughed, calling each other openly by every pet name that could move the wrath of the gods. The city below them was locked up in its own torments. Sulphur fires blazed in the streets; the conches in the Hindoo temples screamed and bellowed, for the gods were inattentive in those days. There was a service in the great Mahommedan shrine, and the call to prayer from the minarets was almost unceasing. They heard the wailing in the houses of the dead, and once the shriek of a mother who had lost a child and was calling for its return. In the gray dawn they saw the dead borne out through the city gates, each litter with its own little knot of mourners. Wherefore they kissed each other and shivered.

It was a red and heavy audit, for the land was very sick, and needed a little breathing space ere the torrent of cheap life should flood it anew. The children of immature fathers and undeveloped mothers made no resistance. They were cowed and sat still, waiting till the sword should be sheathed in November if it were so willed. There were gaps among the English, but the gaps were filled. The work of superintending famine relief, cholera sheds, medicine distribution, and what little sanitation was possible went forward because it was so ordered.

Holden had been told to hold himself in readiness to move to replace the next man who should fall. There were twelve hours in each day when he could not see Ameera; and she might die in three. He was considering what his pain would be if he could not see her for three months, or if she died out of his sight. He was absolutely certain that her death would be demanded—so certain that when he looked up from the telegram and saw Pir Khan breathless in the doorway, he laughed aloud. "And?"—said he.

"When there is a cry in the night and the spirit flutters into the throat, who has a charm that will restore? Come swiftly, heaven-born. It is the Black Cholera."

Holden galloped to his home. The sky was heavy with clouds, for the long-deferred rains were at hand, and the heat was stifling. Ameera's mother met him in the court-yard, whimpering. "She is dying. She is nursing herself into death. She is all but dead. What shall I do, sahib?"

Ameera was lying in the room in which Tota had been born. She made no sign when Holden entered, because the human soul is a very lonely thing, and when it is getting ready to go away, hides itself in a misty border-land where the living may not follow. The Black Cholera does its work quietly and without explanation. Ameera was being thrust out of life as though the Angel of Death had himself put his hand upon her. The quick breathing seemed to show that she was either afraid or in pain, but neither eyes nor mouth gave any answer to Holden's kisses. There was nothing to be said or done. Holden could only wait and suffer. The first drops of the rain began to fall on the roof, and he could hear shouts of joy in the parched city.

The soul came back a little, and the lips moved. Holden bent down to listen. "Keep nothing of mine," said Ameera. "Take no hair from my head. *She* would make thee burn it later on. That flame I should feel. Lower! Stoop lower! Remember only that I was thine and bore thee a son. Though thou wed a white woman to-morrow, the pleasure of taking in thy arms thy first son is taken from thee forever. Remember me when thy son is born—the one that shall carry thy name before all men. His misfortunes be on my head. I bear witness—I bear witness"—the lips were forming the words on his ear—"that there is no God but—thee, beloved."

Then she died. Holden sat still, and thought of any kind was taken from him till he heard Ameera's mother lift the curtain.

"Is she dead, sahib?"

"She is dead."

"Then I will mourn, and afterward take an inventory of the furniture in this house; for that will be mine. The sahib does not mean to resume it? It is so little, so very little, sahib, and I am an old woman. I would like to lie softly."

"For the mercy of God be silent awhile! Go out and mourn where I cannot hear."

"Sahib, she will be buried in four hours."

"I know the custom. I shall go ere she is taken away. That matter is in thy hands. Look to it that the bed—on which—on which—she lies—"

"Aha! That beautiful red lacquered bed. I have long desired—"

"—That the bed is left here untouched for my disposal. All else in the house is thine. Hire a cart, take everything, go hence, and before sunrise let there be nothing in this house but that which I have ordered thee to respect."

"I am an old woman. I would stay at least for the days of mourning, and the rains have just broken. Whither shall I go?"

"What is that to me? My order is that there is a going. The house gear is worth a thousand rupees, and my orderly shall bring thee a hundred rupees to-night."

"That is very little. Think of the cart hire."

"It shall be nothing unless thou goest, and with speed. O woman, get hence, and leave me to my dead!"

The mother shuffled down the staircase, and in her anxiety to take stock of the house fittings forgot to mourn. Holden stayed by Ameera's side, and the rain roared on the roof. He could not think connectedly by reason of the noise, though he made many attempts to do so. Then four sheeted ghosts glided dripping into the room and stared at him through their veils. They were the washers of the dead. Holden left the room, and went out to his horse. He had come in a dead, stifling calm, through ankle-deep dust. He found the court-yard a rain-lashed pond alive with frogs, a torrent of yellow water ran under the gate, and a roaring wind drove the bolts of the rain like buckshot against the mud walls. Pir Khan was shivering in his little hut by the gate, and the horse was stamping uneasily in the water.

"I have been told the sahib's order," said he. "It is well. This house is now desolate. I go also, for my monkey face would be a reminder of that which has been. Concerning the bed, I will bring that to thy house yonder in the morning. But remember, sahib, it will be to thee as a knife turned in a green wound. I go upon a pilgrimage, and I will take no money. I have grown fat in the protection of the Presence, whose sorrow is my sorrow. For the last time I hold his stirrup."

He touched Holden's foot with both hands, and the horse sprang out into the road, where the creaking bamboos were whipping the sky, and all the frogs were chuckling. Holden could not see for the rain in his face. He put his hands before his eyes and muttered, "Oh, you brute! You utter brute!"

The news of his trouble was already in his bungalow. He read the knowledge in his butler's eyes when Ahmed Khan brought in food, and for the first and last time in his life laid a hand upon his master's shoulder, saying: "Eat, sahib, eat. Meat is good against sorrow. I also have known. Moreover, the shadows come and go, sahib. The shadows come and go. These be curried eggs."

Holden could neither eat nor sleep. The heavens sent down eight inches of rain in that night and scoured the earth clean. The waters tore down walls, broke roads, and washed open the shallow graves in the Mahommedan burying-ground. All next day it rained, and Holden sat still in his house considering his sorrow. On the morning of the third day he received a telegram which said only, "Ricketts, Myndonie. Dying. Holden. Relieve. Immediate." Then he thought that before he departed he would look at the house wherein he had been master and lord. There was a break in the weather. The rank earth steamed with vapor, and Holden was vermilion from head to heel with the prickly-heat born of sultry moisture.

He found that the rains had torn down the mud pillars of the gateway, and the heavy wooden gate that had guarded his life hung drunkenly from one hinge. There was grass three inches high in the court-yard; Pir Khan's lodge was empty, and the sodden thatch sagged between the beams. A gray squirrel was in possession of the veranda, as if the house had been untenanted for thirty years instead of three days. Ameera's mother had removed everything except some mildewed matting. The *tick-tick* of the little scorpions as they hurried across the floor was the only sound in the house. Ameera's room and that other one where Tota had lived were heavy with mildew; and the narrow staircase leading to the roof was streaked and stained with rain-borne mud. Holden saw all these things, and came out again to meet in the road Durga Dass, his landlord—portly, affable, clothed in white muslin, and driving a C-spring buggy. He was overlooking his property to see how the roofs withstood the stress of the first rains.

"I have heard," said he, "you will not take this place any more, sahib?"

"What are you going to do with it?"

"Perhaps I shall let it again."

"Then I will keep it on while I am away."

Durga Dass was silent for some time. "You shall not take it on, sahib," he said. "When I was a young man I also— But to-day I am a member of the Municipality. Ho! ho! No. When the birds have gone, what need to keep the nest? I will have it pulled down; the timber will sell for something always. It shall be pulled down, and the municipality shall make a road across, as they desire, from the burning ghat to the city wall. So that no man may say where this house stood."

THE END

THE HONEY-MOON.

When the clover's in its prime,
Then's the sweetest marriage-time.
They the longest honey-moon
Have who marry now in June,
When the earth's been wooed and won,
And the summer's just begun;
When the daylight loves to stay,
And steals half the night away;
And the moonbeams shine so deep
That there seems no time for sleep;
When the air throbs with the gush
Of the silver-throated thrush,
And the soil has felt the thrill,
And bursts into bloom at will,
Imitating every shade
That the skies have ever made;
When the perfume, songs, and light,
Earth's fulfilment of her plight,
Steal into the human heart,
Making all the love chords start
Into harmonies so sweet
That there seemeth no retreat
But to sing and blossom, too,
Just as birds and flowers do.

Mary A. Mason.

MR. SARGENT'S PORTRAIT OF LA CARMENCITA.

The full-length portrait, by Mr. John S. Sargent, of La Carmencita, the Spanish dancer, of which we give a reproduction, was shown at the recent Exhibition of the Society of American Artists, and attracted a great deal of favorable notice. It is one of the most brilliant productions of a painter who is chiefly known by his remarkable works in portraiture, and it illustrates in an eminent degree the striking characteristics of his art. The subject is one that is well suited to his powers. The picturesque young woman, whose grace in the movements of her peculiar dance has called forth such admiration from artists as well as from the public, is shown just as, with her hands resting on her hips, her head thrown back, and her right foot a little forward, she is beginning the graceful changes of posture that will fascinate the spectators before her. She wears a dress of yellow satin, which is seen through an over-skirt of white lace, and a scarf of the same diaphanous material is thrown across her arms and bust. Her youthful and expressive face is of the Spanish type of beauty, and her dark hair and eyes and red lips are in harmony with her rich complexion. The artist has well indicated the sense of movement in her posture, and the figure as well as the countenance of the dancer is full of expression, and both are painted with extraordinary breadth and freedom.

It will be remembered that it was through Mr Sargent's admirable treatment of a similar subject that his skill in this direction was first brought to the notice of lovers of art in America. "El Jaleo," which was exhibited after his return from Spain, some ten years ago, represented a woman dancing in a Spanish *posada*, while a group of her companions, ranged against the wall, accompany her with guitar, tambourine, and castanets. The present work, while possessing much of the extraordinary power and dash of the earlier picture, is far more pleasing in its subject. It is remarkable for its harmony of treatment as well as for the breadth and vigor which characterize it, and the lithe, graceful figure that is so strikingly portrayed will not easily be forgotten by those who have seen the picture. Like "El Jaleo" and the works of a similar character from Mr. Sargent's brush, this portrait shows the influence upon him of Velasquez, and it worthily reproduces for us some of the most admirable characteristics of the great Spaniard's art.

Mr. Sargent was born in Florence, of American parents, thirty-five years ago. In his twentieth year he went to Paris, and entered the studio of Carolus Duran, whose portrait he soon afterward painted in a style that attracted favorable notice. His works, many of which have been shown in the Salon, have been marked by such vigor and brilliancy of treatment as to place him among the foremost of American painters. The pictures which he contributed to the recent Exhibition of the Society of American Artists illustrated the versatility as well as the brilliancy which are among the qualities of his art. He has been called a "painters' painter," and it is true that the technical excellence of many of his works that have been seen in the exhibitions appeals more especially to the artist than to the general spectator. Yet such a picture as this portrait of La Carmencita can hardly fail to win the admiration of the casual observer.

THE AMERICAN GIRL IN LONDON.

There are not less than fifteen gentlemen, and on one young lady their thirty eyes are focused. A mob of men two ranks deep rise and desire presentation. It is evident that the prelude to the dance has just been floating through the rooms. You will observe the methods employed so as to obtain recognition. Poses are various, and crush-hats are sported by the suitors in different ways. The engaging youth with the eye-glass handles his hat as if it was a salver, while there is an imploring, supplicating manner about one gentleman who holds his hat before him. The sensation the American girl makes goes beyond those who are nearest to her. Away beyond, where there are six men and three ladies, the attention of five of the men is directed toward the same young lady. And how does the American girl take all this homage? There is no expression of surprise. She has often been subjected to the same conditions. She looks supremely cool, not exactly indifferent. She might have an instant's hesitation—an *embarras de choix*, let us say—but just before she rose, having first with a graceful pat arranged her skirt, she had cast her eyes over the lot (she says "lot," that being very English), and had made her decision.

Mr. Hyde shows very properly all the little by-play of the situation. There are whisperings arising from the three young ladies in the front of the sketch. Of course, behind their fans they have scanned the American as to looks, set of gown, and can find nothing to disparage. As to that group in the distance, one young woman shows mitigated dislike as she stares into vacancy, while the other young person to the extreme right is in high dudgeon. It is wretched to be a wallflower, and exhibitions of temper under such circumstances are to be forgiven. What is amusing to the American girl, who is conscious of her social success, is the staid ceremonial which accompanies such so-called festivities. Its solemnity ought to impress her. It has quite the contrary effect. Something she is entirely wanting in is pity for the others, those young ladies, who, if they do not remain exactly fixtures, at least are asked to dance after her. She rather likes having the first choice of cavaliers. That is what she was born for. Under such circumstances commiseration for others is out of place. What that girl has is a certain charm of her own, a wonderful good taste in dress, an *aplomb* which forces consideration (something English people invariably bow before), and then again she can dance, and dance as few can. And talk! Just let her have a sympathetic partner, and when the dance is over, the fortunate man will say: "There is more real fun in that American girl than in a roomful of English ones. It's style and action that conquer England to-day."

JOHN JASPER, CITY SUPERINTENDENT OF SCHOOLS.

John Jasper, who at the last meeting of the Board of Education of New York city was elected City Superintendent of Schools for a sixth term, is a man still in the prime of life, being now in the fifty-fourth year of his age. He was born on Manhattan Island, and after a preparation in the public schools, was admitted to the Free Academy, now the College of the City of New York, from which he was graduated in 1856. After a year's experience as assistant engineer on the Central Park survey under General Viele, he was appointed an assistant teacher in Grammar School No. 9, and in 1864 he succeeded to the Principalship. His efficient management of this small school gained him promotion to the Principalship of Grammar School No. 51 in 1866.

In 1872 the growth of the school system called for the appointment of two additional Assistant Superintendents, and Principal Jasper was one of the two selected by the Board of Education. While acting in this capacity he was intrusted with the duty of supervising and directing the work of the teachers in introducing a new and extended course in drawing. Under the heavy strain of his duties his health broke down, and he spent a short time in Florida. His recovery was rapid, and on his return to New York, he resumed his labors with his accustomed energy. In September, 1879, he was elected to succeed Henry Kiddle, who had resigned his position as City Superintendent of Schools.

Mr. Jasper had been teacher and Principal in the evening schools, and teacher and Principal in the Evening High-school, and this, coupled with his experience in the other positions held by him, had given him an insight into the school system in all its phases and details. He was thus enabled to bring to the use of the Board of Education and its committees a large fund of practical knowledge, and in accordance with his suggestions and recommendations salutary changes have been made in the courses of study, and improved methods of instruction have been introduced.

THE GREAT GERMAN SHOOTING FESTIVAL.

The tenth Deutsche Bundesschiessen, or German Shooting Festival, will be held at Berlin in July, and promises to be the greatest meeting of riflemen and members of shooting clubs ever seen. A central committee of all the Schuetzen corps of Germany and Austria arranges such a meeting once in three years, and this year the invitations sent to German riflemen all over the world have been so generally accepted that the committee estimates that no less than sixty thousand men will take part in the contests. Unlike the English and Americans, who devote themselves exclusively to making scores when they go to shooting matches, the Germans introduce the element of sociability into their sports, take their wives and children to the rifle range, have parades and banquets, and get a great deal of all-round enjoyment out of their meetings.

A great many German-American shooting societies will be represented at Berlin, and most of the members who go to the meeting will be accompanied by their families, and make their trip a holiday excursion to the father-land. The steam-ship *Wieland* was chartered by the New York Independent Schuetzen Corps, to sail for Europe on the 12th of June with several hundred shooters and their families as passengers. Thirty-five members of the New York Central Schuetzen Corps and the representatives of the New-Yorker and New York City Corps went by the regular line steam-ships at an earlier date. All will meet in Hanover on July 3d, and proceed directly to Berlin, where they will find all arrangements made for them by an advance committee consisting of Messrs. William V. Weber, Alexander Stein, and Gus Zimmermann.

Matches will be shot in Bremen and Hamburg before the grand festival, and some of the American representatives will take part in them. When the corps go to Berlin they will enter the Unter den Linden by the Brandenburg Thor, march to the palace, with American, German, and corps flags flying, and listen to a speech of welcome from the Emperor. Afterward they will march to the City Hall, where they will be received by the Mayor.

The Independent Corps will give a banquet at the Kaiserhof on the evening of the Fourth of July. They will entertain 100 guests of honor, and they expect the Emperor to attend, although that point is not definitely settled. Minister Phelps will be present, and will respond to a patriotic American toast. Mr. William V. Weber, the Festpraesident, will preside at the banquet.

On the 5th of July there will be a grand parade in Berlin of all the Schuetzen corps, and the Americans will have a great open-air reception in Kroll's Garden, near the Thiergarten. The shooting will begin at five o'clock in the afternoon of Sunday, July 6th, and continue until the 13th.

The programme of the festival shows that the Schuetzen corps take little or no interest in long-range shooting. All their matches will be shot off-hand at ranges of 175 and 300 metres, equivalent to 200 and 328 yards. There will be 112 targets for the use of the riflemen, divided equally between the two ranges, and nearly $100,000 worth of prizes will be distributed among the contestants at the end of the festival. The target at the 300-metre range is oblong in shape, 90 centimetres high, and 45 centimetres wide. The black centre is 57 centimetres high and 12 centimetres wide. A shot in the black counts 2 points, and in the outer part of the oblong it counts 1 point. The 175-metre target has a round bull's-eye 30 centimetres in diameter, with an inner ring of 15 centimetres. Most of the fine sharp-shooting will be at the shorter range. A great variety of special targets will be used also, such as the running deer, at 60 metres; the jumping hare, at 35 metres; and disappearing targets, to test quickness of sight, etc.

On Tuesday, July 8th, the sharp-shooters who have entered their names within a prescribed time will contest for supremacy in rapidity and accuracy of fire. The man who makes the greatest number of bull's-eyes within a certain number of minutes, or a certain number of points in the shortest time, will win the first prize. Ten cups are the prizes offered in this quick shooting contest. Most of the contests are open to all comers upon payment of a small entrance fee. A fee of six marks will secure an admission card for the whole festival, and any foreigner not a member of a Schuetzen corps can become a member and engage in the field shooting by paying three marks.

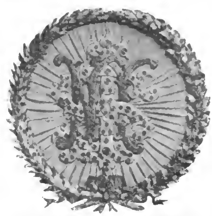
The rules of the range admit any kind of rifle weighing not more than 12½ pounds. Plain open sights must be used at the 300-metre range, but at 175 metres a peep sight is allowed. The front sight must be open at all ranges. The three-pound trigger-pull rule is not in favor with the Germans, and they admit hair and set triggers without discrimination.

Several targets will be devoted to revolver and pistol shooting at a distance of 38 yards, and it is expected that many army officers will take part in the revolver matches. No professionals will be allowed to participate. The Schuetzen corps have not paid much attention to revolver practice, however, and only a few members of the American societies will shoot at the pistol range. Mr. Alexander Stein, who is the best marksman with a revolver in the Seventh Regiment, is probably the only one who will try to win a prize with the smaller weapon.

The American contingent hopes to achieve the most fame in the team matches, and with that object in view a number of the best marksmen have been selected from the various corps to shoot for places in a team of five men. Mr. Weber, the Festpraesident; Captain Diehl, of the Independent; Captain Sieburg, of the New York Central; Captain Meyer, of the New York City; and Captain Wehrenberg, of the New Yorker Schuetzen Corps, are fair shots, but they do not aspire to places in the team, which probably will be made up from the following list: Gus. Zimmermann, Bernard Walther, Alex. Stein, David Miller, F. W. Hofele, G. Hoenighausen, A. Begerow, S. Kraus, and Mr. Fischer. If Strecher and Jacoby, of San Francisco, go to Berlin, they will be added to the list. Strecher is one of the best off-hand marksmen in the country, and was credited last winter with the best score on record at 200 yards.

Gus Zimmermann is Captain of the Bull's-Head Rifle Club, and a member of the Zettler, New York Independent, New York Central, and German American Sharp-shooters. In the contest at the American Institute in 1889 he won the first prize by a score of 2604 bull's-eyes, the next highest being Frank Ehret's string of 1604. In a match with Hofele, at 200 yards, Zimmermann made 601 bull's-eyes in three hours, his opponent making 325. The Tiffany cup was won by Zimmermann at Creedmoor last year.

Bernard Walther is President of the Zettler Rifle Club, and a member of the New York City, German American, and Bull's-Head clubs. Mr. Walther's record places him among the best off-hand marksmen in the country. He defeated Sergeant T. Dolan in the off-hand matches at the last fall meeting at Creedmoor. With a repeating rifle he has made 232 points out of a possible 250 in 1 minute 32 seconds.



TROPHY PRESENTED BY THE INDEPENDENT NEW YORK SCHUETZEN.

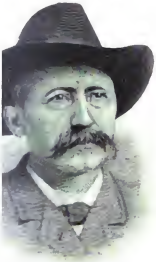
Alex. Stein, shooting-master of the Bull's-Head Club, is the high-score man of the Seventh Regiment. He has made a good record with the military rifle at Creedmoor, and is expert with the revolver.

David Miller, of Hoboken, is a veteran sharp-shooter, and being steady and reliable in team shooting, he probably will be one of the five.

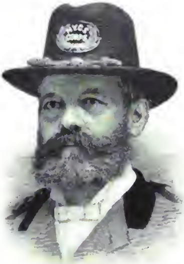
Messrs. Hofele, Kraus, Fischer, Begerow, and Hoenighausen are all excellent marksmen.

The team selected to represent the German American societies will shoot a match at Bingen, after the festival, with the best team of any German club. The last contest of all will be at Neustadt, where a day will be spent in individual prize and team shooting.

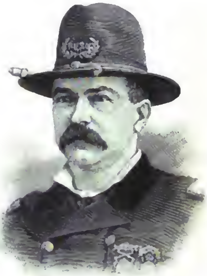
The Californians who will compete in Berlin for honors and prizes are Philo Jacoby, John Utschig, Captain F. A. Kuhls, Jacob Iloff, Fritz Boeckmann, F. Plagermann, and F. Gerecken, all members of the California Schuetzen Club and expert marksmen. Mr. Jacoby is President of the club, and one of the best shots in the country with either the German target rifle or the military weapon. He was born in Prussia, and has been a citizen of San Francisco for thirty years. He is the editor of a weekly paper called *The Hebrew*, and is prominent in all athletic affairs, being one of the founders and ex-director of the famous California Athletic Club. Mr. Jacoby's record as a rifleman is as follows: Took first prizes at the great United States shooting festival in Jones's Wood, New York, in 1868, first prize in Germany in 1868, and received there a needle-gun from the War Department of Prussia; took first prize at



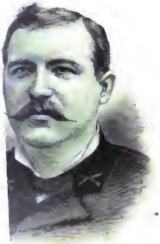
ORY, OF THE CALIFORNIA SCHUETZEN CLUB.



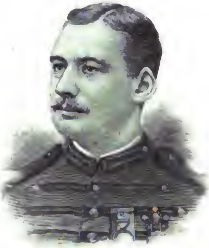
CAPTAIN JOHN C. MEYER, NEW YORK CITY SCHUETZEN.



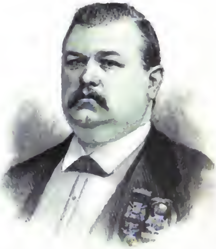
CAPTAIN GEORGE WEHRENBERG, NEW-YORKER SCHUETZEN CORPS.



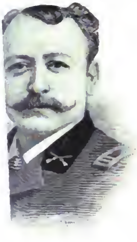
ORGE SIEBURG, NEW YORK CENTRAL SCHUETZEN CORPS.



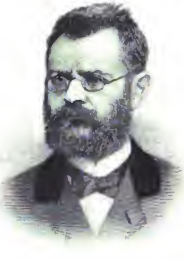
ALEXANDER STEIN, INDEPENDENT NEW YORK SCHUETZEN.



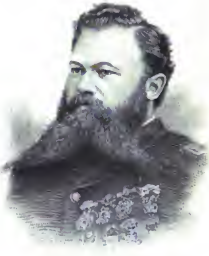
CAPTAIN J. J. DIEHL, INDEPENDENT NEW YORK SCHUETZEN.



JAN, INDEPENDENT NEW YORK SCHUETZEN.



WILLIAM V. WEBER (FESTPRAESIDENT), INDEPENDENT NEW YORK SCHUETZEN.



B. WALTHER, INDEPENDENT NEW YORK SCHUETZEN.

RMAN-AMERICAN REPRESENTATIVES AT THE GERMAN SHOOTING FESTIVAL TO BE HELD AT BERLIN IN JULY.

FROM PHOTOGRAPHS.—[SEE PAGE 467.]

oting King at Washington, D. C., 1870;
irich, Switzerland, 1873, first prize in
ival at World's Fair, 1873, took first
hooting King in German shooting fes-
873, commanded California Schuetzen
ntennial shooting match at Philadel-
team took the champion cup, and Ja
nedal for the highest score of the team
twenty-four silver goblets, many med-
ip belt. In the Berlin shooting he will
r single loader. The Californians ex
l work in the matches with the open
tch with the famous Nevada military
team twenty men of the California Schuetzen Club made the unprecedented average of 87½ per cent.

The prize contributed by the Californians consists of a large vellum sheet, upon which, in the shape of a five-pointed star, are gold and silver coins of the United States, each point containing a $20, $10, $5, and $2 50 gold piece. The German and American colors are combined in the star, and above is the inscription:

> „Ehrenpreis für das deutſche Bundesſchießen für die Schützende „Deutſchland," gewidmet von deutſchgeborenen und deutſchfreundlichen Bürgern San Franciscos."

The New York Independent Schuetzen Corps also contributes a handsome prize, consisting of the corps monogram in red, white, and blue velvet ornamented with gold pieces to the value of $600. The trophy is three feet square.

The Californians will carry in the parade in Berlin a silk flag designed by Jacoby to combine the colors of the State and the United States. It has the regulation thirteen stripes, but in place of the blue field is the grizzly bear of California.

The marksmen who arrive early in Europe will take part in the Bremen festival on June 15th, and the Hanover festival on June 22d. After the great festival in Berlin some of them will go to Switzerland, to compete in the Federal shooting festival at Frauenfeld on July 20th.

that there are points of scientific play which serve to make it a subject of close study, and render possible constant improvement. There are a few rules which underlie good bowling.

Alleys are provided with balls from about two pounds to slightly less than sixteen pounds in weight. The beginner should take a small ball that is easily controlled, gradually increasing the size to the largest that can be used effectively. Put the thumb and third finger in the holes, and stand just back of the regulation line. Hold the arm perfectly straight, and let it swing like a pendulum. Swing the ball backward until the arm is on a level with the shoulder, then bring the ball downward so that it comes within an inch of the floor, and, if possible, just brushes the alley. At this very instant release the ball, when it will go without jar or bound. One of the most common mistakes of bowlers is that the moment of delivery of the ball is postponed until it is on the upward swing, when it is thrown rather than bowled, and goes bounding down the alley. The bowler should not lose control of the ball at the moment of delivery. In order to make a "strike," the ball should not hit the head pin directly in the centre, but a trifle to one side, between the first and second pins; otherwise a path is quite likely to be cut through the triangle, leaving some pins standing on both sides, and consequently a difficult "spare."

Finally, in order that the pins may be scattered as much as possible, a twist should be put on the ball at the instant of delivery. A great question among bowling experts is as to the relative excellence of the centre ball, which is rolled straight down the alley, and the cross ball rolled from the side. Opinion is about equally divided on the subject, and a somewhat critical analysis of the last season's playing fails to show any marked superiority in the work of either style of bowlers. The cross ball obviously is the more difficult. Perhaps the work of straight-ball rollers is more steady, while that of the cross-ball rollers is at times more brilliant, occasionally high scores being made, and often poor ones. There are a few who roll a curved ball, but as this style of play depends on the power of the ball to catch the wood, it is evident that until all alleys are of uniform smoothness, like a billiard table, this style of play cannot be rendered scientific. It requires, of course, considerable skill to roll a ball sixty feet and hit the head pin, but it requires more to pick off the difficult "spares"; and it is here that pretty and scientific play comes in.

That the game has the elements of enduring popularity is shown by the fact that clubs like the Out Club, the American Bowling Club, and others, have been organized for several years, and have continued to play season after season with but slight change of membership. The pastime has, besides, many features to commend it. The elements of scientific play and skill are applied to a sport of a not too violent nature, and there is an entire absence of danger. In driving balls with precision at a distant point there is required keenness of vision and coolness of control, and there comes greater muscular development and an increased grace and freedom of carriage. Some sports require more skill, others more exertion, but few, if any, unite these qualities so admirably. The game is adapted alike to women, men of sedentary habits, and to those most proficient in athletic sports. There is, further, a clearly defined limit to team records—a limit that may be more and more nearly approximated, but doubtless never reached. It may be said in this connection that the Phœnix Club of this city has a record of 1885 out of a possible 3000 points. While it would be hazardous to say that this has not been excelled in some remote alley or unheard-of game, yet it is regarded as about the record score of a ten-man team made on a regulation alley. In the recent *Herald* Amateur Bowling Tournament, which doubtless brought together the best individual bowlers and teams that ever met in a bowling contest, the highest record for a five-man team was 969 out of a possible 1500, and the highest individual record was 258 out of a possible 300. The Jersey City Athletic Club won the championship with an individual average of 175 4-45. In Brooklyn the Echo Club has done some notable bowling during the past season, as has the Phœnix Club, of this city.

An especially interesting fact about bowling is that the best bowlers are found not among the professionals, but among those strictly amateurs. This fact has been potent in giving a high standard to the game, and in making it popular with all classes. Aside from a multitude of independent clubs, there are clubs formed from various organizations. It is almost needless to say that every athletic club has its picked team of representative bowlers. The Produce Exchange has an excellent team, so has the Consolidated Stock Exchange; and there are teams selected from the big houses of Wall Street, from the national banks, from the silversmiths, and a host of other organizations, many of the representatives being expert bowlers. There is also much bowling in the city clubs, and some of them, like the University Club, of this city, and the Lincoln Club, of Brooklyn, hold elaborate tournaments.

Nor is bowling confined to men. Women have recently taken it up, and have shown an ability to surmount those difficulties which are supposed to obtain against their acquiring proficiency in sports requiring free play of the arm, as in throwing the ball. Some excellent bowling has been done during the season by women. The new Ladies' Berkeley Athletic Club has some finely constructed alleys devoted exclusively to women's use. Some very creditable scores have been made also at the Knickerbocker Bowling Club's tournament by the women as well as the men. The number of clubs composed of both women and men is very large, bowling parties having become a social feature, alleys being rented one evening each week.

So popular, indeed, has the sport become that even now, before the season has fairly closed, most of the alleys have been engaged for next season, new ones are being projected, new clubs are forming, and everything indicates increased prosperity and interest in the game.

CHARLES S. REINHART

We Americans are accused of making too much ado about our celebrities, of being demonstratively conscious of each step that we take in the path of progress; and the accusation has its ground doubtless in this sense, that it is possible among us to-day to become a celebrity on unprecedentedly easy terms. This, however, at the present hour is the case all the world over, and it is difficult to see where the standard of just renown remains so high that the first stone may be cast. It is more and more striking that the machinery of publicity is so enormous, so constantly growing, and so obviously destined to make the globe small, in relation of the objects, famous or obscure, which cover it, that it procures for the smallest facts and the most casual figures a reverberation to be expected only in the case of a world-conqueror. The newspaper and the telegram constitute a huge sounding-board, which has, every day and every hour, to be made to vibrate, to be fed with items, and the diffusion of the items takes place on a scale out of any sort of proportion to their intrinsic importance. The crackle of common things is transmuted into a thunder, which is perhaps louder in America than elsewhere for the reason that the sheet of tin shaken by the Jupiter of the Press has been cut larger. But the difference is only of degree, not of kind; and if the system we in particular have brought to perfection would seem to be properly applied only to Alexanders and Napoleons, it is not striking that these adequate subjects present themselves even in other countries. The end of it all surely no man can see, unless it be that collective humanity is destined to perish from a rupture of its tympanum. That is a theme for a later hour, and meanwhile perhaps it is well not to be too frightened. Some of the items I just spoke of are, after all, larger than others; and if, as a general thing, it is a mistake to pull up our reputations to see how they are growing, there are some so well grown that they will bear it, and others of a hardy stock even while they are tender. We may feel, for instance, comparatively little hesitation in extending an importunate hand toward the fine young sapling of which Mr. Reinhart is one of the branches. It is a plant of promise, which has already flowered profusely, and the fragrance of which it would be affectation not to notice. Let us notice it, then, with candor, for it has all the air of being destined to make the future sweeter.

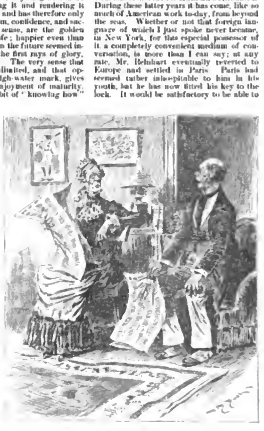
The plant in question is of course simply the art of illustration in black and white, to which American periodical literature has lately given such an impetus, and which has returned the good office by conferring a great distinction on our magazines. In its new phase the undertaking has succeeded; and it is not always that fortune descends upon so deserving a head. Two or three fine talents in particular have helped it to succeed, and Mr. Reinhart is not the least conspicuous of these. It would be idle for a writer in these pages to pretend to any diffidence of appreciation of his work; for they are studded, from many years back, with the record of his ability. Mr Reinhart took his first steps and made his first hits in Harper, which owes him properly a portrait in return for so much portraiture. I may exaggerate the charm and the importance of the modern illustrative form, may see in it a capacity of which it is not yet itself wholly conscious, but if I do so Mr Reinhart is partly responsible for the aberration. Abundant, intelligent, interpretative work in black and white is, to the sense of the writer of these lines, one of the pleasantest things of the time, having only to rise to the occasion to enjoy a great future. This idea, I confess, is such as to lead one to write not only sympathetically but pleadingly about the artists to whom one looks for confirmation of it. If at the same time as we commemorate what they have done we succeed in enlarging a little the conception of what they may yet do, we shall be repaid even for having exposed ourselves as fanatics—fanatics of the general manner, I mean, not of particular representatives of it.

May not this fanaticism, in a particular case, rest upon a sense of the resemblance between the general chance, as it may be called, of the draughtsman in black and white, with contemporary life for his theme, and the opportunity upon which the literary artist brings another form to bear? The forms are different, though with analogies; but the field is the same—the immense field of contemporary life observed for an artistic purpose. There is nothing so interesting as that, because it is *ourselves*; and no artistic problem is so charming as to arrive, either in a literary or a plastic form, at a close and direct notation of what we observe. If one has attempted some such business in a literary form, one cannot help having a sense of union and comradeship with those who have approached the question with the other instrument. This will be especially the case if we happen to have appreciated that instrument even to envy. We may as well say it outright, we envy it quite unspeakably in the hands of Mr. Reinhart and in those of Mr. Abbey. There is almost no limit to the service to which we can imagine it to be applied, and we find ourselves wishing that these gentlemen may be made adequately conscious of all the advantages it represents. We wonder whether they really *are* so; we are disposed even to assume that they are not, in order to point the moral, to insist on the lesson. The master whom we have mentally in view—Mr. Reinhart is a near approach to him—may be, if he will only completely know it, so prompt, so copious, so universal—so "all there," as we say nowadays, and indeed so all everywhere. There is only too much to see, too much to do and his process is the one that comes nearest to minimizing the quantity. He can touch so many things, he can go from one scene to another, he can sound a whole concert of notes, while the painter is setting up his easel. The painter is majestic, dignified, academic, important, superior, anything you will; but he is, in the very nature of the case, only occasional. He is "serious," but he is comparatively clumsy; he is a terrible time getting under way, and he has to sacrifice so many subjects while he is doing one. The illustrator makes one immense sacrifice, of course—that of color; but with it he purchases a freedom which enables him to attack ever so many ideas. It is by variety and numerosity that he commends himself to his age, and it is for these qualities that his age commends him to the next. The twentieth century, the latter half of it, will, no doubt, have its troubles, but it will have a great compensatory luxury, that of seeing the life of a hundred years before much more vividly than we—even happy we—see the life of a hundred years ago. But for this our illustrators must do their best, appreciate the endless capacity of their form. It is to the big picture what the short story is to the novel.

It is doubtless too much, I hasten to add, to ask Mr. Reinhart, for instance, to work to please the twentieth century. The end will not matter if he pursues his present very prosperous course of activity, for it is assuredly the fruitful vein, the one I express the hope to see predominant, the portrayal of the manners, types, and aspects that surround us. Mr Reinhart has reached that happy period of life when a worker is in full possession of his means, when he has done for his chosen instrument everything he can do in the way of forming it and rendering it complete and flexible, and has therefore only to apply it with freedom, confidence, and success. These, to our sense, are the golden hours of an artist's life; happier even than the younger time when the future seemed infinite in the light of the first rays of glory, the first palpable hits. The very sense that the future is not unlimited, and that opportunity is at its high-water mark, gives an intensity to the enjoyment of maturity. Then the acquired habit of "knowing how" must simplify the problem of execution and leave the artist free to think only of his purpose, as befits a real creator. Mr. Reinhart is at the enviable stage of knowing in perfection how; he has arrived at absolute facility and felicity. The machine goes of itself; it is no longer necessary to keep lifting the cover and pouring in the oil of fond encouragement; all the attention may go to the idea and the subject. It may, however, remain very interesting to others to know how the faculty was trained, the pipe was tuned. The early phases of such a process have a relative importance even when, at the time (so gradual are many beginnings and so obscure many a morrow), they may have appeared neither delightful nor profitable. They are almost always to be summed up in the single precious word practice. This word represents, at any rate, Mr. Reinhart's youthful history, and the profession in which, though no doubt occasionally disguised, the boon was supplied to him in the offices of this periodical. There is nothing so innate that it has not also to be learned, for the best part of any aptitude is the capacity to increase it.

Mr. Reinhart's experience began to accumulate very early, for at Pittsburgh, where he was born, he was free to draw to his heart's content. There was no romantic attempt, as I gather, to nip him in the bud. On the contrary, he was despatched with almost prosaic punctuality to Europe, and was even encouraged to make himself at home in Munich. Munich, in his case, was a *pis-aller* for Paris, where it would have been his preference to study when he definitely surrendered, as it were, to his symptoms. He went to Paris, but Paris seemed blocked and complicated, and Munich presented advantages which, if not greater, were at least easier to approach. Mr. Reinhart passed through the mill of the Bavarian school, and when it had turned him out with its characteristic polish he came back to America with a very substantial stock to dispose of. It would take a chapter by itself if we were writing a biography, this now very usual episode of the return of the young American from the foreign conditions in which he has learned his professional language, and his position in face of the community, whom he addresses in a strange idiom. There has to be a prompt adjustment between ear and voice, if the interlocutor is not to seem to himself to be intoning in the void. There is always an inner history in all this, as well as an outer one—such, however, as it would take much space to relate. Mr Reinhart's more or less alienated accent fell, by good fortune, on a comprehending listener. He had made a satirical drawing, in the nature of the "cartoon" of a comic journal, on a subject of the hour, and addressed it to the editor of Harper's Weekly. The drawing was not published—the satire was perhaps not exactly on the right note—but the draughtsman was introduced. Thus began, by return of post, as it were, and with preliminaries so few that they could not well have been less, a connection of many years. If I were writing a biography, another chapter would come in here—a curious, almost a pathetic one; for the course of things is so rapid in this country that the years of Mr. Reinhart's apprenticeship to pictorial journalism, positively recent as they are, already are almost prehistoric. To-morrow, at least, the complexion of that time, its processes, ideas, and standards, together with some of the unsophisticated who carried them out, will belong to old New York. A certain mollifying dimness rests upon them now, and their superseded brilliancy gleams through it but faintly. It is a lively span for Mr. Reinhart to have been at once one of the unsophisticated and one of the actually modern.

That portion of his very copious work to which, more particularly, I apply the latter term has been done for Harper's Magazine. During these latter years it has come, like so much of American work to-day, from beyond the seas. Whether or not that foreign language of which I just spoke never became, in New York, for this especial possessor of it, a completely convenient medium of conversation, is more than I can say; at any rate, Mr. Reinhart eventually reverted to Europe and settled in Paris. Paris had seemed rather inhospitable to him in his youth, but he has now fitted his key to the lock. It would be satisfactory to be able to



SEASONABLE.

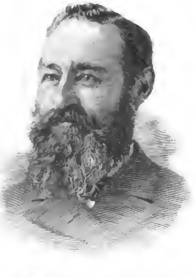
"P. L., Mrs. Simpkins."
"No, sir; N. L."
"P. L., I say."
"Now here, Hezekiah Simpkins, if you dare to say P. L. to me again, you won't see a game of base-ball this season! I'll stop your weekly allowance."

CHARLES S. REINHART, ARTIST.—FROM A PHOTOGRAPH.—[SEE PAGE 471.]

atifically the reasons why, as a g, the American artist, as well as ' of many another land, carries on with less sense of resistance han elsewhere. He likes Paris t is not scientific. The differ- though theoretically the produc- res is recognized in America and In Paris it is recognized both and practically. And I do not simply that pictures are bought e not, predominantly, as it hap- at they are more presupposed. s implied in the French concep- s, and the studio is as natural a of it as the post-office is of let- Vivid representation is the gen- rench language and the need of aind. The people have invented it than any other, and as these p a large part of the artist's life, best home to be in the place ds them most. He may begin lth that home on the day a com- introduced by the question of ll represent—a totally different from that of the method; but hart this question has not yet able difficulties. He represents he has accepted so general an ing as his countrymen flock to ve in a homogeneous procession es, there is not the smallest dif resenting *them*. When the case they shall be taken in connec- r native circumstances and seen dent air, he is prepared to come ve several months to the task, as ion of Mr. Dudley Warner's his- r among the watering places, to rnished so rich and so curious a mpaniment Sketch-book in akes himself, according to need, to England, to Italy, to Spain of HARPER'S will have forgot- rable pictorial notes on the po- at Berlin, so rich and close in ion To the *Spanish Vistas* of throp he contributed innumer- delightful notes of an artist's sketchable, many of which are l pictures. The "Soldiers Play- " at a cafe is a powerful page Reinhart has, of course, interpreted many a fictive scene—he has been repeatedly called upon to make the novel and the story visible. This he most energetically does; though of course we are unable to say whether the men and women he makes us see are the very people whom the authors have seen. That is a thing that, in any case, one will never know, besides, the authors who don't see vaguely are apt to see perversely. The story teller has, at any rate, the comfort with Mr. Reinhart that his drawings are constructive, and that he produces life. He likes to represent character—he rejoices in the specifying touch.

The evidence of this is to be found also in his pictures, for I ought already to have mentioned that, for these many years (they are beginning to be many), he has painted as well as worked in black and white. It is not probable that he regards himself in the first place as an illustrator, in the sense to which the term is usually restricted He is a very vigorous and various painter, and at the Salon a constant and conspicuous exhibitor He is fond of experiments, difficulties, and dangers, and I divine that it would be his preference to be known best by his work in color, in which he handles landscape with equal veracity. It is a pity that the critic is unable to contend with him on such a point without appearing to underestimate that work Mr. Reinhart has so much to show for his preference that I am conscious that it takes some assurance to say that I am not sure he is right This would be the case even if he had nothing else to show than the admirable picture entitled "Washed Ashore" ("Un Épave") which made such an impression in the Salon of 1887. It represents the dead body of an unknown man whom the tide has cast up, lying on his back, feet forward, disfigured, dishonored by the sea. A small group of villagers are collected near it, divided by the desire to look and the fear to see. A gendarme, official and responsible, his uniform contrasting with the mortal disrepair of the victim, takes down in his notebook the *procès verbal* of the incident, and an old sailor, pointing away with a stiffened arm, gives him the benefit of what *he* knows about the matter. Plain, pitying fish wives, hushed, with their shawls in their mouths, hang back, as if from a combination too solemn—the mixture of death and the law. Three or four men seem to be glad it isn't they. The thing is a masterpiece of direct representation, and has wonderfully the air of something seen, found without being looked for. Excellently composed but not artificial, deeply touching but not sentimental, large, close, and sober, this important work gives the full measure of Mr. Reinhart's great talent, and constitutes a kind of pledge. It may be perverse on my part to see in it the big bank-note, as it were, which may be changed into a multitude of gold and silver pieces. I cannot, however, help doing so. "Washed Ashore" is painted as only a painter paints, but I irreverently translate it into its equivalent in "illustrations"—half a hundred little examples, in black and white, of the same sort of observation. For this observation, immediate, familiar, sympathetic, human, and not involving a quest of style for which color is really indispensable, is a mistress at whose service there is no derogation in placing one's self. To do little things instead of big may be a derogation; a great deal will depend upon the way the little things are done. Besides, no work of art is absolutely little. I grow bold and even impertinent as I think of the way Mr Reinhart might scatter the smaller coin. At any rate, whatever proportion his work in this line may bear to the rest, it is to be hoped that nothing will prevent him from turning out more and more to play the rare faculty that produces it. His studies of American manners in association with Mr. Warner went so far on the right road that we would fain see him make all the rest of the journey. They begot an inevitable requisition for more, and were full of intimations of what was behind. They showed what there is to see—what there is to guess. Let him carry the same inquiry farther, let him carry it all the way. It would be serious work, and would abound in reality; it would help us, as it were, to know what we are talking about. In saying this I feel how much I confirm the great claims I just made for the revival of illustration.

HENRY JAMES.



JOHN JASPER, M.A., SUPERINTENDENT OF THE PUBLIC SCHOOLS OF THE CITY OF NEW YORK.—FROM A PHOTOGRAPH BY SARONY.—[SEE PAGE 467.]

THE PREVENTIVE OF A TERRIBLE DISEASE.
No disorders, excepting the most deadly forms of lung disease, involve such a tremendous destruction of organic tissue as those which fasten upon the kidneys. Such maladies, when they become chronic—and none are so liable to assume that phase—completely wreck the system. To prevent this terrible disease, recourse should be had, upon the first manifestation of trouble, to Hostetter's Stomach Bitters, which experience has proved to be highly effective as a means of imparting tone and regularity to the organs of urination, as well as to the liver, stomach, and bowels. Another beneficial result of this medicine, naturally consequent upon its diuretic action, is the elimination from the blood of impurities which beget rheumatism, neuralgia, gout, dropsy, and other maladies. By increasing the activity of the kidneys, it augments the depurative efficiency of these organs, which are most important outlets for the escape of such impurities.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP
has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for Diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA,
"THE GREAT PAIN RELIEVER," cures Cramps, colic, colds: all pains. 25 cts. a bottle.—[*Adv.*]

NICHOLSON'S Liquid Bread contains a smaller percentage of alcohol than any other article of its kind. Delicate females and nursing mothers can use it with impunity. Ask your druggist or grocer for it.—[*Adv.*]

BURNETT'S COCOAINE kills dandruff, allays irritation, and promotes the growth of the hair.—[*Adv.*]

No well-regulated household should be without ANGOSTURA BITTERS, the celebrated appetizer.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER.
Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

The Best Worm Lozenges for Children are Brown's Vermifuge Comfits, 25c. a box.—[*Adv.*]

BURNETT'S FLAVORING EXTRACTS are invariably acknowledged the purest and best.—[*Adv.*]

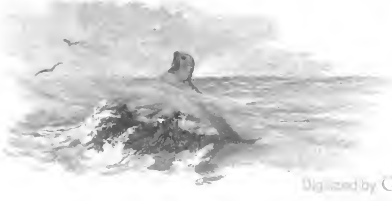
ENGRAVED BY F. S. KING. SUPPLEMENT TO *HARPER'S WEEKLY*, JUNE 14, 1890

FOG."



ATHLETICS IN AND AROUND NEW YORK.

BY WALTER KERSHAW.

THERE is a season for rowing, and a season for base-ball; a season for tennis, and a season for foot-ball; but for general athletics there is no particular season. Gymnastics may be practised the year round. Men can walk and run and jump almost as well in-doors as out, and swimming-tanks have made exercise in the water as practicable in winter as in summer. Most clubs now have both winter and summer "meetings"—competitions, that is to say, open either to members of the club or to all amateurs. In winter their energies are apt to be mainly directed to bowling and general gymnastics; in summer more attention is paid to base-ball, rowing, yachting, and tennis. The late fall is the season for foot-ball, and in a winter like the one just past cross-country runs may be held every week.

The past ten years have seen a most remarkable development of athletics in this neighborhood. Twenty years ago only two of the present athletic clubs were in existence—the Scottish-American and the New York. Fifteen years ago there were more, but they have not survived. The Manhattan, Staten Island, and American athletic clubs were founded in 1877; the Elizabeth, Pastime, and Jersey City in 1878; the Williamsburg in 1879, the Palma in 1882, the Nassau in 1885, the Orange in 1886, and the New Jersey in 1887; the Berkeley in 1888, the Acorn in 1889, and the Actors in 1890.

Now there are in this city, Brooklyn, and the neighborhood, within fifteen miles, including Newark, Orange, and Elizabeth, some thirty clubs recognized by the Amateur Athletic Union, not to mention the hundreds of separate bowling and tennis and base-ball clubs. It has become fashionable to be an athlete, and there is many a man who would be called a dude east of the Bowery that is prouder of his muscle than of his clothes, and that could "put up his hands" with any of the brawny denizens of the east side. It is said by those who know that New York has more active members of athletic clubs, both absolutely and in proportion to population, than any other large city in the world.

Perhaps a fair measure of the interest taken in such matters may be obtained from the fact that in the cross-country run, held by the National Cross-country Association at Morris Park, March 15th, there were 114 starters, belonging to twenty-two different clubs, all of them in or near the city. It may be worth while to mention just here that the American champion, "Willie" Day, of the New Jersey Athletic Club, not only beat all his native competitors, but also outran Sidney Thomas, the English cross-country champion—who was entered by the Manhattan Club—by more than two minutes on an eight-mile course.

Of all our indigenous athletic associations the New York Athletic Club is the oldest, as it is about the largest and best established. It was founded twenty-four years ago by William B. Curtis, John C. Babcock, and Henry E. Buermeyer in a back parlor on Sixth Avenue. It was in this year that amateur athletics began to become prominent in England. The first Oxford-Cambridge athletic contest was held in March of that year, and the first amateur championship meeting was given in the same month. It was the accounts of these competitions that inspired the young athletes already mentioned to renewed efforts.

The first public contests of the New York Athletic Club were held in the American Institute building, on Third Avenue, November 11, 1868. Since that time its progress has been rapid. It now has over two thousand members; it owns one of the largest, best-appointed, and most complete club-houses in the world, and besides that has a country house at its summer resort of Travers Island which is itself as fine a club-house as could be desired. At Travers Island are the field and track where the out-door competitions are held, and the course where boat-races are rowed and sailed. There are the tennis grounds and base-ball grounds; while the house itself contains every appliance for in-door comfort, pleasure, and exercise.

As would naturally be expected from its age and size, the New York Club has produced many champion athletes, and many more who rank with the champions. Among the "best-on-record" performances of its members are those of F. G. Saportas, 75 yards, 7⅗ seconds; Wendell Baker, 80 yards, 8 seconds, 100 yards, 10 seconds, 125, 130, 180, and 220 yards at the same rate of ten yards a second, and a quarter-mile in 47⅘ seconds; R. L. La Montagne, 101 yards, 10 seconds; W. C. Wilmer and E. J. Wendell, 100 yards, 10 seconds. All these but the 75, 150, and 220 yards are world's records. Among other best American records of New York members have been those of Mr. E. C. Carter at all distances from one mile to ten; Mr. A. A. Jordan's 16⅕ seconds for 120 yards over ten hurdles; Mr. M. W. Ford's running and standing broad jumps (these being also world's records) of 23 feet 3 inches and 10 feet 9¾ inches; Mr. C. A. J. Queckberner's and Mr. W. L. Condon's performances with the shot and hammer; Mr. H. E. Toussaint's swimming, 25 yards in 15 seconds; and Mr. G. D. Phillips's skating at various distances. The present President of the Club is Mr. Walter G. Schuyler, and the Captain Mr. G. Johnston Bradish.

The only rival of the New York Club in numbers, wealth, and influence is the Manhattan, whose magnificent new club-house was illustrated in HARPER'S WEEKLY at the time its corner-stone was laid. The club was not legally incorporated until 1878, but it took a prominent place from the start. Its leaders secured a track and grounds within the city limits, and made the track one of the very best and fastest in the country. They devoted much energy to the development of athletes who would make records and bring glory to the club. They gave handsome prizes and held frequent meetings. Their success was wonderful, and in 1880, 1881, and 1882 the Manhattan athletes won against all comers the handsome stand of colors offered by G. M. L. Sacks for the club winning the most points at the championship meeting of the National Association. It still holds the grounds on the block bounded by Eighth and Ninth avenues, Eighty-sixth and Eighty-seventh streets, and their convenience and the excellence of the track help to account for the club's great success in all out-door sports.

Manhattan's most distinguished athlete is undoubtedly Mr. L. E. Myers, whose career was one almost unbroken success for six years, and who made new records at almost every distance from fifty to twelve hundred yards, both in England and America. His quarter-mile in 48⅘ seconds and his half in 1.55⅖ stood as the record for years; his 350 yards in 38⅘ seconds is one of the most wonderful performances ever known. His records at 300, 400, 500, 600, 700, 800, and 1000 yards still stand. Among other Manhattan runners the best known are T. P. Conneff, who has held the record at 1½ and 1¾ miles; A. B. George, once champion at 2½ miles; P. D. Skillman, for various long distances; Sidney Thomas, an English importation, who has made new records between 8 and 15 miles, and A. G. Waldron, H. Fredericks, and F. Westing for the shorter distances. Among the walkers are Purdy, Lange, and Hart; among the hurdlers are Copeland and Jordan; at swimming, Meffert has made records from 220 yards to a mile; at skating, Donohue and Craft have distinguished themselves. Finally, at the running high jump, Mr. W. Byrd Page has beaten the world's record out of sight. The club now contains about eighteen hundred members. The present President of the club is Mr George W. Carr.

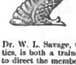
One of the best "all-round" clubs is the Staten Island. Most of the clubs, especially the smaller ones, confine their efforts largely to one or two branches of sport. Thus the Palmas are mostly given to shooting and bowling, the Crescent to foot-ball and base-ball, the Star and National to boxing, the Jersey City to bowling, the Elizabeth to bowling and base-ball, the Turnverein to gymnastics proper; but the Staten Islanders do a little of everything, and do it pretty well. They have some good performers on field and track athletics; they have a good crew; they keep up canoe races and yacht races; they have tennis tournaments every year; their lacrosse team is one of the best in the country; and they are making a fine record as base-ball players. The club property is valued at $100,000. There is a good house, a boat-house, a track, a ball-ground, and tennis grounds. Among the club champions have been, among the runners, Messrs. J. H. Rimmer, Fred. W. Janssen, M. W. Ford, George Schwegler, E. J. Hoep, and H. E. Hallock; among rowing men, Harry Janssen and W. C. Rowland; among bicyclers, A. B. Rich, sometime champion of America; and among the heavy-weights, C. A. J. Queckberner. Mr. Eberhard Faber has been President of the club for the past two years.

The Pastime Athletic Club, founded in 1878, early earned for itself the title of the "Nursery," because it produced so many good athletes who afterward joined larger and wealthier organizations. The social feature is perhaps not quite so prominent in the Pastime as in some of the others. Its club-house is an old church, more or less surrounded by gravestones, and it has not the advantages of some other clubs. Notwithstanding this fact, and the drain of some of its best athletes, it still maintains a good standing, and some of its men are always among the prize-winners at meetings of the A. A. U. Among its prominent athletes at present are Capt. J. H. Hughes, who has gained distinction as a wrestler; Mr. A. J. Murberg, the sprinter; Mr. M. O'Sullivan, a heavy-weight; Messrs. T. Murphy and D. O'Brien, boxers; and Messrs. J. E. Sullivan, W. R. Burckhardt, H. Dimse, and W. F. Pallman, pedestrians. Among the prominent men whom it has "graduated" are Messrs. F. L. Lambrecht, the heavy-weight; H. Fredericks, A. G. Waldron, and E. C. Carter, runners; and the Ellingsworth brothers, known everywhere as expert boxers.

Of the younger athletic organizations none is now more prominent and promising than the New Jersey Athletic Club, which has its headquarters at Bergen Point. It was incorporated two years and a half ago, the Bergen Point Base-ball Club, and the Argonauts and Viking rowing associations joining in its formation. Since then the Olympic Athletic Club and the Claremont Cricket Club have cast in their fortunes with it. It has about 550 members, a good club-house, a fine field and track, and an excellent rowing course on Newark Bay. Its President is Mr. A. C. Stevens, and Mr. A. M. Sweet is chairman of the Athletic Committee. Mr. E. Hjertberg is captain of its cross-country team, which won the championship at the great meeting of the National Cross-country Association on March 15th. Among its more prominent athletes are Messrs. W. D. Day, who holds running records from 1½ to 4 miles, and at 10 miles, and the individual cross-country championship; Mr. J. H. Mitchell, the heavy-weight hammer-thrower; Mr. T. Sherman, the pedestrian; Mr. F. G. Brown, the bicycler; Mr. Wm. Halpin, the jumper; Mr. F. Schroeder, the expert swinger of Indian clubs, and Mr. Hermann Braun, the champion swimmer. The champion cross-country team contains, besides Messrs. Day and Hjertberg, C. B. Gardiner, John Rumpf, W. S. French, and A. Gray.

The Acorn Athletic Club is only a year old, but it is already prominent. Its club-house and grounds are in South Brooklyn, at Fifty-sixth Street and Second Avenue. It has a good cross-country team, and cultivates general athletics. Mr. M. A. Cuming is the President, and F. L. Lambrecht the Captain. Among its prominent members are Messrs. John Nolan, boxer and cross-country runner; E. Edwards, Chas. O'Malley, Jun., and G. Jackson, sprinters; and Arthur C. Cole, tug-of-war man.

The Crescent Athletic Club is devoted mainly to foot-ball and base-ball. Its house and grounds are at Bay Ridge, on Narrows Avenue, between Eighty-third and Eighty-fifth streets. Its President is Mr. Chas. M. Bull. Among its leading members are Harry Beecher, the famous quarter-back of Yale, and William Bull, the equally famous full-back, Messrs. Terry and Edwards, half-backs, and Mr. W. H. Ford, centre rush and captain. The foot-ball team has won the amateur championship ever since it began to play, and last year "whitewashed" all its opponents. The base-ball team, of which Mr. W. H. Halstead is captain, was second in the Athletic Club League last year. It has almost 600 members.



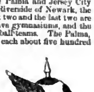
One of the most complete of all the clubs is the Berkeley, which is eminently a college men's club, and which prides itself on its freedom from "professionalism." It contains now 600 members; it has a fine club-house on Forty-fourth Street, and its grounds, the Berkeley Oval, at Morris Dock, is known far and wide as one of the finest in the world. The object of the club is not to bring out champions, but to cultivate all its members. Dr. W. L. Savage, who has charge of the in-door gymnastics, is both a trained athlete and a physician, and is able to direct the members in their work so as to obtain the best results in general development.

Besides the departments of gymnastics and general athletics, the club cultivates cricket, base-ball, foot-ball, rowing, canoeing, swimming, bowling, and billiards, and pays some attention to whist and chess. There are committees also on art, music, and the drama, and the club theatre is widely known. Among the athletes are Mr. Wendell Baker, who is chairman of the committee on out-door athletics, Mr. H. S. Brooks, the famous Yale sprinter, and Mr. William Windle, who has made records on the bicycle from half a mile to ten miles. The Berkeley is a young club, but it already owns property valued at $410,000. Its President is Mr. John S. White.

The St. George Athletic Club is one of the many organizations started by Dr. Rainsford, the energetic rector of St. George's Church. Its head-quarters are in the St. George Building, on Sixteenth Street. It has about two hundred members, and has made a creditable showing in the cross-country runs of the past season. The President is Mr. Robert Conn, and the Captain Mr. M. J. Rawlinson.

No account of the athletic clubs of New York could be complete without a reference to the Actors' Club—the "five A's." This was founded by Messrs. Barr McIntosh, De Wolf Hopper, Digby Bell, Charles Thomas, and Robert Hilliard. It has now 400 members, including all the well-known actors. Among those prominent as athletes besides those mentioned are Francis Wilson, who is an expert boxer and fencer, Maurice Barrymore, and John Drew, an artist with the foils. Many of the members are confirmed base-ball "cranks," and they are heart and soul with the Brotherhood in its new venture.

Among the prominent clubs in New Jersey, beside the New Jersey Athletic Club, are the Palma and Jersey City of Jersey City, the West Side and Riverside of Newark, the Orange, and the Elizabeth. The first two and the last two are largely given to bowling, but all have gymnasiums, and the Orange Club has base-ball and foot-ball teams. The Palma, Jersey City, and Orange clubs have each about five hundred members.



The growth of athletics has been nowhere more clearly manifest than in our militia regiments. The building of such immense armories as those of the Seventh in New York and the Thirteenth in Brooklyn has given the regimental athletes room enough to hold games in-doors, and has greatly stimulated winter exercises of all sorts. Nearly all the regiments now have athletic clubs, the most notable of which are those of the Seventh, the Twenty-second, the Twelfth, and the Thirteenth. The Seventh contains many members who belong also to the New York or Manhattan or other local clubs. An idea of the variety and excellence of its games may be had from a mere list of the events and some of the principal competitors in the meeting of Saturday, April 5th. Here is the programme: 1000-yard run, 220-yard run, half-mile walk, putting 16-pound shot, 440-yard run, 220-yard hurdle, running high jump, wheelbarrow race, half-mile roller-skating race, three-legged race, and 2-mile bicycle race. Among the entries were such well-known athletes as C. A. J. Queckberner, A. A. Jordan, A. W. S. Cochrane, A. B. Rich, E. A. Powers, and P. A. Ware.

The Thirteenth Regiment of Brooklyn devotes less attention to general athletics than the Seventh; but the interest in base-ball is very strong, and games have been played all winter in the armory. The Twenty-second has some excellent athletes, and the general average of its men as to physical condition is high.

It is easily seen that the encouragement of athletic sport among members of the National Guard is an excellent thing for that important branch of the service. Young men who keep "in condition," and who are trained to walk and run and jump and play ball, are certainly capable of better service in the field than they could render without such training.

The Prospect Harriers devote themselves to cross-country running, and last year they were the champions. They have a very strong team, and number among their members some well-known runners, among whom are Messrs. J. D. Lloyd, S. T. Freeth, W. W. and F. Kuhlke, P. Dolan, J. S. H. McGregor, and S. T. Stagg.

Among the other clubs more or less prominent in the neighborhood are the American, the Amity, the Down-Town, the Grayling, the Hoboken, the Yonkers, the Sylva, the Star, the Allerton, the Brighton, the Union, the West End, the Titan, and last, but oldest of all, the Scottish-American. Altogether there are about thirty, besides the "Y. M. C. A.'s," and they own property to the aggregate value of over $2,500,000.

The "Y. M. C. A.'s" deserve a separate article to themselves. Almost every well-organized Young Men's Christian Association in the city and neighborhood has now its athletic department, and many of them have gymnasiums. It is the muscular form of Christianity that seems to take best among young men. The New York Y. M. C. A. is the oldest and best known, and its gymnasium has been celebrated these fifteen years. Last year there was a flourishing Y. M. C. A. base-ball league of some twenty or thirty clubs, and this year the interest bids fair to be still greater.

As will be seen by the table of "fixtures," the Turners are represented. These German societies afford excellent

ining, and their athletes always distinguish
the more purely gymnastic games.

been added a number of competitions;
at it was their first meeting, the New
a pretty good variety. The 100-yard
sprint race, and a one-mile run is now
t in every meeting. The hurdle races
by introducing two heights of hurdles,

no less awkward, but theoretically it ought to be better than the other, for in striding the swing of the arms is in the opposite direction from that of the legs; and if the right arm, being extended, is drawn back at the same time the right leg comes forward the runner should get into his stride at once. A third way of starting is to stand with both feet on the line, and bend forward slightly at the word "ready," so as to jump at the report of the pistol. The great objection to this style of start is that the runner is very apt to "beat the pistol"—that is, to get under way before the pistol really goes off; and a false start penalizes the starter for the next attempt. Some years ago the practice of "beating the pistol" was very common in sprint races, and it is only a very cool-headed and determined and quick-eyed starter who can keep his men under control. Among the fastest performances at 100 yards besides those already mentioned, are the following: 9⅘ seconds, John F. Owen, Jun., and 10 seconds, V. E. Schifferstein, W. C. Wilmer, F. Westing, and L. H. Carey. Mr. C. H. Sherrill has done 150 yards in 14⅘ seconds, and 125 yards in 12⅘ seconds. At 220 yards, Mr. John F. Owen, Jun., holds the record with 21⅘ seconds, made at Detroit last fall. The quarter-mile world's record is held by Mr. Wendell Baker with 47¾ seconds, and the 600-yard world's record by L. E. Myers and W. C. Downes, with 71⅘ seconds.

If there is anything prettier than a hundred-yard or furlong dash it is a hurdle race. The speed is of course not quite so great, but the jumping diversifies the action; and when the runners are dressed in bright-colored suits they make a beautiful picture. As may be imagined, hurdling is somewhat more difficult than ordinary sprinting. The runner must

fast runner can cover the distance without any hurdles at all. Occasionally three-foot hurdles are used, and the number is sometimes varied all the way from eight to twenty, but ten is the standard number. The record at 120-yard hurdles is now held by Mr. H. L. Williams, of Yale, 16 seconds, and at 220 yards by Mr. J. P. Lee, of Harvard, 25⅘ seconds.

Jumping has always been a favorite form of athletic exercise. To go no farther back than the middle of last century, we find that George Washington "held the record" in his time; and if we are to believe what Harry Warrington says, his record stood until very recently. In his account of the great jumping match he had with Lord March at Tunbridge Wells, Harry wrote to his mother:

"I had the *gratafaction* of beating his lordship by more than two feet—viz., two feet nine inches—me jumping twenty-one feet three inches by the drawer's measured tape, and his lordship only eighteen six." A little farther on he adds: "I told them that there was a gentleman at home who could beat me by *a good foot;* and when they asked who it was, and I said Colonel G. Washington, of Mount Vernon—as you know he can, and he's the only man in his county or mine that can do it—Mr. Wolfe asked me ever so many questions about Colonel G. W."

This record, although no literary man would think of doubting it, is regarded by modern athletes as somewhat apocryphal in character. Certainly, until very recent years, we have no authentic performances that compare with it. Mr. M. W. Ford is the only man in America that has a record better than 23 feet, although Mr. J. S. Voorhees has come within 4½ inches of it. If "Gascoyne, the Sandalwood Trader," were still alive, he might be able to do better than Mr. Ford; but Gascoyne's performance is even more apocryphal than the great Virginian's, and cannot be allowed to go on record.

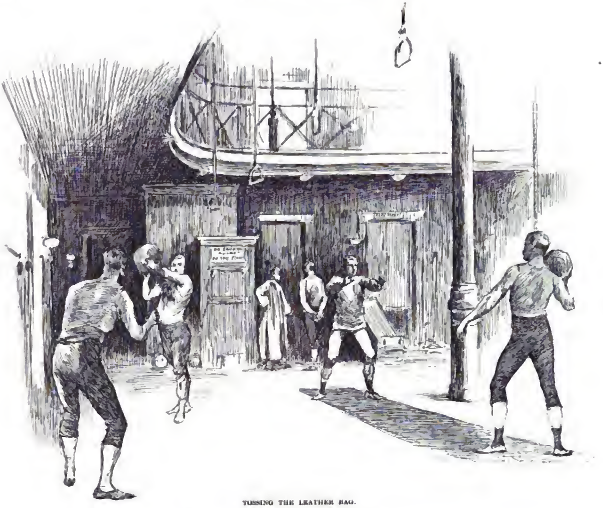
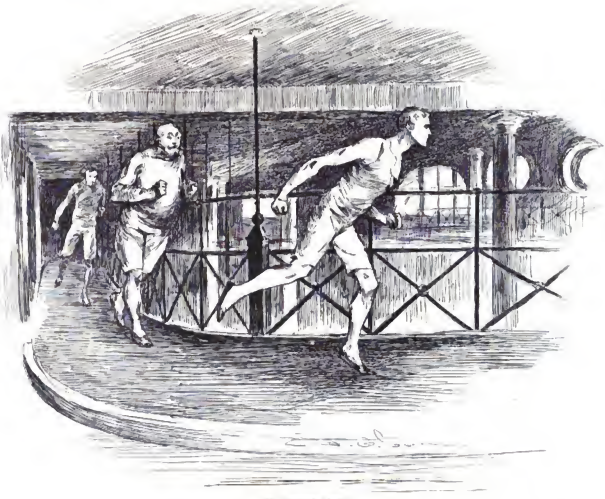
find out by practice just where it is best for him to "take off" for the jumps, just how many steps he can take with most advantage between hurdles, and just what proportion of force can most economically be expended in jumping. It is of much more importance that the jumper should alight in a position that will help him to keep on running without a break than that he should make a long jump. The problem to be solved is how to expend the least force on the jumping consistent with clearing the hurdles and keeping up the momentum. The 30-inch hurdles are comparatively a slight obstruction, as may be seen by comparing the time of hurdle and flat races for the same distance. There is only about three seconds difference. A good sprinter will cover the 120 yards flat in a little less than thirteen seconds, and a good hurdler will cover the same distance in less than sixteen seconds. The 42 inch hurdles are a greater obstacle, but the time is only about one second slower for the distance. The jump must of course be higher, and is generally of a somewhat different character. The runner seems to skim over the lower hurdles, taking long low jumps that seem to delay his progress scarcely at all, while over the higher hurdles the jump is seen to be a more decided hinderance. For the benefit of those who have never seen a hurdle race it may be well to explain that the hurdles are placed ten yards apart, with a run of ten yards at the start and one of twenty yards at the finish. If the course is longer, there are still ten hurdles, placed farther apart. Two hundred and twenty yards over 42 inch hurdles have been run by A. F. Copeland, of the Manhattan Athletic Club, in 26⅘ seconds; and 440 yards—a quarter of a mile—over the same obstacles, in 61⅗ seconds, by L. E. Myers of the same club—about as fast as an ordinarily

The running high jump is in great favor just now, for there are fashions in athletics as in everything else. The performances of the present champion of the world, Mr. Page, who put the record about 5 inches higher than it ever had been before, doubtless helped to create a *furor* for this game. Still, it is a pretty sport, and its intrinsic merits will probably keep it in favor. Most beginners at this sport take a run directly at right angles with the bar, and try to go over it straight, with both feet together. This style is very pretty to look at, but its votaries seldom do as well as those who cultivate the sidewise fashion. The best jumpers generally run toward the bar diagonally; and in "taking off" throw first one foot and then the other higher than the body in going over. In all styles the bar is oftener knocked down by the arm or body of the jumper than by his feet or legs. Anything over 5 feet is a good high jump, but it must be over 5 feet 6 inches to be very good, and Mr. Page's record stands at 6 feet 4 inches—a height that seems more wonderful from the fact that the champion himself is only 5 feet 6 inches high.

The running hop, step, and jump, so great a favorite with school-boys, does not appear to any great extent in recent competitions. Why, it is difficult to tell, for it is an attractive sport. The American record, made by Mr. M. W. Ford, stands at 44 feet 1½ inches, and the Irish, which is the best, at 50 feet 1½ inches. Anything over 40 feet is very good. The proportion of the different parts to one another varies



TOSSING THE LEATHER BAG.



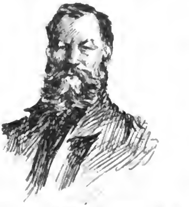
THE RUNNING TRACK.

ATHLETES IN TRAINING.—Drawn by C. D. Gibson erent athletes, but the usual proportion in a ɪrmance would be about 14 feet for the hop, and 17 for the jump.

It is rather a complicated performance. The he pole with hands about three feet apart and from the lower end, takes a run, plants his s legs and body upward, and just as he is go- r lets go his pole, giving it a little push back- olds on too long, the pole falls against the go too soon, he hits the bar himself. There is in the styles adopted by vaulters. In Eng- common to "climb the pole" while in the air. us say, ten feet high; the vaulter himself is If he grasps the pole more than his own e lower end, it will be hard for him to go up must raise himself somehow at least four feet to clear the bar. If the lower hand is six end, and the upper hand ten feet, he must y his arms to the height of the upper hand. to "climb the pole" hand over hand while in ery likely to come to grief. It is a difficult nd one in which eminence can be acquired derable skill, agility, and practice. The best port is 11 feet 6½ inches, made by Mr. H. H.

ning is not so popular with spectators—un- ors are themselves athletes—as sprinting, be- l is not so great, and there are not so many Still, it is one of the most important branches l the half-mile, mile, and three-mile running retty regularly at all the open games. In especially in the longer ones, there is a con- tunity for "jockeying"—not in the unfair ml necessarily—and the runner must work well as with his legs. Some distance run- hose who are not very good sprinters, think the pace" from the start, having found out st how fast they can go at a steady gait for ce. Others prefer to take a comparatively e first half or three-quarters, and reserve for a spurt at the finish. This style is more the other, and when it succeeds, always s applause from the gallery; but it requires tion and a pretty good knowledge of your ow just how far it is safe to let them get when to begin to "make your run." Rec- ave been brought down steadily for twenty under 5 minutes is still considered good, der 4.40 to be very good. The present rec- by W. G. George, in England.

ecord has been brought down below 2 min- rs, whose best (1.55⅗) long stood as the l and America; but anything under 2.10 is Mr. Myers's time was beaten, Mr. F. J. K. istance in 1.54⅗ in England, and Mr. W. ere. The three-mile is a hard race. There seventeen years old who can run three t a good deal of training. The speed that what training will do. The record now es 29⅗ seconds in England, and 14 min- America; but anything under 17 minutes D. Day, of the New Jersey A. C., who ust named, and others from 1½ to four en miles (52.38⅘), is the champion 'cross-



GEORGE GOLDIE, INSTRUCTOR IN ATHLETICS IN THE NEW YORK ATHLETIC CLUB.

country runner. His other records are: 1¼ miles, 6 minutes 8 seconds; 1½ miles, 8 minutes 2⅗ seconds; 1¾ miles, 8 minutes 18⅖ seconds; 2 miles, 9 minutes 32⅘ seconds.

Fast walking is a sport which is not so generally popular as running. There is the same difference between the two that there is between a race between thorough-breds and a "hoss trot." Fast walking is no doubt an artificial gait. Most men, if they have a mile to go, and eight or nine minutes to do it in, would run, just as most horses would run in order to do a mile under 2.30; but, after all, trotting races have their fascination, and fast walking has its charms also, not only for the walker, but for the spectator. It is a sort of technical pleasure that a walking race affords—a pleasure that is only real after the spectator has been trained to understand the difficulties that the good walker overcomes; just as the theatre-goer must have a certain training before he can appreciate good acting.

Persons who have never been trained to walk fast generally quicken their gait by bending forward and lengthening the stride, at the same time bending the knees very much at each step. It is pretty safe to say that no one can possibly adopt this style and keep a fair walk at a faster gait than six miles an hour. The fast walker must keep himself erect, his shoulders back, and chest thrown out. He must put down his forward foot heel first, and with the leg straight. He must take strides so quick that they look short. He must, if he expects to get a good stride, work his hips considerably, overcoming the sidewise tendency of the hip movement by a compensatory swinging of the arms. The length of stride in fast walking is astonishing to those who look at it. A little figuring will make it clear why this is so. There are 1760 yards in a mile, or 1760 strides 3 feet long. To do a mile in 8 minutes, a walker must cover 220 yards a minute, or 11 feet a second. Now 220 steps a minute—nearly four a second—is pretty quick work, as any one may discover for himself. Even three steps a second, or 180 to the minute, seems quick. The chances are that your 8-minute man, although his legs move so quickly that the steps seem short, is not doing as many as 200 steps to the minute, and consequently that the stride is at least 3 feet 6 inches. With a little practice a man 6 feet high can easily maintain a 4-foot stride for half a mile.

It is true that fast walking is an artificial gait; but it is also true that practice at fast walking will quicken a man's unartificial gait. One who can do his mile in 7.30 in racing trim and on the cinder path, can walk in the street at a six-mile gait without either getting out of breath or becoming red in the face, and without attracting attention by any peculiarity of his gait except its swiftness. It is a real gain to any man to be able to walk a mile in ten or twelve minutes without over-exertion or fatigue; to be able to walk five or six miles for every four he used to walk without any more conscious effort, and with a sense of enjoyment in the mere exercise that he never had before.

The walking records at some of the ordinary distances stand: One mile, 6 minutes, 29⅗ seconds, F. P. Murray; two miles, 13.48⅗, F. P. Murray; three miles, 21.09⅖, F. P. Murray; five miles, 38.01, W. H. Purdy; seven miles, 54.07, E. E. Merrill; ten miles, 77.40⅘, E. E. Merrill.

For the strong men—the men of 40-inch chests and 15-inch biceps and 175 pounds of weight—the favorite games are putting the shot, throwing the hammer, and the tug of war. The standard weight for the shot is 16 pounds, but nearly all weights are used, from 9 pounds to 56. The record for the 14-pound shot—46 feet 3¾ inches—was held by Mr. F. L. Lambrecht, of the Manhattan Athletic Club, until June 6th, when Mr. Gray made a "put" of 47 feet 7½ inches. For the 16-pound, 18-pound, and 21-pound shots, the records are held by Mr. George R. Gray, of the New York Athletic Club, with "puts" of 46 feet, 41 feet 9¾ inches, and 38 feet 8½ inches respectively. Mr. C. A. J. Queckberner holds the record among our American athletes for throwing the 56-pound weight—26 feet 3½ inches. Among other athletes prominent at this game are Messrs. M. O'Sullivan, of the Pastime Athletic Club, and W. L. Condon, of the Baltimore Athletic Club.

The hammer generally used is one weighing 16 pounds, with a handle 4 feet long. Mr. Condon did hold the American record with 108 feet 3 inches, but the Irish giants—Davin, Mitchell, and Barry—have all done over 120 feet. Mitchell now holds the American record with 133 feet 8 inches, and Condon has thrown it 123 feet 6½ inches this month.

The tug of war is generally done by two teams of four or more on a side, but the individual tug has been reintroduced, and will be pulled off at several meetings this year. The old way of pulling was on sod or dirt. The two sides grasped a 1½-inch rope, all standing. At the word, they began to pull, and each man dug for a foothold, and dropped when it was secured. The end man, or "anchor," wears a belt of leather, and wraps the rope lightly around his waist, pulling in when there is any to spare, and letting out a little if necessary to prevent being pulled out of position. At the end of a certain limit, time is called, and the measure taken from the original centre of the rope to the original centre between the two teams. Now the pulling is done on boards with cleats nailed on 6 feet 6 inches apart, and the teams are "set" from the start.

ALPHONSE DAUDET'S

Humorous Novel,

"PORT TARASCON."

HENRY JAMES's translation of "Port Tarascon: the Last Adventures of the Illustrious Tartarin," richly illustrated by celebrated French artists, is now running in serial form exclusively in HARPER'S MAGAZINE, and in advance of book publication. A novel by DAUDET has never before been first published outside of France.

One of the most noteworthy of recent magazine achievements comes from the happy idea of the editor of HARPER'S MONTHLY *in obtaining a new "Tartarin" story from* ALPHONSE DAUDET. *"Port Tarascon" was written solely for "*HARPER'S*" and is illustrated by* ROSSI, MYRBACH, *and other originators of the style of illustration which is so capitally exemplified in the earlier Tartarin stories. This last chapter of the adventures of the illustrious Tarasconian relates his exodus at the head of his people to plant a colony, and is inimitable in its humor.*—CHRISTIAN UNION, N. Y.

ON A RECENT INCIDENT.

THE laws concerning freedom of speech and of the press in this country leave complete liberty to the speaker and writer outside the line of libel, indecency, or, in some quarters, blasphemy. The rest is left to the good sense and good taste of the citizen. There is no law which prevents any number of citizens assembled for any purpose, religious, political, literary, or whatever else, from objecting to a fellow-citizen's clothes or manners, his food or his drink. It is only a question of propriety and manners upon their part, and also of the golden rule. If the Stock Board or the Board of Education pass a resolution lamenting that Senator EVARTS does not discard his old hat and buy a new one, or declaring that in their judgment the hour has now arrived when Governor HILL should procure a wig, and that official propriety plainly demands that it should be of a sober hue and of a modest price, there is no law prohibiting such action. But the gentlemen who thought fit to publish such declarations would be universally regarded as exceedingly impertinent, and would hear very "plain language" from an independent press.

Distinguished orators have justified personal vituperation as a permissible method of vivid illustration. In the days of the antislavery controversy, when public men were held up to personal contumely and scorn, the orators said that while general condemnation of fugitive slave-hunting, for instance, might command listless assent, the indignant rebuke of the individual slave-hunter by name startled and aroused the community, and shamed the culprit into an abandonment of his evil ways. It was in effect, they said, simply an application of the *ad hominem* sermon—"thou art the man." If it was good in the old prophet, it could not be bad in the modern reformer, and consequently the sinners, as the abolitionists believed the pro-slavery men to be, received no quarter. The orators who did not spare invective alleged that it was not a question of caste or manners, but of human rights, and that if a Senator or a President held slaves he ought to be exposed by name to universal execration as a man who trafficked in human flesh and made merchandise of men and women.

The same argument is urged to cover other cases which are held to involve a similar principle. Tea and coffee are declared by much excellent authority to be injurious to the human system. Tobacco is a poison, as that *arbiter elegantiarum* JAMES the First insisted, and its use is a filthy and disgusting habit. Now if people choose to indulge injurious practices instead of observing noble self-denial, they are sinners and must be dealt with. Let them be publicly censured. Rebuke loves a shining mark. There, for instance, is the President of the United States. If that conspicuous citizen actually takes poisonous coffee at breakfast and poisonous tea in the evening, and solaces his repose with a poisonous cigar, shall we permit his example to contaminate the commonwealth, and insidiously promote the poisoning of the state? Is it not our duty, who prefer raspberry vinegar to coffee, and doughnuts and slack-backed bread to tobacco, by public manifesto solemnly to reprehend him, and admonish him in his evil course? Of course we must expect similar treatment. If some assembly of our fellow-citizens thinks us too careless of bodily exercise, we must not be surprised if they resolve at some length that we neglect the laws of health, and are guilty of bathing in tepid water, and that wisdom and virtue and public decency invoke us to go to the ant as sluggards, and plunge into a cold bath. Of a general freedom of speech like this it might be said, as of Shylock's pound of flesh at Venice, the "law allows it and the court awards it." But if every person and every assembly of citizens should permit themselves publicly and reprovingly to comment upon the dress and manners, the food and drink, of other citizens, the peaceful commonwealth in which at present we are not held accountable to our neighbors for our eating and drinking would very soon resolve into "a circus."

PUBLIC ACCOUNTING FOR ELECTION EXPENSES.

WE are sorry to see that the Massachusetts Senate has defeated the bill providing for the publication of political campaign expenses. There was no partisanship in the large vote which carried the bill in the House, nor in the support of it by the press. But in the Senate only three Republican votes were recorded for the bill. This is an unfortunate defeat, because the most important public question of the moment is that of public corruption, and the measures which command most general and profound public interest are those that aim to deal with it. The deep and universal interest in electoral reform, or the Australian ballot system, springs from the belief that it is a simple and practicable method of diminishing corruption and securing an honest vote. Devoted as we are in this country to party, and unwilling to break with "regularity," even to prevent a serious mischief, there is yet among honest men of all parties a desire to arrest the flagrant corruption which is not only the immediate peril of our politics, but which becomes even more startling when a Senator of the United States tells us that honesty is out of place in politics. It is curious that a Republican Senator, by declaring that morality has nothing to do with politics, should have done his part to justify the old sneer at the party as a party of moral ideas.

One of the most effective methods of arresting and baffling corruption is the publication of the details of campaign expenses. In New York the law applies to candidates, but Governor HILL very properly proposed to extend it to committees, which is the vital provision, because the larger part of the money is expended by committees. When Mr. WANAMAKER raised an enormous sum and paid it to Mr. QUAY, he is said to have remarked that he knew his friend Mr. QUAY would dispose of it properly. Very well, let the law require Mr. QUAY to justify this noble confidence by a publication of the details. Mr. DUDLEY, too, is no doubt equally sure that every dollar was honestly used for legitimate purposes in Indiana. Therefore let the law vindicate Mr. DUDLEY by demanding to know the actual prices of voters in blocks of five. Thousands, even millions of dollars are raised for campaign expenses. If they are honestly paid, there can be no good reason that the accounts should not be published. In 1884 the independent campaign committee in New York received and spent a large sum of money, and after the election it published a detailed itemized statement of the way in which it was spent. Is not every honest Republican or Democrat not only willing, but desirous, that his party committee should do likewise?

Undoubtedly he is. The large favorable vote of the Massachusetts House without regard to party, shows the real feeling of the people. The trouble is that the people are really controlled by politicians, who wish to spend money at elections without accounting for it. Does any intelligent man suppose that Mr. QUAY desires to publish a truthful and intelligible statement of the amount and object of the expenses of a campaign which he conducts? But he is the Chairman of the Republican National Committee. Does anybody suppose that Senator INGALLS, who thinks that talk about corrupt politics is wearisome cant, wishes to see the exact cost of a floater blazoned to the country after an election? But Senator INGALLS is elected by the Republican Senate as its President. Unless regard for honest politics has died out of the public mind, and unless parties are not to be estimated by the actions and words of their chosen representatives, these are very damaging facts for the Republican party. Yet undoubtedly there is an immense body of the party which earnestly desires to expose and arrest campaign corruption. It seems as if the Republican members of the Massachusetts Senate, by defeating a bill for so excellent a purpose, has not benefited their party. And it seems also as if the Republicans who do not despise the decalogue even in voting could do their party no greater service than making it the agency to secure honest elections by such means as a public accounting for campaign expenses and similar measures.

ENLARGING THE CITY OF NEW YORK.

THE New York City Consolidation Commission, of which Mr. ANDREW H. GREEN is chairman, and which is to report to the Legislature upon the question of combining the various adjacent communities around the Bay of New York into one great municipality, is engaged in a very important work. It is a question, however, upon which there is as yet no public opinion. The subject practically is wholly new, and the proposition necessarily shocks and disturbs traditions. But in forming an opinion the experience of other places will be found very serviceable. Boston, for instance, within the last few years has absorbed many of the adjoining towns and villages, which, however, for that reason are not thought to have lost any essential advantage. The towns and villages which have been annexed or consolidated would not probably now vote to return to their former situation. When neighboring towns by a natural extension at last blend and become one, three or four distinct local governments for what is then practically one community may easily be complicated and inconvenient.

This inconvenience is illustrated in a village whose charter permits a division of the common care of the community by wards, which, of course, actually prevents a common care. Thus there is a village in which the line of two adjoining wards runs along the middle of a street or road. If the road needs mending and the trustee of one of the two wards has expended what is called his share of the road money, although there may be unexpended money enough in the hands of the other trustee, the road will not be mended, and the common interest of the village suffers. Two towns or settlements extending toward each other and finally merging are like such wards in a village, and the community which thus becomes one may suffer in the same manner. The various communities around the Bay of New York, many of which practically blend, are divided among two States, four cities, and six counties. When any of them are united by bridges they are substantially one, and if in the same State they will endeavor to devise some method of uniting their local governments.

This is the situation of the shores of the Bay of New York. The shores immediately adjacent to the city have become parts of it, and a united municipal administration is a natural proposition. The extent of its jurisdiction, however, and the details of its organization would be questions not easy of settlement, and the settlement, to be satisfactory, must be the work of citizens of the highest character and ability. It would not follow, for instance, because the union of certain parts is desirable that the union of the whole settlement around the bay would be so. As there would have been no reason in such a proposition while all the communities in question were separate, there is none while any of them are so. It is, in fact, a subject of extreme delicacy and difficulty, and as yet its merits and scope are not by any means completely disclosed. Such a change must be shown to be respectful of really valuable traditions, and to be attainable with entire regard for all just rights. It will be largely a calculation of actual statistics and a collection of the results of similar experience elsewhere. The public convenience and advantage must be demonstrated, but in the demonstration local feeling and tradition must be regarded not as sentimental, but as substantial elements.

THE MOHONK CONFERENCE.

THE recent Mohonk Conference of friends of the colored race was a very interesting and suggestive meeting. Its object was evidently to gather authentic information of the industrial and social condition of the negro, and to compare views as to wise measures for improving it. There were eminent citizens present whose opinions upon the subject are of great weight and value, and the general conclusions of the conference, as stated in a formal declaration or platform, deserve careful attention. The spirit of the assembly was altogether admirable. Friendly, considerate, thoughtful, the proceedings aimed evidently at no other than a common purpose, and assumed the existence of no necessary or invincible local feeling or hostility. It would have been pleasant to see more delegates from the great centres of the colored population, and they need not have been held back by any doubt of entire sympathy in the conference. The results already achieved in the Southern States, and "the noble work" of education in those States, were fully and warmly recognized.

Besides this friendly and wise spirit, the most notable fact of the conference was the apparent absence of any conviction that the demand of the situation is political. Probably much the larger part of the assembly was of Republican sympathy in politics. But there was no suggestion that the thing most to be desired is something else than industry, education, thrift, and morality. While the Republican majority in Congress is devising a national election bill, it was not mentioned by the conference as essential or even desirable for the great end of securing the intelligent self respect and progress of the colored citizen. While every member of the conference would unquestionably approve every honorable means of securing equal rights of every kind for all citizens, white or colored, we presume that the larger part would hold that, under existing circumstances, those equal rights cannot best be secured by action which aims at a political majority in Congress rather than at industrial and moral welfare. In a recent interview in the *World* Mr. HENRY CABOT LODGE is stated to have said that a national election law will be soon passed by Congress, and that "with such a bill we shall have fair elections in the South and all over the country, and with fair elections we will continue to hold a majority in Congress."

The Mohonk Conference holds that the negro in this country will generally remain where he is, that no other race ever made such industrial progress in twenty-five years, that there is already an encouraging number of land-owners, and that the welfare of the country requires that the negro should live in relations of good-will and mutual confidence with his white neighbors and fellow-citizens. While very much has been done for education, the common school should be made more effective, and the opportunity of higher education opened more fully to ability. "In a thoroughly Christian education is our hope for this race, as for all races." For the attainment of these ends the conference looks to the enlightened Christian sentiment of all parts of the country. "To the unselfish service of helping the negro to help himself in education, in morality, in religion, and thus in civilization and in fitness for citizenship, we fraternally invite all our fellow-citizens." Probably the conference thought that in this way hostility to the negro vote would disappear more certainly and swiftly than in any other. Certainly the motive is better than that of securing a party majority in Congress. The view of the conference does not mean deliberate submission to any acknowledged and obvious wrong, but it means a different spirit and method in securing a right. The colored citizen, under the Constitution, is the equal of the white citizen. But if any of his rights, or many of them, are practically nullified, a law of Congress will not necessarily provide relief.

BISMARCK AND THE EMPEROR.

It was impossible that the most conspicuous and powerful living political figure should suddenly withdraw from participation in public affairs and that simultaneously all interest in his words should cease. BISMARCK left office, but he became the one private man in Europe whose opinion would be desired and heeded. His will, indeed, can be enforced no longer, but his word will greatly influence the opinion of his country. The new Emperor makes as yet no very definite impression beyond that of a man resolved to rely upon himself, and apparently determined not to be controlled by BISMARCK.

The new Chancellor, CAPRIVI, speaks with careful and probably sincere courtesy of his predecessor, admitting that his retirement has made the transaction of business difficult, and the situation of affairs less secure. The tone of the new Chancellor is wary, and shows great good sense. Let us understand each other in a friendly way, he says to the Reichstag, and wait a little. In a year we shall be ready for what may come. In the mean time I face affairs with some anxiety.

There is politic candor in such a statement. The confidence of the country which BISMARCK had earned cannot be transferred easily to an Emperor young and little known and suspected of wilfulness; still less easily can this be done when the young Emperor seems to cut aloof from the immediate traditions of the imperial greatness. The intimation that he proposed to silence BISMARCK was alarming, and the reason assigned not less so, for it was really an impeachment of the ex-Chancellor's patriotism. But such an impeachment would not be tolerated. BISMARCK may be disappointed or even indignant with the Emperor, but he is not likely to discredit his own work and destroy his own fame.

THE SOCIETY OF THE ARMY OF THE POTOMAC.

The Society of the Army of the Potomac holds its annual assembly this year at Portland, in Maine, when General FRANCIS A. WALKER will deliver the oration, and ex-Postmaster-General HORATIO KING, of Washington, the poem. There is no more respected or representative organization of Union veterans than this society, and no military meetings command more general interest and attention. There is no fear that the literary performances of this year will not be worthy of the society and the occasion, or of the anniversary of Gettysburg on which the meeting is always held.

The society wisely avoids politics, and the proceedings hitherto, so far as we have known them, have been neither sectional nor partisan, but always of the highest and purest tone of patriotism. There is, of course, no unmanly evasion of the fact that the Army of the Potomac stood for a great cause and won a historic victory. This avoidance of politics is in every way admirable. Political partisanship would discredit it. But there is a question upon which the expression of the sentiment of such a body would be most serviceable. It is a public question, but not in its nature political, although circumstances might be thought by wise leaders of the society to have given to it a partisan character.

There is no body of Union veterans from which a clear and comprehensive statement in regard to the just limits of a pension law would be received with more interest as an authoritative declaration than from the society of the Army of the Potomac. To know the spirit and view of that society upon the subject would be of the highest benefit. If it favored, for instance, a service pension, not as relief from the consequences of service, but as a reward for enlistment, it would be fair to assume that such is the general view of all survivors of the war. If, on the other hand, the surviving Army of the Potomac took the view which we confess seems to us more consonant with American character and patriotism, the friends of that view would be greatly strengthened. Under the circumstances, perhaps, such an expression can be hardly anticipated. The society certainly could not be reproached for its silence. But this time speech would be golden.

MR. PLATT AND THE SENATE.

The discipline of party will be exposed to a severe test and strain in the acknowledged Senatorial candidacy of Mr. PLATT. He was elected in 1881 by the power of the machine. Nobody thinks that he became Senator because of recognized or proved public ability, or service of any kind, or of any conceded or known fitness for the office. There was no more reason for his selection than for that of any other active party politician who was unscrupulously clever in managing caucuses and doing the work of a boss. The master of the machine thought him a useful machine agent, and for such reasons, and for no other reasons, Mr. PLATT was made Senator.

During the few weeks of his official service before his resignation, during his struggle at Albany to get back to Washington again, and during the nine years which have since elapsed, if he has proved his possession of the qualities and powers which fit a man for the Senate, if he is known in this State or in any part of the Union except as an adroit, incessant, and clever party politician, but in no sense whatever an accepted personal representative or an able and conspicuous advocate of the higher party principles, character, and traditions, the fact is not familiar.

Everybody knows that he would not depend for success in a Senatorial contest upon public regard for his public services, upon confidence in his public character, or upon admiration for his public abilities, but wholly upon bargains, intrigues, and wire-pulling. No sense of State pride or party enthusiasm, no anticipation of the display of powers in the Senate worthy of that great arena of great debates, no feeling that the standards of public character would be raised, that generous reforms would find in him a champion, and that his party would be morally strengthened, would be gratified by his election. It would be a signal triumph of a party machine, and a striking illustration of the political situation.

THE LATEST ROYAL FARCE.

Our republic had always one fundamental advantage over every other, that we had no pretenders. There were no American Prince CHARLIES or doubtful Dauphins. Royal traditions were remote, and they had had no royal representatives in this country. WASHINGTON put aside the crown, and a royalistic reaction or movement was impossible from the first. But France has had various forms of the pretender since the Revolution. He has been growing constantly thinner and more futile, however, until his last appearance ends in an amused indifference, which shows that he is no longer regarded seriously.

The late performance of the young Duc d'Orleans was really worthy of the comic opera. He came, he said, to serve France as a soldier in the ranks. France at the moment was not at war, and the Prince had been told that he was not wanted. The law was quietly enforced, therefore, and he was placed comfortably in prison. After a few weeks, the law having been vindicated long enough to show that the Duke was not of the slightest importance, the President pardoned him, and he was quietly sent out of the country. The Governor of the prison paid his guest the prettiest compliments as he opened the door: "I am very sorry to lose so amiable a companion in captivity, for I too have been your prisoner." It was neatly turned, and showed the harmlessness of his guest, who offered the Governor a scarf-pin as a souvenir.

Upon leaving the country, the Duke, who is apparently a truly *bougie* personage, issued the inevitable manifesto to his "dear comrades" of the conscription. Pardon, he says, restores to him the sorrows of exile. But nothing can destroy his ardent hope of serving the country. "Keep for me the place which I desired in the ranks, in your midst, near the flag, and I will come and occupy it. Yours for God and for France." And so he goes over the frontier, and some friendly hand, let us hope, waves an adieu, and the orchestra strikes up "Partant pour la Syrie," and the worthy *père de famille* smiles and resumes his evening paper.

PERSONAL.

The people of Marion, Massachusetts, who have come to regard Ex-President CLEVELAND and his charming wife as a part of their summer belongings, are happy over the arrival of their distinguished guests. A reporter chronicles the fact that on the first Sunday after their coming the CLEVELANDS attended the Congregational Church, and joined in the singing. Then they walked home to their cottage on the bluff, a quarter of a mile away, and after lunch the towns-people and summer visitors called to pay their respects; the local postmaster, who must be a "spared monument," doing the honors.

—The greatest man of letters now living in Scotland is probably DAVID MASSON, Professor of Rhetoric and English Literature in Edinburgh University. He is best known by his *Life of John Milton and the History of His Time*, although he is the author of a number of other works that have brought him fame. Professor MASSON was acquainted with DOUGLAS JERROLD, DICKENS, THACKERAY, and CARLYLE, and is said to resemble the last-named in personal appearance. He is an effective lecturer and orator, and has made himself prominent as an advocate of woman's right to higher education and participation in the learned professions. Although sixty-eight years old, he is full of fire and vigor.

—Miss DORA WHEELER, the well-known artist, who has painted the portraits of a number of prominent authors, and has decorated the walls of some of the finest houses in New York and Washington, was married the other day to BOUDINOT KEITH, of New York.

—Miss PHILIPPA FAWCETT, daughter of the late Professor FAWCETT, the blind English philosopher and statesman, has taken the highest educational honor yet won by a woman at Cambridge University. She is twenty-two years old, and her marks in mathematics far surpassed those received by any man at the recent examinations.

—A unique bronze statue of General GORDON has been unveiled at Chatham, England, by the Prince of Wales. The General is represented in his official dress as Governor-General of the Soudan, and as riding on a camel, his own features, the fez on his head, the medals on his breast, and the trappings of the camel being all admirably delineated. The sculptor was E. ONSLOW FORD, A.R.A., and his work is highly praised.

—The election of Rev. SAM W. SMALL to the Presidency of the Utah University, a Methodist institution at Ogden, and his occupation of the place, caused much surprise among his friends in Georgia. He was a candidate for election to the Georgia Legislature, and had set a day for ordination in the Episcopal Church.

—Rev. VIRGIL MAXEY, a nephew of Ex-United States Senator MAXEY, of Texas, and well known in the South as a Baptist minister and revivalist, is to go on the stage. He will act on week-days and preach on Sundays.

—AMASA PARKER, of Fitzwilliam Depot, New Hampshire, thinks that as he is ninety-nine years old, and was graduated from the University of Vermont in 1815, he is the oldest living college alumnus in this country. He was on the staff of the Governor of New Hampshire when LAFAYETTE visited Concord in 1825.

—Among the graduates of the Medical School in Boston University this year was CHARLES ALEXANDER EASTMAN, a Santee Sioux, who finished the Latin-scientific course at Dartmouth three years ago. It has taken him some years to master the English language, but he has become so fluent in it that at Boston he was made the class orator. With his other studies he has read law, and he goes back to his people now, hoping to teach and help them, and to act as interpreter for them in their dealings with the government.

—Cardinal MANNING has recently observed his silver episcopal jubilee. A testimonial fund, toward which American Roman Catholics have subscribed liberally, has been raised for him.

—The fact that E. T. PAGE, the Democratic postmaster at Ingersoll, Texas, is the father of quadruplets, all promising little girls, as well as a model official, does not seem to have saved him his place when a Republican coveted it.

—The $170,000 paid at Paris by a rich retired draper for Meissonier's "1814" is recorded as the highest price ever given for the picture of a living artist. The painting represents Napoleon on horseback, surrounded by his Generals, on the eve of his abdication. It was painted in 1864, and is thirty inches long by twenty inches high.

—A beautiful album, bearing the signatures of many of the most distinguished personages in this country and England, and containing drawings by a few eminent artists, has been presented to M. PASTEUR, the eminent chemist, as a testimonial. It was originated and successfully carried through by Mrs. PRIESTLY, the wife of the distinguished English physician.

—STAMFORD LEVI LYON, said to be the oldest Freemason in this country, died recently at Rondout, New York, at the age of ninety-eight years. He had been a Mason since 1819.

—Mrs. GROVER CLEVELAND is heir to one-sixteenth of $800,000 worth of real estate in Omaha, Nebraska.

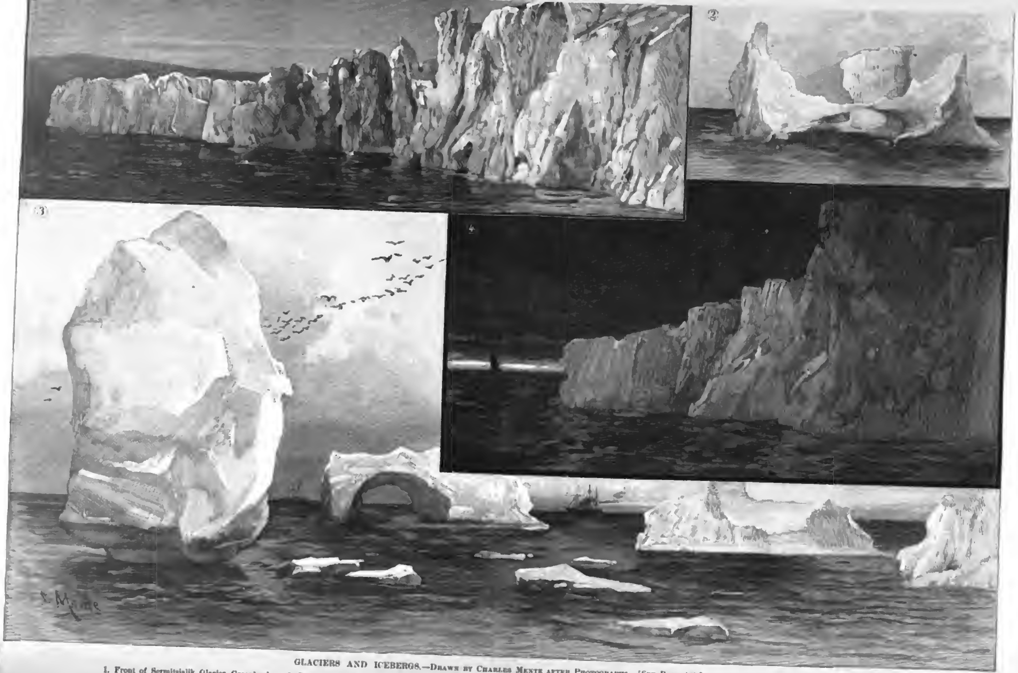
—Dr. L. B. CLIFTON, an English naturalist who devotes particular attention to raising rare moths, has just hatched one which he values at $50.

—Cardinal NEWMAN is eighty-nine years old.

—In the description given of the Drexel Institute, of Philadelphia, in the WEEKLY of June 7th, the name of the firm of architects was omitted. They are the well-known WILSON BROTHERS & Co., and the sketch given in the WEEKLY was made from their drawings.

—ELIZABETH POTTER, a colored woman living in Chatham County, Tennessee, is said to be one hundred and thirty-six years old, and to have 432 descendants. She was married three times, and had twenty-seven children.

—The larynx of the great tenor GAYARRÉ, who died not long ago in Madrid, was removed after his death, and was found to be of such peculiar formation that it will probably be preserved in some Spanish museum. GAYARRÉ received $1400 a night in opera, the largest salary ever paid a tenor, and his fortune is estimated at $800,000. He was the son of a blacksmith, and a common workman when his voice first attracted attention, and he was only forty years old when he died.



GLACIERS AND ICEBERGS.—Drawn by Charles Mente after Photographs.—[See Page 482.]

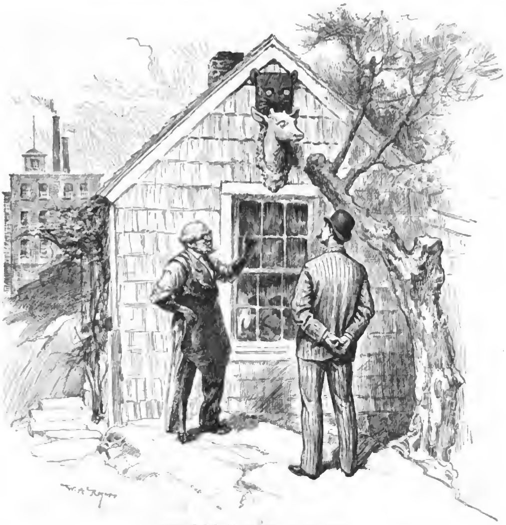
FROM FISHING SMACK TO SHOE-BENCH.

While the British champion the *Galatea* was lying in the Marblehead Harbor, off the house of the Eastern Yacht Club, we used to read in the newspapers the opinions of the old tars of the old town concerning her prowess. These old tars thought the British yacht a very terror for speed; but they knew that the *Mayflower* was a better boat, and would maintain the honor of the American flag. It must have been a very ancient mariner that the reporters saw, and fished up out of the caverns of the deep at that; for it is many a year since Marblehead was a seafaring town. Yet the flavor of the sea still hangs about it. Its repute is that which its fishermen have made for it upon the water in war and peace, but the quaintness and its peculiarities are departing. It no longer stands unique among the strong and interesting towns of Essex County. The main line of the railroad has reached down two siphons in the shape of branches from Lynn and Salem, and even the recent enterprises of the rare old town seem to have been sucked out of it. The fire which not long ago burned down the shoe factories that were in the heart of the village seems to have worked irreparable damage, for big holes still mark the site where once was housed the whole prosperity of Marblehead. No one knows what now supports the place. Its fishing fleet has departed. Not a vessel sails for the Banks. The people who were employed in the shoe shops travel daily to the two neighboring cities, where they earn wages which they will not be long willing to pay out for railroad fares. In view of the untoward circumstances that have beset this ancient home of one of the most peculiar, industrious, intelligent, and patriotic peoples in New England, one might well believe that its history is its strongest point, unless indeed one happened to know that there is a deal of energy left among the sons of men of the present generation. In the dialect of the place, some of which continues to linger with the descendants of the emigrants from the Channel Islands, no one in Marblehead is "pixilated"—meaning thereby confused by the commercial darkness into which the people have been plunged. The spirit of old Marblehead as well as its dialect is extinct—the spirit that is so graphically portrayed in that most stirring of town histories written by Senator Roads, whose ancestors were among the earliest settlers of the town, and who, besides writing the history of his birthplace, upholds its principles and maintains its traditions as President of the Sea-serpent Club, whose annual picnic is alone sufficient to wipe out all disbelief in the venerable and interesting reptile.



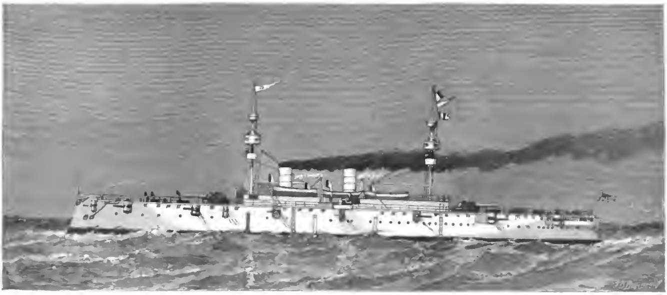
A RELIC OF THE OLD DAYS.—Drawn by W. A. Rogers.

For more than two centuries the life of Marblehead, more than that of any town of the colony and commonwealth, was inspired and stimulated by the limitless freedom of the ocean. Its houses climbed up the steep and rocky hills of its peninsulas, or crept down as near as possible to the waves that lapped the occasional sand beaches. Anything for a whiff of salt air! The men from Jersey, Guernsey, and the western counties of England brought their birthright with them, and transmitted it to those who came after them.

The Marbleheaders were thorns in the sides of the Puritans, who may have looked upon them as intended for their discipline. They treated the degenerate sons of the sea with great harshness. The Marbleheaders were not pleased by the restriction of the suffrage to church members, for as late as the middle of the seventeenth century Marblehead had no church members and maintained no church. It was the subject of special legislation, which sought to provide for the punishment of the reprehensible violators of Puritanical observances when Jacky was ashore. Jacky followed his instincts and drank too much rum, so that the magistrates of Salem were kept busy fining him, much to the scandal of their righteous town, but much also, no doubt, to their delight, insomuch as they were enabled to punish the wicked after the most feeling fashion. So foreign, however, was the spirit of these fishermen to the Puritan principles that Salem finally petitioned the General Court to erect Marblehead into a towne, and the first record of the town concerns fish. It was "agreed by the towne that all such as are strangers fishing or employed about fish shall pay unto the towne for their wood and flake stuffe and other conveniences the sum of ten shillings a year for every man."

And thus Marblehead set out upon its briny career. For a long time its people were prosperous. Fortunes were made from its single industry, and a noble fleet of fishing vessels sailed in and out of the beautiful harbor which is now the resting-place of yachtsmen, and whose shore is yearly becoming more popular for the summer homes of the wealthy. All the energies of these active people were bent to one end. "The whole township," wrote School-master Josiah Cotton, "is not much bigger than a large farm, and very rocky, and so they are forc't to get their living out of the sea, not having room to confound the fisherman with the husbandman, and so spoil both, as they do in some places." When a boy came to the age of eleven or twelve years—sometimes when he was only nine years old, if he were large for his age—he shipped aboard a smack, and became a "cut-tail," which, being interpreted, means that he was paid only for the fish actually caught by him, the tail being cut as the fish was taken from the hook for the purposes of the count. From "cut-tail," through the various grades of "header," "splitter," "salter," to the distinguished rank of "skipper," was a great and dignified career, and many a modern Marbleheader is proud of the long line of skippers that unites him of these days of shoe-pegging to the maritime glories of the past.

How the towne smells of salted fish! The catch was sent to all quarters of the world—to Spain, to the West Indies, to Portugal. Often the sailors married women of the tropics, and to this day dark-faced natives of Marblehead revive the memories of the traffic which built the fine dwellings of the town, still preserved in all their stateliness. Everything spoke of fish, the breeders of wealth. When Lafayette paid his first visit to the town, in 1784, the toast he proposed was, "The town of Marblehead, and success to its fisheries." When the colonies were at the beginning of the dispute with the mother country, the act of Parliament which most aroused



ARMORED CRUISER NO. 2 OF THE NEW NAVY UNDER STEAM.—[See Page 491.]

the stormy wrath of Marblehead was that which forbade the colonists to fish on the Banks of Newfoundland. The Marbleheaders hastened to express their gratitude to John Adams for "preserving to the United States of America the extensive advantage of the cod-fishery." And when the government was finally formed, it was voted at a town meeting, March 6, 1789, "to present his Excellency John Adams, Esq., with six quintals of table fish."

A great race of men was bred up on the sea—bold, active, generous, and apparently made more fond of their country by their constant contact with the provincial fishermen on the Banks. Their town meetings were very whirlwinds of discussion. They were sailors, and had little sympathy with landsmen or their ways. Their town was like no other. It had no streets, paths only, that made their way from the dwelling-places to the water's edge. Each house was placed where the owner saw fit, without any regard to building lines. The paths and lanes bore names, many of them ribald and some of them profane, such as were suggested to the people by the nature of the way, the exceptional experience of some passer, or the character of those who dwelt along the line. It was not only a hardy and independent community, but it was very jealous of its rights, and not seldom was a law unto itself. Once, when an anonymous pamphlet, published in the neighboring town of Salem, denounced the town officers whom the Democrats of Marblehead had elected, very much after the fashion of more modern times, the town meeting ordered "that the Lying Pamphlet . . . be burned by the chimney sweeper." It was burned, however, by the mob, and several leading citizens being indicted by the grand jury for engaging in what was denominated a riot, a town meeting was held at which it was "Voted: That this town has a fellow feeling of sympathy for the good citizens thereof, and that should any of them be indicted, or process of law be commenced against any of them for the doings of that day (March 17th), for burning what was then termed the Lying Pamphlet, this town will in its corporate capacity (agreeable to the laws and Constitution of this Commonwealth), defend and support them in and against any lawsuit that has been or may be commenced in consequence of the proceedings of the 17th of March aforesaid." So stubborn, so determined that their own way was right, and that they should have it, were these sons of the sea, that there was generally a difference of opinion between them and their neighbors, and Marblehead was Democratic while the neighboring towns were Federalist, Whig, and Republican. Its oldest church—St. Michael's—is Episcopalian, the frame of whose building, still in use, came from England in 1714.

It may have seemed to many of their neighbors as though the Marbleheaders were afflicted with that vice which is known to Yankeedom as cantankerousness, but there has never been any such vice in the disposition of the fishermen when war was upon the land. The men who contended with the elements on the ocean in peace, or quarrelled with their neighbors when they had nothing better to do, were the sturdy lovers of a sturdy freedom, and have done much more than their share of the country's fighting. In every conflict from the French and Indian war to the war for the Union, old Fort Sewell, looking outward to the harbor and the ocean, has been manned by the sons of Marblehead. Colonel John Glover's regiment of fishermen was famous in Washington's army. Captain John Manley's schooner *Lee* was the first vessel of the Continental navy, and it was to her Pine-tree flag, so John Adams asserted, that the British flag first struck. It was the *Lee* which captured the British brigantine laden with provisions of war, among them the mortar over which Putnam broke a bottle of rum as he christened it "Congress." And listen to this from General Knox, writing of the terror inspired by the floating ice in the river at Trenton: "I wish that when this occurrence threatened to defeat the enterprise they could have heard that distinguished warrior [General Washington] demand, 'Who will lead us on?' and seen the men of Marblehead, and Marblehead alone, stand forward to lead the army along the perilous path to unfading glories and honors in the achievements of Trenton. There, sir, went the fishermen of Marblehead, alike at home upon land or water, patriotic and unflinching whenever they unfurled the flag of the country."

From Marblehead came Commodore Samuel Tucker, mighty capturer of British prizes, and a host of other gallant sailors. It was a great day for Marblehead when the Revolutionary War was over and the independence of the United States acknowledged. Nearly all her fishermen had taken part in it, and her fleet was destroyed. Poverty and dire distress followed, for the relief of which lotteries and other devices were resorted to, so that in a few years the men of the town were once more making their way to the Banks in search of the profitable cod.

While the Legislature of Massachusetts protested against the embargo, the town of Marblehead resolved, in a special meeting, that the "embargo law was a law of wisdom, and that the President and Congress of the United States are entitled to and shall receive our warmest thanks for their early attention to the independence, liberty, and just rights of the Union."

Marblehead fishermen played a great part in the war of 1812—the war for "Free-trade and Sailors' Rights." When the war was declared, Boston, Salem, and other towns neighboring to Marblehead begged for peace, but the independent fishermen held one of their clamorous town meetings and cheered for the war, declaring it to be "the last resort of a much-injured people." Then they went into the fight. They manned and officered the ships of the navy and the privateers. Eighty of the crew of the *Constitution* in its fight with the *Guerrière* were from Marblehead, and one of them piloted "Old Ironsides" safely into Salem Harbor when she was pursued by the British frigates *Tenedos* and *Endymion*. It was off Marblehead Neck that the battle between the *Chesapeake* and the *Shannon* took place. When peace was declared, more than 700 men of Marblehead were prisoners of war, 500 of them being in Dartmoor prison. To Marblehead the war was emphatically for "Free-trade and Sailors' Rights," and 726 of them engaged in it on privateers, 120 in the navy, 67 in the army, and 100 in the Marblehead Light Infantry. Up in the old burying-ground, which is on one of the rockiest hills in the town, one may read on the tombstone of a typical Marbleheader a legend to the effect that the deceased believed in "Free-trade and Sailors' Rights." But the war was the beginning of the end of the fishing business, which, at least in part, accounted for the free and independent spirit that distinguished the people of Marblehead, and set the seal of peculiarity upon the town. When the released prisoners of war came home, having usurped command of the ship which brought them over because her captain would not carry sail enough to please them, they found that nearly two-thirds of the fishing fleet was destroyed. The embargo and the war which they and their fellow-townsmen had so strongly advocated had ruined them, and had given a terrible blow to their industry. It only needed the great storm of 1846 to thoroughly discourage those who made their livings by fishing, for the Marbleheaders had been beaten by the Gloucester business men, who gradually absorbed the whole trade. When business arts entered in, the bluff Marbleheader, who knew only how to sail his smack and catch his fare, was driven off the Banks. He did not know how to contend with the packers and shippers into whose hands had come the majority of the American fleet. Trawl-fishing was too much for the men who had accepted the innovation of dory methods doubtfully.

In the mean time the shoe industry had made an insidious inroad into the maritime town. All sailors are not agreed in regarding the land as simply a place for fitting out and frolic. Besides, with the rising warehouses of Gloucester grew the fishing interests of the provinces, and fares brought less money than they had when the century was young. Then the share system was abandoned, and the crew were no longer partners in the results of the voyage. Capital took the profits and hired the seamen, so that gradually the native Yankee was superseded by the Nova Scotia man and the Irishman and Swede, for it was difficult, next to impossible even, for the independent citizen of Marblehead to bring himself down to sailing as a hired man, be the skipper a fellow-citizen or foreigner. When the long winters came, and the fishing for the season was finished, the industrious seamen, for some reason or other, possibly on account of the propinquity of the Salem tanneries, had taken to the making of shoes, chiefly of the kind known as "misses' and children's." And these maritime cobblers prospering, their example became contagious, and many a tarry hand turned its cunning to the making of coverings for young feet. By and by these men, who had been accustomed to the division of the crews into "headers" and "splitters" and "salters," and had consequently learned the economic principle which lies at the basis of all modern manufactures, brought their benches together under one roof. Little one-story houses grew up about the streets of Marblehead, and half a dozen shoemakers entered into the business together. The little shops exist to this day. Indeed since the big fire which destroyed all the large shops in the vicinity of the railroad station these little factories are about all that remains of the modern industry of Marblehead. They have no machinery, none of the great patent implements by which a pair of boots can be made for you while you look about the premises. The workmen are Americans who are independent citizens of the town, who probably once upon a time followed the sea and lived upon its inhabitants, whose ancestors at least were fishermen, who can point out to you the house in which the Spanish pirate was captured, and the back yards where other pirates murdered the beautiful woman whose shrieks are still heard on each recurring anniversary of the terrible night. Marblehead, it must be recollected, was a favorite resort for the bloody as well as the peaceful rovers of the sea in the seventeenth century. These native shoemakers are mild-mannered men, who lock up their little factories every day at noon and at six o'clock in the evening, and go home to dinner and tea. Their town meetings are not so tumultuous as they were, although every citizen takes a lively interest in whatever is going on in reference to public matters. That, however, is characteristic of New England rather than peculiar to Marblehead.

The town did not abandon the sea for the factory without a struggle. When it was finally recognized that the fishing fleet and its glory had departed forever from the place to which the sea air had so long been the breath of life, an effort was made to establish the industry of ship-building. It would have been some gratification to the former rovers of the main if, now that their voyaging days were over, they might have furnished to other tarry spirits their stately ships and swiftly sailing smacks. But the ways and docks fell before the deadly shoe peg; not, however, before a new section of the town had stretched out into level land, and modern cottages, facing rectangular streets, had intruded into the ancient borough.

But though there had been a change in the ways and manners of the people, the fire and patriotic spirit of the town had not departed. When Mr. Lincoln made that memorable call for 75,000 men, the militia companies of Marblehead were the first to march into Boston, and during the war for the Union Marblehead furnished about 1000 men in excess of its quota. "For Heaven's sake," Governor Andrew is reputed to have said, "don't send any more men from Marblehead, for it is imposing on your goodness to take so many men as have already come." Marbleheaders fought through the war on sea and land, as they had fought in other wars. The women, who remained at home, went on with the shoe business, and when the struggle was over the troops and sailors who came back found that there was an infusion of foreign element into the life of their old home—an element which was destined to grow more and more important as the factories increased and multiplied. The sea spirit was still preserved among the natives in tradition and history, as is aptly illustrated by the flourishing Sea-serpent Club, which has been spoken of, by the yarns—known of all men whose birthright is citizenship of Marblehead—of the mysterious visits and cruises of pirates, and by the cherished glories won on the battle-fields of the ocean. In front of the Neck is the starting point of the finest ocean racing course in the country, and the regattas of the Eastern Yacht Club have preserved the interest of the population in achievements on the water.

But that a change has come over the spirit of the old fishing port who can doubt? What a sport of nature would it be if the fishing smack and the shoe-bench did not breed different-natured men, and women too! For women and children are affected by this enormous change of pursuit quite as much as the men. The fisherman's wife has her fearful cares and anxieties, but she does not spend her days in the close confinement of a factory; and is not the "cut-tail" who breathes the salt air and is developed by the activities of a sailor's tasks likely to be a man of stronger body than the boy whose early days are spent in the shop?

The influence of the wild free life on the stormy Banks has departed, and instead of the rollicking, independent, strong-headed, obstinate sailors, speaking a dialect of their own which the outside world understood with difficulty, we have the sober and sedate shoemaker, most worthy citizen, most domestic and sometimes most philosophic of men, but not at all unique. There are straight streets now. There are no slop-shops as there were, nor merchants in oil-cloth clothes, nor ship-chandleries, nor red-curtained bar-rooms, nor drunkenness. So that, in some respects, Marblehead is more moral than it used to be when it was a sea city. It is a prohibition town, but the manner in which this result was brought about is indicative of the old town rather than the new. Marblehead is not fond of sumptuary legislation on principle, but it voted prohibition in a fit of popular indignation. A person generically known as a rumseller viciously struck and knocked down another person generically known as a temperance man, and it appearing that all the rumsellers sympathized with the deed, the town voted to close up their shops, and closed they have been ever since that fatal episode. One still hears occasionally the dialect that used to distinguish the native Marbleheader—the quick speech, the cutting off of terminal letters, the oi for i in such words as "wife" and "died." Sometimes the family of Crowninshield is called "Grounsel." Sometimes a housewife speaks of the ceiling as the "planchment," and says, when chill November's wintry blast compels the goose-flesh, that she feels "crimmy." But all this is infrequent, and many an old family name is not to be found in the modern directory.

Not many weeks ago two very old Marbleheaders met on the burying hill. One was the grave-digger. A boxed coffin was lying on the ground before the open door of an old tomb.

"Whose burial box be that, Cyrus?" said the Marbleheader who was not the sexton.

"That's Abigail C——'s."

"Where 'd she doi?"

"She doied 't Boston."

"Whose woife was 't?"

"Wa'n't ner one's woife?"

"'S that so?"

"Um."

"C—— tomb 's ben shut er long time."

"Um."

"W'en was 't open before?"

"Nigh forty year."

"Um. No one's woife!"

Henry Loomis Nelson.

THE ICEBERG'S BIOGRAPHY.

BY CLARENCE DEMING.

It was some eight years ago, during a homeward voyage from Europe in the month of May, that the writer first saw an iceberg. For four days after leaving Queenstown there had been smooth seas, gentle winds, and the balmiest of ocean temperatures. Suddenly there came a change. The ocean remained smooth, but a sharp chill cut the air. The blue skies shifted to a canopy of lead, through which the sharply disked sun struggled, without, as it seemed, either heat or light. Icebergs the weather eye of our captain forecast in this quick change of temperature, and the sharper gaze with which the lookouts scanned the horizon as well as the repeated tests of the sea water by the thermometer, emphasized his judgment. A few hours later the bergs, three in number, came to view miles away on the western sea line—one, a wrinkled cliff of ice; a second, also cliff-like, with a promontory at either end; and a third, rising from the waters as a huge cube, topped at the centre by a truncated cone, which at its crest broke into sharp pinnacles a hundred feet above the ocean-level. In the weird leaden light the three bergs at first took the hue of dull tempered steel. But an hour later, when the sun broke out as we passed them, they put on a garb of fleecy white, fringed at their upper parts with fitful lines of silver, slowly fading out to the northeastward as our swift steam-ship sped past. Not many days later, doubtless, those floating giants went back to their original fluids in the tepid current of the Gulf Stream. We had seen them on their ocean death-bed, and had read but a few lines near the close of their life-story, which had begun years, perhaps generations, before on the arctic plateaus of Greenland.

That mystic country, the great breeding-ground of the icebergs of the North Atlantic, and as their prolific parent second only to the antarctic continent, merits here its brief description. It reaches from a point in north latitude not yet precisely known, but probably about four hundred miles from the pole, southward for some thirteen hundred miles, to the latitude of 60°. Its pear-shaped form on the map spans at its largest diameter, in the latitude of 70°, about seven hundred miles east and west. Of this great country, containing not less than half a million square miles, probably five-sixths is covered by an ice crust with an average thickness of upward of a thousand feet. Only along its shores is a fringe of soil or rock some fifty miles broad at its widest southern point, and diminishing to mere littoral cliffs as the trend of the shores runs northward. We may, in fact, speak of the whole of Greenland's interior as a vast *mer de glace*, with a surface almost nine times the area of New York State and a little less than three and a half times that of Great Britain and Ireland. Explorers who have penetrated its desolate plateaus—Hayes, Nordenskiöld, and Nansen—substantially unite in their descriptions of the Greenland ice cap, a comparatively smooth expanse of ice, rarely broken by crevasses, and sloping up gently toward the interior. Greenland, indeed, may be deemed a survival of the glacial age, when an ice sheet of far greater depth and area swept down over North America to a point about the centre of the United States. Each long arctic winter deposits its heavy snows on the Greenland *mer de glace*, to be transmuted into ice, and finally to be discharged by glaciers through the many fiords which descend to the sea. The middle and upper coasts on the west of the semi-continent are cut thickly by these great ice streams, one of them, the Humboldt, the glacial Amazon of the North, being estimated at from forty to sixty miles in width. They, like the rivers of water which drain away from the lakes of more temperate zones, fulfil the law of circulation in the terrestrial fluids. Let us illustrate that law, as written in icy characters, by tracing briefly the iceberg from its primal unit.

A drop of water forms by night on a leaf, and, as a globule of dew, glistens in the early rays of the sun. As his beams warm it the drop changes into vapor, and its parts rise in air and disperse, each to become a bit of a cloud, or to float in the atmospheric spaces as an invisible watery mote. Then the winds may seize the vapory particle and bear it to the far North, where, joined by countless myriads of others, and congealed as snow, hail, rain, or fog, it may fall on the Greenland ice cap. Next, the particle, under pressure or by frost, is changed to ice itself, and becomes an integral portion of the dismal country's icy crown. Days, years, decades go. Moving slowly but constantly, the particle descends the slope into a fiord, to become a minute factor of the glacier by which the inland ocean of ice finds its outlet to the other ocean of waters. As time goes on, the particle imbedded in the glacier moves down to the coast, where, launched in the berg, it begins the long ocean journey which is to bear it southward to melt in the Gulf Stream, to be drawn up as vapor anew, and repeat the great law of circulation in nature's blood.

Glaciers, their motions and changes, are still the battle-ground of scientific controversy, but from the mass of learned discussion we can distil many proved facts relating to these cold mothers of the berg. They move down their inclined beds at a rate varying from a few inches a day up to the sixty feet a day measured by Helland on the Jakobshavn Glacier of Greenland. As a rule, the larger the glaciers are, the faster they move, owing to the diminished friction at their sides, size being a far more important factor in their rate of speed than the steepness of their gradients. They descend also much faster at their centres than at their edges, where they are checked by the friction of the land; and for the same cause they have more downward motion at their surface than at the base. Solid and inflexible they seem to eye or touch, but under their own momentum they become plastic, shaping themselves to channels, scouring the rocks, and pouring over cliffs in imperfect semblance but complete analogy to the water-fall.

The glacial surface, with its smooth reaches, its wavy rapids, its eddies circling round the jutting rocks of its banks, still further expands its fluvial analogue. But unlike the river of water, the glacier is broken into diagonal crevasses pointing up stream toward the centre, opening when the slope drops, closing together again when the slope rises; it flows with cracking sounds in lieu of the continuous roar of water-fall or the splash of wave; and it has at its tunnelled base a literal stream of running water, a *fluvius in fluvio*, derived largely from the meltings of the surface, which in summer pour in torrents down the cracks, unite below, and rush out in a muddy tumult of waters beneath the glacier's front. On top of the glacier and parallel with its axis of flow are the long lines of mingled rocks and soil styled moraines, over which science has battled so fiercely. When these moraines, scoured from the glacier's shores, trend near the sides, they are "lateral"; passing from branches to the centre of a new and wider glacier, they are "medial"; and deposited in a ridge at the foot, where the glacier melts on land or passes into the sea, they become "terminal," as illustrated strikingly by the moraine at the foot of the Davidson Glacier of Alaska.

The dynamical law by which the glaciers abutting on the sea generate their bergs is still somewhat vague. In earlier days it was held that the glacial tongue broke off by its own weight. To this has succeeded the following explanation, perhaps more popularly than scientifically accepted. Moving down the fiords to the ocean the glacier's front enters the waves, at first ploughing up the sea-bottom into a deep furrow. But as the ice prow pushes out over the sloping ocean floor, the weight resting upon the bottom steadily diminishes. The floating power of the water tends constantly to lift the ice, which is held down by the rigidity of the glacial sheet below its normal sea line. Moving on still, the glacier's front reaches the point in deeper waters where it is lifted from the bottom altogether. Still it remains unbroken, the strength of the sheet, hundreds of feet in thickness, holding it. But as it proceeds, the awful leverage on the unsupported tongue waxes. It is like the van of an army drawn further and further away from its main body, and encountering increasing attacks of the foe. Each surge of the tide, every onset of storm, racks its structure. At last comes the point where the hardly sustained equilibrium of forces ends, and the glacial tip breaks away into the floating berg. Finally we have a third and more recent hypothesis based on the differential movement of the upper and lower parts of the glacier. This latest theory asserts that the glacial front is thrust over from above by the swifter descent of its upper portion—a movement which may be roughly likened to the breaking comb of a sea wave sweeping to the shore.

But whatever the specific direction of the force which expels the berg from the glacier, the grandeur of the phenomena which often attend it is without question. Constantly the brow of the glacier over the sea is shaking off with sharp explosions smaller masses of ice, which drop to the water in cloudlets of spray. Suddenly there comes a set of louder and deeper blasts that blend into a subterranean roar. A great section of the fissured front of the glacier bends, with water-falls pouring from its sides, and obscured in clouds of vapor from the cold surfaces newly exposed to the air. As these clear away, the broken off glacial tongue surges down, forcing up a wave of water dangerous to near vessels, to boats or men at the water's edge. Up and down the new-born berg sways, moving, meanwhile, slowly away from the glacier, and out to sea. It has been born amid the travail of the icy elements to begin its life journey, that is to be long or short according to its own size and the places to which the currents of air and water are to bear it.

The amount of ice thus sent out from the large glaciers which have rapid flow is most amazing. At the Jakobshavn Glacier alone Helland fixes the daily discharge at 432,000,000 cubic feet, and this is but one of the great glaciers, known and unknown, which outflow from the Greenland ice sheet. From the Muir Glacier of Alaska—only one of the several thousand, large and small, in our Northwest Territory, two of them estimated by Lieutenant Schwatka at twenty miles in breadth—Professor G. F. Wright fixed the daily outflow of ice at 200,000,000 cubic feet during the August of 1886, when his examination of the glacier was made. It may be noted, in this connection, that there are few reports of our Alaskan ice rivers discharging large bergs. Authority can be cited to prove that this is due to the irregular grades at which most of the Alaskan glaciers reach their outlets, forming many crevasses, and consequently smaller bergs.

The more massive bergs, once "calved" from the front of their parent glaciers in Greenland, and floating away with almost nine-tenths of their bulk beneath the waves, may have a varied life history. They are assailed instantly by the forces of the sea and air. If born in the summer, their blue sides change quickly to a snowy whiteness that marks the entrance of air into their pores. The arctic sun, which is not to set for months, shoots its rays unceasingly on their exposed surfaces. As the heat increases, pools of water form on their upper levels and overflow in foaming streams down their sides, fluting them in the fall. Under the unequal expansion, not seldom a berg cracks, throwing off great masses, and sometimes, if not of large dimensions, it splits from top to base into smaller bergs. The warm breezes attack it; the sea-waves lash its sides; storms drive it upon other bergs or on the coast, or the ocean currents may start it on a longer journey. From the moment of its noisy birth its biography is a story of decay, with every energy of nature preying upon its life. Moving northward, and stranded on a cold shore, it may endure for years, like the anchored berg two years old measured by Dr. Hayes in 1860, which reached 315 feet above the water-line, half a mile below it, and was three-quarters of a mile long, with a weight of 2,000,000,000 tons, and a mass of 27,000,000,000 cubic feet. Or the berg may be nipped in the swirl of the dreaded "middle pack" of Melville Bay, there also to prolong its life during one or two arctic winters. But more commonly it is caught in the current which sweeps around the lower point of Greenland, runs northward, and crosses Baffin's Bay to join the arctic current, also ice-laden, setting south to Labrador and the Newfoundland Banks. Then the berg, if of great size, outlives its long journey to become the terror of the transatlantic voyager until it vanishes in the warm Gulf Stream.

The Monthly Review of the Signal Service of the United States for January, 1890, as an example, supplies impressive evidence of the amount of arctic ice that makes the long voyage from Baffin's Bay or above it to the routes of the ocean steam-ships. Reports of ice are given for every day except five of that month, and some of them in condensed form may fitly add here their testimony to the photographic print.

January 6th.—Berg from seven to eight hundred feet long and seventy feet high.

7th.—Berg four hundred feet long and one hundred feet high.

8th.—Enormous berg one-fourth of a mile long and two hundred feet high.

9th.—Berg about six hundred feet long and one hundred feet high.

18th.—Field ice studded with large bergs.

20th.—Large berg about two hundred feet high.

21st.—Great quantities of ice with several large bergs. Field ice for fifty-six hours. Densely packed field of ice twenty miles long.

23d.—Field of pack ice twenty-nine miles long.

25th.—Whole eastern coast of Newfoundland blockaded with ice.

27th.—At 8 30 P. M. vessel completely jammed. Engines stopped until 11 30 P. M.

29th.—Large berg one-half mile wide and one mile long.

As indicating the time of the passage of the arctic bergs from upper Baffin's Bay to the Gulf Stream the voyage on an ice floe of the castaway party from the *Polaris* is in evidence. The party separated from their vessel near the upper extremity of Baffin's Bay on the 15th of October, 1872, in latitude about 77° 30′, not far from Northumberland Island. They were rescued off Labrador on the 30th of April, 1873, in latitude 53° 35′. They had drifted in the arctic current a distance of about fifteen hundred miles in 197 days. This would indicate by ratios about 284 days as the period for the passage of field ice from the upper Greenland region to the routes of the ocean steamers after the ice has once entered the arctic current. In the case of the bergs, with almost nine-tenths of their surface submerged in the current and less retarded by winds, this time must evidently be somewhat reduced.

Around the bergs, after they are borne from the glacier, float forms of ice different in origin, less impressive in magnitude, but still in their dynamic manifestations sublime and fearful. Out from the arctic coasts, where the thermometer during the sunless winter months registers at times as low as 70° below zero, and usually ranges between 20° and 40°, there forms the coast ice many feet in thickness, known as the ice foot—the comparatively smooth pathway fast between the shore and the hummocky tidal ice, and along which arctic explorers have so often pushed their sledge parties northward. In summer most of the ice foot detaches from the land, and joined by ice of other seasons and origins, becomes the huge fields of the "pack," spreading often to the horizon. In these expanses of the pack are united many kinds of ice—small bits that have fallen from land cliffs, from the bergs, or from the glacial fronts; the freezings of winter in the ice field itself; old (palæocrystic) floes, or the greater floe bergs so interestingly described by Greely, and attributed by him to the gentler grades of far north glaciers, cubical, stratified, discolored, and the arctic counterparts on a smaller scale of the South polar bergs. As these composite ice fields sweep on before current and gale, impinging on the shore, on the bergs, or on one another, the mighty dynamic energy shapes the surface into manifold and wondrous forms—strata piled one above another, now and then warped into curves by the strain; hummocks rounded, blunted by friction, sharp or focussed into a series of craggy points like the edges of a volcanic crater. All these divergent ice shapes in the field, impelled by the powers of sea and air, join with the other elements in the general attack upon the berg.

What marvel that, as the objective point of assault by all these disintegrating forces of water, of atmosphere, of heat, of the ice itself, ever varying in intensity and exerted from different directions, the berg takes on those strange shapes that the photograph depicts—not so fanciful as the drawings of the imaginative old navigators, but still fantastic, beautiful, awful. Starting at first as an irregular block of ice, the berg, as it is melted, ground, and shattered bit by bit, changes each day its figure. Its centre of poise shifts constantly, presenting gradually new surfaces to the eye, and betimes toppling the mass completely over. At first the berg may assume the form of a huge floating structure fringed with ornamental work at its eaves and ridges. Slowly these upper parts may melt to minarets, to flying buttresses, to castellated turrets, to Gothic spires and arches. Next, these too may fall, and leave the berg lying on the ocean in the likeness of a strange living monster of the deep. Things animate and inanimate without number the berg may counterfeit during its life. Often its whole or part will take the mushroom or conical shape, with clearly outlined stem where the waves have worn its base near the water-line; and at many points in its structure may be traced the old grooves where in earlier days the ocean has wasted it. The arched berg is a not uncommon type, created at times by the action of the waves, but when its curve is lofty attributed more justly to the enlargement of the original arch, in which the frontal glacier split off over the subglacial river—such as was one berg under which Dr. Hayes avers his schooner could have sailed. The rocks and deposits of soil which the berg often bears away from its glacier, and which from time to time it drops into the sea, add to its grotesqueness of shape. Under certain conditions of sunlight they melt into the slope of the berg, giving it an eruptive or pocked aspect. Under other conditions of heat, these land masses appear like a dark human head mounted on a white-cloaked icy column.

Infinite in variety as are its figures, so are the iceberg's tints. In general, under the sunlight it is garbed in the milky whiteness which quickly succeeds the steely blue of the side recently ruptured from the glacier. But this tint itself often receives reflected colorings from the blue of the sky, from the shadow of cloud, from the hues thrown up from the ocean, and from the prismatic effects reflected where the sun-rays touch it at varied angles. On the bergs whose crests break into minarets and sharp lace-work this play of the sunbeam gives coruscations that may make the floating thing like a great diamond cut into a million facets, and dimpling with every prismatic color. When seen directly below water, the ice of the berg is a bluish-white. Over an artificial bottom of this blue-white ice, caused by the projection of the subaqueous part of a berg, one famous arctic explorer passed in his boat for a hundred yards before he reached the ice giant's erect side. In placid arctic waters, which are often so clear that the boat seems hung in air, these color effects of submarine ice are sometimes hardly less striking than those of the berg in the upper sunlight.

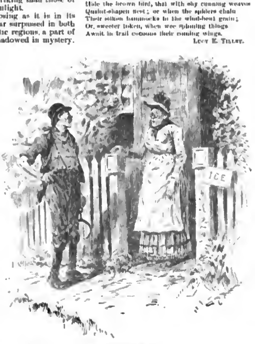
North polar ice, imposing as it is in its forms and motions, is far surpassed in both by the ice of the antarctic regions, a part of the world still deeply shadowed in mystery. What we know of it comes principally from the narratives, penned half a century ago, of Commander Wilkes, of the French explorer D'Urville, and from the more important but far from complete explorations of Sir James C. Ross, the discoverer of the volcanoes Mount Erebus and Mount Terror. From the almost contemporaneous discoveries of these three explorers we can infer that there is a continent surrounding the south pole some thousands of miles in circumference. Thus far it has been untrodden by man, and only seen by him from the decks of his venturous ships. Like Greenland, this continent wears an ice cap, but thicker and more uniform. The fiords and separated glaciers of the arctic region merge at the antarctic in what may be called a single vast and expansive glacier, which pushes its vertical front continuously along the coast for miles out to sea, an insuperable barrier hitherto to explorers. More heavy and more frequent falls of moisture than in the arctic spaces feed the south polar sheet, and give it well-defined strata. When this continental glacier has pushed out to the point of rupture in the ocean, it launches, along with smaller and more variable masses, not the irregular berg of Greenland, but a huge floating table of ice, the stratified "table berg" of Ross and Wilkes, with vertical faces often miles in length; and generally not until this berg has drifted northward to summer latitudes, and has passed the great southern pack which, on his second voyage, detained Ross for fifty-six days, does it become irregular and fantastic in shape, like its icy kinsmen floating from the North. From the antarctic sheet, with its even, gentle slope and probably few crevasses, we should logically infer immense bergs, and some of them the log-books of navigators describe. The records of the British Board of Trade from 1839 to 1867 supply us with the dimensions of a number of these gigantic table bergs, "with one or two exceptions accurately determined by angular measurements." They range from a height of about 400 to 1000 feet above the sea-level, and in cases have a length of several miles, indicating a depth below the water-line sometimes much more than a mile. These icy magnitudes dwarf the largest Greenland bergs, as the latter belittle the bergs of Alaska. They imply parts of the south polar continent still unseen where either the ice sheet reaches a size much larger than the parts that have been explored, or where glaciers attain a thickness wellnigh dazing to the human mind. It is noteworthy also that two of the loftiest bergs recorded in the reports of the British Board of Trade were encountered in latitude so low as about 37° south, corresponding very nearly with the north latitude of Norfolk (Virginia) and Lisbon (Portugal).

In all its mutations of life the berg is a thing haloed by human fancy, or shadowed by human terrors. Blended with its traditions of mortal suffering, of ships crushed and wrecked, of death within the arctic circle, is the mystic fascination of its stupendous size, of its stately voyage over wind-beat seas, of its sunlit beauties, of its varied and fanciful shapes. The devout worshipper may see in these white-faced colossi of the ocean another of those divine orders by which Nature returns to herself and recuperates her own works, the man of science reads on the same floating mountain the story of the glacier, the formulas of the realm of ice, the rules of molecular and cosmic force, and over and above them all the greater law of circulation on the globe and in its atmospheres; and to wellnigh all of us the story of the origin, birth, and life journeys of the bergs is not less moving because they are severed from us by an "enchanted distance" which photography and the pen span but imperfectly at the best.

THE SPINNERS.

They learned their art, these weavers, long ago
In those sweet days when Pan went to and fro
Making all other music strangely mute
Before the sweetness of his reeded flute;
Or when in flaming forge great Vulcan wrought
Achilles' armor, and Athene caught
From off the distaff her fair wroughten weft.
Now when the reeds and thickets are bereft
Of those god wanderers—lo! their old-time ways
Are still revealed in these later days,
When in the long-forsaken haunts young leaves
Hide the brown bird, that with shy cunning weaves
Quaint-shaped nest; or when the spiders chain
Their silken hammocks in the wind-bent grain;
Or, sweeter token, when wee spinning things
Await in frail cocoons their coming wings.

LUCY E. TILLEY.



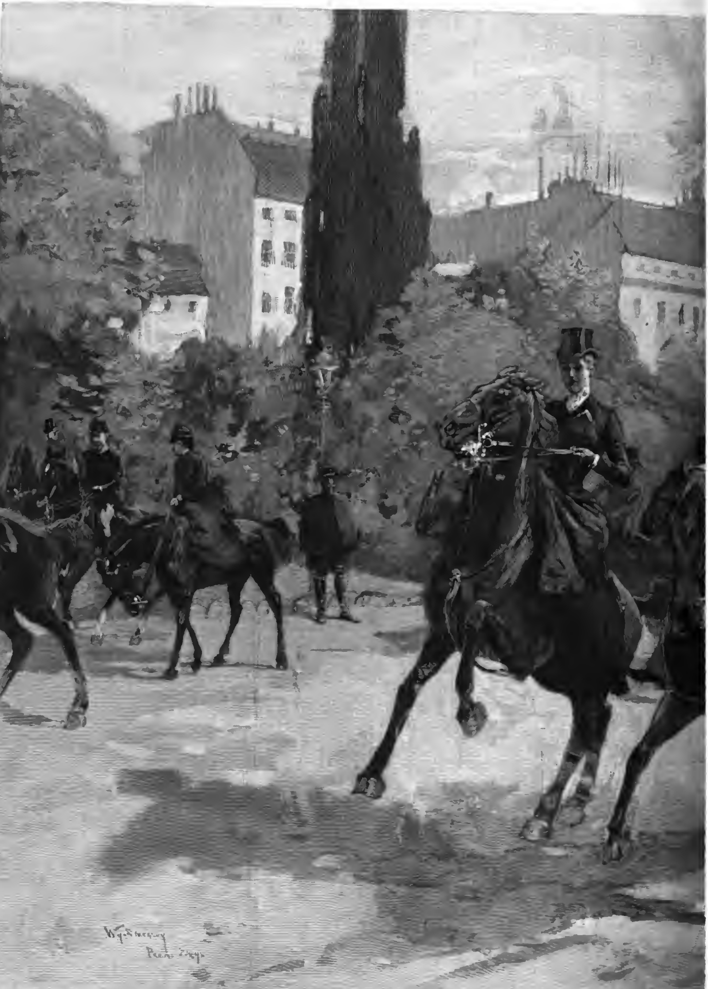
EXPLAINED.

"How much ice did you leave me yesterday?"

"Fifteen poun's, mum."

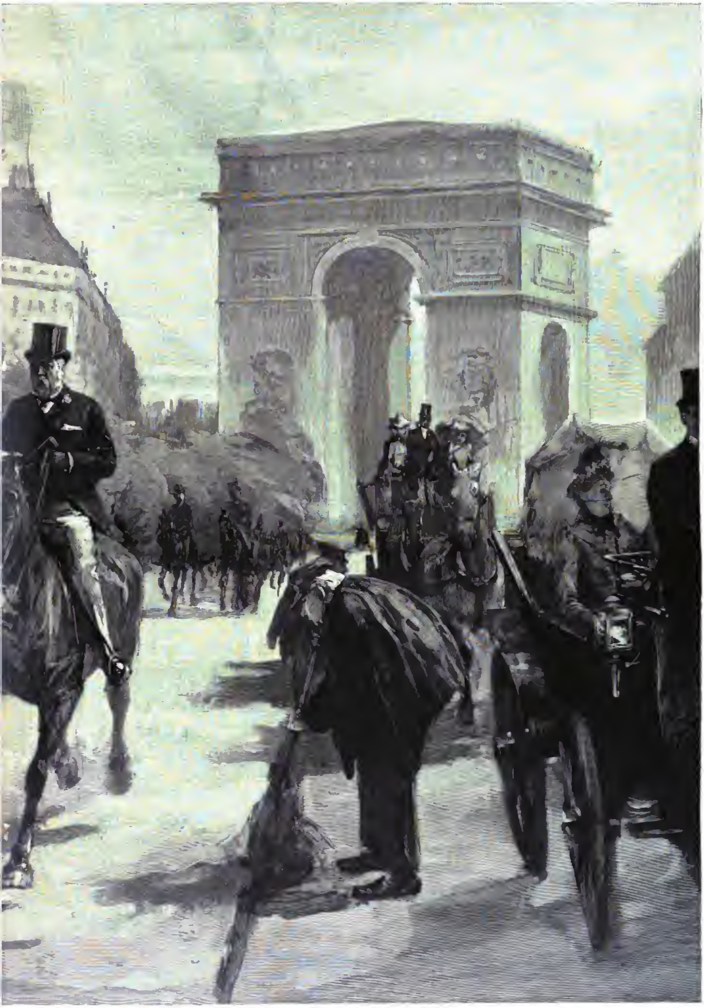
"You did; well, I weighed it the instant you left, and there were seven pounds exactly."

"Yis, mum, we sells it just as we gets it in Maine, mum, widout makin' no allowance for shrinkage in New Yoerrk."



GOING TO THE GRAND PRIX—A BIT OF PARIS

Google



IN JUNE.—Drawn by W. T. Smedley.—[See Page 487.]

THE ELECTION.

BY LYNN R. MEEKINS.

MATTERS did not go as well with the candidacy of Abner Green as the beginning had promised. He had been nominated unanimously. He had accepted with seeming reluctance. The support in party lines had been solid, and there was a strong Independent sentiment in his favor. The canvass had progressed favorably and everything looked auspicious. And yet in the closing days of the contest a batch of clouds appeared upon the horizon of his hopes.

With his good wife Jane he was sitting in the parlor of his humble house, the lower part of which was a store. He seemed disconsolate. Jane busied herself with sewing, while he gazed alternately at the lamp and floor and cogitated on his prospects.

"Abner," said Jane, "something is troubling you."

"Yes, dear; something usually is."

"You haven't any doubt about your election, have you?"

"Of course not. Did you ever know a candidate to have any doubts except as to the size of his majority?"

"Now I know something's wrong. What is it?"

Abner did not answer. He looked steadily and stupidly at the floor. Jane waited awhile, and then resumed.

"What is it, Abner? You haven't been comfortable since the mail came in yesterday."

Abner glanced up quickly. "Jane," he said, "did you ever see through a brick wall?"

"The idea of such a question! I believe you are losing your mind. You've lost about everything else since you got into politics."

"Yes," responded the candidate for sheriff, gloomily; "and I'm going to lose more."

Jane dropped her sewing and gazed at him in open-eyed dismay. "What!" she asked, "do they want money? Why, they declared it shouldn't cost you anything."

Abner shook his head sadly. "It's always that way," he said. "They sugar-coat you with compliments, and for every compliment they issue a note that you've got to pay before the campaign ends. This politics, Jane, is a great scheme to use a man's vanity for opening his pocket-book. It's got so that I'm afraid to hear a man praise me, lest he should come around afterward to borrow money, and I'm disappointed if he doesn't come, because I feel sure he's going to vote against me."

"Now, Abner, if they said that you would strengthen the ticket, and if that is why they put you on, why don't they go ahead and elect you?"

"Bless your innocent soul, Jane, you don't know politics! Six weeks ago they all said I'd go through with flying colors, and everybody was crowding around promising to put up money and help me, but six weeks in politics is about six years longer than eternity."

"Didn't they contribute as they said they would?"

"Yes, some did. Major Powderdry for one."

"Major Powderdry! Why, Abner, I never knew that he contributed to anything except the size of his debts."

"That's about what he did. It was this way. Three weeks ago the major came around and said he wanted to make a good contribution to the campaign fund, and after a lot of a-hemming and a-hawing he asked me to lend him a hundred dollars on his note. As long as I had taken the nomination from him, and as the money would help my own election, I loaned it to him."

"And he contributed it to the fund?"

Abner smiled grimly. "Yes, twenty-five of it. He put the other seventy-five in his pocket. It was the first time that I ever knew Major Powderdry was a financier."

"A financier!" exclaimed Jane, indignantly. "I call it robbery."

"No, my dear; it's finance. As far as I can see finance is the general barter of humanity, and the biggest financier is the fellow who manages to hold on to the most money. Now old Caxton is another financier. We made him chairman of our first mass-meeting, and gave him enough honor for his whole family. Of course we expected to get a good contribution from him. Well, he promised and promised. Then he kept saying that times was hard, and it all ended by his handing over five dollars out of his fifty thousand. And now he is lending me money, and making me pay twelve per cent. interest on it. The old skinflint will make nearly a hundred dollars out of me."

Jane did not know much about politics, but she had helped Abner in the store enough to understand something about the rules of interest. This disclosure evidently alarmed her.

"Do you mean to say," she asked, "that you have put a thousand dollars into this thing?"

"As the day of execution is near at hand, my dear, I suppose I'd just as well confess. A thousand is about the size of it."

"But, Abner, I don't see where you can use all the money."

"Campaign expenses," he answered, sententiously.

"What are they?"

"Printing tickets and mass-meetings and hiring music, and—and other things."

"What other things? You don't mean to say, Abner, that you pay to get votes?"

"Certainly not, my dear; but some people have to be persuaded."

"Persuaded?"

"Yes, persuaded. There are lots of men who will vote our ticket, but they must be paid for their loss of time. Now, for instance, there is Bill Simpson. Bill will vote for our ticket, but he needs persuasion. He wants five dollars for his loss of time in going to the polls."

"But, Abner, you know that he never does anything, and how can his time be valuable?"

"That's just it. His time isn't valuable except when elections come round. Then everybody finds out that it is a very busy season, and that it will be hard to get to the voting places unless the party does something for them. I went to see Bill. He said he certainly wanted to vote for me, but he did not see how he was going to get away, for he had a big job of work to do, and it would be worth every cent of five dollars for him to lay off and go to the polls. What are you going to do with such a man unless you compromise?"

"Compromise?"

"Yes, compromise. He'll really expect about two dollars. Last year he got one."

"Abner," said Jane, after a pause, "isn't it wrong to do this?"

"It may not be exactly right, dear, but it's painfully necessary. At election time every man is as big as every other man, and his vote counts just the same whether he is a President or a loafer."

Jane paused again while her thoughts struggled for utterance. Presently she said: "Abner, I'd rather see you defeated than do anything that is not right. I hope and pray that you do not think of buying votes."

"Of course not, of course not," he replied, with some warmth. "What put such an idea into your head? And, moreover, what would be the use of trying? The other fellows have got the most money."

"How do you know?"

"That's what the letter said, and that's what has been troubling me. Why, Jane, the unprincipled scoundrels on the other side have got three hundred new two-dollar notes for use on Tuesday. Just think of it! That's enough to carry this district against the Angel Gabriel! And if I lose Sussex, I lose the election and my thousand dollars. It's awful."

Jane quickly jumped from criticism to sympathy. She wanted Abner to be elected, and she had thought he would be until now, when the prospect seemed to change.

"If women only had the right to vote!" was all she could say at first.

Abner smiled sardonically. "Yes," he said, "if they could. It's always 'if.' If wishes were two-dollar notes I'd be satisfied."

In his perturbation he picked up the paper that was lying on the table and began to read, while Jane returned to her sewing. There was silence for some minutes until Abner called for the scissors. Jane handed them to him, and he cut a paragraph from the sheet.

"Jane, how many people around here take the Sussex *Weekly?*"

She named several.

"Well, to-morrow morning I want you to go to all the houses and get the papers. I need them."

"What is it, Abner?"

"Oh, nothing much. You know I always make it a rule to cut things out that strike my fancy, and I find in the long-run that a newspaper is the best investment that I make, because it gives me more new ideas than anything else. I calculate that this little piece of paper is worth a hundred dollars, if not more."

He folded it carefully and placed it in his pocket-book.

The next morning after breakfast Jane started out to visit her neighbors to borrow the Sussex *Weekly*. She succeeded in bringing back five copies. Abner was delighted. At dinner she questioned him again, but his only reply was,

"Come down in the store when I close to-night and you will see."

It was a busy day. The next morning the election was to begin. Visitors came constantly to consult the candidate for sheriff. Tricks and rumors of tricks were in the air. Workers wanted money. All asked favors. Everybody whispered fears of defeat in the private office, and boasted of victory to the crowd in front of the store. Major Powderdry, radiant in his optimism, and exhaustless in his declarations of victory, was there.

"We will sweep the country as clean as the celestial dome," he said, "and proud old Sussex will lead the districts in the great battle of free government and low taxes. Gentlemen"—nodding to several smiling members of the opposition—"you'd better join the army, and march through the sea of politics with the children of Israel, for, sure as you're born, it's going to be a damp season for the Egyptians. Take the advice of a friend, and get in out of the wet by voting for Abner Green."

"Major," replied one of the opposition, "there was an Irishman once who happened in a field where there was a large healthy bull. He pulled out a red handkerchief, and the bull began kicking and bellowing. It was very funny. The Irishman laughed so loud that he had to hold his sides. But suddenly the bull came close, and when Paddy picked himself up on the other side of the fence he said, sadly, 'It's a mighty good thing I got that laugh in first.'"

"My dear fellow," said the major, impressively, "I have profound respect for the age of your story, but excuse me if I say that it doesn't fit the case. To-morrow we shall take that bull by the horns, and lead him to the slaughter like a frightened lamb that has been fed on mint sauce just to whet our appetites."

The major was in his element, and he kept up his fire of repartee with undiminished vigor. The crowds gathered, and everybody talked about the morrow. Presently somebody discovered a newspaper clipping pasted on a board placed rather inconspicuously near the desk of the store.

"Hello, Abner, what's this?"

"What's what?"

"This newspaper article?"

"Oh, that! I suppose it is something that John has stuck up for reference." John was the general factotum who often helped Abner in the store. He was a tomb-like character who always did those things that Abner wanted done without being known.

Of course the people crowded around to see what it was. This is what they read:

"LOOK OUT FOR BAD MONEY!

"We are informed that a lot of counterfeit two-dollar notes are in circulation in this State, and some of them have found their way into this county. The bank officers tell us that they are so clearly and perfectly engraved that it is difficult for anybody who is not an expert to tell the differences from the real article. Of course our readers know that it is a crime punishable by imprisonment to attempt to pass these notes, and there is a reward for the arrest of everybody caught in the act. We advise you all to be careful about this thing. Beware of new two-dollar notes."

They read it carefully, and wanted to know its meaning. Abner was very ignorant about it.

"John's simply stuck it up there, I guess. John's a little absent-minded sometimes, and he wants something to keep him from taking in another counterfeit. He took in one, and he looks as if he'd been to a funeral ever since."

"You don't think that any of the bills are around here?" put in one of Abner's political opponents, rather experimentally.

"No; not that I know of. All the two-dollar notes I've seen this week are old, and of course they're all right."

The hour of breaking up came, and the people started for their homes. As they left the store, Major Powderdry stood on the highest step and indulged in more rhetoric.

"To-morrow's setting sun," he said, "is going to witness a sight that will cast new glory on the American eagle. Victory will perch on our standards, and our ticket will go through like a streak of greased lightning. Sleep well, gentlemen, and be at the polls early."

"We'll be there," shouted the major's opponents.

After they had gone and the shutters were put up, Jane came down stairs. She looked around until she discovered the clipping stuck on the board.

"Is that it?" she asked.

"Yes," said Abner, "that's it."

Good weather blessed the day of election. The people were up early. Around the polls there was plenty of life and noise. An election in a rural district differs entirely from an election in the city. Your city people walk to the polls, cast their ballots, and walk away. The highest privilege of citizenship is a matter for expedition. In the country it is an occasion for assembling, for gossip and argument and entreaty. Along the road are carriages and horses, ox carts, wagons, and all the curious kinds of vehicles of the neighborhood. The voters stop to talk and to consult. No hurry disturbs them. They stand around, some whip in hand, some holding tickets, some smoking bad cigars, and all personally interested in the contest. The fences are the reserved seats of the occasion. Up the road in quiet corners are the practical workers with the sinews of war. Behind trees are jugs and bottles of dangerous inspiration. A mercenary voter is never in haste to vote. He canvasses the situation, finds out the resources of both sides, gets frequent exhilaration from the jugs and the bottles, and finally casts his ballot with the largest pecuniary benefit to himself. The efforts of the workers to monopolize this individual are earnest, prolonged, and untiring.

It was this way in Sussex District. Abner Green's friends made a cordon around the polls. The candidate for sheriff was not present at his polling-place, except for a short time to cast his vote, but he was ably represented. The opponents, however, were just as strong, and were all the more dangerous because they remained in the quiet corners up the road, where they could barter without discovery.

In Abner's store matters were quiet, as the chief interest centred at the polls. John was ostensibly in charge. Abner kept watchfully and quietly in the background. He was waiting for developments. About half past seven o'clock he saw a figure coming from the voting place, and his heart beat more excitedly with anticipation. The man was a surly fellow named Timson, an unconscionable bribe-taker, who had the reputation, to use the phrase of Major Powderdry, "of being able to raise more fuss over a two-cent stamp than Shylock could over a whole carcass."

Timson came into the store, which was the only one near the polls, and bought some tobacco. In payment he proffered a new two-dollar note.

"No, you don't," said John.

"Don't what?"

"We ain't taking no bad money here."

"What do you mean?" said the fellow, with a mixture of indignation and alarm.

"This is what I mean," said John, and taking down the board, he read the article about counterfeits.

Timson was dumfounded. Then he recovered his powers of speech, and deluged the place with his surcharged feelings. In the midst of it, Abner made his appearance.

"Good-morning, Mr. Timson. It's a pleasant day for the election. Have you voted?"

Without replying, Timson called himself various unprintable names, and told Abner how he had been imposed upon by some unnamed scoundrel.

"This is very serious," said Abner. "Of course you thought the money was good, and I don't believe you would want to run the danger of getting arrested by trying to pass a counterfeit. But if I were you I'd make the fellow who gave it to you pay for it with interest."

Timson, with unmistakable emphasis, declared that he would, and left the store in hot haste. He had just disappeared around the bend of the road when Major Powderdry drove up and dismounted. He rushed to the store, and led Abner into the back shed.

"It's all right," he said. "Our men have got the articles at every polling-place, and they're going to raise the devil just as soon as a two-dollar note appears. How are things here?"

"Timson's just been in with a two-dollar note, which we refused to accept."

"Good!"

"And he's gone back to the polls to see about it. He's hotter than a tin roof in August."

"That's simply magnificent. I'm going down there to help him. You stay here."

The major was lost in a cloud of dust. He urged his horse on until he came near the voting place, and then slowed up and approached with an easy dignity which seemed to indicate that he had only a passing interest in the momentous events of the day.

But he did not remain passive. All around him the people were talking excitedly. Timson's voice was loud in anger. His charges were taken up by the other rascals who, like himself, had sold their suffrages for two dollars each. The managers of the opposition tried entreaty and pacification, and it looked as if they were making some headway until Major Powderdry jumped into the breach. His face flushed, his fists beat the air, his voice rang out in fury. The people crowded around him.

"It is the most atrocious outrage I ever heard of," he exclaimed. "These men try to pollute the fame and corrupt the citizenship of this district; they insult every honest voter here; and not only that but they impose on their victims by giving them worthless money. Gentlemen, I repeat that it is the most damnable affront that was ever offered to the decent sentiment of the sovereign people. Where is the man who will swear out warrants against these persons?"

In the face of the indignation the opponents beat a retreat to an obscure corner of the road where they could consult. Major Powderdry took charge of the work. Every arrival was deluged with stories of the worthless money, were told how the opponents of Abner Green were trying to defeat him by debauching and bribing voters and was led to the polls through a line of Abner Green's friends. The other side did not recover from the set back; it could not cope with the tireless energy and exhaustless adjectives of Major Powderdry.

And so the work went bravely on until—until—

Major Powderdry, dust-covered and husky, rushed into the house of Abner Green. It was past sunset, and the voting was over. Abner jumped forward to hear the result.

"Not yet—not yet," exclaimed the major, with a majestic wave of his oratorical arm. "Bring out your demijohn—your large demijohn. I have got four acres of dust and five summer fogs in my throat, and I'm doomed to certain death unless I get a drink within the next five minutes."

Abner supplied the demand with welcome alacrity.

"Consider yourself decorated with a life-saving medal," said the major.

"Now tell me how it all went."

"You know when I left here this morning?"

"Yes."

"Well, as soon as I arrived there I began to raise thunder, and, by Jove, we kept it raised until the polls closed! We simply knocked the other side out on the first round, and then bothered them more. The fates favored us when Timson came up to the store. When he got back, he bellowed like a bull, and the more he bellowed the more we egged him on, and pretty soon we had things our own way. I discovered that about five or ten years ago, Cartridge, who was handling the money for the other side, had got mixed up in some of that green goods business in one of the cities; he was innocent undoubtedly, but that didn't make any difference. I went up to him and whispered, 'Look here,

Google

Mr. Cartridge, you can't come any of your green-goods game on these people. We want a fair election, and we're going to have it. If you pay out any more of those two-dollar notes, we'll put you in the penitentiary, and keep you there till your head gets bald!"

"What did he say?"

"Nothing. I didn't give him time to say anything. We were too busy keeping up the cry of bribery and counterfeit to discuss side issues. We laid it on heavy. The people backed me up nobly. I talked more than I ever did in all my life. As the voters came up, we never let them go until we gave them the whole story with a lot of ornament. We told them of the plot to defeat you, and let them know plainly that the decent people were not going to allow any such an outrage. And the negroes! Oh, Abner, you ought to have seen how we managed them! I got hold of Big Jim, for I knew he had more influence with his race than any one else, and promised him that you would pay him five dollars to-morrow if he would scare the negroes with the counterfeit story, and keep them away from those new two-dollar notes. It worked beautifully. The other fellows are swearing like pirates. They're beaten. I know that we have carried this district."

"But how about the county?"

"I haven't heard a word. Let's wait awhile, and see if we can get any news."

They waited. In an hour the result of that precinct came in. The counting of the vote had been completed. It gave Abner a majority of 167—fully 100 more than he expected. An hour later a rider brought news from the adjoining voting-place. The counterfeit dodge had worked successfully. Abner had a majority there of 45, when he did not expect more than 15 or 20. Matters looked bright. About ten o'clock a messenger from the opposite direction arrived. He came from the district adjoining the county town. The counterfeit dodge had been a failure. As soon as it was sprung, the workers had rushed on horseback into town, and had their new money changed for old. They got back without much loss of time, and swept the district against Abner by a majority of 284.

"I'm nearly dead," exclaimed the major, "but I can't stand this. I'm going to town."

Others joined him, and off they started at full gallop. Abner remained at home. If he was elected, all well and good; if not, he wasn't going to be in town to let the people see his disappointment.

He and Jane went to bed, but not to sleep. He tried to feel calm, but his mind refused to be quiet. He turned and twisted. His eyes would not stay closed. The clock struck the hours. Time seemed to crawl along. Four o'clock came. Toward five the minutes were travelling when he heard the sound of horses' hoofs coming at breakneck speed up the road. A minute more there was a halt before his store, and a mighty shout of "Hurrah for Green!"

Above the din was the major's voice, "Come out, Abner."

Abner appeared at the window in short order, and as soon as his white-robed form was seen, the shouts were trebled in vigor. The major tried to make a speech, and his companions tried to help him, but it was not a brilliant success. They were full of very bad liquor, and Abner was full of the emotions of a man who has run his first campaign and won.

"Come away from that window, or you'll catch cold," said a small, shrill voice; but Abner did not hear.

He stood there listening to the revelry. By-and-by the revellers got tired, and with more hurrahs started on their way, making the night hideous as they went with bacchanalian sounds, which might be interpreted into something about not going home until morning.

Abner felt proud of the exhibition, but Jane lost no time in declaring that it was scandalous.

A week later Abner and Jane were sitting in their room. The store had been closed for the night. In the fireplace the logs burned lazily, and the shaded lamp sent its rays upon Jane's knitting and Abner's newspaper.

"I am certainly thankful it's all over," said Jane. "I hadn't any peace from the time the campaign started. But I'm truly glad that you are elected, and it did my heart good to read the fine things that the newspaper said about you. And yet, Abner, I feel rather sorry in having to leave this store and our old friends."

"We won't leave them all, dear. I saw Major Powderdry to-day, and told him that I would like to do something to show my appreciation of his work, but the best I could do was to offer him the position of deputy, which I would be very glad if he would accept."

"Did he?"

"Yes; he accepted. He's been after an office for twenty years, and this is the first real chance that he had had, so he did not let it escape. And speaking of the major reminds me that we took in three of those new two-dollar notes to-day. I gave one to John. Here is one that I want you to frame with that newspaper clipping, as a souvenir of our first campaign."

"And the other?"

"I guess I'll send that to renew my subscription to the Sussex *Weekly*."

GOING TO THE GRAND PRIX.

Le Grand Prix de Paris—that is the greatest of all French events of the turf—compares with the Derby. Hippic reputations are made during that summer meeting at Longchamps. As to the course itself, it is the finest in the world, and is reputed by the knowing ones to be the fastest. On the occasion when the Grand Prix, the prize of prizes, is contested for, it is said that all Paris, half London, and as much of New York as can get there looks on the course.

Mr. Smedley's sketch shows two of a cavalcade *en route* for the Bois de Boulogne, bent on being present at the great race. Certainly *cette belle* demoiselle is an equestrienne of finished grace. She is accompanied by her father. The artist has seized the moment when the lady's horse shows his fine-strung spirits. The rider does not seem surprised or flurried. As a capable horsewoman, she keeps her eyes well ahead of her, in case the animal should feel inclined to bolt. Her pose is charming; so perfect, that a cavalry officer on the sidewalk cannot but admire her. *Monsieur le père* has a good solid seat, that of the cavalier used to the Bois, who has passed around the Arc de Triomphe many a time. He bestrides a more sober steed than the young lady, and the flowers in his button-holes during the canter will not lose a leaflet. From the Barrière de l'Etoile to the entrance of the Bois the distance is short. On such an occasion the broad *allées* are thronged. If "tout Paris" rides on horseback, what remains drives to the race-course. Elegant equipages encumber the way. Mounted police ride up and down, and try their best to prevent entanglements. Perhaps that rougher element found in England has a greater facility in attending race-grounds than the same class in France. The road to the race-course takes, then, a more elegant form in Paris. Has *Monsieur le père* given mademoiselle the proper tip? Has she a favorite? Has she made her book with gloves or bonbons? A good many millions of francs change hands in France on such an occasion, and as to the gloves and sugar-plums, no statistician could ever estimate their quantity.

ANIMALS ON THE MOVE.

From an English review I learn with satisfaction how the great ant-eater, a mere worm for courage, can turn on his tormentor. "Oh!" said the man, whose mission it is to plague animals; "that is just one of those creatures I can bother with impunity. He looks as if made to be provoked. I will proceed at once to annoy him. No keepers around? Here is my chance." Then the party poked the ant-eater with his brand new umbrella. The animal took a prod or two in a subdued manner. Then, quick as a flash, he wound his great flexible tongue around the umbrella, and with a muscular movement of his snout stripped the silk covering of the umbrella clear of its ribs. Then the ant-eater retired in a dignified manner, went sound asleep, and a man left the Zoo with but the skeleton of an umbrella.

Experimenting with animals within certain reasonable bounds has always been a habit of mine. I think the first experiment I ever made was with an elephant. I was then of a tender age. It was at that happy time when peppermint was dropped on paper, like buttons on a shirt front. I had no conception of the greediness of the elephant. I offered him in a guileless way my paper of peppermint drops. He took advantage of my innocence. He was not content with two or three peppermints. He swallowed them, paper and all. I might have been disgusted with his bad manners, but I really was apprehensive that the paper would make him ill. I never heard that he was any the worse for it. Poor old elephant! I followed him in his peregrinations for many years, and it grieved me much when a good while afterward I heard the volley fired into him.

I am, I trust, to be forgiven in later years for having experimented with an ostrich. My punishment was merited. I was turned out of the Royal Amsterdam Zoological Gardens. I think it was Frank Buckland who put me up to it, because he had vaunted the wonderful digestive powers of the ostrich. I do not mean to intimate that he said anything like this: "Try it on those Dutch birds, but not on ours in the Zoo. Whatever an ostrich can swallow, he can digest. It is the bulk of the thing, not its sort, that bothers an ostrich." I had fed the Amsterdam *Struthio camelus* with Dutch buns, and he had bolted an uncommon quantity at my expense; and still he looked Oliver-Twistish. I was watching for that beautiful sliding node formed in the neck when the ostrich makes a large swallow. But the massive cannon-ball Amsterdam buns were as pills for that bird. I had a London *Times*, supplement and all, and I rolled it up into three ovoid forms, and fed them to the ostrich. He made no bones over it. I saw the nodes beautifully accentuated, when the faithful custodians of the Zoolukiljk Zoologish, Genootschap, marched me out. I am pleased to state that the ostrich lived many years afterward. Even more, I was forgiven, or maybe forgotten, because some years ago I was the recipient of a very kind letter from the society for some practical work done in the field of natural history.

The fine condition of the animals at Central Park is indicative of the care taken of them and the good judgment of the superintendent, Mr. W. A. Conklin. The public see and admire the collection, and forget how constant is the vigilance exercised. I am gathering some information from Mr. Conklin in his office, and a keeper comes in, with his face beaming with pleasure, and he says, "The jaguar eat a fair piece of meat, sir, and lapped a lot of water; and I do think he is coming round."

"That case is one of want of care in shipping an animal to us," said Mr. Conklin. "The jaguar was confined in a small box during a long sea-voyage, and has become probably cramped. I have thought that if he were rubbed down with liniment it might do him good. You never saw a jaguar under treatment? Come and look."

It was, of course, novel to witness a jaguar under massage. Three keepers who undertook the task entered the cage, using brooms for purposes of friction. The poor brute was very much used up. He was young, about the size of a mastiff. He did not take to the rubbing of him down with pleasure. He seemed unconscious that it was for his own good. The liniment was poured on his back despite his hissing and snapping. He was neatly and quietly worked over by the three keepers. In case of need, a short iron bar was put in the cage, but there was no necessity to use it. The poor brute was too stiff to offer much resistance.

Animals at particular seasons have to be moved from their winter to their summer quarters in Central Park. This exodus takes place with certain animals about the middle of May, and Mr. F. S. Church's page of illustration gives an excellent idea of it. Tippoo Sahib on such occasions gives his valuable services. On the move, he is worth more than a great many truckmen with their horses. He has in his charge the camel house, a fairly heavy structure, thirty feet long by twenty broad. This was put on rollers, and Tippoo applied his massive forehead and breast to the building, and without much apparent force he shoved it along a distance of 400 yards. Tippoo is a royal Indian elephant, and was a present of some Rajah to Victor Emmanuel. Not being a very amiable brute, at least at certain seasons, he was disposed of by the Italian government after Victor Emmanuel's death, and came into the possession of Mr. Forepaugh, who presented the elephant to the Park. When in the circus business his vast strength was often called on to move vans and wagons which had been mired. Tippoo wears at the tips of his long tusks two brass balls weighing fourteen pounds each. If you look at a massive wooden door which separates Tip from the other two elephants, you can see by the dints in the wood with what prodigious force the animal can drive those pointed ivories. To me an elephant's eye possesses some traits which are almost human. In certain lights it is of a clear hazel, with gray tinges. It is the most thoughtful animal eye I know of. Not placid, not stolid, but ever on the alert. I do not think that it mirrors in the least what is going on in his huge brain. It is not exactly sinister, nor is it an uncanny eye, only suspicious when the animal casts a backward glance at you. Tippoo will balance a weight of 9000 pounds, and has increased 1000 pounds during the last twelve months.

Making alligators change quarters cannot be a pleasant job. Those at the Park are Floridian. The big one, which took four men to move, will weigh two hundred pounds. He has been a New-Yorker for the last two years, but civilization has not improved him. He will eat twenty pounds of horse per diem. It is an art for four men to carry one alligator. If he grows, a fifth man may be necessary so as to become a kind of brake for his tail. If the transfer were made later than June, the trouble would increase, because when warm weather sets in the alligator shakes off his lethargy and becomes active. The smaller 'gators offered little resistance. They weigh from ten to twenty-five pounds. Mr. Church showed me how the small ones all seemed to head up one way, as if following the sun. Mr. Conklin tells me that the little alligators may all be sprawling on the ground, but if there is a shower they at once scuttle for the water.

Make room for the Caliph and his lovely spouse, the Lady Fatima! This is no figurative introduction of the hippopotami at the Park, for when they do move, ample room is given them by the keepers, or to explain it perfectly, those who have them in charge do not care to be too close to them. The way it is done is to make a runway of heavy timbers from their winter-quarters, which are under cover, to their summer ones, which are in the open air. Last year the hippos gave some trouble; this spring none at all. Fatima seemed to remember her last year's experiences. The runway had been prepared the day before, and the big brutes seemed to understand what it meant. Bright and early Fatima sighed, grunted, let me say, to be correct, and rubbed against the bars. The instant the coast was clear off she bolted, followed impetuously by her lord. There was no use of the keeper's acting as fugleman. The charge of that heavy brigade was so precipitous that the keeper, like a bull-fighter, had to leap the barriers so as to get out of the way. The Caliph weighs a solid two tons, and Fatima 600 or 700 pounds less. These hippos are from the Nile. That Fatima had a baby last year is well known. I handled the skull of that little hippo at the Museum of Natural History lately, and a very solid bony structure is it. How wide a hippo can open his mouth, I was curious to learn. Could a flour-barrel find a place there? It looked as big as all out-of-doors. In taking a loaf of bread, chucked into the Caliph's vast gullet, it occupied much less room proportionately than would a small ginger snap in the adult man's mouth.

"Oh! he doesn't open his mouth to any extent when he gets his food. It is when he gapes that the stretch of his jaws is superb," said Mr. Conklin, with all the zest of a naturalist. Then Mr. Conklin took a piece of wood two and a half feet long, and held it between the upper and lower jaws of the hippopotamus, and the measure was far too small.

"I should say something over three feet would about measure the width of the opening when Caliph takes a comfortable yawn," said Mr. Conklin, reflectively.

Of a hippo's ability to take a mouthful of boat or canoe there can be no question. The blunt fangs could chew up anything excepting steel plate. Hippopotami are not amiable nor social, and so Caliph is neither taken to be better nor worse tempered than those of his kind. These brutes in their pool, which is twelve feet deep, can stand very comfortably at the bottom of it. Mr. Conklin times their period of submergence at about four minutes. The eye of the hippo may be wonderfully constructed for peculiar conditions; but considered in an artistic sense it is a very ugly eye. It bulges, looks goggled, and is the eye of a drunkard. Having once eaten a portion of perfectly cured and smoked Nilotic hippo, I must declare it to be fairly good and palatable meat, scarcely distinguishable from a rasher of bacon.

It is amusing to witness the cheekiness of the young sea-lion as he bids the pelicans make way for him. He barks at them in a petulant way, expecting them to skurry. They take little notice of him. If he is too offensive, they indulge in a snap at him with their scissor-like bills, and he immediately subsides. In the Park there are pelicans from Florida, from the West, with some European varieties. The last pelican I killed was on the Gulf side of the Florida coast. I never could have secured him if he had not gorged himself with mullets. Though I wanted him for study, I remembered for a long time the reproachful look he gave me. He stared and stared at me until the death film glazed his great bird eyes. Pelicans are playful birds among themselves. They catch hold of one another's long and graceful necks with their uncouth bills, and you would think that strangulation would ensue; but the bites are loving ones, and their snappings all for the fun of the thing.

ATHLETICS IN AND AROUND NEW YORK.

(Continued from page 476, Supplement.)

Among the other games sometimes indulged in are rope-climbing, sack races, potato races, three-legged races, the "hitch and kick," throwing the base-ball, and kicking the foot-ball. The sack race, in which each competitor has his lower limbs encased in a sack, holding up the open end with his hands, is farcical, and always amuses the audience. The potato race is generally very funny also, but it is a genuine test of speed. A number of potatoes are placed on the ground at even distances, and the competitors, starting from scratch, must bring each potato separately and place it in a receptacle provided for the purpose. The three-legged race was no doubt originally intended to be simply amusing, but practice has given competitors such skill that falls are rare, and very good time is made. The right leg of one man and the left leg of another are bound together at the ankle and the knee; the two grasp each other about the waist, and run, keeping step "woman fashion," or left with right. Of course if a false start is made, or the partners get out of step, there is a fall.

For five years past a contest has been held for the individual general athletic championship of the United States, each competitor being obliged to reach a certain standard. Here is a list of the events and standards:

1. 100-yards run, 11¼ seconds.
2. Throwing 56-lb. weight, 18 feet.
3. Running high jump, 5 feet.
4. 440-yards run, 58 seconds.
5. Putting 16-lb. shot, 32 feet.
6. Pole-vaulting, 8 feet 6 inches.
7. 120-yds. hurdle race (10 hurdles 42 in. high), 20½ sec.
8. Throwing 16-lb. hammer, 70 feet.
9. Running broad jump, 18 feet.
10. One mile run, 6 minutes 30 seconds.

Mr. Malcolm W. Ford has won the championship four times, and Mr. A. A. Jordan once, their principal competitor being Mr. George R. Gray.

The bad feeling which once existed between the New York and Manhattan clubs, and which led to the formation and the maintenance for several years of separate national organizations, is now happily gone. All the clubs have come together in the Amateur Athletic Union—the "A. A. U.," as it is generally called for short—and harmony prevails throughout the United States. Such an organization is desirable and necessary for many reasons, but mainly because of the good-fellowship it cultivates among athletes everywhere, and because it prevents any conflict of the dates of open meetings. Individual clubs are often dissatisfied with the action of the A. A. U. on some particular point, but the advantages of union are too great to be overbalanced by any temporary injustice, either fancied or real, and there seems to be no reason why the A. A. U. should not live many years. Here are the dates fixed for the open out-door meetings for the season of 1890:

May 10—Manhattan Athletic Club.
May 17—American Athletic Club.
May 24—Staten Island Athletic Club.
May 26—Park Athletic Club.
May 30—New Jersey Athletic Club.
May 31—Intercollegiate Association.
June 7—New York Athletic Club.
June 11—Actors' Amateur Athletic Association.
June 14—Acorn Athletic Club.
June 14—Athletic Club of the Schuylkill Navy.
June 21—Berkeley Athletic Club.
June 28—Amateur Ath. Union Eastern Championship.
June 29—Lorillard Debating and Athletic Association.
July 4—Scottish-American Athletic Club.
July 5—National Athletic Club.
July 12—Riverside Athletic Club.
July 19—Manhattan Athletic Club.
July 26—Star Athletic Club.
Aug. 2—Lorillard Debating and Athletic Association.
Aug. 9—West End Athletic Association of Newark.
Aug. 16—Pastime Athletic Club.
Aug. 23—American Athletic Club.
Aug. 30—New Jersey Athletic Club.
Sept. 1—Staten Island Athletic Club.
Sept. 6—Riverside Athletic Club.
Sept. 13—A. A. U. Championships at Washington.
Sept. 18—Lorillard Debating and Athletic Association.
Sept. 20—Manhattan Athletic Club.
Sept. 22—New York Turn Bezirk.
Sept. 27—West Side Athletic Club.
Oct. 4—New York Athletic Club.
Oct. 11—Manhattan Athletic Club.

The meetings so far held have been fully attended, and very largely by the same athletes, for they are open to all members of clubs connected with the A. A. U. Some records have already been broken, and some new champions will be developed this season.

After all, however, the real object of athletic organizations should not be, and in most cases is not, to break records and to produce champions. Their main purpose should be the development of healthy bodies in all their members. That club is really the most successful which benefits the most of its members, whether it also and incidentally produces champions or not. These facts are recognized far more generally to-day than they were even as lately as ten years ago. All the good clubs now have their gymnasiums, with varied apparatus for the development of all parts of the body. Some of them have swimming tanks; all have bath-rooms. The better-appointed club-houses contain bowling alleys, billiard-rooms, rooms for fencing and for boxing, a good running track, rowing machines, and all sorts of gymnastic appliances. Most important of all, a few have regular instructors, who are at the club-house every day, and conduct classes and give private advice and instruction to the members. Without such advice and instruction novices nearly always overdo, and so either injure themselves or become disgusted and stop exercising.

Of all such instructors no doubt the best known is Mr. George Goldie, of the N. Y. A. C., formerly instructor in gymnastics at Princeton College, a sketch of whose fine head illustrates our text. Mr. Goldie has been at his present post for about seven years, and to him in no small degree the success of the club is due. Certainly it is mainly due to him that the club is one of the best institutions in the world in which men of ordinary build and no especial athletic proficiency build up their strength and improve their general health. It will astonish any one who has never been inside the club-house to examine the ingenious apparatus—some of it devised by Mr. Goldie himself—for strengthening the neck, the back, the fingers, the wrists, the abdominal muscles—in fact, all parts of the body. The N. Y. A. C. is celebrated for the number of its champions, but it deserves to be still more celebrated for the excellence of its provision for helping its ordinary members. The eminence of the Berkeley Club in this respect has already been referred to. As the clubs become larger and richer, all will be provided with houses containing as good facilities as are now enjoyed by members of the New York, the Manhattan, and the Berkeley. There will be a more general diffusion of athletic education among young men. The result can hardly fail to be the gradual evolution of a higher and better type of physical manhood.

THE ENGLISH AT HOME.

BY JULIAN RALPH.

TEN weeks in England will not qualify a man to write laws for the English, but they will give him seventy days in which to observe what goes on about him over there. In that time I saw very little, yet I was more fortunate than most tourists, for I was invited to half a dozen English homes that were representative of the life of the "better classes." I was taken to two or three of the most notable events in the elegant life of London "in the season," and I saw the interiors of several clubs. This is not my boast: it is my authority for what I am about to say.

The typical English home is repellent without, no matter how fascinating its interior. In city, village, and country it is always walled in. I read in my guide-book that "the most stately mansions in May Fair, Belgravia, and Tyburnia contribute to the gay throng in Rotten Row," and then I went to those prettily named regions, only to see rows of great dull houses, usually covered with stucco or painted drab, and with high walls in front of their gardens, when they have gardens. "Exclusiveness" gains a sharper definition to the mind when one has seen these dead-looking houses and walled-in grounds of the aristocrats; a still deeper meaning when one sees the inevitable soldiers, in addition to the walls, wherever royalty is housed, even to the third and fourth generation. But this is worthy of a word more when we come to share the hospitalities behind the walls.

First a few words about the people. While I was waiting to take a train to Brighton one day, the Princess of Wales and her unmarried daughters came flying into the station behind a drab-colored locomotive, which carried the Prince's three feathers in front of the boiler and over each set of driving-wheels. The engine pulled two cars—a parlor coach of mahogany with plate-glass windows, and a baggage coach. On the instant, as the train stopped, servants in gold lace came out of it and swarmed all about it. Four lustrous coaches, in the charge of drivers wearing leather cockades, drew up on the opposite side of the concrete landing-place. The flunkies flew about, and while some talked to the drivers, and others went into the parlor coach, four busied themselves at spreading an enormous roll of purple carpet over the concrete. On purple carpet, wherever it is possible to spread it, royalty always walks when out-of-doors in England. When it walks on the bare ground or stones it is *incog.*, as when it goes shopping, for instance.

Wishing to see whatever was to be seen, I was met by a police inspector, and then I noticed that there were policemen at every few feet between royalty and the people. "I am an American," said I. To say you are an American in England is precisely like saying you are a reporter in America. Rules vanish at the words. The beautiful Princess and her two stocky, German-looking daughters tripped over the carpet and into a carriage just, it seemed to me, as any other ladies would have done. A flunky banged the door with an extra bang, and then took off his cap and received the instructions he was to give to the driver. Those given, away went the carriage, followed by the other carriages with the maids and some of the flunkies. In the mean time there had been rolled out of the baggage car a mountain of bags and trunks and boxes and baskets, all covered with black leather, and all stamped "H. R. H. the Princess This," or "H.R.H. the Princess That," or "H.R.H. the Prince of Wales." It will interest every one to know that each of the ladies carried a bag of pillows, and the Prince carried a basket of newspapers, also that there was at least one flunky for every article of baggage. As for the Princess's car, it was not comparable with a Pullman day car; it was merely a mahogany room on wheels, with tables and chairs scattered about in it.

At Brighton—which is to London what Long Branch would be to New York if the gamblers had not degraded it—I saw thousands of the cultivated and the well-to-do English. The men dressed better than ours do, because the climate permits them to do so. They nearly all wore patent-leather shoes, which keep soft and lustrous in that moist atmosphere, whereas they are cracked here both by our heat and our cold. Old men, who desired to, wore baggy Knickerbockers and long ribbed stockings, and, better yet, they put them on in London when leaving there and wore them back to town again. The young fellows wore suits of flannels and cricket caps in the daytime, and—like the ladies, who put on fur capes or boas over their gingham dresses—they wore overcoats over their flannels if they needed them. The girls under twenty wore their hair down their backs loose, or caught with a ribbon near the bottom. Their mothers wore theirs short behind and banged in front, or drawn tight back from their faces over a coil behind. A great many very "swell" women wore sailor dresses, with low broad collars and with low necks covered by false shirts of striped stuff. They seemed to insist that their gowns should never be made to fit; but this must be said, whether their gowns fitted or not, a lady over there always looked like a lady. Their women walk better than ours—straight and with their heads up and their shoulders back, with steady, fearless eyes and composed features. And then the children. The boys all wore sailor suits if they were small, and "Eton" suits if they were twelve to fifteen years old. You see ten thousand boys so dressed in London. The Eton suit consists of a pot hat, a jacket cut with a point behind, and over the top of it a flat, big, laundried linen collar. The trousers are like any trousers. The little girls always had on the shortest dresses possible to make or imagine, with startling lengths of bare legs, always sun-browned to within two shades of the color of their shoes. The indifference of the women (I am speaking of gentlewomen) to the arrangement of their drapery when they sat down was startling. So it was when they walked in the rain in London. But it was only at first that it startled; afterward one realized that American taste, which prefers draggled skirts, is poor taste, and that American opinion, which views with alarm the display of a shoe top, is not only wrong in itself, but it begets an evil view of a simple neglect, be that neglect inadvertent or be it necessary.

In the first English home I visited the gentleman of the house seemed anxious to get me out into his garden as quickly as possible. I suppose his garden was 70 feet wide by 300 feet deep, yet if I insist that you could never have seen any reason to believe that it was not a mile square in size, had you stood at any point in it, you will understand how ingeniously it was ordered. It is his boast that it was arranged by the contractor who laid out the Crystal Palace grounds. By cutting off a path on either side; by means of tall hedges, and by piling tons upon tons of dirt in tiny hills at either end and in the middle; by growing clumps of trees here and there, with pavilions and bowery seats beneath them—he had totally robbed his guests of the power to measure the enclosure they walked in. You could not see his house once you got twenty-five feet from it, and at no point could you see either end or either side of the grounds. Of course it was a beautiful garden, with lawns like rich carpets, with flowers radiant and luxuriant as in a hot-house, with trees such as only England can boast, massing their foliage in soft and graceful heaps like clouds of greenery.

"Ah," said he, proudly, "it took years to get it, but now we can boast that, no matter who may try, there is no point from which any neighbor or passer-by can see any one in this garden."

"That must be the English idea," said I. "That must account for the walls I see everywhere, even around enclosures so small that they are kept damp and mouldy for want of sun and air. Why do you take such pains to hide your pretty places from your neighbors and the world? It has struck me as the very height of selfishness. I am used to seeing and half enjoying the breathing-grounds of the rich, but your city mansions and country houses compel me to walk forever beside walls that shut you and your finery in, as if you were afraid that the poor or the strangers might rob you of your luxury by looking at it."

"Not rob us," said this gentleman; "but my idea is this: that if a man can't be private in his own house and garden, why live at all? I demand some one place where I may be unobserved, uncriticised, beyond curious, prying eyes. There can be but one such place—a man's own home."

"But see the difference between the countries," said I. "All over America, in hundreds of little cities, a vigorous movement toward removing all front fences has long been revolutionizing and beautifying our country. Furthermore, where I live, in a town of 5000 inhabitants, the houses are all set in a woodland growth, and the woods, cut in blocks between the streets, are the common garden of all the people."

"Monstrous!" said he. "You could not induce my countrymen to live so. The animals in a menagerie have the better of you, for three sides of their cages are walled up, while you are forever on exhibition."

Quite as typical of his nation was this man's knowledge of all the flowers about him, his familiarity with the names and characters of his trees, his love of animals, as seen in the number of cats and dogs around him, and in the number of cages of birds in the windows and on the walls. If the English have emigrated and built up colonies wherever there was earth to seize upon, it is not strange. "Every Englishman wants his acre," and "At forty an Englishman begins to dig," are two of their proverbs. I was told that the hay crop of little England is as great as the rubber crop of South America, and that points the same moral.

The next home I visited had a garden that the owner was equally proud of, but it was the ordinary English garden of flowers and sward, walled in with a tall stone wall. When we Americans say that our home is our castle, we little suspect how true the phrase is to the average Englishman. His home is a castle into which you may not break, nor even peep.

"I have spent about £20,000 upon this house and lot in one way or another," said this second Englishman, a famous scholar and a magistrate, "and the lease has fifty years yet to run."

"Lease!" said I. There was another queer phase of life I was running upon wherever I went. Continually I heard of men beautifying their homes and building magnificent properties to present them some day to a nobleman or landlord of one sort or another. "Then," I added, "this is all to belong to Lord So-and-so in fifty years?"

"Yes," said he. "In that lord's father's time this thickly built and fashionable suburb was all in farms. This lord's son will be one of the great landed proprietors of England. On every hundred feet is a mansion, and every mansion will go to the son or to his son."

"But you, how do you feel about it?"

"I never think about it. If I were an American I suppose it would trouble me, but I was brought up to it. I am a landlord myself in another part of the country. I live here because it is convenient and a respectable neighborhood. I improve the property because I want to be comfortable. When I die my son will not need to spend much money upon it, or if he sells his lease he will get back a great part of what I have spent, for I have spent wisely. You talk of owning your own home. Man alive! if you own your home while you live, and forty years afterward, what on earth do you ask beyond that?"

What an English home would be without tea, I cannot imagine. What England itself would be without that beverage, it is difficult to conceive. It is no exaggeration to say that one might as well try to fancy New York city without a bar-room. They drink enough liquor in England, Heaven knows—enough to float our navy. But the liquor-drinking is incidental, while tea-drinking is apparently essential to the national life. Where we see advertisements of patent medicines in America, they see advertisements of tea. "O & O Tea," "Tip-top Tea," "Wonderful Tea," "Ceylon Tea"—these words stare at the British from every dead-wall, on every 'bus, in every newspaper. And no foreigner can escape the actual substance or fluid any more than the native can avoid the advertisements. You have tea for breakfast, tea for luncheon, tea at late supper. You only miss it at dinner, but mean while you have had it at five o'clock. If you call on your banker in his office, on your friend in his home, on your fellow-lodger in your hotel, he rings a bell, and tea is brought in with thin slices of buttered bread, or, if ladies are present, with tarts.

Why, the editor of one of the principal newspapers in England told me that every man-jack in his establishment—clerks, reporters, publisher, and editors—has tea at five o'clock every day as sure as that hour arrives. "And it is a most excellent practice," said he, sipping from his own cup in his delightful home; "for it brings all the people together as nothing else could do, and we find out from one another just what each one has been doing or is going to do during the day."

Tea! tea! tea! Was ever a nation so enslaved? Whatever they do, wherever they go, they have their tea. There is no commodity or habit in America to liken to that in England. They cannot eat without it, visit without it, assemble at home without it, picnic without it, or attend to business without it.

And such tea! They say we Americans do not know what tea is. If they know, we certainly do not, for never have I tasted such tea as I got nearly everywhere in England—such biting, strong, nerve-murdering, sleep-dispelling, drug-like tea. I had to weaken it at least one-half, and then I found it aromatic and pleasant—that is to say, as nearly pleasant as that sick-room decoction ever can be to a masculine, coffee-drinking American.

Coffee-drinking, did I say? That reminds me that coffee is murdered in England until one would think that all the delightful visions of the mind and all the exquisite sensations of the entire human system which coffee has created would turn into mighty powers of vengeful evil, and crush that clumsy nation for the cruelty of its behavior toward the West-Indian bean. They know no more how to make a cup of coffee in England than they do how to judge an Irishman fairly. Coffee, soup, and the Irish are beyond the capacity and comprehension of the British intellect. I admire England; she gave me a

Google

delightful vacation, she is the mother of our patriot founders, she is the apostle of Old-World progress, but when the subject of coffee is mentioned in the same breath with a mention of England, my feelings fly away with my judgment, and all I can remark is in keeping with the thought of the American who was told the other day that if America did not do thus and so, England would crush us. "What! *again?*" said the Yankee.

They told me I must go to France to taste coffee properly made. I went to France, and now I know better. America is the only land where coffee is treated with that circumspection, delicate courtesy, and hearty respect which it is capable of extorting from those who have souls to know its worth. They make "black coffee" well in France, and they make that out of a tincture of chiccory called "coffee essence"; but there is a wide difference, in my opinion, between coffee and black coffee. "There are two kinds of good," I once heard a New Jersey farmer say; "good and good for nothing."

As for the drinking of spirits, the thing that surprises an American is the drinking by women in England. I have said that the bar-rooms are often as well patronized by women as by men, and I may add that at Sunday and summer resorts (and on the way to and from them) the frequency with which I met tipsy women astonished me. These were common women, of course, but they were of the class that we denominate "poor" over here. They were not outcasts. But I cannot do justice to that striking phase of life on the other side unless I say that in the fine homes to which I was invited I also found the women drinking. "My wife and I take whiskey," said one gentleman at dinner, "my daughters drink claret; but you have whatever you wish." At one country house which was filled with visitors I lay awake one night when all the ladies came back from a dance. The butler had put upon the dining-room table bottles of whiskey, port, sherry, claret, champagne, gin, and Bass's ale, and as each man or couple came, he asked them what they would have. Of all the ladies, only one declined to take anything. The others took whiskey. The one who declined changed her mind just before retiring, and called to her father from the head of the stairs to bring up a glass of toddy when he came. I mention these two experiences—the lady of the house taking whiskey at dinner, and the bevy of ladies taking whiskey at night—because I never ran across their parallels in this country. The simple facts are, first, that drinking is more general over there, and second, that the human system either requires, or at least can stand, more stimulant in that climate than in this.

The servants are a distinct breed from ours. Their work is performed with cheerfulness, their manners are deferential, their ambition seems to be to keep the family good-will and their own places. I had many talks with men and women about our household service over here, and saw that they knew nothing of what we are experiencing. All hail to caste! A humbug and fraud in every other way, it yet does that much good, it permits servants to be contented, and therefore faithful in their places.

But I had some significant talks with servants who waited upon me at hotels. The girl at Laurence's, in Liverpool, who waits on table in the coffee-room was very anxious to hear about America. Her intended is here, but she was the only servant who spoke to me who was not anxious to come to America. It was *because* her lover is here that she did not want to emigrate. "I'll follow no man that lives," said she. "If I'm not worth fetching, I'm not worth having." But the number of servants, male and female, who managed before I left England to hint that they would like a chance to go to America, and who had "uncles" or "brothers" over here, made a considerable total. One pompous head waiter in London offered to be my valet across the water if I would pay his fare. When it fell out, even upon a chance visit to a friend in lodgings, with whom I took cold luncheon, that the "buttons" who carved the meat desired a "sitooation" in America, I began to feel if George Peabody realized the nature of the choice he had between offering to fit out emigrants to America or building model tenements to keep them at home. It is no wonder he chose the latter course. One more word about English servants. They call themselves so. "I'm only a servant," or, "I went out with another servant," are phrases I heard used as freely as some of ours put on their mistresses' clothing. And they talk about their "characters"—meaning letters of reference—quite in a way to recall old times at home.

If you want a peculiar sensation, find yourself suddenly arm in arm with an English lord without having ever thought how you would address one in such a case. A lord is no better in an American citizen's opinion than a piece of animated clay. He is whatever he proves himself to be—a gentleman, a pleasant fellow, a snob, a blackguard, or whatever. But an American citizen who values himself can never be at ease unless he knows the requirements of the situations in which he finds himself when abroad, and he would be a dullard who would not desire to acquit himself gracefully, whether with a servant or a king. I suddenly found myself arm in arm with a nobleman named Lord Harold Benwick, or so we will call him. He is a bright, witty fellow, has travelled all over the world, has fought tigers, chummed with cow-boys, climbed all the big mountains, lived in the Australian bush, walked across Mexico, bicycled, canoed, jockeyed—done everything a healthy young fellow with plenty of money and no business naturally would do. And now he is devoting himself to public life with such a vengeance that he told me he had not a day in the ensuing three months that did not bring an engagement with it for a meeting of members of Parliament, school boards, charitable societies, or what not. He is a character for fiction, and one that has not been hackneyed. All I can say of the impression he made upon me is that he was as interesting as any man I met, and his title was all that an American could find fault with about him. But when he took my arm there fled from my mind all that I ever knew about how a lord should be addressed, particularly a lord with a courtesy title like his. A noted American told me he was once in the same plight with the Prince of Wales. He'd be hanged if he would call him "Y'r Roy'l Highness," and so he called him "sir," which turned out to be exactly what every gentleman calls him, and what every waiter and servant calls every one else in England.

In my case I would as lief call my companion "your Lordship" as I would call Senator Hiscock "Senator." I would as lief call him "your Sacred Holiness," if that were the thing to do; for in America we probably have more men with titles than there are in any other country in the world, so that any American who thinks to glorify himself by refusing to call a nobleman by his title is inconsistent to the last degree. But what to call Lord Harold, or his Lordship, or Harold Benwick, or Mr. Benwick, or Lord Benwick, I did not know. I solved the problem like a Solomon. I did not call him anything. I behaved toward him as if I had not heard his name. It was at a little place on the Thames, and presently he took a boat with some ladies, and I took another boat with other ladies, and we set out for a turn up the river and back. There were crowds on the river in boats, and Lord Harold, losing sight of us, went toward the wrong side of an island.

"Call to him that he is going wrong," said one of the women in my boat.

"But what on earth shall I call him?" I asked.

"Don't call him 'Lord Harold,' whatever you do," she replied, "or everybody will look at him."

So I called out, "Hello, Benwick!" and he looked around, and all went well. But that, I knew, was too familiar, and what was correct I did not know. Since then, having no more concern about the matter, I have asked no one, so I cannot say yet with positiveness what an Englishman would have called out or called him. But at the time the thing was a bother, and if Americans are going over by the hundred thousand every year I recommend the nobility to wear tags, like the exhibits at a cattle-show, telling citizens of a democracy like me what they consider the proper way of addressing them.

DAY LILIES.

They grew, these lilies, in a tangled skein
Of truant woodbine and of grass half grown;
And when about the new-waked day was blown
In suddenwise a dash of blinding rain,
Three tall white lilies slipped them from their sheath.
Throughout the storm-swept day they stood ablow,
Sweet as if all the way were fair, and lo!
One standing by to whom the years bequeath
Naught of calm weather watched them from her place
Within the shadows. "Shall we know no rest?"
She questioned, as the day sank in the west.
As if in answer, for a moment's space,
One gleam of sunshine from the western deep
Covered the lilies ere they fell asleep.

L. E. T.

WHEELING, WEST VIRGINIA.

Wheeling is the largest city in West Virginia, one of the oldest towns in the Ohio Valley, and has long been the seat of important manufacturing interests. It stands at the mouth of Wheeling Creek, which comes down through the beautiful "bluffs" that form the western foot-hills of the Appalachian Mountains; and a space of flat lands along the Ohio affords a convenient site for factories and business streets, leaving the highlands for the residences of the citizens. The city has now some 35,000 inhabitants, and stretches, more or less compactly, for five miles along the brink of the Ohio. Although a fortified trading-post was built there in Revolutionary times, and a frontier settlement, which was the scene of many desperate adventures, gradually enlarged, the importance of Wheeling began with the completion of the old National Road, which reached the Ohio at this point. It thus became a natural distributing and trafficking point for all the region up and down the Ohio Valley accessible by boats, as well as by wagons, and to this day it retains a large business in freighting and steam-boating upon the Ohio and its connecting waterways.

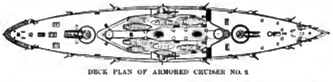
As the town grew the advantages which it enjoyed as a manufacturing point were perceived, and most of the productive industries which now distinguish the place were started at an early day. These advantages were cheap fuel and cheapness of transportation to market. In the early days all carriage of heavy articles, at least, was by boat, and nearly all the consumers lived along the rivers. When, later, railroads superseded to a great extent the river traffic, Wheeling was able to compete with Pittsburgh and other points of production, because the best of furnace coal could be mined only a few miles away by the cheapest methods of level tunnelling and shuting into cars, and because she had a variety of industries which helped one another. The chief of these industries is iron-making. Blast furnaces and rolling-mills are scattered along both sides of the Ohio, and produce vast quantities of bar and sheet iron, and of material for making cut nails, in the manufacture of which Wheeling takes the lead among American cities not only, but leads the world. The iron out of which these spikes and nails are made is manufactured on the spot, out of a mixture of Missouri and Lake Superior iron ores for the most part, and nearly the whole of it is consumed by factories on the spot. In addition to the nail-mills are extensive foundries, and boiler and machine works.

Next to making iron, the glass-works of Wheeling take rank for their importance to the community. As early as 1820 a small factory for making window-glass was set up, and it prospered so well as to attract other makers to the locality, who extended their product to include bottles, cylinders, and a great variety of household articles. The prices of course glass fell so rapidly that the Wheeling factories were soon devoted to making flint, and in a short time acquired a wide reputation. Now, in addition to window-glass, all sorts of fine table-ware, bar-keepers' ware, lamps, and ornamental articles are turned out, which rival in quality of material and in excellence of design and finish anything else of its kind in the country. Thousands of workmen are employed, and the industry is constantly growing.

Tanning leather is another large and natural industry in Wheeling. The best of tan-bark grows in the mountains which lie east and north of the city, and thousands of cords of it are consumed annually in making into harness and sole leather the hides which are gathered from all parts of the country. The making of harness out of this leather gives employment to many workmen. Lumber mills, woollen factories, brick-making, paper-mills, and many other industries might be mentioned among the lesser agencies in the prosperity of the town; and to all of them, as well as to the great iron and glass works, the introduction of natural gas has been an assistance and a comfort. This gas has been brought from the same field which supplies Pittsburgh, and Wheeling has enjoyed all the advantages of fuel, light, and increased household comfort and cleanliness concurrently with the former city.

Finally, in a sketch of the resources of this town, the manufacture of tobacco should not be forgotten. This has grown steadily, and now reaches very large proportions. During the fiscal year of 1889, according to the revenue report to the government, no less than 2,367,270 pounds of smoking tobacco and nearly 6000 pounds of plug were made there. This is an enormous increase since 1875, when the product was only 88,000 pounds. But, in addition to this, the factories of Wheeling sent out something more than half of the 47,000,000 cigars which constituted West Virginia's contribution to the world's supply. Nearly all of these were the famous "stogies"—long, slender cigars, about the size of a lead-pencil, which are made of what is called "Kentucky leaf" tobacco, and are coarse and strong, but inexpensive and genuine.

Wheeling is beautifully situated, its higher streets overlooking the river, up and down, for a long distance. Ranges of hills surround the town, exhibiting upon their slopes a pleasing diversity of cultivated and forested lands, and dotted with fine country residences. The schools of Wheeling were noted long ago among educators, and a free-school system was organized here long before West Virginia became a State, and before any general school system was in operation in the towns of old Virginia. There are also several excellent private academies for both sexes. Under this influence, and fostered by the wealth and assured position of the old families of the locality, a cultivated and interesting social tone dominates the city, and a long list might be made of men of eminence whose early if not their life-long homes were in this pleasant city.



DECK PLAN OF ARMORED CRUISER NO. 2

NEW MEN-OF-WAR.

On the 10th inst. bids were opened at the Navy Department for the construction of three more vessels to be added to our navy register. These three are the last, with two exceptions, for which Congress has made any appropriation to date. The two exceptions are the ram and the submerging monitor, and in the case of each of these there are certain difficulties of construction to be overcome before they can even be offered for contract. So that the three ships referred to—the 5500-ton protected cruiser, the 8100-ton armored cruiser, and the practice ship for the Naval Academy—virtually complete the list of vessels to be added to our naval force until the next naval appropriation bill becomes a law.

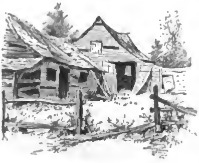
The practice ship is a small vessel, intended, however, to have all the improvements developed by modern naval science, and to be used by the cadets at the Naval Academy instead of the old *Wyoming*, which has for so many years been their sole reliance. The lowest of the two bidders for the construction of this ship was the firm of A. F. Wheeler & Co., of Bay City, Michigan, so that it is probable that this vessel's keel will first touch *fresh* water, and come around by the canals to its permanent home at Annapolis.

For the construction of the 5500-ton cruiser there was but a single bidder, the Union Iron-Works, of San Francisco. A picture of this powerful man-of-war, with a full description, has already been given in the Weekly.

The armored cruiser of 8100 tons—a sketch of which accompanies this article—is the most powerful and the largest vessel yet authorized to be built for our navy, and will be the largest vessel of any kind ever built in this country. To her planning and development Secretary Tracy has given especial personal attention and careful study, and it is believed that she will prove to be the finest vessel of her class afloat. The department gave bidders an opportunity to bid on the plans prepared by Chief Constructor Wilson, carrying out the Secretary's ideas, and which are the ones illustrated this week, and also on their own plans, drawn in accordance with a general circular issued to ship-builders. To give our readers an idea of the expense of preparing such plans, it is said that one firm spent $7000 in preparing their specifications and designs. The Union Iron Works of San Francisco were the lowest bidders ($3,100,000) on the department plans, and W. H. Cramp & Sons ($2,985,000) were the lowest on their own plans. A third firm, Risdon & Sons, from the Pacific coast also, put in a bid of $3,450,000.

One feature of this great ship that is different from any other is the reintroduction of the quarter galleries which used to be so prominent in the old frigates and ships of the line. Armored cruiser No. 2—the *Maine* being No. 1—is to have a length on main water-line of 350 feet; breadth, 64 feet; and draught, 24 feet. Her battery is to be six 8-inch breech-loading rifles of 35 calibres, twelve 4-inch rapid-fire guns, four 6-pounder rapid-fire guns, four 3-pounder rapid-fire guns, four 1-pounder rapid-fire guns, four 37-millimetre revolver cannon, four rifle calibre machine-guns, six launching tubes for torpedoes. She will require 400 officers and men, must show a minimum rate of speed for four hours of 20 knots, and have a total coal capacity of 1150 tons. The barbette turrets to the forward and aft 8-inch guns will have a thickness of 10 inches, with shields of 7 inches, and the shields protecting the 4-inch guns will be 4 inches thick. The conning tower is to be at least 7½ inches. Six boilers; twin screws; engines triple expansion, four in number, two on each shaft, and in two compartments. The hull is to be of steel, not sheathed, with double bottom. Two military masts with fighting tops, to carry no sail. She is to be fitted as a flag-ship, with admiral's quarters, etc.

Protection of the hull is to be afforded by means of a steel deck, worked from stem to stern, and supported by heavy beams. The edges of this deck amidship are to be 3 feet below the water-line at the centre of the vessel. On the slopes of the deck, over machinery and boilers, the armor is to be 6 inches thick; on the horizontal portions it is to be 3 inches thick; forward and abaft the machinery and boilers, to stem and stern, the deck is to be at the thinnest part at least 2½ inches in thickness. Below its protection are to be placed all that is ordinarily styled "the vitals of a war ship." Protection of the hull against injury to the water-line region is to be afforded by means of an armor belt 5 inches in thickness, extending the entire length of the machinery space. Within this armor belt and skin plating, and above the armor deck, a belt about 3 feet 6 inches wide of woodite (or other water-excluding material) is to extend the whole length of the vessel in depth, from the armor deck to the berth deck.



FARMING.

II.

is not always the easiest matter to de-
how to go about a thing after you have
up your mind to do it. Every one
a where to go for the best Spanish olives,

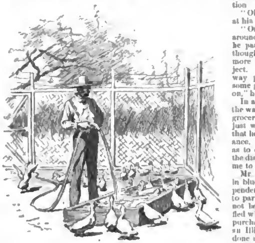
"Doubtless you are right," I exclaimed, "but I have no city property to offer."

"That has nothing to do with it," she replied, tapping the floor lightly with her slipper. "I think the best thing for you to do is to go out and look at the place."

On the following morning I purchased an excursion ticket for Cranberry Corners, the nearest station to Dove's Nest. I enjoyed the ride very much, as it took me through a farming country. At every station I noticed there were nothing but farmers standing around, looking at nothing in particular, and seeming to be fairly stupid from content and lack of care. This, I concluded, was a proof of the farmer's independence, which before I was unable to appreciate. If he can work a farm, and still spend half his time at the railroad station, and retire for the night at 8 P.M., he indeed, enjoys an ideal existence. I was disturbed in these optimistic visions of a bucolic existence by two men who boarded the train at Bulrush Centre, and took a seat just behind me.



"I tell you," said the first man, "if you ever settle out here, you want to keep away from Swellmore. If the local dealers once get a mortgage on you, you're gone."

"Didn't you live in Swellmore at one time?" asked the second man.

"Yes, for seven years."

"Why did you stay so long?"

"I staid two years because I liked it, and five because I couldn't get out."

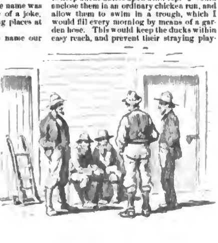
This shattered my popular metropolitan belief that it only costs five hundred dollars per annum to live in the country.

"Did you hear about old Bill Freeman's bad luck last spring?" asked the first man.

"No. What happened to him?"

"Why, all his ducks and geese were swept away in a freshet—never recovered one of them."

I made a memorandum in my mind never to keep ducks unless upon a hill-top. I would enclose them in an ordinary chicken run, and allow them to swim in a trough, which I would fill every morning by means of a garden hose. This would keep the ducks within easy reach, and prevent their straying playfully away to lay eggs on the adjoining farm.



I might have learned more from the men sitting behind me, but just then the conductor shouted, "Cran-berry Cor-ners!"

I stepped off the train and over to the only store in the place in quest of information.

"Can you direct me to Dove's Nest?" I inquired of the neck-whiskered proprietor, in my jubilation forgetting that he would not know the place by the name Philada had selected for it.

"The which?" he inquired.

"W. L. Stoker's farm, I mean."

He led me to the door, and said: "You want to go down that road a mile and a half, until you come to a big oak; then turn to your left and walk down the turnpike two miles, and you will see a little white house. That's where Lem Sikes lives. Lem will tell you where Bill Stoker's is."

"If I could find a conveyance," I said.

This suggested an important business mission.

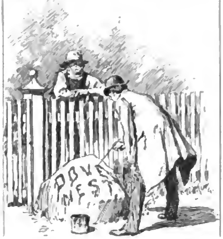
"One o' them lawyer chaps a-comin' up to foreclose on Bill?" he asked, as he stroked his whiskers in deep meditation.

"Oh no! I want to look at his place."

"One o' the finest farms around these parts." Then he paused for a moment, as though there was nothing more to be said on the subject. "I'm goin' down that way pretty soon to deliver some goods, and you can hop on," he continued.

In a short time we were on the way to Dove's Nest. The grocer was so anxious to know just what I was going to do that he was too full for utterance. He was even so kind as to drive me the whole of the distance, and to introduce me to Mr. Stoker.

Mr. Stoker was picturesque in blue overalls and one suspender. Although he wanted to part with his farm, it was not because he was dissatisfied with it. He had recently purchased a windmill from an Illinois concern, and had done so much in the way of praising it that others about the place followed his advice and bought one. This so pleased the Illinois concern that it offered him a good commission to travel in its interest. This, of course, satisfied me that I could make my own terms.



"Suppose I rent the farm just as it stands, stock and all, for a year, with a view of purchasing or giving up at the end of that time? That will be long enough for me to ascertain if I like farming, and for you to learn whether or not you are endowed with the drumming gift."

He ran his fingers through his iron gray hair and filled the air with bran. Then he said, "I'll take your offer."

We walked over the place, and he explained everything. The windmill I liked very much, because it gave the place a Dutch effect. The pigeons were circling in the sun about the walnuts, and the white ducks were floating listlessly on the silent pools in chaste armadas.

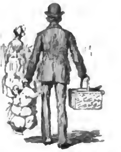
"How soon can I take possession?" I asked, in an outburst of heart-felt enthusiasm.

"Next Monday," he replied.

I then borrowed a pot of black paint from him, and on a large stone at the gateway painted "Dove's Nest," as a surprise for Philada.

That night we sat up in the flat until after midnight, talking the matter over, and on the following Monday our effects rolled gracefully from the flat, the movers, with their usual contempt for care and the elements, having packed the tin and china-ware on the bottom of the truck, and the plush-covered furniture and mattresses on top.

Philada tripped lightly on, holding Philip



by the hand, wishing, as I afterward told her, to impress the public with the idea that she was not even personally acquainted with poor me, who trudged on behind, holding in my left hand a cage containing a petulant parrot, and in my right a basket about two sizes too small for the tomcat within.

R. K. Munkittrick.

Note.—The first article of this series was published in No. 1746 of Harper's Weekly.

WHERE SUMMER BIDES.

Down through the mountain's silver haze,
Down through the song-thrilled wooded ways,
And 'midst the meadow's drenched grass,
The feet of Summer swiftly pass.
"Stay! stay!" the yearning mountains cry.
"Stay! stay!" the drowsy grasses sigh.
But on and on the sweet guest flies,
With wind-blown hair and wide still eyes.
On, on, until her eager feet
Abide amidst the yellow wheat.

Lucy E. Tilley.

WHEREVER MALARIA EXISTS,

The bilious are its certain prey. In intermittent and remittent fever, dumb ague and ague cake, the liver is always seriously affected, and the blood contaminated with bile. One of the chief reasons why Hostetter's Stomach Bitters is such a sure defence against chills and fever and every form of malarial disease is, that it does away with liability to the disease, by reforming irregularity of the biliary organ in advance of the arrival of the season when the disease is prevalent. There is no finer fortifying preparative for those about visiting or emigrating to a locality where the miasma taint exists. There is no certain immunity from disease in an endemic or epidemic form to be secured by the use of the average tonics and antispasmodics. But where quinine fails the Bitters succeeds both in preventing and curing. Moreover, it removes every vestige of dyspepsia, and overcomes constipation, rheumatism, inactivity of the kidneys and bladder, and tranquillizes and strengthens the nervous system.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—
[*Adv.*]

Sufferers from sleeplessness, kidney or bladder trouble, or any chronic malady, should address Dr. J. Charles, Richmond, Ind., who will mail to you an illustrated book *free* that will be worth its weight in gold.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

The demand for Nicholson's Liquid Bread is unprecedented. Orders from all parts of the country show its increasing popularity. Try it. Ask your grocer or druggist for it.—[*Adv.*]

Burnett's Cocoaine is the best and cheapest Hair Dressing in the world.—[*Adv.*]

If you suffer from looseness of bowels, or fever and ague, Angostura Bitters will cure you.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER. Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

USE BROWN'S CAMPHORATED SAPONACEOUS DENTIFRICE for the TEETH. DELICIOUS. 25c. —[*Adv.*]

Burnett's Flavoring Extracts are the best, the strongest, and most healthful.—[*Adv.*]

THE ELECTION LAW

ONGRESS will undoubtedly pass a national election law like the one now pending. This ought t to be surprising, because the relief of the sup essed vote in certain districts has long been one of e most positive party policies of the majority. The t of the suppression is not denied, but defended e Governor of South Carolina said two years ago at "only a flimsy statute, the eight box law," ood between the white race in the State and black le. The eight box law is a device to annul the lored vote by multiplying ballot boxes, labelling em, and requiring the ballots to be placed in the oper box or thrown out of the count. As the col ed voters are generally illiterate, and as they can helped only by white Democrats, this scheme tends prevent voting, and to throw out much of the vote st. The suppression is not denied, and it affects most exclusively the Republican vote. The Con itution authorizes the regulation by Congress of the times, places, and manner of electing Representatives, and Congress is now controlled by a Republican majority. Under these circumstances it is not surprising that an election bill is proposed.

Speaker REED, in discussing the question, says that the general objection to colored voting that it gives power to a barbarous majority does not apply to national elections, because there is no possibility that negroes should acquire control of Congress. But this argument is irrelevant upon his postulate that the suppression of the colored vote is an intolerable injustice. This implies that, however barbarous it may be, its suppression is not to be tolerated. This, and not the fact that it would not acquire control, is the real argument. The Speaker would hardly offer as a reason for not suppressing a particular lawful vote in Maine that it was not large enough, if cast, to carry the State, because such an argument would imply that if it were large enough it might be suppressed. The only valid reason that could be urged for the proposed law is that it would relieve a suppressed lawful vote, not that the vote, if relieved, would be inconsiderable. If Mr. REED'S implied concession that locally there may be some excuse for the suppression of the colored vote should be accepted, the national constituency might very logically object to the injection of a barbarous element (as the argument claims it to be) into the national council.

The real argument for the bill is not Mr. REED'S. The real argument for any such bill is that there is an acknowledged suppression of a lawful vote for which local law and feeling supply no remedy, that Congress has power to provide a remedy, and that the proposed law will be effective. The last is the chief consideration for Congress. If circumstances, experience, and general knowledge of the situation authorize the belief that the method proposed instead of relieving the situation will make it worse, it would be extremely unwise legislation. Statesmanship consists largely in adapting means to ends, and in the comprehensive and sympathetic knowledge of the circumstances to which laws are to apply. The Republican party is entitled undoubtedly to all its honest votes. Despite "blocks of five" and "soap," it is no more inclined to dishonest voting than Tammany and the Democratic machine. But we have not yet seen the Republican argument which demonstrates that in the present condition of local feeling regarding the colored vote the proposed law will in the slightest degree affect the situation from which the suppression of the vote springs or relieve the vote. Until that is done the proposed election bill is neither wise nor patriotic legislation.

THE CHANCE FOR THE CITY.

IN reply to a question whether he would approve a non-partisan ticket for city officers, Collector ERHARDT is reported to have said that he is a Republican, that he believes in Republicanism, that we want good Republicans nominated for office, and that he had "never been able to see any good come of coquetting." This was not a plain answer, but it shows a disposition, and it is to this precise disposition that the city of New York owes the disgrace of Tammany rule. For if honest citizens, who desire an honest care of the streets and lighting and sewers and all the public services for which a city government is instituted, would select the proper officers with no more regard to their politics than to their knowledge of Greek or music, New York would be a well-governed city. But so long as intelligent New-Yorkers permit their votes for such officers to be determined by a knot of politicians "on the make," they will confirm and perpetuate Tammany rule.

Year before last the nomination of Mr. ERHARDT for the Mayoralty could have, as it had, but one result, the election of the Tammany candidate. If Mr. ERHARDT had declined to accept on the distinct ground that the welfare of the city required the defeat of Tammany and the continuance of Mr. HEWITT in office, Tammany would have been unquestionably defeated. Mr. ERHARDT'S insistence upon the fact that he is a Republican, which is not questioned, is no more relevant to the question of the city government than the fact that he is Collector of Customs or an attendant upon a certain church. To say that his reiteration of the fact that he is a Republican means that he believes any Republican Mayor would be better than any Democratic Mayor is amusing, but not to the point; and to interpret his remark as meaning that in general it is better to have Republicans in office is futile, because if that were the accepted ground of municipal voting there could be no Republican Mayor. The city is overwhelmingly Democratic, and if the citizens are to vote for city officers as partisans, the Mayor will be always Democratic, or Republican only by a bargain.

The difficulty of escaping Tammany domination is shown not only in the reported remarks of Mr. ERHARDT, who is a good representative Republican, but by Democratic remarks. Ex-Secretary WHITNEY is a good representative Democrat. He is reported by cable from Paris to have said that Mr. STEINWAY, another Democrat of the same kind, would be a capital candidate for the Mayoralty. But Mr. STEINWAY declares himself to a reporter as thinking Mayor GRANT "a thoroughly satisfactory Mayor"—a remark that might have been made of DE WITT CLINTON or ABRAM HEWITT. Mr. STEINWAY finds nothing but an excellent joke in Mayor GRANT'S gift as godfather. Now if Mr. WHITNEY and Mr. STEINWAY, who are excellent citizens and reputable Democrats, and Mr. ERHARDT, who is a Republican of the same kind, hold these views, and so tend to prevent any other than merely partisan government of the city, it is encouraging to reflect that the new ballot law makes independent movements much more practicable and promising. In all political movements organization is indispensable for success, but much of the old labor and cost is saved by the provisions of the new law. The proposed union of citizens who are less anxious to be known as Republicans and Democrats than to secure honest and efficient administration of local affairs is not made too soon, and deserves the earnest support of the great body of intelligent New-Yorkers.

A CHARITY SERMON.

THE proposition to establish a co-operative charitable board among the various Episcopal churches in the city as an exchange to promote a general understanding and prevent the enormous waste of money, time, and energy which springs from the want of general understanding and organization, is a good but very imperfect scheme. There is a larger and better one of the same kind already in operation, and the local multiplication of such agencies is not desirable. The ingenious devices of professional pauperism keep pace with those of charity. Nothing, indeed, more nobly distinguishes the last quarter of a century than the immense quickening of the charitable impulse and the enormous annual gifts of private persons for charitable relief. But corresponding to this is the immense waste of this fund of benevolence and the development of the pauper class. Sentimentality greatly perverts and prostitutes the charitable impulse, and although scientific charity is derided as mechanical and heartless, it cannot be doubted that sentimental charity is a greater evil.

It is demonstrable that the larger part of the alms which are ignorantly given promotes drunkenness, poverty, and crime. It is very much easier to give a dime to a beggar in the street than it is to ascertain whether you ought to give it, and whether you are not doing evil instead of good. The duty of giving is not greater than the duty of giving intelligently. Indeed, alms-giving is not necessarily charity, and the Jack Horner emotion of giving a dime, which is immediately changed into a dram, is a ludicrous but very mischievous conceit. But even the highly organized and carefully administered charities of church societies are outwitted by clever professional paupers. There are multitudes of these last who enjoy a regular stipend from several societies, and in this and other ways in which relief is reduplicated the aggregate waste of relief is enormous. As every denomination maintains its own system of charitable relief, each overlapping the other, and all combining not only in a general waste, but in confirmation and extension of every kind of ingenious pauper swindling, the obvious course is a general organization of the work of all such societies to secure the utmost honesty, thrift, and efficiency in charitable relief.

This, as we understand, is the purpose of the Charity Organization Society, which has been established for some years, and with the best results. One of its great virtues is its total freedom from sectarian character or control. It welcomes every denomination by making no denominational distinctions, and it offers to every church, as to every individual, the opportunity of making charity as effective as it is economical. This is the only way to prevent the confusion and waste and mischief of independent sectarian action in such a community as this city. While each denomination maintains the exclusive and even jealous administration of its charities there will be a vast multitude of recipients who live upon the aggregate alms of many churches. But if the ample charitable resources and energy and intelligence of all the churches were combined and organized in a single agency thoroughly manned and equipped, not for sectarian proselyting, but for charitable aid, the present charitable fund of the city, without the addition of a dollar, would be practically doubled, and the moral and social and humane results would be incalculably increased. Something of this may be achieved by the union of the different societies of one denomination. But it would be accomplished very much more completely and satisfactorily by the union of all the societies of all denominations in such an agency as the existing Charity Organization Society.

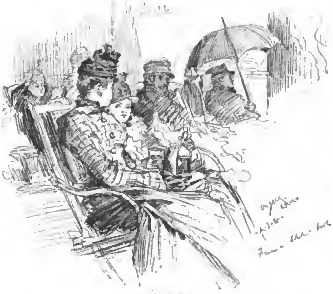
THE TEMPERANCE CONGRESS.

THE late meeting of the National Temperance Congress was a scene of most intemperate rhetoric, and could have been of no service to any good cause. The better method of dealing with the question of drunkenness or the sale of ardent spirits as beverages is a very difficult one, upon which public opinion will not be hectored or bullied. This important fact was

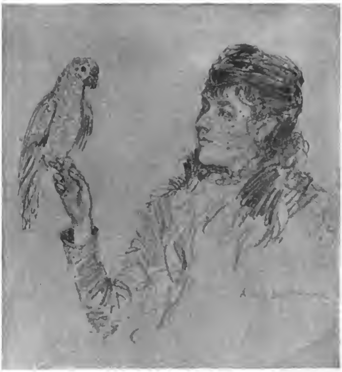
SCENES IN THE STEERAGE.

The steerage from Liverpool to New York is one thing; the steerage from New York to Liverpool another. It is on the first named voyage that one sees the wretched creatures huddling in groups like animals, shivering in abject terror at the motion of the water, croaking hoarsely in the obscure patois of remote European villages, and mumbling prayers at impromptu shrines. But after a few years in America a great change takes place. The men and women—Irish, Scandinavian, Hungarian, Italian, or what not—are no longer slaves to their own ignorance, poverty, and superstition. The women, most of them, have been living out at service, and feel themselves as good as their mistresses, if not better. The men have become American voters, and, as such, the superiors of any; that is to say that each one has probably voted oftener and more effectually than any native-born American of the same age. They own houses and land, and have drawn a little from their balances at the banker's to come over and dazzle the old folks at home. It is not from necessity they travel in the steerage, but because there they can feel at home and smoke their pipes at ease.

Some of the groups seen from the upper deck in daylight have individual character. There is a young fellow with his bride; they are on their wedding tour; in sickness or in health he holds her rough red hand in his, and she clings with equal affection to his horny palm. An alderman, or a cousin of one, is there, accompanied by his slatternly wife and seven small, shrill children. The wife wears showy jewelry, and is too proud to comb her hair. The unkempt children, supposed to be infant Pattis and Tamagnos, pass incredible hours shrieking such songs as "Home, Sweet Home" and "Where did you get that Hat?" They sing from one side of the mouth only, after the manner of Ned Harrigan.



ON DECK



TRAVELLING COMPANIONS

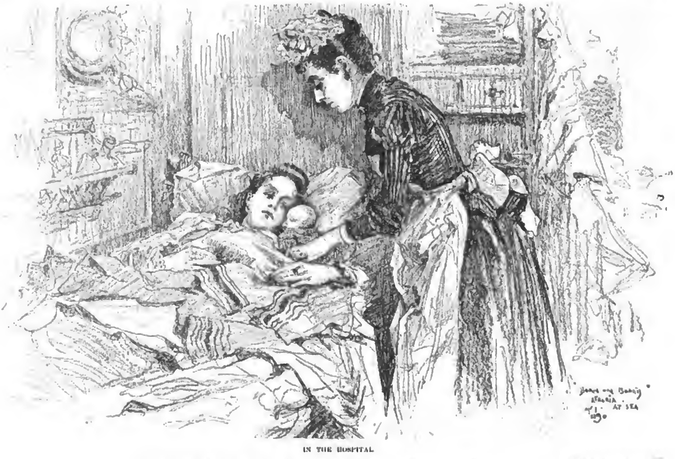
The chamber-maid from Fifth Avenue and the laundry-maid from Gramercy Park chaff the butler from Madison Avenue and the coachman from Washington Square with a finency peculiar to high life below stairs. Here they discuss domestic secrets, and when they feel merry and the weather is fine, give capital imitations of their employers.

A discipline almost military prevails on board the most careful of the Atlantic steam-ships—a discipline absolutely military, so far as the steerage is concerned. The steerage can never be romantic save in the dark. Perhaps the only scene of any poetic interest is the one to be observed when at nine o'clock in the evening comes the order, "All women below." The half veiled moon sheds a pleasant darkness, which is shivered and rent in places by the ship's electric lights. An officer peremptorily enforces the order, and, willy nilly, the women form in line and disappear down the steep gangway that leads to their quarters. Some of the men remain indifferent, but most of them hang about bidding sweethearts, wives, or little ones "Good night." Sometimes they take up the refrain of the old song, "Good night, Ladies," with the last words lost in the swish of the waves as the doors of the hatchway close on the last struggling female form.

Sometimes on board an Atlantic steamer an incident occurs which causes human sympathy to bridge for an instant the gulf between the first cabin and the steerage. As when, for instance, on the first day of May a young married woman in the steerage became the mother of a tiny girl, and in mid-ocean the passenger total was suddenly increased by one.

Great was the excitement among the children in the first cabin when they heard there was a new baby in the steerage.

"It's such a long way for an angel to fly without resting," explained Phyllis, aged six, to Lillian, aged four, "that they don't often bring them to ships. But I s'pose he just felt



IN THE HOSPITAL

SKETCHES ON A CUNARDER, EASTWARD BOUND.—DRAWN BY ARTHUR J. GOODMAN.

like coming, it was such a lovely moonlight night."

"I wish the angel had brung it to me," whimpered Lillian. "I heard the doctor tell mamma that the mother who got it was only a little girl."

"Don't cry, Lillian," says Phyllis. "You know Polly, our stewardess? Well, she says it's awful pink, and they're going to call it Mayflower. Isn't that nice?"

"Oh, my!" says Lillian. "Let's get a lot of presents, and go ask the governess if she won't borrow it and let us baptize it."

The baptism is postponed, but presents arrive, and from all quarters. Flannels, wine, bonbons, and toys find the mother and child in the steerage hospital. The toys are perhaps a little premature for a miss just three days old. But the children who send them refuse to be denied the pleasure of giving, and the prudent grandmother carefully puts them away against the time when they will be needed.

The hospital nurse, a comely young woman in a neat black dress crisp apron, and dainty lace cap, holds the little mite on the pillow by the proud young mother while the ship tolls and tosses, and the artist, braced against the doorway, sketches the sympathetic little group for HARPER'S WEEKLY. The hospital is neat and ship shape, but very small. While the artist sketches, the happy father and doting grandmother stand outside, and vainly try to moderate their delighted smiles. They are all going to visit the old home in Scotland, and the grandmother explains that although little Mayflower "is a wee bit bairnie noo, she'll aye be bigger coomin' back."

MINNIE BUCHANAN GOODMAN.

AMERICAN SPORTING CLUBS IN CANADA.

BY EDMUND COLLINS.

THE industrial territory of Canada belongs to England; a great portion of the hunting and fishing territory belongs to the United States. New Brunswick and Quebec are for sportsmen the banner provinces. The great St. John River, winding from the sea through the heart of the province, and projecting its streams into Maine, affords almost every kind of exercise for rod and gun together, with scenery alternating from the wildly picturesque to the delicately beautiful. The Miramichi, a great inland sea at its mouth, and bordered along its upper branches with hill, valley, and primeval wood, has been the cradle and the haunt of the finest and most gamy salmon for ages. Then there is the Restigouche, stretching in from the sea in wide, blue, shining coils for hundreds of miles, and sending its feeding streams into regions in Quebec where the sound of the woodman's axe has never been heard. Along these great rivers numerous preserves of well-stocked land and teeming pools are set apart, and by far the greater number and the most important ones belong to sportsmen from every part of the United States. These facts are not known to the Canadian people, nor is there a record of them in the provincial Crown Land offices, for the leases are given and the revenue drawn merely for the sake of adding to the income of the Crown Land Department. They are sore pressed in some of these provinces, notably in Quebec, New Brunswick, and Nova Scotia, to make up an income equal to expenditure, and for this reason the lands of the crown have almost entirely passed into other hands. The disposal of the public lands to American citizens is a subject that the Crown Land offices do not care to discuss; if it comes up in the Legislature, they say that they have no official statistics, and this ends the matter. Moreover, several members not belonging to the government join with other persons in acquiring a tract of sporting territory, disposing of the same afterward, at three or four times the first cost, to Americans of wealth and leisure.

Pre-eminent among all these clubs in Canada stands the Restigouche Salmon Club. Nearly all its members are Americans, and include Henry W. De Forest, secretary, William K. Vanderbilt, Franklin E. Taylor, Philip Schuyler, Goold H. Redmond, Henry T. Sloane, William H. Scott, Stanford White, Arthur D. Weekes, William E. Dodge, Nathaniel K. Fairbank, Robert G. Dun, S. Weir Mitchell, Rev. William S. Rainsford, G. Von L. Meyer, Robert Goelet, Henry B. Hollins, Gilbert E. Jones, Francis L. Higginson, A. Lawrence Mason, John S. Kennedy, William Hall Penfold, James C. McAndrew, Samuel Thorne, Charles P. Horton, James J. Hill, Frank Thomson, J. Hart Welch, Frederic S. G. D'Hauteville, Frederick L. Ames, Bayard M. Brown, Heber R. Bishop, Julius Catlin, Jun., William L. Breese, John L. Cadwalader, Francis Bartlett, William P. Clyde, and Charles Carroll. A large number of these gentlemen are New-Yorkers.

There is not probably anywhere in the world a more picturesque range of territory than that owned by this club. The great river itself, as it progresses toward the sea, becomes leisurely and smooth, and its volume of water is very large from the streams that it receives in its course. The view from the site of the club-house is grand and beautiful, the Restigouche on the one hand treading its shining course through the hills beyond the reach of glass, the Matapediac winding down from its own territory and discharging its water into the main river within gunshot of the home of the clubmen. High cool hills, crowned with fir and pine, birch and maple, rise on either side of the valley, and stretch upward along the shining rivers till lost in soft blue haze. On the hottest day in summer there is a breeze stirring through the valley, and it is always delightful on the hills. You may drink the clear river-water, for it has come from unpolluted regions, through wholesome forests, and over clean rocks and gravel beds.

The railroad station is near at hand, but there are only a few inhabitants. The cluster of buildings belonging to the club-house affords plenty of room for club members and their families, and the household conveniences and table luxuries are almost equal to those in the city. Some clubmen reach the ground early in June. Dr. Rainsford likes to claim the earliest trophies, and he is already announcing his successes. The extent of territory under lease by the club is enormous, and its riparian property along the main river is very valuable. As the question of riparian rights has so long disturbed Canadian settlers who live along the rivers, I may explain that the courts have decided that any person owning a *ripa*, or bank, fronting a river has the right to take fish in the water fronting his property. Murders have been committed in these wildernesses over the question before it was settled. The Restigouche Salmon Club therefore bought the land property along the best fishing parts of the Restigouche, and put the question of their exclusive right to fish beyond dispute. In addition to the Restigouche "privilege," the club holds, under lease, almost all the government lands from the Matapediac to Tracey's Brook on the New Brunswick side, a distance of about fifty miles, and it is also the lessee of the Quatawamkedgwick and Patapedia rivers, both tributaries of the Restigouche. But they do not fish the latter two streams, merely holding them in guardianship, as they are favorite spawning resorts of the Restigouche salmon. The club owns three or four fine lodges, situated in different parts of their territory, now visiting one and now another, according to the condition of fishing in the district.

The men and women usually wear strong light-colored clothing. Some of the ladies are as expert with the rod as the men, but many of them call for assistance before the fish is landed. The thirty-pound salmon does not surrender without a brave struggle, and frequently takes his captor far up or down the river. Many of the men prefer wading, though others, and all the ladies, fish from canoes and other river boats, or from the bank. There are almost as many grilse—the grilse being a year short of salmonhood—in the Restigouche waters each season as full-grown fish.

The chief flies used are the jock scott, silver doctor, black doe, dusty miller, and dark and orange fairies. The abiding places of the salmon are the quiet dark pools to be found along every river, and in one of these you will often see as many as a dozen grilse and salmon. When spawning time comes the old fish move out on the shallow gravelly beds, where they burrow and rub till a hole is made large enough to receive the eggs. Here the ova remain till the following spring, when the little salmon come forth. There is not much poaching on these waters, probably because the club spends about $4000 a year for protection. The largest yield on the main river and its streams for a season was 801 fish, aggregating 14,288 pounds, or an average of about eighteen pounds for a fish. A great many salmon taken there range from thirty to thirty-five pounds. As there is plenty of ice to be had, these fish are carefully packed in refrigerators and sent to the homes of the club people.

When fishing becomes monotonous for the ladies, they take their cameras or sketch-books to the more picturesque places. Sometimes they play tennis, amuse themselves with bow and arrow, or go on botanical excursions. On wet days all remain in-doors, reading and playing different games, or the ladies are busy with their needles. The flies are numerous and bloodthirsty, but a netted head-protector is worn, and very broad-brimmed hats are used for the sun. When the scenery at one place begins to pall, they break up residence, take tents, and go off in their canoes to some spot with fresh charms. Thus is the season spent in one round of exhilarating and delightful change. Every one gets weighed before starting for the fishing-grounds, and weighs again on the return. And what a difference! Several members of this fine club are already on the ground.

Sometimes a piece of wilderness is leased by the Crown Land Office and the officials do not know what the territory contains. I am sure this was the case when Mr. Emile Hartzig became lessee of the Renous River. This place would gladden the heart of any sportsman. The Renous is a branch of the Miramichi, and is resorted to every year by myriads of sea trout, while its upper waters are the spawning and abiding places of vast numbers of speckled trout and sea trout. The main part of the Renous is twenty miles long, and is inhabited for about eight miles up from the mouth. There are two branches, one running north, and the other south, each about thirty miles long. The lease includes all the lakes and ponds discharging water into the river and its branches, and the land lying between. Mr. Hartzig informs me that there are no fewer than twenty good-sized lakes in the territory, all swarming with fish. Only a few of the lakes appear on the government map. The scenery is bold and fine, and the forests in a great many parts of it are in a primitive state. Bears roam through the woods, and the fisherman often sees moose and caribou dash into the water to escape the heat and the flies. The head-quarters are but thirty hours by rail from New York city. Several gentlemen have the use of the grounds, among them being John M. Johnson, of Norwich, Connecticut; Archibald Mitchell, of the same place, Clarence M. Rolf and F. D. Storey, of New York. It is a curious fact that the sea trout, like the salmon, after its long wanderings through the sea, returns to the same brook where it first saw the light. It leaves its cradle waters when a mere baby fish, and wanders hundreds and hundreds of leagues about the sea, but nearly always, with unerring instinct, returns to its native river. Wardens and trained fishermen often see a silver-trout or a grilse, which has mistaken its way, getting into the wrong stream. It swims back and forth in a bewildered way, and after having satisfied itself that this is not its brook, it turns and swiftly makes its way to the coast again, and once more begins to explore. Mr. Hartzig's river is also a very fine salmon resort.

A very attractive stream, which is well stocked with salmon, is the Upsalquitch, a branch of the Restigouche, which river it enters from the New Brunswick side, about six miles above the Matapediac. Ezra Fitch, of Waltham, Massachusetts, is the lessee, and it is frequented in summer by several American fishermen. The surroundings are picturesque, and the water clear, cool, and rapid; but there are many fine pools.

At the mouth of the Upsalquitch is Camp Harmony, a delightful fishing lodge, the property of Dean Sage, of Albany. The salmon run early here, and the fishermen reach the ground in the first part of June. Captain Sweeney, also of Albany, is the riparian owner of several good salmon pools near the mouth of the same stream. He has a comfortable lodge, to which he brings members of his family, and several friends with their families. Canoes, pirogues, and batteaux are used on the river. There is charming scenery for ladies who are expert with the pencil.

Below Captain Sweeney, on the Restigouche, are two fine privileges—one, on the New Brunswick side, held by William H. Sage, of Ithaca, New York, the other, on the Quebec side, being under lease to W. Forest, the actor. The lessees visit these preserves each year, in company with many friends, and several ladies are to be seen in the canoes, rod in hand. Then, a short way up the Upsalquitch, on the New Brunswick side, are the fishing places of Mr. Clyde, of 85 Broadway, New York city, and Messrs. Olcote and Lansing, both of Albany. They own a beautiful lodge with picturesque surroundings. There are several pools in which there are always abundance of grilse and salmon. On the Quebec side of the river is the pretty cottage, waters, hills, and valleys leased by Mr. McAndrews of New York. This lodge and its surroundings form a wild lyric. In the background is a high, steep hill, green the year round; great bowlders have fallen from its side, and gleam among the trees that shade the building. Near by come roaring down the cool waters of Toad Brook. Mr. McAndrews's family and several friends occupy the lodge nearly every summer, and a fleet of Micmac canoes dart hither and thither, with two fisher-folk in each. Along the beach are to be seen several birch-bark camps, but they are screened from the sun by trees. Mr. C. Fearing and some other New York gentlemen own some populous pools on Brandy Brook, about four miles further up. There is a handsome lodge in the heart of the fishing-grounds, and the spot is excellent.

Archibald Rogers, of Crumwold Hall, Hyde Park, on the Hudson, has several large shady pools by riparian proprietorship, just below the wild and picturesque Kedgewick, and is lessee of the ten-mile stretch extending from the latter stream to Tracey's Brook, all being very good salmon water. The scenery is bold and diversified, and the water clear. About four miles above the mouth of the Nepisiquit is an inviting lodge, owned by Ivers W. Adams, of Boston. The pools are the best known on the river, and the fisherman never comes away from them empty-handed. Mr. Ivers usually fishes with Mr. Sampson, of New York, and other friends have the privilege of the waters. But C. B. Burnham, of St. Louis, is the lessee of all the government waters on this river, and he has associated with him several American fishermen. These preserves comprise about all the sporting territory, save that occupied by a few local clubs, in the northwestern part of New Brunswick.

On to the eastern side of the province is the region drained by the Miramichi, and here are several extensive tracts of fishing and hunting territory held under lease and riparian right by Americans. It will be well advanced in June before fishermen and their families go to the Miramichi waters, as neither salmon nor sea trout, as a rule, ascend this river quite so early as they do some others. It is interesting to note that a salmon will not ascend a river except when the water is rising, that is, during and immediately after heavy rainfalls. I suppose this is due to their horror of being left without swimming room over some of the bars and shallows along the river.

Near about Clearwater, on the Southwest Branch, are grouped the properties of several American associations. The place is wild and uninhabited, but the opportunities for fishing are among the best in the province. Mr. A. H. Woods, of Boston, and Mr. Joseph Jefferson, the actor, own a handsome club-house a little above Clearwater, and in the midst of several fine pools. A short distance further up is the fishing stretch owned by Mr. Robinson, his head-quarters being known as Burnt Hill; while further up still is the well-known stretch of river held by H. Sage, of Ithaca, New York. Mr. Sage's four miles of river embraces several of the best-fished pools on the Miramichi. There is a first-rate chance for the formation of a club on this river, as the place may be reached in a day by rail and canoe from Fredericton. The scenery along the river is bold, sloping upward as it runs back, and culminating here and there in high cool mountains with valleys between. Mr. Henry Phair, of the Crown Land Office of New Brunswick, one of the most expert fishermen in Canada, informs me that while club opportunities everywhere are becoming circumscribed, there is an excellent chance for the formation of a club on this river.

In a very charming piece of country is located the grounds of the Tobique Salmon Club. The wilderness here is almost entirely in a virgin state. The club is lessee of all the government lands along the river, and of all the private lands and the domain owned by the New Brunswick Railway fronting good fishing waters. The incorporators are F. W. Cram, Bangor, Maine; William D. Winsor, James M. Rhodes, William H. Ingham, and Charles H. Wurts, of Philadelphia. Several provincial fishermen are members of the organization. The club is building a large house capable of accommodating members and ladies, and it has spared no expense in replenishing and guarding the waters of its excellent property. All kinds of flies are used on the river, and fishing is carried on by wading, in canoes, and from the banks. Poachers here are timid of late.

The Eutopia and Trout, Fish, and Game Association is one of the later organizations. Its waters are fairly well stocked, and there is some game in the woods. Some of the incorporators are Henry P. De Graaf, John H. Barclay, Benjamin F. Vosburg, Albert Darling, J. W. Hausden, John Glass, Jun., all of New York city.

The Tracadie Club is erecting a club-house [illegible] the finely stocked river of that name. The [illegible] is picturesque, being diversified [illegible] and valley, and penetrated by [illegible] small streams. Mr. Edward Jack [illegible] of the stream, and a number of [illegible]merican fishermen are about forming a club. Prominent members of the Miscou Island Goose and Brant Shooting Club are Dr. Orne Green and H. McBeath, of Boston; and Frank Todd and William F. Todd, of Calais, Maine. Probably the best shooting in the province is here, the club owning the greater part of Miscou, a picturesque island rising out of the Gulf of St. Lawrence. The club is primarily provincial, and its members are said to bag more goose and brant than any other Canadian sportsmen.

Much of the foregoing information would have been inaccessible to me but for the kindness of Mr. Henry Phair, the well-known fisherman, to whom I have already referred.

In Nova Scotia there is not so much attraction for the sportsman, and there is only one American club with regular premises, at Greenfield, Queens County. The Hon. J. W. Longley, Premier of Nova Scotia, himself an expert sportsman, and one of Canada's best chroniclers of sport, informs me that "there are splendid facilities for fishing, moose-shooting, and other sports" in his province.

No fewer than half the incorporated fishing and hunting clubs in the province of Quebec are composed entirely or in part of Americans, the greater number of the clubs being provided with comfortable lodges and other buildings. Perhaps the most notable of these is the Paradise Fin and Feather Club. The president is ex-Judge H. A. Gildersleeve; vice-president, J. C. Davis; treasurer, Kit Clarke; and secretary, J. K. Emmett, Jun. Among members of the club are Grover Cleveland, John Woods, Augustus Piton, James T. Davis, H. C. Miner, William Moet, H. S. Taylor, L. Richardson, Dr. W. F. Duncan, and Dr. E. R. Lewes, of Westerly, Rhode Island. The club-house stands in the centre of the Lac des Grandes Isles, 115 miles north of the city of Quebec. The lake is about twenty-two miles long, but it is so indented with little arms, coves, and inlets that it has over 100 miles of shore. The lake fairly swarms with speckled trout, and no fish, when full grown, runs below a pound. As many as fifty fish have often been taken with the fly in a couple of hours. Away in the distance can be seen the hazy tops of tall Laurentian hills, and the wild forest comes from the distant mountains to the shore from which the angler casts his tackle. The ladies delight to wander and explore through the myriad recesses of this lake, some of them using sculls, others paddles. Many of the ladies show records of good catches in these waters. The tackle used by some of the experts here seems hardly heavy enough to lift the fly, but 8-pound fish can be killed with these 4½-ounce rods. The fish are put on ice and shipped home by rail. The winninish, that curious but handsome fish which fights in the air, can be got after a four hours' ride from Paradise Club.

About twenty miles north of the Paradise Club, on Cedar Lake, is the Metabetchouan Fishing Club, the president being Senator O. H. Platt, Meriden, Connecticut. Other members are Stephen W. Kellogg, Waterbury, Connecticut; John C. Chamberlain, W. B. Briggs, Dr. G. L. Porter, Major D. M. Read, of Bridgeport, Connecticut; A. Chamberlain, John W. Coe, Walter Hubbard, H. W. Lyons, Wm. R. Mackay, Meriden, Connecticut; and Professor W. K. Townsend, of Yale.

On the same river the Springfield Fish and Game Club has its head-quarters, E. S. Brewer, president; David N. Coates, vice-president; and E. M. Coates, secretary-treasurer. The members belong to Springfield, and among them are Frank B. Foote, R. W. Day, Louis Herr, E. C. Barr, Henry S. Dickenson, E. A. Alden, Colonel M. V. B. Edgerly, and D. D. Gillmore. Great hills sentinel the fishing waters, and no voice is to be heard here save those of birds and wild beasts. Game fish are abundant, and there is fight in them from snout to tail. The ladies also find this place bracing and full of wild charm.

The Philadelphia Fishing Club is situated on the Metabetchouan, twenty miles above the club named after that river. There is no diminution in the quantity of fish, no scarcity of pools, of encircling hills, brawling brooks, cascades, and close green forests. Here, as further down, the canoe is to be seen flitting from point to point; and in the early morn you can hardly look at a pool without seeing a struggle there between angler and fish. The president of the club is Amos R. Little, and among the members are George W. Childs and David G. Yates. The club-house is built of logs in an airy spot, with the river in front and forest and hill behind. Ten miles of poling or paddling below takes the members to a railway siding. Among the other American clubs incorporated under provincial acts let me mention the following well-known ones: The Marguerite Salmon Club, Megantic Fish and Game Club, and Amabelish Fish and Game Club, all owning capital preserves with the most delightful surroundings. There are a score of other clubs composed of American and Canadian sportsmen, but I have endeavored in this article to show the enormous extent of sporting territory owned and leased in Canada exclusively by American citizens.

THE LAS VEGAS [illegible] SPRINGS.

Six miles northwest of the town of Las Vegas, in New Mexico, the Rio Gallinas leaves its picturesque cañon valley among the foot-hills of the Rocky Mountains to emerge upon the plain, and take its course through the meadows that give the town its name. Directly back of the cliffs that guard its entrance the cañon widens into an oval amphitheatre, round the south side of which the river winds. In this basin, surrounded by steep high hills covered with scrub oak and pine trees, are the Las Vegas Hot Springs.

The virtues of these thermal waters have long been known. From the earliest times the Indians of the surrounding region resorted to this place to cure their illnesses, and the tribe which claimed the springs jealously guarded their possession. The Mexicans of an early day came hither horseback, donkey-back, or in carretas (carts), and keeping careful watch against Indian attack, hollowed basins in the earth in which to bathe, drank the hot water, and sometimes, to secure specially good effects, buried themselves to the neck in the warm mud, and remained for hours.

In 1846, the first year of the Mexican war, after New Mexico had been conquered by forces led by Doniphan and Kearny, the United States military authorities established a hospital here—a long one-story adobe house, fronted by a veranda with posts of natural logs. It served for military hospital purposes as late as 1862, and afterward was made a hotel. With the completion of the Atchison, Topeka, and Santa Fe Railroad to Las Vegas in 1879, a handsome stone hotel and a bath-house were built at the springs; and later, in 1882, after the railroad had bought the property to help its passenger traffic, the Montezuma, a large and elegant wooden hotel, was opened, and many other improvements made. People from all parts of the world visited the springs during the next two years, and the prosperity of the place seemed assured up to the time when the hotel burned to the ground in January, 1884.

The second Montezuma, built to replace the first one, shared the ill fortune of its predecessor, and was burned in the summer of 1885, only a few weeks after its opening. It was rebuilt the next year, and named the Phœnix—a reminder of disaster which has happily been dismissed within a few months by the readoption of its old name. This hotel stands nearly 6800 feet above the sea-level, upon a plateau or shelf of the hill-side overlooking the park below, a massive, spacious, handsome building, built of brownstone, elegantly furnished, and entirely modern in all details. It contains 250 rooms, and is so constructed that nearly every guest-chamber is open to the sunshine at some hour of the day. About the front of the hotel are long verandas, from which may be enjoyed a wide view, embracing in one direction the picturesque Gallinas Cañon, and in the other the green meadows toward the town, the level-topped mesa, and the broad plains beyond. The New Mexican climate, with its cloudless skies, stimulating air, and agreeable temperature, makes out-of-door life a perpetual delight. Owing to the high elevation the summer heat is never excessive at Las Vegas Hot Springs, and the extremes of temperature between summer and winter are not so widely apart as in the corresponding low altitudes. The nights are always cool, and the locality comprises the features of both a winter and summer resort.

The first objects of interest to the invalid are naturally the waters and baths. The springs, which lie on the south bank of the stream, are over forty in number, and about twenty-five of them have been excavated and walled, in order to develop the flow of water and create small reservoirs. The spring known as No. 6 furnishes 30,000 gallons of hot water a day, at a temperature of 140° Fahr., and several of the other springs are of considerable volume and nearly as hot. The waters of the springs are of the class termed alkaline saline, resembling in many respects the hot springs of Töplitz, in Austria, while in the two chief active constituents—the carbonate and sulphate of soda—they much resemble the Carlsbad waters, but are weaker. Among disorders for which these waters are specific when drunk are chronic rheumatism, gout, biliary and renal calculi, and some forms of dyspepsia. Used as baths, they are smooth and agreeable, producing a cosmetic-like effect upon the skin. Their medicinal effect, when used in this way, applies in general to the class of diseases treated by baths in other hot springs establishments. The main bath-house, a long two-story building built of native red sandstone, stands on the brink of the Rio Gallinas, opposite the hotel, and is approached in front by graceful bridges. It is 300 feet long by 42 feet wide, with the baths for males in one wing, and those for females in the other. The capacity of the establishment for baths is 1000 per day, embracing every variety usually found in a complete water-cure establishment, and the attendants, male and female, are carefully selected and well trained.

A notable feature of the Las Vegas Hot Springs is the mud baths. On a part of the ground in which the waters of the springs for centuries have percolated the soil, a thick, black, slippery mud, impregnated with the chemicals of the waters, has formed, and the practice of the old Mexican bathers has been revived in the use of warm mud as a remedial bath. The mud bath house is an irregularly shaped wooden structure of considerable size, containing departments for males and for females. In giving these baths each tub is filled half full of mud, first freed from all foreign substances, and then mixed with warm spring water to the consistency of thin mortar. At the time of bathing the mixture is warmed by steam to the proper temperature, and in it the patient, with only his head in sight, wallows in placid comfort during the time prescribed by his physician. After leaving the tub, from which he emerges with a body painted glossy black with liquid mud, the patient is placed under the graduated douche, thoroughly washed with a hose, rubbed down clean and dry, and taken to a couch in the resting-room, where he enjoys supremely the *dolce far niente* that follows the ablution. In the novice the thought of immersing himself in a tub of black mud arouses a shudder; but once in it, he finds the experiment not unpleasant. The mud, acting like a poultice, produces a profuse perspiration, and has proved efficacious in curing a wide range of physical disorders. At the springs these baths are very popular with members of both sexes, who soon come to regard them as a luxury.

The good effects produced upon patients by the drinking of the waters and by the baths are greatly assisted by the climate, which has a specially beneficial effect on visitors afflicted with consumption, asthma, and other diseases of the throat and lungs. For many people it is enjoyment enough simply to sit on the hotel verandas, or to stroll about the park, with its fountains, trees, grass, and flowers. In improving the grounds thirty carloads of blue-grass sods were brought 800 miles from Kansas to be used in the terrace, and for sodding the flower beds and edges of the lawns. A small herd of deer is kept upon the grounds and across the driveway is a museum of native curiosities. By climbing the hill top in the rear of the hotel a view of seventy miles is obtained; and if one prefer in-door amusement he can repair to the billiard-room and bowling-alleys of the hotel.

A walk or drive up the cañon soon brings one among pine forests, mountains, cliffs, and plateaus—a region filled with novelty and mystery. A rustic road leads along the Gallinas River three miles, then turns to follow a branch stream another mile to its source—a deep and spacious pool formed by numerous rills that flow from beneath a cliff of limestone rock down a bank densely grown with moss and lilies. In the clear cool greenish waters of this pool, known as the Ojo de las Truchas, or Trout Spring, mountain trout may be seen lying at rest or darting away as the shadow of the visitor falls into the depths. But neither at the Ojo de las Truchas nor in the Gallinas, once famous for trout, is the fishing now good. The constant taking of fish, often by unfair means, has nearly exterminated the trout, which are found now only in the upper waters of the streams, and are hard to secure. Under the game and fishing laws now in force in the Territory these waters may be restocked, and afford good sport to the angler once more. Bears and deer no longer venture down to the very Hot Springs grounds as they did at an earlier day, but they are still found in the mountains at the head waters of the Gallinas, fifteen miles above, and one who ventures far enough up the valley and the heights at its sides to command a view of the distant serrated peaks of the snowy range sees a region where the elk and the grizzly still abide. The sight of a hunter winding down the trail with a bear or deer strapped across his burro's back is not uncommon at the Hot Springs, and the hotel table in the season is well supplied with mountain game.

There are many walks and rides to be taken over the bridle-paths among the foot-hills, beneath the pine-trees breathing balsamic fragrance, where the sombre grandeur of the dark forest and cliffs alternates with the sunshine in the open lands. As the excursionist proceeds up the valley there comes into view at its head a high, flat-topped, massive mountain, with almost perpendicular sides. This mountain, in appearance like a vast howitzer, is Hermit Rock, and upon it the Italian religious recluse John Augustani lived for several years in a cave or "dugout," his abode the object of pious pilgrimages by Mexicans of the humbler class, who still hold his memory in sanctity, and make bonfires on the mountain-top in his honor on certain days in the year.

The form of excursion most in favor with the guests at the Hot Springs is made upon the back of burros, or donkeys, and every morning a train of these sure-footed, docile little animals is brought before the door in waiting for the riding parties. The burro carries without remonstrance astonishingly heavy loads, but let him once get it into his thick head that he is overweighted, all ambition ceases within him. The spectacle of a burro subsiding beneath the weight of a stout lady, and settling himself comfortably on the ground with a total dismissal of all idea of rising, is not uncommon in these excursions. In such cases he always carries his point, and nothing but an exchange of riders will induce him to proceed.

A series of observations and records shows that the mean temperature at the Hot Springs during the three winter months is 47° Fahr., with a great proportion of clear days. There is in the winter about holiday-time some cold, overcast weather, with snow, and the winter nights are usually freezing. The rainy season occurs between the middle of June and the middle of September, during which period it rains irregularly in the afternoon and night. Sometimes there will be a shower every day for weeks, and again there may occur an interval of unbroken fairness for several days, with now and then a downright rainy day that sets in for the whole twenty-four hours. The showers alternate with clear skies and sunshine, and during the rainy season the country takes on an unwonted greenness.

The visitors to the Hot Springs represent every part of the continent of America, and nearly every tourist from abroad who crosses the continent by the southerly routes stops there for a time. Eastern men whose business takes them into the mining or cattle country like to make the place a head-quarters. Balls and amateur entertainments of various kinds are frequent during times when guests are numerous. An element of great interest to the Eastern visitor is the surrounding native population and its antique way of living. Between Las Vegas and the springs, on the line of the railroad, are Mexican villages of a primitive type, and in remote mountain hamlets one may still behold the Mexican ploughing with a wooden plough of the pattern of three centuries ago. On the branch railroad line running to the springs the visitors may go at several times in the day to Las Vegas, or, for a more extended excursion, take a trip to the quaint old city of Santa Fe, less than half a day's journey away, and from there ride out to Tesuque, a town of the peaceful Pueblo Indians, of the same race as the Aztecs of old Mexico.

CLARENCE PULLEN.

ACCIDENTS IN THE COAL REGIONS.

If the statistics of mortality in the Pennsylvania coal country were accessible, it would be found that the forces of nature are hardly less destructive to the life of the laborer than war to the life of the soldier. It is quite within the fact to say that mine disaster, floods, railway catastrophes, and storms have done such ravage in the State during the last twelve months as is rarely witnessed by an active campaign in an enemy's country. Though the first reports of the destruction wrought at Johnstown were overstated, the total still remains an impressive evidence of the futility of all our appliances for the safe guarding of life and property against the aberrations of nature. Elsewhere in this issue of the WEEKLY the artist has reproduced the external effect of one of the phases of danger that confront the toiler in a mining country. The history of one disaster is, with slight modification, the history of all disasters. The gaunt armies impressed into the service of the corporations year after year, generation after generation, confront the same conditions of uncertainty, the cumulative chances—from fire-damp, foul air, flimsy and inefficient chambers, imperfect communication—which made mining the work of malefactors in the early stages of civilization. A curious student, journeying through the anthracite and bituminous coal regions of Pennsylvania not long ago, found, on inquiry, that there was not a hamlet from the Lackawanna to the Monongahela where a certain percentage of the homes had not been visited by loss of life in the mines, on the gravity railways, or some one of the innumerable constructures incident to the production of coal. It is no exaggeration to say that there is blood—the blood of the young, the old, the infirm—upon every fireside where the fuel of the mine burns. In other countries disasters are now and then heard of, brought about by causes that the most sagacious foresight may not prevent. But with us it is regarded as a settled matter that every shaft must sooner or later contribute its tale of horror.

It is at once a reproach to the corporation and an evidence of the desperate needs of the millions who toil, that every man engaged in mining feels that he takes his life in his hand when he embarks in the business for his daily bread. Indeed, when the conditions of mining and the bestowal of the miner is examined, it fairly looks as if improvidence and recklessness were deliberately inculcated upon the masses dedicated to the garnering of treasures of the earth. The hamlets housing the miner and his family are capriciously set in narrow gorges which serve as water-ways in seasons of flood, or if not in these death-traps, upon the thin crust of surface covering actual or arched out excavations. Entire cities, like Scranton, Pittston, Wilkesbarre, are built upon thin crusts of rock and soil. When, as often happens, single houses, whole streets cave in, there is little ado made over it, life is lost, property destroyed, there are no words of reproach in the local presses, no awakening of the great corporations to set about a new order of things. *À la guerre, comme à la guerre*, seems to be the maxim of the barons who command the conscripts of Pennsylvania. A mere glimpse at the fabrication and construction of the mountain railways, the hill-side breakers, the subterranean galleries, impresses this upon the observer. Everything is put together for the single object of producing the coal at as small a cost as possible; little or nothing seems to be done to make the mining of it secure, the lives of the toilers easier. The ingenuities of science adapted to speedy results are well paid for by the coal men; but, save in rare cases, there is no spur for those who seek to make life secure for the toilers in the shafts. "Fire-damps," flooded galleries, crumbling supports, are manifestly regarded as major forces of nature that the cunning of man is incapable of contending with. And yet, for more than a thousand years, the salt mines of Bavaria have been worked further into the bowels of the earth than any shafts known in this country, and the records show no accident involving human life. This, however, is not due so much to the more active philanthropy of the owners as to the precision of the laws and their zealous enforcement. There are laws for the security of miners' lives in Pennsylvania, but they are little regarded. The men whose safety and comfort depend upon their enforcement are naturally the least able to get them applied. It might naturally be supposed that under a condition of things where the operators find it for their interest to cease mining three or four months every year, the idle hands might be humanely employed in securing the shafts against such slaughters as those the artist represents.

That it is possible to diminish if not wholly prevent disaster to life, the incident in the Youghiogheny Valley clearly shows. A miner struck his pick into the wall of coal. When he withdrew it, a stream of water gushed out. The men lying on their faces in the narrow vault at once realized their danger, but a new one confronted them. The coal bunkers—a train of small cars lowered and raised by an engine on the surface at the mouth of the pit—coming down at full speed, block the egress. A lad with an exposed wick burning on his cap rushed into the crevice to warn the men. Then followed the usual slaughter. The foul air released with the water filled the cavern with "fire-damp." The place was in an instant a burning brazier, with a dozen men gasping and suffocated. Thirty-five men perished before the wholly inadequate means at the disposal of the rescuers could be brought into use. Fifty families are bereaved. The dead are buried; new men have been sent down to take their places, the widows and orphans will be dispossessed of their scant hovels, and the incident forgotten. Now it is very easy to foresee what must happen when an opening is made in a wall of coal. Why, in such a case, cannot precautions be taken in advance? Why, at such a conjuncture, are the tapers on the miners' caps exposed to the fatal whiff of fire-damp exhaling from the suddenly opened orifice? Such scenes as these, such a record of death in every form that the mind can conceive of as appalling, are a stigma upon the State of Pennsylvania—upon the whole country, in short, for to merely read the tale, shudder over it, and dismiss it is, in a sense, making ourselves responsible for the continuance of a system, or want of system, which makes such constantly recurring slaughter possible.

HONI SOIT QUI MAL Y PENSE.

BY GERALDINE BONNER

MR. BERTRAM LAMAR sat on the arm of a chair in the hall of the hotel at Monterey, and idly swung his foot. Mr. Lamar was bored. An extended acquaintance with this young man forces me to confess that he was not often afflicted in that way. We know that no man can aspire to be of the highest fashion without constantly experiencing the pangs of this distinguished ailment, and yet Mr. Lamar was unquestionably of the highest fashion. The most cursory glance would tell you this. Any one could see that he belonged to the best people, that he was used to the best people, that only the best people would be bearable to him. It was therefore with humiliation that he confessed to himself how seldom, how singularly seldom considering all his advantages, he felt the inspiring throes of boredom. Who can guess how hard he tried to crush his exuberant vivacity, to quell his laughter, to extinguish the sparkle in his handsome brown eyes? He could draw amusement from Philadelphia, find diversion at Tadmor in the Wilderness. If you were a true devotee of fashion, his unquenchable spirits would make your hair stand on end.

But now he was genuinely bored, and he felt joyously that any one could see he was. Ladies passed—old ones, who swept up the dust with trains, and who creaked as they moved, as if they wanted oiling; young ones in light frocks, and wide flowered hats which cast a shadow over the clearest eyes. They kept banging open the glass doors and going out into the blaze of sun beyond, with a bursting into bloom of lace parasols, or coming into the cool of the hall, with the rustling, silken sheathing of the parasols suddenly furled, and the tapping of little heels on the hard floor. He never glanced at them. But they did at him—swiftly, obliquely—from under the hat brim out of the shadow. He looked away, with raised chin and indolently drooped eyelids; but about his heart he began to feel a little creeping, warm titillation of interest, a premonition that he was not going to keep bored very much longer. There was one girl—she kept going to and fro—and as he looked on the ground he could see the hem of her dress and her feet. They were pretty feet in yellow shoes, small and pointed. Mr. Lamar found himself ruminating: "Suppose the head is as pretty as the feet. But it never is. There's a law of compensation which prevents that. The head which belongs to those feet is thirty-five—" And he looked up. The head matched the feet to perfection. Mr. Lamar felt that he didn't look bored any longer. Rather, however, than sacrifice this dearly bought and enviable condition of being, he turned his back on that enchanting head, and sauntered into an adjoining room. There would be no one to look at here to destroy the aristocratic vacuity of his mind.

The room was empty, cool, and dim. It had oak chairs and tables and writing desks, sea-green walls, and a great window opening on the balcony. Outside there were old ladies sitting under a forest of parasols. Beyond were velvety sweeps of close-cropped turf, dappled with short shadows shrinking to the tree roots. Splinters of dusty sunlight crept down the boles of the stately cedars and trembled on the white dresses of passing girls. There were glimpses of spiked unfolding fan-palms and rustling melancholy dracænas, fat Arizona cactuses of an unhealthy morbid hue, and little squat, flat, prickly green things growing in irritable confusion. Mr. Lamar felt that he might gaze upon this prospect for an infinitude of time and remain bored.

But fate willed otherwise. As he entered the room he saw something on the floor near the table. He picked it up. It was a band about an inch and a half wide, covered with a puckered yellow ribbon, and with one end run through a clasp of dull silver showing a monogram in small diamonds. There was a bunch of narrower yellow ribbon beside the clasp, each end finished with a little tongueless silver bell. It appeared to Lamar from some hanging filaments of thread that the two ends of this band had once been stitched together. He looked curiously at his find.

"What can it be?" he mused, staring at it. We have said that he was young, and came of the best people, and with the best people there is always a doubt as to whether they wear such vulgar things as stockings or possess such unmentionable things as legs. "Wings, not legs and feet, shall move them," as the poet gracefully expresses it.

Lamar first thought he would take it to the office. But curiosity impelled him to study it. It might be worn round the neck; but no; it was not long enough. He drew the severed ends together, and held it off from him, eying it dubiously, and reflectively pulling his small mustache. Oh yes, of course. Now he saw. How dense he'd been! A bracelet. Holding it together, he pushed his hand through it, and it swung on his wrist.

"I don't think I ever saw a bracelet just like that before," he thought, moving it round and looking at it with his head on one side.

And then, as he looked at it, came a sudden flash of wakening light, and for a moment he stood staring at it in stupefied horror as it hung over his wrist. With the return of consciousness he crumpled it up and crushed it into his pocket. What should he do with it? If he took it to the office, it's owner would never dare to claim it. If he found out who she was, he would never dare to offer it.

He could imagine the scene: A lovely and youthful lady is discovered walking in the corridors. To her appears Mr. Bertrum Lamar in full evening dress with a white pink in his button-hole. Making toward her, he executes one of those majestic yet easy bows for which the Lamar family have been famous ever since their illustrious founder came over in the *Mayflower*, and stepping ashore on Plymouth Rock, which has since bashfully retired before the advances of the boisterous Atlantic, greeted the Indian chief Walla Walla with so elegant a salute that the rancor of that untamed barbarian melted like snow before thaw. Then drawing a package from his pocket, Mr. Lamar presents it to her, murmuring, "Yours, I believe," and vanished through a trap-door. He might give it to her, and then pretend to be prostrated by the heat, and fall on the floor with his eyes shut, to avoid embarrassing her by witnessing her inevitable confusion. The Lamars were also famous for their chivalrous attitude toward the sex. But can a man be prostrated by heat on a day when the thermometer in its most ambitiously soaring moments can only struggle up to 75°? What should he do to spare her feelings and his own? And he turned the cause of his perturbation over in his pocket.

Just then he heard a step outside—a feminine frou-frou. With a guilty start, he retreated from the table, fell into a chair, and seized the morning paper, in which he buried his head. Any one noting this fact would of course imagine that he slumbered, and feel themselves safe from espial.

"It is she," thought Bertram, ...zed with guilty tremors. "She has come to hunt for it," and he remained motionless.

So did she. There was not the smallest vibrating rustle from her silent figure. Bertram rattled the paper, stabbed a little hole through it with his finger, and peeped at her. She was standing in the doorway, peering about the room, and she was the young lady with the yellow shoes. She was charmingly pretty in a light dress of striped flannel and a loose skirt of thin silk made like a boy's. Under the turned-down collar was knotted a four-in-hand necktie of white piqué, and about her waist was a woven silk belt clasped with a silver S. She was slowly sweeping the room with a long glance, only her head moving, her figure finely erect, her right thumb in her belt, and her left hand hanging by her side, and lightly clasping a little leathern thong which was wound about her knuckles. As to her head—that lovely head with strong brown hair curling up crisply under her sailor hat, delicately rounded cheeks, and gravely pouting lips—it was an image of soft, delicious beauty. At her side sat a little pug-dog on its haunches, gasping and rolling its eyes.

She cast a hurried glance at the gentleman reading the paper, and walked into the room, looking intently about the floor.

"What would she say," thought Bertram, as she passed him in her search, "if I were to innocently ask her what she's looking for, and gallantly offer to help her find it? But I'll spare her that, even though I do appear a clown," and the hero peeped again.

She was certainly hunting thoroughly. She moved several of the chairs, drew up the lace curtains and looked under them, peered into all the corners and under the tables and round the desks.

"What the deuce could she have been doing?" thought the young man. "She must have been playing puss in the corner or forfeits. I'll burst with curiosity soon, and hit her with one of the pieces."

When she had searched everywhere she straightened herself with a sigh, threw one last reluctant look about the room, and calling to the pug, "Come along, dearest; it isn't here," departed.

Bertram laid down the paper and looked after her. She appeared to him to have a singular amount of *sang-froid*, also a very graceful back. How well she walked! How proudly she carried her small dark head!

When she was out of sight he cautiously drew forth the yellow band and studied the monogram. It was exceedingly complicated, and seemed to him to consist mainly of large B's, with small O's distributed about them.

"B & O," said he, musingly. "Baltimore and Ohio! Perhaps her papa is a railway man, and this is a touching evidence of filial devotion. What a sweet girl!"

Mr. Lamar was not bored that afternoon. He was consumed with perplexity. How could he return the lost treasure to its owner without causing her embarrassment, without making her his enemy for life? If it had been anything else, how delightfully he could have broken the ice with it! But to break the ice with that historic emblem—impossible! It would have exactly the opposite effect, and cause the ice to form as beneath a breath from the Arctic.

He roamed about listlessly. It was a warm afternoon, and outside the glass doors there was a great blaze and glare of sun. After lunch the guests dispersed. The dowagers lumbered up stairs to appear resplendent at dinner time, and sit along the ballroom walls, watching three gyrating couples try to imagine, like the ambitious little goats who endeavored to persuade themselves that they were cows, that they were attending a large and select ball of the most brilliant gayety and fashion. The younger married women also withdrew to lounge away the afternoon in golden-tinted gloom behind drawn blinds. Driving parties started out with laughter and gay voices, the snapping of whips, and the grinding of gravel under revolving wheels. Away they whirled down the drive, streaked with already lengthening shadows, to range along winding yellow roads beside the many-sounding sea, where dark, writhing cypresses crouched before the angry breezes, or steal through noiseless, dim, dun-colored woods, silent and dripping with funereal mosses, the sad ghosts of once green and whispering forests. Some of the young ladies strolled over the lawn, away through light and shade, parasol on shoulder, book in hand.

Then it grew very hot and still. The surf boomed faintly on the distant shore. There was the long roll and crash of balls from the bowling-alley, and a gentle, occasional clicking from the billiard-room. The clerk read a novel with his feet on the desk; down in the barber's shop the barbers were all sitting in white jackets reading papers. In the glass-covered end of the balcony enormous flies buzzed ceaselessly, and bees swung in the cups of the huge drowsy-headed poppies. The shadows stole across the velvet sward, a leaf circled languidly downward through sun and shade. The afternoon was steeped in the strange silence which broods over the Californian landscape. Here was a condition of things to have bored a newly liberated convict, to have subdued the high spirits of a miss fresh from the convent.

But Mr. Lamar was not bored. He even didn't care whether he looked so or not. His pride was shattered. He sat on the balcony, and there being no one to dispute his loneliness, he put both his legs over the arm of his chair, clasped his hands behind his head, and tilted his hat on to the bridge of his nose. From under the hat brim rose occasional thin spirals of smoke and long sighs.

"I must give it to her this evening," he thought. "I'll wrap it up in paper and tie one of the ribbons round it that are on that mouchoir case Milly gave me. Then, if she asks me—as of course she will—what it is, I'll say, carelessly: 'Oh, nothing! Just a little trifle I think belongs to you. Don't hurry to open it. Have you noticed what a beautiful night it is?' And so I'll engage her in absorbing conversation. But if the conversation is not sufficiently absorbing and she begins to open it, I must flee from the wrath to come. And when next I meet her, dying to speak or even bow to her, there will be a wall of ice raised between us. She will turn her profile toward me and become engrossed in the beauties of the landscape. Such is the irony of fate."

The languorous afternoon burned itself away in loitering stages of deepening light and color to a smouldering crimson sunset. Dinner loomed in the near distance, and was awaited with fond expectancy. At seven o'clock Mr. Lamar came slowly down the broad stairs, looking as handsome as the young Dionysius in his dress suit, his shining shirt bosom, and a white pink in his button-hole. The hall was full of moving figures and a blaze of light and color. Gay running laughter and broken ends of sentences detached themselves from the hum of voices. Splendidly dressed ladies passed and repassed in couples, in threes, in long lines, or stood in groups, with the gas-light breaking in myriad little splinters on their tumbled trains of soft silk, and sliding with glossy radiance along their half bared arms. There was a fluttering and sweeping of fans, a rustling of rich crushed fabrics.

Outside there was still light. Through breaks in the foliage gleamed the fiery eye of the angry sunset. The summits of the taller trees were touched with a lingering brightness, but in their odorous shadows lurked the reluctant dewy dusk. Mr. Lamar was too perturbed in mind to care to mingle with the gay, loud-voiced, laughing crowd. He wished for solitude, and directed his steps toward the little writing-room. He had not wrapped the treasure in paper, nor tied it up with a ribbon from his mouchoir case. He had not done anything with it. He did not dare. The sight of its owner might inspire him to the desperate pitch of boldly offering it to her, or suggest to him some cunning way of returning it without betraying the identity of the finder. With these ideas in his mind he carried it still in his pocket, in company with his keys, jingling on the end of a chain.

The gas in the writing-room was not lit. Red gleams shot in from between the great boles of the cedar trees and touched the sea-green walls. Mr. Lamar liked the softened light and the pensively faint prospect, and went to the open window. Just outside it, on the balcony, in a Shaker rocking-chair, was the young lady who had worn the yellow shoes. She was reading and rocking, her pug in her lap, and if she was pretty in her flannel morning dress, words cannot describe her in a mist of fine black gauze cut square round her neck, and showing her arms to the elbow. Her skin was as white and flawless as a blanched almond. There was the gleam of a gold pin from the shadow of her dark hair, and a jewel hung round her neck rose and fell with her quiet breath. As she read she absently pulled the pug's ears, which drowsed with its eyes half open and its head against her arm.

Lamar looked. She turned the page. The pug, disturbed, rose to its fore paws, gazed at her with an expression of idiotic fondness, and tried to lick her chin. She avoided this demonstration of affection by moving her chin from side to side, keeping her eyes still on the book. The pug continuing, she struck it gently, observing,

"Don't, you bad little abominable dog!"

"I beg your pardon," said Lamar suddenly from the window.

The lady looked up with the raised eyebrows of polite inquiry.

"I have something of yours," said the young man desperately, and in a low tone.

"Yes? What is that?"

"I—I—don't quite know. Or rather—Well— But— Um! I didn't like to leave it at the office. I thought—yes—I thought—" He leaned out of the window, with his closed hand extended. "Here it is."

She held out her hand, and he dropped it in. She looked, and gave an exclamation of joy that caused the pug to jump to the ground.

"Oh, how glad I am! Thanks so much. Thanks awfully! I was so afraid it was lost. Isn't that lucky?" And she looked affectionately at the returned treasure with her head on one side.

There was light enough to see her face distinctly. She did not exhibit a sign of embarrassment, not the ghost of a blush. Lamar felt a sudden chill of disappointment and disapprobation.

"You found it in there?" she said, indicating the writing-room, and looking up at him with frank, candid eyes. "Yes, that's where it was lost."

"I—I supposed so," said Lamar, with a wan smile.

"I looked for it myself this morning all over," she continued; "under everything; but it was gone."

"Yes?" said the young man, with a fatuously inquiring air. "If she knew I was behind the paper, she'd ask me why I didn't give it to her then and there; and what the deuce would I say? I couldn't tell her that I was afraid she would be embarrassed, for such an idea has apparently never entered her head. I must dissemble," thought he.

"I value this very much," she went on, turning it over in her hand.

"I should imagine so."

"You see there is only one like it. There is not a single duplicate anywhere."

She looked smilingly into his face. Lamar stared at her in stupefied horror.

"Only one—did you say?" he managed to articulate in a faint voice.

"Only one," she repeated, nodding her head. "It was made to order."

There was a moment of silence. Lamar made no comment, but continued to stare vacantly at her. He was thinking: "It must have been an accident. She can't be a veteran of the war. I might have known it—the law of compensation again. Such a lovely face as that must have some counter-balancing defect."

"When you have only one—and that such a pet," she continued, not noticing his silence—"you like to have everything as pretty as possible."

"Yes, yes. Of course, of course," ejaculated Lamar, laughing idiotically. "If you have only one, I expect it must be somewhat of a treasure," he thought. Then he added boldly, but with the air of confiding a piece of news, "I have two."

"Two?" said the young lady, with vivacious interest. "What kind?"

Lamar looked askance at her, in alarmed silence. Was she doubly afflicted? She was stroking the pug with the tips of her fingers, and there was nothing in her placid expression to suggest mania of any form.

"The same as everybody else's," he answered, with some hauteur. "Are the people in this part of the country in the habit of managing with one?"

"As a rule, they have only one; it's so much less bother. Though, to be sure, I have a friend who has—let me see—yes, eleven."

"*She* must be a centipede," thought Lamar. "I seem to be encountering remarkable freaks of nature. There is a fortune waiting here for any one who wants to start up a dime museum." Then he remarked aloud, regarding her with his head on one side, a tolerant, fond smile on his lips, "That must be quite an *embarras de richesse*, especially when you're walking."

"They do get rather in the way," admitted the young lady; "but most of them are very well trained."

"Very clever of them, I am sure," murmured Lamar, leaning against the window-frame, and feeling that he was about to swoon.

There was another short silence, during which the girl continued to examine her restored treasure. Presently she said, musingly: "I see the threads are broken. She has broken them once before, though I don't see how she can possibly do it."

Lamar only stared and swallowed. She held his glance with a horrible, eerie fascination.

"You know she loves to run about so," she prattled on. "She ran away from me this morning, and when she came back it was gone. She must have crept under the table, and not come out until she had got it off."

"Who is *she?*" asked Lamar, in a voice from the tombs.

"She? Why, Bobo—my pug. Isn't she a beauty? Come up here, Bobo"—patting her knee. "I want to put your collar on, and

Google

show this gentleman, who was kind enough to return it, how pretty you look when you're all dressed up." She held the band round the dog's neck, and, turning to Lamar, said, with laughing archness, "Isn't it becoming?"

Lamar sat down on the window-sill. He was not bored, but he took up the morning paper, which lay on an adjacent desk, and began to fan himself with it, though the evening had grown cool.

"WAIT DES A MINIT."

I have a gallant lover,
He's true as true can be;
But it's come to this when I want a kiss
He always says to me,
"Wait des a minit."

He does not love another;
His heart is all my own;
Yet I grieve to know, when he treats me so,
That mine to him has flown—
"Wait des a minit."

His face is very fair;
His eyes are violet blue;
And the light they send as on me they bend
'Most breaks my heart in two—
"Wait des a minit."

His hair is like the sun
That shines upon the dew;
But he likes not girls, and he shakes his curls,
With words that pierce me through—
"Wait des a minit."

Whenever I talk of love,
In moonlight or by day,
He just looks at me, and in mocking glee
Remarks, and runs away,
"Wait des a minit."

I'll tell you what I'll do
To punish this young man:
When he wants a wife, if it takes his life,
I'll say to the young woman,
"Wait des a minit."

Sandy Broad.

A TEMPEST IN A TEAPOT.

Whichever of the thirty questions—"the want to knows, you know"—embodied in the schedule of the Eleventh Census of the United States was it that aroused the wrath of the gray headed gentleman? Did he take in high dudgeon the nineteenth one, "Was he able to read?" Perhaps it was the one as to his naturalization which irritated him. More probably it was the twenty-second question which touched him to the quick, for just then he might have had a twinge of gout, and so he answered that and the twenty-third one in a most conclusive manner, showing that he was neither "defective in mind, sight, hearing, or speech."

The census young man, who had rather prided himself on his nice get up, had considered himself lucky in having allotted to him the better portion of the city. He certainly is taken aback at the reception he is meeting. He has bearded the lion in his den, for the fretted head of the family looks as if he were inclined to swallow the young census man, portfolio and all. There probably was no reason why Paterfamilias should have fumed so, though a tempestuous manner is often assorted to the part.

Perhaps it was unfortunate for the young searcher after facts to have interrupted that hour, devoted to after dinner coffee. If a man has any sacred right, it would be at that precise time.

There is no reason to suppose that the enumerator asked any impertinent questions. He probably kept within the strict limits of the schedule. It was the suddenness of the outburst, just as Mr. Smedley has sketched it, that agitated the enumerator. It was so entirely unexpected. He had not suspected that a storm was lowering. A schedule is, however, a schedule, and he clings to it, nor will he drop it in his nicely brushed hat and bolt, or call on the authority of the United States to bring this old gentleman to a better comprehension of the amenities of life. We are sorry to suspect "the head of that family" to be a very wrong headed one. It is evident that the gentleman's wife and daughter intercede. The young lady, with an imploring gesture, has her hand on her father's arm, and his wife begs him to mitigate his ire. Don Furioso's fist may make the cups, the saucers, the silver rattle, but that will be the worst of it. There are certain human geysers which must seethe, foam, and spout forth. The pressure being relieved, a calmer period sets in. It might be that the census man, after the first shock, was so courteous, took the old gentleman's blurt and bluster in so manly a way, youth forgiving the faults of old age, that the young lady found something quite interesting in the enumerator. So she felt doubly obliged to him when he neither smiled when the question of sex (the No. 5) was asked, nor did he simper nor look as if in doubt when the terrible No. 6, her age, was confided to him.

MODERN JAPAN AT THE TOKIO EXHIBITION.

The progress of Japan in the last twenty years or so has inspired on-lookers with sincere admiration for the enterprising little country. The progress of Japan differs from that of other Asiatic countries in kind as well as in degree, being vital and national, and not imposed by foreigners. At first the Japanese resolutely repelled foreign invasion, then, with hardly a pause, they grasped and assimilated foreign ideas. The country itself—tiny, lovely, clean, compact—favors progression. It looks as if it had been made piecemeal, like its fans, cabinets, and crêpes, and with no space for deserts. Man has mastered every spot of it. The very volcanic force, so easily traceable, seems to be disciplined, almost sentient and humorous, and appears as if it exercised its powers in earthquakes and eruptions with the knowledge and consent of the population, whose ancestors, one might fancy, had crept out from daintily moulded grottoes of softly tinted lava buried in some volcanic crater.

In the few years during which they have been taking on the polish of nineteenth century civilization they have done wonders, as their roads, railways, and towns all testify. While their phlegmatic neighbors, the Chinese, have scarcely any show to make for a much longer contact with Western ideas, and palter feebly over introducing a few miles of railway, Japan goes the length of organizing successful exhibitions, the third of which is now being held at Tokio, her large and well laid out capital. It is a great attraction to tourists naturally, and the writer was glad to seize the opportunity of passing through Japan to go and view the exhibition. I reached Tokio after about an hour's railway journey from Yokohama, and on arriving at Shimbashi, the Tokio station, I found there was some distance to go to reach the exhibition. There were street cars running, but we preferred rickshas, as the cars were filled to overflowing. So I and my companion mounted one of these large perambulators pulled by a small fellow-creature in a huge mushroom of a hat, who trotted pluckily the long distance, dodging cars, pedestrians, lamps, shops, and affording us some excitement from hair-breadth escapes. At last trees and flags and booths came in sight, and our man carriage stopped at the entrance to the exhibition.

We dismissed our coolies, and presented our ticket to the official at the gate, and passed in with swarms of natives, whose *geta* (clogs) made a pretty clatter as they walked. The entrance is wide, and leads one up a long street between two rows of buildings. Our first idea being lunch, we looked about for a restaurant, and soon found one conducted on foreign principles, with a clean matted floor, little tables, and a surprisingly cheap *menu*—chicken or beef, eight cents; fish, six cents, and so on, with tea, coffee, chocolate, and Japanese beer to drink. Having made a good meal for about fifty cents, we set off to see the crowds and the exhibition, and followed the stream of natives to the large main building, at the door of which an old Japanese took away our umbrellas with a sweet smile, and gave us a check for them with an obeisance. We went in, and soon saw that the exhibition was not exactly what we had anticipated. Being for the amusement and edification of the Japanese, naturally enough a large amount of space was occupied with exhibits similar to what one sees at home, and not, as we had imagined, with exclusively Japanese articles. There were stuffed animals, skeletons, specimens of modern European silks, wall-papers, and so on, all of which interested us less than it did the natives. Still there were examples of their old rough pottery, their modern ware and lacquer-work and arms, etc. The catalogue not being ready at that date, it was a little difficult to follow things, and the few inscriptions visible consisted mostly of necessary but unenlightening instructions not to touch anything.

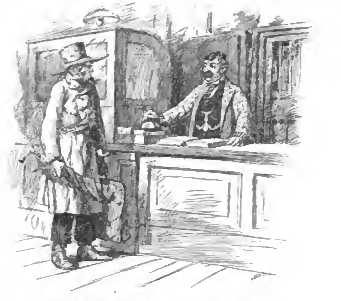
The display of armor was good, and some fine swords attracted us, also the curious carriage belonging to the Mikado. After a short stroll through the different rooms we left the building, first noticing a handsome cabinet in gold lacquer which had a card attached, stating it had been shipwrecked on its way home from the Vienna Exhibition, and had not been injured by going to the bottom of the sea. All the damage perceptible was a slight tarnishing of its metal hinges, corners, etc., the lacquer being none the worse. On regaining the door, we reclaimed our umbrellas and pressed some money on the civil old man, but with a series of elegant court bows he declined. We walked about the beautiful grounds, looking at the tea houses with their little table, on which you sit with your tea. We admired the crowds of natives, who really interested one more than the exhibition did. Every one is familiar with the fashion of Japanese garments, and also with their pretty stuffs, cotton and otherwise; but the full effect of the elegance of the dress can only be appreciated when seen on crowds of natives. The girls nearly all carried a fan and umbrella, and indulged, besides, in a variety of airs and graces, especially when they had extra claims to good looks. They are very picturesque, with a kind of swaying, knock kneed grace admirably in keeping with their garments; but, after all, they are not so very pretty. In fact, few escape downright ugliness in foreign dress. After a walk, we began to do the side shows. One which attracted the natives strongly turned out to be a collection of electro-plated ware.

Passing into another building we came upon some beautiful scrolls and hangings, painted and embroidered, also a fair collection of native oil-paintings, two of which struck us particularly. The first showed a large tree with a heavy branch, on which sat some birds most delicately defined against a clear silvery moonlit sky. The tone of the sky reminded one of Doré's "Dream of Pilate's Wife." The other picture represented a Turneresque marine scene, with a great writhing sea-monster, half dragon, half serpent, fold upon fold of whose scaly length showed through the waves and foam, and upon whose arched and evil-looking neck stood the fair figure of a woman. Both these paintings were eight or ten feet high by four or five feet wide, and would have attracted attention in any European exhibition.

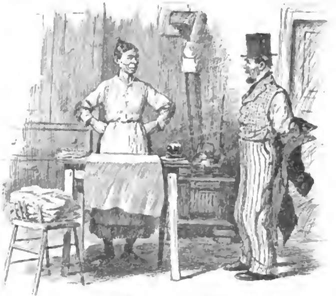
The people behaved like highly bred guests at an extremely select garden party. We felt almost guilty of bad manners in staring at them, and on one occasion, when watching the process of a tiny baby being strapped on to its mother's back with a long silk scarf crossed Greek fashion, I felt like an intruding vandal. Although we were the only foreigners within sight, these gentle Asiatics took no embarrassing notice of us. Just as we left we saw the prettiest dresses of all, on a group of three girls in pale green silk crêpe *kimonas*, with *obis* of cloth of gold. After leaving the exhibition we were glad to arrive at the railway in time for the four o'clock train. It stops at several stations between Tokio and Yokohama, and the Japanese crowded in and out the second and third classes, but only one native appeared in the first class. The carriages are small but clean, and indeed everything in Japan seems clean. It is their standard virtue; and whatever one makes of their godliness, their cleanliness is beyond dispute. Would that the clean-handedness which distinguishes them in their houses were their guiding-star in political and commercial life! A leading San Francisco merchant who has been spending some months in China and Japan for business and pleasure tells me that there is no comparison between the Chinese and Japanese for straight dealing. "A Chinaman," said he, "is a difficult man to bargain with; but once the contract is closed, and his 'chop' on the document, you can be sure that he will treat you fairly. But a 'Jap,' all bows and smiles, promises everything, and the next day stands you out to your face that you misapprehended his meaning." The Chinese expression, "Hua tunghsi" (slippery thing), so often applied to this people, seems to fit them not inaptly, but, like too many unreliable people, they have charming manners, and one forgives them for the sake of their delightful surroundings.

It has been well said that the Japanese are far too picturesque for politics, that they should stick to tea houses and geisha girls, and leave "rings" and caucuses to the ubiquitous Anglo-Saxon. But these things must be faced, and that in a near future. Japan has elected for constitutional government, and her first Parliament is to meet this next September in the handsome building now rapidly approaching completion at Tokio. At a political banquet given some time ago one of the oldest foreign residents said to a distinguished Japanese official, "The first time I saw your Excellency you were wearing two swords, and had given orders to throw all the outer barbarians into Yokohama Bay." The little man bowed, and replied, "Quite true, but that was before we had studied the Constitution of the United States."

There is a key-note in those words. The Japanese are looking toward America in the great domestic struggle that is before them. The old leaven of feudalism is still among them, and the new Constitution has yet to earn its right to the gratitude of the people at large. The first six months of the new Parliament will be watched with eager interest by all the well-wishers of this plucky and go-ahead little nation. Ixuonax.



HOTEL CLERK. "Now, when you retire, don't try to blow out the light."
FARMER. "Why not?"
HOTEL CLERK. "Because it is an electric light, and you can't."



INSURED, BUT NOT ASSURED.

"I'm after gittin' ther house insured for one hundred and fifty dollars, Bridget."
"Arrah! an' where's ther money, Pat?"
"Faix, they won't pay that till ther house is burnt down."
"Och, yer fule, if they won't give it to yez now, divil a cent will they give whin there's no house at all."

six feet in
tion of forty feet. It stands in the southeast corner of the spacious grounds around the Capitol, right in the line of approach to that building from Washington Street.

The occasion of the unveiling will be one of marked interest in Indianapolis, and will attract considerable attention throughout the State. The late Vice President was an unexceptionable example of the trite political figure known as a "favorite son"—a phrase which has a stronger meaning in the West than in the East. In the former, public men are more in social touch with the masses, and especially with the better elements of the people, than they are in the latter. The interest in politics and public affairs is more general. Mr. Hendricks possessed traits that rendered him personally popular aside from his official record. He had his ambitions, but cherished no animosities if they were balked. Conrad Baker, a Republican, who defeated him for the Governorship in 1868, subsequently became his law partner. His acceptance of the second place on the Democratic national ticket in 1884 was attended by a deep disappointment that he did not secure the first place, and not without an unfounded feeling that he was entitled to it. At least three times he came almost within reaching distance of the nomination for the Presidency. In 1868 he stood second on the first ballot, and only three votes behind the leader. In 1876 he again came near the goal; but Tilden won, and he took the Vice-Presidential candidacy. If the highest honor in the gift of the nation was to fall to an Indiana Democrat, no one but Hendricks, for the last twenty five years of his life, was seriously thought of as the recipient.

Though born in Ohio, his Hoosierism was not to be impugned. He went to Indiana in 1820, when but six months old, grew up there, and graduated at South Hanover College in 1841. In 1843 he began the practice of law at Shelbyville, and in 1845 was sent to the Legislature. He was elected to Congress in 1850 and 1852, and in 1851 was a member of the Constitutional Convention. During Pierce's administration he was Commissioner of the Public Land Office. In 1860 he was defeated for Governor by Henry S. Lane. From 1863 to 1869 he was United States Senator, and was Governor from 1872 to 1876. His uncle, William Hendricks, represented Indiana in the United States Senate from 1825 to 1837. The name Hendricks came to be regarded as almost an institution in the State.

There was no single act or event of overshadowing importance in the life of Mr. Hendricks that raised him to the marked distinction he enjoyed. He was a man of even abilities, a clear thinker and finished speaker, conservative in temperament, suave in manner, and an eminently prudent leader. His civic virtues were of a high order, and it is to his credit that he died in moderate financial circumstances. He was to the Democracy of his State in his day and generation what his distinguished contemporary, Oliver P. Morton, was to the Republicans; and the fact that his old political opponents as well as his friends will assemble to do honor to his memory at the unveiling of his statue is an eloquent tribute to him as a man and citizen.

AMONG THE CORN ROWS.

BY HAMLIN GARLAND.

I.

Rob held up his hands, from which the dough depended in ragged strings.

"'Biscuits,'" he said, with an elaborate working of his jaws, intended to convey the idea that they were going to be specially delicious.

Seagraves laughed, but did not enter the shanty door. "How do you like baching it?"

"Oh, don't mention it!" entreated Rob, mauling the dough again. "Come in an' sit down. What in thunder y' standin' out there for?"

"Oh, I'd rather be where I can see the prairie. Great weather!"

"*Im*-mense!"

"How goes breaking?"

"Tip-top! A *leetle* dry now, but the bulls pull the plough through two acres a day. How's things in Boomtown?"

"Oh, same old grind."

"Judge still lyin'?"

"Still at it."

"Major Mullens still swearin' to it?"

"You hit it like a mallet. Railroad schemes are thicker'n prairie-chickens. You've got grit, Rob. I don't have anything but crackers and sardines over to my shanty, and here you are making soda biscuit."

"I have t' do it. Couldn't break if I didn't. You editors c'n take things easy, lay around on the prairie, and watch the plovers and medder-larks; but we *settlers* have got to work."

Leaving Rob to sputter over his cooking, Seagraves took his slow way off down toward the oxen grazing in a little hollow. The scene was characteristically, wonderfully beautiful. It was about five o'clock in a day in late June, and the level plain was green and yellow, and infinite in reach as a sea; the lowering sun was casting over its distant swells a faint impalpable mist, through which the breaking teams on the neighboring claims ploughed noiselessly, as figures in a dream. The whistle of gophers, the faint, wailing, fluttering cry of the falling plover, the whir of the swift-winged prairie-pigeon, or the quack of a lonely duck, came through the shimmering air. The lark's infrequent whistle, piercingly sweet, broke from the longer grass in the swales near by. No other climate, sky, plain, could produce the same unnamable weird charm. No tree to wave, no grass to rustle; scarcely a sound of domestic life; only the faint melancholy soughing of the wind in the short grass, and the voices of the wild things of the prairie.

Seagraves, an impressionable young man (junior editor of the Boomtown *Spike*), threw himself down on the sod, pulled his hat rim down over his eyes, and looked away over the plain. It was the second year of Boomtown's existence, and Seagraves had not yet grown restless under its monotony. Around him the gophers played saucily. Teams were moving here and there across the sod, with a peculiar noiseless, effortless motion, that made them seem as calm, lazy, and unsubstantial as the mist through which they made their way; even the sound of passing wagons was a sort of low, well-fed, self-satisfied chuckle.

Seagraves, "holding down a claim" near Rob, had come to see his neighboring "bach" because feeling the need of company; but now that he was near enough to hear him prancing about getting supper, he was content to lie alone on a slope of the green sod.

The silence of the prairie at night was wellnigh terrible. Many a night, as Seagraves lay in his bunk against the side of his cabin, he would strain his ear to hear the slightest sound, and be listening thus sometimes for minutes before the squeak of a mouse or the step of a passing fox came as a relief to the aching sense. In the daytime, however, and especially on a morning, the prairie was another thing. The pigeons, the larks, the cranes, the multitudinous voices of the ground birds and snipes and insects, made the air pulsate with sound—a chorus that died away into an infinite murmur of music.

"Hello, Seagraves!" yelled Rob from the door. "The biscuit are 'most done."

Seagraves did not speak, only nodded his head, and slowly rose. The faint clouds in the west were getting a superb flame-color above and a misty purple below, and the sun had shot them with lances of yellow light. As the air grew denser with moisture, the sounds of neighboring life began to reach the ear. Children screamed and laughed, and afar off a woman was singing a lullaby. The rattle of wagons and voices of men speaking to their teams multiplied. Ducks in a neighboring lowland were quacking. The whole scene took hold upon Seagraves with irresistible power.

"It is American," he exclaimed. "No other land or time can match this mellow air, this wealth of color, much less the strange social conditions of life on this sunlit Dakota prairie."

Rob, though visibly affected by the scene also, couldn't let his biscuit spoil, or go without proper attention.

"Say, ain't y' comin' t' grub?" he asked, impatiently.

"In a minute," replied his friend, taking a last wistful look at the scene. "I want one more look at the landscape."

"Landscape be blowed! If you'd been breakin' all day— Come, take that stool an' draw up."

"No; I'll take the candle box."

"Not much. I know what manners are, if I am a bull-driver."

Seagraves took the three-legged and rather precarious-looking stool and drew up to the table, which was a flat broad box nailed up against the side of the wall, with two strips of board nailed at the outer corners for legs.

"How's that f'r a lay out?" Rob inquired, proudly.

"Well, you *have* spread yourself! Biscuit and canned peaches and sardines and cheese. Why, this is—is—prodigal."

"It ain't nothin' else."

Rob was from one of the finest counties of Wisconsin, over toward Milwaukee. He was of German parentage, a middle-sized, cheery, wide-awake, good-looking young fellow—a typical claim-holder. He was always confident, jovial, and full of plans for the future. He had dug his own well, built his own shanty, washed and mended his own clothing. He could do anything, and do it well. He had a fine field of wheat, and was finishing the ploughing of his entire quarter section.

"This is what I call settin' under a feller's own vine an' fig tree"—after Seagraves's compliments—"an' I like it. I'm my own boss. No man can say 'come here' 'n' 'go there' to me. I get up when I'm a mind to, an' go t' bed when I'm a mind to."

"Some drawbacks, I s'pose?"

"Yes. Mice, f'r instance, give me a devilish lot o' trouble. They get into my flour barrel, eat up my cheese, an' fall into my well. But it ain't no use t' swear."

"'The rats and the mice they made such a strife
He had to go to London to buy him a wife,'"

quoted Seagraves. "Don't blush. I've probed your secret thought."

"Well, to tell the honest truth," said Rob, a little sheepishly, leaning across the table, "I ain't satisfied with my style o' cookin'. It's good, but a little too plain, y' know. I'd like a change. It ain't much fun to break all day, and then go to work an' cook y'r own supper."

"No, I should say not."

"This fall I'm going back to Wisconsin. Girls are thick as huckleberries back there, and I'm goin' t' bring one back, now you hear me."

"Good! That's the plan," laughed Seagraves, amused at a certain timid and apprehensive look in his companion's eye. "Just think what a woman 'd do to put this shanty in shape; and think how nice it would be to take her arm and saunter out after supper, and look at the farm, and plan and lay out gardens and paths, and tend the chickens!"

Rob's manly and self-reliant nature had the settler's typical buoyancy and hopefulness, as well as a certain power of analysis, which enabled him now to say: "The fact is, we fellers holdin' down claims out here ain't fools clear to the *rine*. We know a *couple* o' things. Now I didn't leave Waupac County f'r fun. Did y' ever see Waupac? Well, it's one o' the handsomest counties the sun ever shone on, full o' lakes and rivers and groves of timber. I miss 'em all out here, and I miss the boys an' girls, but they wa'n't no chance there f'r a feller. Land that was good was so blamed high you couldn't touch it with a ten-foot pole from a balloon. Rent was high, if you wanted t' rent, an' so a feller like me had t' get out, an' now I'm out here, I'm goin' t' make the most of it. Another thing," he went on, after a pause—"we fellers workin' out back there got more 'n' more like *hosses*, an' less like human beings. Y' know, Waupac is a kind of a summer resort, and the people that use' t' come in summers looked down on us cusses in the fields an' shops. I couldn't stand it. By God!" he said, with a sudden impulse of rage quite unlike him, "I'd rather live on an iceberg and claw crabs f'r a livin' than have some feller passin' me on the road an' callin' me 'fellah!'"

Seagraves knew what he meant, and listened in astonishment at this outburst.

"I consider myself a sight better 'n' any man who lives on somebody else's hard work. I've never had a cent I didn't earn with them hands." He held them up, and broke into a grin. "Beauties, ain't they? But they never wore gloves that some other poor cuss earned."

Seagraves thought them grand hands, worthy to grasp the hand of any man or woman living.

"Well, so I come West, jest like a thousand other fellers, to get a start where the cussed European aristocracy hadn't got a holt on the people. I like it here—course I'd like the lakes an' meadows of Waupac better—but I'm my own boss, as I say, an' I'm goin' to *stay* my own boss if I haf to live on crackers an' wheat coffee to do it; that's the kind of a hair-pin I am."

In the pause which followed, Seagraves, plunged deep into thought by Rob's words, leaned his head on his hand. This working farmer had voiced the modern idea. It was an absolute overturn of all the ideas of nobility and special privilege born of the feudal past. Rob had spoken upon impulse, but that impulse appeared to Seagraves to be right.

"I'd like to use your idea for an editorial, Rob," he said.

"*My* ideas!" exclaimed the astounded host, pausing in the act of filling his pipe. "My ideas! Why, I didn't know I had any."

"Well, you've given me some, anyhow."

Seagraves felt that it was a wild grand upstirring of the modern democrat against the aristocratic, against the idea of caste and the privilege of living on the labor of others. This atom of humanity (how infinitesimal this drop in the ocean of humanity!) was feeling the nameless longing of expanding personality, and had already pierced the conventions of society, and declared as *nil* the laws of the land—laws that were survivals of hate and prejudice. He had exposed also the native spring of the emigrant by uttering the feeling that it is better to be an equal among peasants than a servant before nobles.

"So I have good reasons f'r liking the country," Rob resumed, in a quiet way. "The soil is rich, the climate good so far, an' if I have a couple o' decent crops you'll see a neat upright goin' up here, with a porch and a bay-winder."

"And you'll still be livin' here alone, frying leathery slapjacks an' chopping 'taters and bacon."

"I think I see myself," drawled Rob, "goin' around all summer wearin' the same shirt without washin', an' wipin' on the same towel four straight weeks, an' wearin' holes in my socks, an' eatin' musty ginger-snaps, mouldy bacon, an' canned Boston beans f'r the rest o' my endurin' days! Oh yes, I guess *not!* Well, see y' later. Must go water my bulls."

As he went off down the slope, Seagraves smiled to hear him sing:

"I wish that some kind-hearted girl
Would pity on me take,
And extricate me from the mess I'm in.
The angel—how I'd bless her,
If this her home she'd make,
In my little old sod shanty on the plain!"

The boys nearly fell off their chairs in the Western House dining-room, a few days later, at seeing Rob come in to supper with a collar and neck-tie as the finishing touch of a remarkable outfit.

"Hit him, somebody!"

"It's a clean collar!"

"He's started f'r Congress!"

"He's going to get married," put in Seagraves, in a tone that brought conviction.

"What!" screamed Jack Adams, O'Neill, and Wilson, in one breath. "That man?"

"That man," replied Seagraves, amazed at Rob, who coolly took his seat, squared his elbows, pressed his collar down at the back, and called for the bacon and eggs.

The crowd stared at him in a dead silence.

"Where's he going to do it?" asked Jack Adams. "Where's he going to find a girl?"

"Ask him," said Seagraves.

"I ain't tellin'," put in Rob, with his mouth full of potato.

"You're afraid of our competition."

"That's right; *our* competition, Jack; not *your* competition. Come, now, Rob, tell us where you found her."

"I ain't found her."

"What! And yet you're goin' away t' get married?"

"I'm goin' t' bring a wife back with me ten days fr'm date."

"I see his scheme," put in Jim Rivers. "He's goin' back East somewhere, an' he's goin' to propose to every girl he meets."

"Hold on!" interrupted Rob, holding up his fork. "Ain't quite right. Every *good-lookin'* girl I meet."

"Well, I'll be blanked!" exclaimed Jack, impatiently; "that simply let's me out. Any man with such cheek ought to—"

"Succeed," interrupted Seagraves.

"That's what I say," bawled Hank Whiting, the proprietor of the house. "You fellers 'ain't got no enterprise to yeh. Why don't you go to work an' help settle the country like men? 'Cause y' ain't got no sand. Girls are thicker 'n huckleberries back East. I say it's a dum shame!"

"Easy, Henry," said the elegant bank clerk, Wilson, looking gravely about through his spectacles. "I commend the courage and the resolution of Mr. Rodemaker. I pray the lady may not

"'Mislike him for his complexion,
The shadowed livery of the burning sun.'"

"Shakespeare," said Adams, at a venture.

"Brother in adversity, when do you embark? Another Jason on an untried sea."

"Hay!" said Rob, winking at Seagraves. "Oh, I go to-night—night train."

"And return?"

"Ten days from date."

"I'll wager a wedding supper he brings a blonde," said Wilson, in his clean-cut, languid speech.

"Oh, come, now, Wilson; that's too thin! We all know that rule about dark marryin' light."

"I'll wager she'll be tall," continued Wilson. "I'll wager *you*, friend Rodemaker, she'll be blond and tall."

The rest roared at Rob's astonishment and confusion. The absurdity of it grew, and they went into spasms of laughter. But Wilson remained impassive, not the twitching of a muscle betraying that he saw anything to laugh at in the proposition.

Mrs. Whiting and the kitchen girls came in, wondering at the merriment. Rob began to get uneasy.

"What is it? What is it?" said Mrs. Whiting, a jolly little matron.

Rivers put the case. "Rob's on his way back to Wisconsin t' get married, and Wilson has offered to bet *him* that his wife will be a blonde and tall, and Rob doesn't bet!"

And they roared again.

"Why, the idea! the man's crazy!" said Mrs. Whiting.

The crowd looked at each other. This was hint enough; they sobered, nodding at each other.

"Aha! I see; I understand."

"It's the heat."

"And the Boston beans."

"Let up on him, Wilson. Don't badger a poor irresponsible fellow. I *thought* something was wrong when I saw the collar."

"Oh, keep it up!" said Rob, a little nettled by their evident intention to "have fun" with him.

"Soothe him—*soo-o-o-the* him!" said Wilson. "Don't be harsh."

Rob rose from the table. "Go to thunder! you make me tired."

"The fit is on him again!"

He rose disgustedly and went out. They followed him in single file. The rest of the town "caught on." Frank Graham heaved an apple at him, and joined the procession. Rob went into the store to buy some tobacco. They followed, and perched like crows on the counters till he went out; then they followed him, as before. They watched him check his trunk, they witnessed the purchase of the ticket. The town had turned out by this time.

"Waupac!" announced the one nearest the victim.

"Waupac!" said the next man, and the word was passed along the street up town.

"Make a note of it," said Wilson. "Waupac—a county where a man's proposal for marriage is honored upon presentation. Sight drafts."

Rivers struck up a song, while Rob stood around, patiently bearing the jokes of the crowd:

"We're lookin' rather seedy now,
While holdin' down our claims,
And our vittles are not always of the best,
And the mice play slyly round us
As we lay down to sleep
In our little old tarred shanties on the claim.

"Yet we rather like the novelty
Of livin' in this way,
Though the bill of fare is often rather tame;
An' we're happy as a clam
On the land of Uncle Sam
In our little old tarred shanty on the claim."

The train drew up at length, to the immense relief of Rob, whose stoical resignation was beginning to weaken.

"Don't y' wish y' had sand?" he yelled to the crowd as he plunged into the car, thinking he was rid of them.

But no, their last stroke was to follow him into the car, nodding, pointing to their heads, and whispering, managing in the half minute the train stood at the platform to set every person in the car staring at the "crazy man." Rob groaned, and pulled his hat down over his eyes—an action which confirmed his tormentors' words, and made several ladies click their tongues in sympathy—"Tlck! tlck! poor fellow!"

"All *aboo-o-a-rd!*" said the conductor, grinning his appreciation at the crowd, and the train was off.

"Oh, won't we make him groan when he gets back!" said Barney, the young lawyer who sung the shouting tenor.

"We'll meet him with the timbrel and the harp. Anybody want to wager? I've got two to one on a short brunette," said Wilson.

II.

A corn field in July is a hot place. The soil is hot and dry; the wind comes across the lazily murmuring leaves laden with a warm sickening smell drawn from the rapidly growing, broad-flung banners of the corn. The sun, nearly vertical, drops a flood of dazzling light and heat upon the field over which the cool shadows run, only to make the heat seem the more intense.

Julia Peterson, faint with fatigue, was toiling back and forth between the corn rows, holding the handles of the double-shovel corn plough, while her little brother Otto rode the steaming horse. Her heart was full of bitterness, and her face flushed with heat, and her muscles aching with fatigue. The heat grew terrible. The corn came to her shoulders, and not a breath seemed to reach her, while the sun, nearing the noon mark, lay pitilessly upon her shoulders, protected only by a calico dress. The dust rose under her feet, and as she was wet with perspiration it soiled her till, with a woman's instinctive cleanliness, she shuddered. Her head throbbed dangerously. What matter to her that the kingbird pitched jovially from the maples to catch a wandering bluebottle fly, that the robin was feeding its young, that the bobolink was singing? All these things, if she saw them, only threw her bondage to labor into greater relief.

Across the field, in another patch of corn, she could see her father—a big, gruff-voiced, wide-bearded Norwegian—at work also with a plough. The corn must be ploughed, and so she toiled on, the tears dropping from the shadow of the ugly sun-bonnet she wore. Her shoes, coarse and square-toed, chafed her feet, her hands, large and strong, were browned, or more properly *burnt*, on the backs by the sun. The horse's harness "creak-cracked" as he swung steadily and patiently forward, the moisture pouring from his sides, his nostrils distended.

The field ran down to a road, and on the other side of the road ran a river—a broad, clear, shallow expanse at that point, and the eyes of the boy gazed longingly at the pond and the cool shadow each time that he turned at the fence.

"Say, Jule, I'm goin' in! Come, can't I? Come—say!" he pleaded, as they stopped at the fence to let the horse breathe.

"I've let you go wade twice."

"But that don't do any good. My legs is

oogle

all smarty, 'cause ol' Jack sweats so." The boy turned around on the horse's back, and slid back to his rump. "I can't stand it!" he burst out, sliding off and darting under the fence. "Father can't see."

The girl put her elbows on the fence, and watched her little brother as he sped away to the pool, throwing off his clothes as he ran, whooping with uncontrollable delight. Soon she could hear him splashing about in the water a short distance up the stream, and caught glimpses of his little shiny body and happy face. How cool that water looked! And the shadows there by the big basswood! How that water would cool her blistered feet! An impulse seized her, and she squeezed between the rails of the fence, and stood in the road looking up and down to see that the way was clear. It was not a main travelled road; no one was likely to come; why not?

She hurriedly took off her shoes and stockings—how delicious the cool soft velvet of the grass!—and sitting down on the bank under the great basswood, whose roots formed an abrupt bank, she slid her poor blistered, chafed feet into the water, her bare head leaned against the huge tree trunk.

And now as she rested the beauty of the scene came to her. Over her the wind moved the leaves. A jay screamed far off, as if answering the cries of the boy. A kingfisher crossed and recrossed the stream with dipping sweep of his wings. The river sang with its lips to the pebbles. The vast clouds went by majestically far above the tree-tops, and the snap and buzzing and ringing whir of July insects made a ceaseless, slumberous undertone of song solvent of all else. The tired girl forgot her work. She began to dream. This would not last always. Some one would come to release her from such drudgery. This was her constant, tenderest, and most secret dream. *He* would be a Yankee, not a Norwegian; the Yankees didn't ask their wives to work in the field. He would have a home. Perhaps he'd live in town—perhaps a merchant! And then she thought of the drug clerk in Rock River who had looked at her— A voice broke in on her dream, a fresh manly voice.

"Well, by jinks! if it ain't Julia! Just the one I wanted to see!"

The girl turned, saw a pleasant faced young fellow in a derby hat and a fifteen-dollar suit of diagonals.

"Rob Rodemaker! How come—"

She remembered her situation, and flushed, looked down at the water, and remained perfectly still.

"Ain't y' goin' to shake hands? Y' don't seem very glad t' see *me*."

She began to grow angry. "If you had any eyes you'd see."

Rob looked over the edge of the bank, whistled, turned away. "Oh, I see! Excuse *me!* Don't blame yeh a bit, though. Good weather f'r corn," he went on, looking up at the trees. "Corn seems to be pretty well forward," he continued, in a louder voice, as he walked away, still gazing into the air. "Crops is looking first-class in Boomtown. Hello! This Otto? H'yare, y' little scamp! Get on to that horse agin. Quick, 'r I'll take y'r skin off an' hang it on the fence. What y' been doing?"

"Ben in swimmin'. Jimminy, ain't it fun! When 'd y' get back?" said the boy, grinning.

"Never you mind," replied Rob, leaping the fence by laying his left hand on the top rail. "Get on to that horse." He tossed the boy up on the horse, hung his coat on the fence. "I s'pose the ol' man makes her plough same as usual?"

"Yup," said Otto.

"Dod ding a man that 'll do that! I don't mind if it's necessary, but it ain't necessary in his case." He continued to mutter in this way as he went across to the other side of the field. As they turned to come back, Rob went up and looked at the horse's mouth. "Gettin' purty near of age. Say, who's sparkin' Julia now—anybody?"

"Nobody 'cept some ol' Norwegians. She won't have them. Pa wants her to, but she won't."

"Good f'r her. Nobody comes t' see her Sunday nights, eh?"

"Nope, only 'Tias Anderson an' Ole Hoover; but she goes off an' leaves 'em."

"Chk!" said Rob, starting old Jack across the field.

It was almost noon, and Jack moved reluctantly. He knew the time of day as well as the boy. He made this round after distinct protest.

In the mean time Julia, putting on her shoes and stockings, went to the fence and watched the man's shining white shirt as he moved across the corn field. There had never been any special tenderness between them, but she had always liked him. They had been at school together. She wondered why he had come back at this time of the year, and wondered how long he would stay. How long had he stood looking at her? She flushed again at the thought of it. But he wasn't to blame; it was a public road. She might have known better.

She stood under a little popple-tree, whose leaves shook musically at every zephyr, and her eyes through half-shut lids roved over the sea of deep green glossy leaves, dappled here and there by cloud shadows, stirred here and there like water by the wind, and out of it all a longing to be free from such toil rose like a breath, filling her throat, and quickening the motion of her heart. Must this go on forever, this life of heat and dust and labor? What did it all mean?

The girl laid her chin on her strong red wrists, and looked up into the blue spaces between the vast clouds—aerial mountains dissolving in a shoreless azure sea. How cool and sweet and restful they looked! If she might only lie out on the billowy, snow-white, sun-lit edge! The voices of the driver and the ploughman recalled her, and she fixed her eyes again upon the slowly nodding head of the patient horse, the boy turned half about on the horse talking to the white-sleeved man, whose derby hat bobbed up and down quite curiously, like the horse's head. Would she ask him to dinner? What would her people say?

"Phew! it's hot!" was the greeting the young fellow gave as he came up. He smiled in a frank, boyish way as he hung his hat on the top of a stake and looked up at her. "D' y' know, I kind o' enjoy getting at it again. Fact. It ain't no work for a girl, though," he added.

"When 'd you get back?" she asked, the flush not yet out of her face. Rob was looking at her thick fine hair and full Scandinavian face, rich as a rose in color, and did not reply for a few seconds. She stood with her hideous sun-bonnet pushed back on her shoulders. A kingbird was chattering overhead.

"Oh, a few days ago."

"How long y' goin' t' stay?"

"Oh, I d' know. A week, mebbe."

A far-off halloo came pulsing across the shimmering air. The boy screamed "Dinner!" and waved his hat with an answering whoop, then flopped off the horse like a turtle off a stone into water. He had the horse unhooked in an instant, and had flung his toes up over the horse's back in act to climb on, when Rob said,

"H'yare, young feller! wait a minute. Tired?" he asked the girl, with a tone that was more than kindly; it was almost tender.

"Yes," she replied, in a low voice. "My shoes hurt me."

"Well, here y' go," he replied, taking his stand by the horse, and holding out his hand like a step. She colored and smiled a little as she lifted her foot into his huge, hard, sunburned hand.

"Oop-a-daisy!" he called. She gave a spring and sat the horse like one at home there.

Rob had a deliciously unconscious, abstracted, business-like air. He really left her nothing to do but enjoy his company while he went ahead and did precisely as he pleased.

"We don't raise much corn out there, an' so I kind o' like to see it once more."

"I wish I didn't have to see another hill of corn as long as I live!" replied the girl, bitterly.

"Don't know as I blame yeh a bit. But, all the same, I'm glad you was working in it to-day," he thought to himself, as he walked beside her horse toward the house.

"Will you stop to dinner?" she inquired bluntly, almost sullenly. It was evident that there were reasons why she didn't mean to press him to do so.

"You bet I will," he replied; "that is, if you want I should."

"You know how we live," she replied, evasively. "If you c'n stand it, why—" She broke off abruptly.

Yes, he remembered how they lived in that big, square, dirty, white frame house. It had been three or four years since he had been in it, but the smell of the cabbage and onions, the penetrating, peculiar mixture of odors, assailed his memory as something unforgettable.

"I guess I'll stop," he said, as she hesitated. She said no more, but tried to act as if she were not in any way responsible for what came afterward.

"I guess I c'n stand f'r one meal what you stand all the while," he added.

As she left them at the well and went to the house he saw her limp painfully, and the memory of her face so close to his lips as he helped her down from the horse gave him pleasure, at the same time that he was touched by its tired and gloomy look. Mrs. Peterson came to the door of the kitchen looking just the same as ever. Broad-faced, unwieldy, flabby, apparently wearing the same dress he remembered to have seen her in years before, a dirty drab-colored thing; she looked as shapeless as a sack of wool. Her English was limited to, "How de do, Rob?"

He washed at the pump, while the girl, in the attempt to be hospitable, held the clean towel for him.

"You're purty well used up, eh?" he said to her.

"Yes; it's awful hot out there."

"Can't you lay off this afternoon? It ain't right."

"No. *He* won't listen to that."

"Well, let me take your place."

"No; there ain't any use o' that."

Peterson, a brawny wide-bearded Norwegian, came up at this moment, and spoke to Rob in a sullen, gruff way.

"He ain't *very* glad to see me," said Rob, winking at Julia. "He ain't b'ilin' over with enthusiasm; but I c'n stand it, for your sake," he added, with amazing assurance; but the girl had turned away, and it was wasted.

At the table he ate heartily of the "bean swaagen," which filled a large wooden bowl in the centre of the table, and which was ladled into smaller wooden bowls at each plate. Julia had tried hard to convert her mother to Yankee ways, and had at last given it up in despair. Rob kept on safe subjects, mainly asking questions about the crops of Peterson, and when addressing the girl, inquired of the school-mates. By skilful questioning he kept the subject of marriage uppermost, and seemingly was getting an inventory of the girls not yet married or engaged.

It was embarrassing for the girl. She was all too well aware of the difference between her home and the home of her school mates and friends. She knew that it was not pleasant for her "Yankee" friends to come to visit her when they could not feel sure of a welcome from the tireless, silent, and grim-visaged old Norse, if, indeed, they could escape insult. Julia ate her food mechanically, and it could hardly be said that she enjoyed the brisk talk of the young man, his eyes were upon her so constantly and his smile so obviously addressed to her. She rose as soon as possible, and going outside, took a seat on a chair under the trees in the yard. She was not a coarse or dull girl. In fact, she had developed so rapidly by contact with the young people of the neighborhood that she no longer found pleasure in her own home. She didn't believe in keeping up the old-fashioned Norwegian customs, and her life with her mother was not one to breed love or confidence. She was more like a hired hand. The love of the mother for her "Yulyie" was sincere though rough and inarticulate, and it was her jealousy of the young "Yankees" that widened the chasm between the girl and herself—an inevitable result.

Rob followed the girl out into the yard, and threw himself on the grass at her feet, perfectly unconscious of the fact that this attitude was exceedingly romantic and becoming to them both. He did it because he wanted to talk to her, and the grass was cool and easy; there wasn't any other chair, anyway.

"Do they keep up the ly-ceum and the sociables same as ever?"

"Yes. The others go a good 'eal, but I don't. We're gettin' such a stock round us, and father thinks he needs me s' much, I don't git out much. I'm gettin' sick of it."

"I sh'd think y' would," he replied, his eyes on her face.

"I c'd stand the churnin' and house work, but when it comes t' workin' out-doors in the dirt an' hot sun, gettin' all sunburned and chapped up, it's another thing. An' then it seems as if he gets stingier 'n' stingier every year. I 'ain't had a new dress in—I d' —know—how—long. He says it's all nonsense, an' mother's just about as bad. *She* don't want a new dress, an' so she thinks I don't." The girl was feeling the influence of a sympathetic listener, and was making up for her long silence. "I've tried t' go out t' work, but they won't let me. They'd have t' pay a hand twenty dollars a month f'r the work I do, an' they like cheap help; but I'm not goin' t' stand it much longer, I can tell you that."

Rob thought she was very handsome as she sat there with her eyes fixed on the horizon, while these rebellious thoughts found utterance in her quivering, passionate voice.

"Yulie! Kom heat!" roared the old man from the well.

A frown of anger and pain came into her face. She looked at Rob. "That means more work."

"Say! let me go out in your place. Come, now; what's the use—"

"No; it wouldn't do no good. It ain't t'-day s' much; it's every day, and—"

"*Yulie!*" called Peterson again, with a string of impatient Norwegian.

"Well, all right, only I'd like to—"

"Well, good-by," she said, with a little touch of feeling. "When d'ye go back?"

"I don't know. I'll see y' agin before I go. Good-by."

He stood watching her slow, painful pace till she reached the well, where Otto was standing with the horse. He stood watching them as they moved out into the road and turned down toward the field. He felt that she had sent him away; but still there was a look in her eyes which was not altogether—

He gave it up in despair at last. He was not good at analyses of this nature; he was used to plain, blunt expressions. There was a woman's subtlety here quite beyond his reach.

He sauntered slowly off up the road after his talk with Julia. His head was low on his breast; he was thinking as one who is about to take a decided and important step.

He stopped at length, and turning, watched the girl moving along in the deeps of the corn. Hardly a leaf was stirring; the untempered sunlight fell in a burning flood upon the field; the grasshoppers rose, snapped, buzzed, and fell; the locust uttered its dry, heat-intensifying cry. The man lifted his head.

"It's a d—n shame!" he said, beginning rapidly to retrace his steps. He stood leaning on the fence, awaiting the girl's coming very much as she had waited his on the round he had made before dinner. He grew impatient at the slow gait of the horse, and drummed on the rail while he whistled. Then he took off his hat, and dusted it nervously. As the horse got a little nearer he wiped his face carefully, pushed his hat back on his head, and climbed over the fence, where he stood with elbows on the middle rail as the girl and boy and horse came to the end of the furrow.

"Hot, ain't it?" he said, as she looked up.

"Jimminy Peters, it's awful!" puffed the boy. The girl did not reply till she swung the plough about after the horse, and set it upright into the next row. Her powerful body had a superb swaying motion at the waist as she did this—a motion which affected Rob vaguely but massively.

"I thought you'd gone," she said, gravely, pushing back her bonnet till he could see her face dewed with sweat, and pink as a rose. She had the high cheek-bones of her race, but she had also their exquisite fairness of color.

"Say, Otto," asked Rob, alluringly, "wan' to go swimming?"

"You bet!" replied Otto.

"Well, I'll go a round if—"

The boy dropped off the horse, not waiting to hear any more. Rob grinned; but the girl dropped her eyes, then looked away.

"Got rid o' him mighty quick. Say, Julyie, I hate like thunder t' see you out here; it ain't right. I wish you'd—I wish—"

She could not look at him now, and her bosom rose and fell with a motion that was not due to fatigue. Her moist hair matted around her forehead gave her a boyish look.

Rob nervously tried again, tearing splinters from the fence. "Say, now, I'll tell yeh what I come back here fer—t' git married; and if you're willin', I'll do it to-night. Come, now, whaddy y' say?"

"What 've *I* got t' do 'bout it?" she finally asked, the color flooding her face, and a faint smile coming to her lips. "Go ahead. I 'ain't got anything—"

Rob put a splinter in his mouth and faced her. "Oh, looky here, now, Julyie! you know what I mean. I've got a good claim out near Boomtown—a *rattlin'* good claim; a shanty on it fourteen by sixteen—no tarred paper about it, and a suller to keep butter in; and a hundred acres o' wheat just about ready to turn now. I need a wife."

Here he straightened up, threw away the splinter, and took off his hat. He was a very pleasant figure as the girl stole a look at him. His black laughing eyes were especially earnest just now. His voice had a touch of pleading. The popple tree over their heads murmured applause at his eloquence, then hushed to listen. A cloud dropped a silent shadow down upon them, and it sent a little thrill of fear through Rob, as if it were an omen of failure. As the girl remained silent, looking away, he began, man-fashion, to desire her more and more as he feared to lose her. He put his hat on the post again, and took out his jack knife. Her calico dress draped her supple and powerful figure simply but naturally. The stoop in her shoulders, given by labor, disappeared as she partly leaned upon the fence. The curves of her muscular arms showed through her sleeve.

"It's all-fired lonesome f'r me out there on that claim, and it ain't no picnic f'r you here. Now if you'll come out there with me, you needn't do anything but cook f'r me, and after harvest we can git a good lay-out o' furniture, an' I'll lath and plaster the house, an' put a little hell [ell] in the rear." He smiled, and so did she. He felt encouraged to say: "An' there we be, as snug as y' please. We're close t' Boomtown, an' we can go down there to church sociables an' things, and they're a jolly lot there."

The girl was still silent, but the man's simple enthusiasm came to her charged with passion and a sort of romance such as her hard life had known little of. There was something enticing about this trip to the West.

"What 'll my folks say?" she said at last.

A virtual surrender, but Rob was not acute enough to see it. He pressed on eagerly.

"I don't care. Do you? They'll jest keep y' ploughin' corn and milkin' cows till the day of judgment. Come, Julyie, I 'ain't got no time to fool away. I've got t' get back t' that grain. It's a whoopin' old crop, sure's y'r born, an' that means somepin purty scrumptious in furniture this fall. Come, now." He approached her and laid his hand on her shoulder very much as he would have touched Albert Seagraves or any other comrade. "Whaddy y' say?"

She neither started nor shrunk nor looked at him. She simply moved a step away. "They'd never let me go," she replied, bitterly. "I'm too cheap a hand. I do a man's work, an' get no pay at all."

"You'll have half o' all I c'n make," he put in.

"How long c'n you wait?" she asked, looking down at her dress.

"Just two minutes," he said, pulling out his watch. "It ain't no use t' wait. The old man 'll be jest as mad a week from now as he is to-day. Why not go now?"

"I'm of age day after to-morrow," she mused, wavering, calculating.

"You c'n be of age to-night if you'll just call on old Squire Hatfield with me."

"All right, Rob," the girl said, turning and holding out her hand.

"That's the talk!" he exclaimed, seizing it. "An' now a kiss, to bind the bargain, as the fellah says."

"I guess we c'n get along without that."

"No, we can't. It won't seem like an engagement without it."

"It ain't goin' to seem much like one anyway," she answered, with a sudden realization of how far from her dreams of courtship this reality was.

"Say, now, Julyie, that ain't fair; that's purty tough. I—I— You don't seem to understand that I *like* you, but I do."

Rob was carried quite out of himself by the time, the place, and the girl. He had said a very moving thing.

The tears sprang involuntarily to the girl's eyes. "Do you mean it? If y' do, you may."

She was trembling with emotion for the first time. The sincerity of the man's voice had gone deep.

He put his arm around her almost timidly and kissed her on the cheek, a great love for her springing up in his heart. "That settles it," he said. "Don't cry, Julyie. You'll never be sorry for it. Don't cry. It kind o' hurts me to see it."

He didn't understand her feelings. He was only aware that she was crying, and tried in a bungling way to soothe her. But now that she had given way, she sat down on the grass and wept bitterly.

"*Julyie!*" yelled the old Norwegian, like a distant fog-horn.

The girl sprang up; the habit of obedience was strong.

"No; you set right there, and I'll go round," he said. "*Otto!*"

The boy came scrambling out of the wood half dressed. Rob tossed him upon the horse, snatched Julia's sun-bonnet, put his own hat on her head, and moved off down the corn rows, leaving the girl smiling through her tears as he whistled and chirped to the horse. Farmer Peterson, seeing the familiar sun-bonnet above the corn rows, went back to his work, with a sentence of Norwegian trailing after him like the tail of a kite—something about lazy girls who didn't earn the crust of their bread, etc.

Rob was wild with delight. "Git up there, Jack! Hay, you old corn-crib! Say, Otto, can you keep your mouth shet if it puts money in your pocket?"

"Jest try me 'n' see," said the keen-eyed little scamp.

"Well, you keep quiet about my being here this afternoon, and I'll put a dollar on y'r tongue—hay?—what?—onnerstand?"

"Show me y'r dollar," said the boy, turning about and showing his tongue.

"All right. Begin to practise now by not talkin' to me."

Rob went over the whole situation on his way back, and when he got in sight of the girl his plan was made. She stood waiting 'or him with a new look on her face. Her ullenness had given way to a peculiar eager- ess and anxiety to believe in him. She 'as already living that free life in a far off onderful country. No more would her 'ru father and sullen mother force her to ks which she hated. She'd be a member a new firm. She'd work, of course, but it uld be because she wanted to, and not be- se she was forced to. The independence the love promised grew more and more ective. She laughed back with a softer in her eyes when she saw the smiling of Rob looking at her from her sun- et.

ow you mustn't do any more o' this," d. "You go back to the house an' tell y'r mother you're too lame to plough any more to-day, and it's too late, anyhow. To-night!" he whispered, quickly. "Eleven! Here!"

The girl's heart leaped with fear. "I'm afraid."

"Not of me, are yeh?"

"No, I'm not afraid of you, Rob."

"I'm glad o' that. I—I want you to—to *like* me, Julyie; won't you?"

"I'll try," she answered, with a smile.

"To-night, then," he said, as she moved away.

"To-night. Good-by."

"Good-by."

He stood and watched her till her tall figure was lost among the drooping corn leaves. There was a singular choking feeling in his throat. The girl's voice and face had brought up so many memories of parties and picnics and excursions on far-off holidays, and at the same time such suggestions of the future. He already felt that it was going to be an unconscionably long time before eleven o'clock.

He saw her go to the house, and then he turned and walked slowly up the dusty road. Out of the May-weed the grasshoppers sprang, buzzing and snapping their dull red wings. Butterflies, yellow and white, fluttered around moist places in the ditch, and slender striped water-snakes glided across the stagnant pools at sound of footsteps.

But the mind of the man was far away on his claim, building a new house, with a woman's advice and presence.

It was a windless night. The katydids and an occasional cricket were the only sounds Rob could hear as he stood beside his team and strained his ear to listen. At long intervals a little breeze ran through the corn like a swift serpent, bringing to the nostrils the sappy smell of the growing corn. The horses stamped uneasily as the mosquitoes settled on their shining limbs. The sky was full of stars, but there was no moon.

"What if she don't come?" he thought. "Or *can't* come? I can't stand that. I'll go to the old man, an' say, 'Looky here—' 'Sh!"

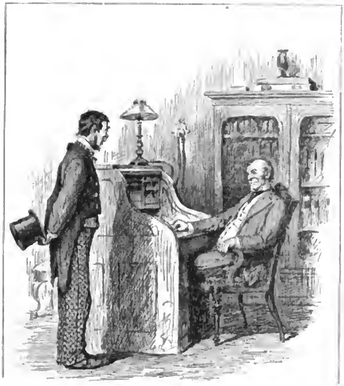
He listened again. There was a rustling in the corn. It was not like the fitful movement of the wind; it was steady, slower, and approaching. It ceased. He whistled the wailing, sweet cry of the prairie-chicken. Then a figure came out into the road—a woman—Julia!

He took her in his arms as she came panting up to him.

"Rob!"

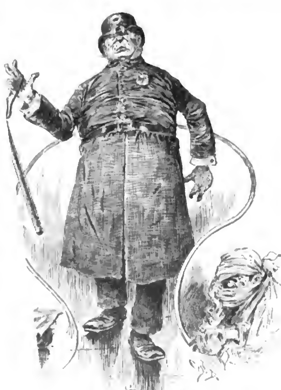
"Julyie!"

A few words, the dull tread of swift horses, the rising of a silent train of dust, and then the wind wandered in the growing corn. The dust fell, a dog barked down the road, and the katydids sang to the liquid contralto of the river in its shallows.



ENGAGING A COACHMAN.

HOLLINGSWORTH. "You say you are an experienced driver?"
PAT. "Yis, sorr."
HOLLINGSWORTH. "Where did you get it?"
PAT. "Oi was a spile-drroiver in th' Boshtan Back Bay for two years, sorr."



E BEST-KNOWN CLUB MEN IN THE CITY OF NEW YORK.

DEAL GENTLY WITH THE STOMACH.

If it proves refractory, mild discipline is the thing to set it right. Not all the nauseous draughts and boluses ever invented can do half as much to remedy its disorders as a few wineglassfuls—say three a day—of Hostetter's Stomach Bitters, which will afford it speedy relief, and eventually banish every dyspeptic and bilious symptom. Sick headache, nervousness, sallowness of the complexion, fur upon the tongue, vertigo, and those many indescribable and disagreeable sensations caused by indigestion, are too often perpetuated by injudicious dosing. An immediate abandonment of such random and ill-advised experiments should be the first step in the direction of a cure; the next step the use of this standard tonic alterative, which has received the highest medical sanction and won unprecedented popularity.—[*Adv.*]

SPECIAL ADVANTAGES OF THE TRAVELERS' LIFE POLICIES.

Security.—The Company's surplus to Policy-holders is $2,162,000.

Certainty.—It guarantees a *definite amount* of insurance, and sells it for a *fixed sum*, leaving no opportunity for assessment, disappointment, or dispute.

Honesty.—It never befogs and deceives with preposterous "estimates" which it will not back up. What it will give and do is printed in [illegible] on each policy, and guaranteed by the Company.

Promptness.—It pays all losses without discount, and immediately upon receipt of satisfactory proofs.

Liberality.—All its policies contain liberal *non-forfeiting* features, cash surrender values or paid-up or special term insurance, plainly stated.

Simplicity.—Its Life Policies permit world-wide travel, and are absolutely free from restrictions after two years. You don't have to carry an atlas under one arm and a calendar under the other to know whether you are insured at any given time or place.

The best.—No other Life Contract equal in liberality gives so low rates; no other so low in price gives so liberal conditions.

Company's record.—It has done business with increasing prosperity for 25 years, and is one of the leading corporations of the world, having in all its departments insured more lives than any other company.

Convenience.—Premiums may be paid either annually, semi-annually, or quarterly.

One form of contract which no other company gives or can give—combined Life and Accident Policies, at about the same rates that most companies charge for Life Policies alone.—[*Adv.*]

MRS. WINSLOW'S SOOTHING SYRUP has been used for over fifty years by millions of mothers for their children while teething, with perfect success. It soothes the child, softens the gums, allays all pain, cures wind colic, and is the best remedy for diarrhœa. Sold by druggists in every part of the world. Twenty-five cents a bottle.—[*Adv.*]

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.—[*Adv.*]

BROWN'S HOUSEHOLD PANACEA, "THE GREAT PAIN RELIEVER," cures Cramps, colic, colds; all pains. 25 cts. a bottle.—[*Adv.*]

[illegible] Liquid Bread is the beverage for those who are subject to lassitude and debility caused by the advent of warm weather. It is a healthy and invigorating tonic. Grocers and druggists keep it.—[*Adv.*]

MILLIONS of bottles of BURNETT'S COCOAINE have been sold during the last twenty years, in every civilized country, and the public have rendered the verdict that it is the cheapest and best Hair Dressing in the world.—[*Adv.*]

ANGOSTURA BITTERS, endorsed by physicians and chemists for purity and wholesomeness.—[*Adv.*]

DR. LYON'S PERFECT TOOTH POWDER. Whitens the teeth and purifies the breath. 25c.—[*Adv.*]

THE Best Worm Lozenges for Children are Brown's Vermifuge Comfits. 25c. a box.—[*Adv.*]

BURNETT'S FLAVORING EXTRACTS are invariably acknowledged the purest and best.—[*Adv.*]

SARSAPARILLA belongs to the smilax family of plants, and is found very generally over the American continent; but the variety that is richest in medicinal properties is the Honduras root, of which the famous Ayer's Sarsaparilla is made.—[*Adv.*]

DAVIDS ISLAND.

THE ENLISTED MAN OF THE ARMY.

BY HENRY LOOMIS NELSON.

SMALL as is the army of the United States, it is constantly receiving recruits. If there were no desertions, deaths, or other causes diminishing the rank and file, one-fifth of the effective strength of the service would be annually lost by expiration of the terms of enlistment. As a matter of fact, more than one-fifth of the army is enlisted each year. In 1884 the enlistments were 8775; in 1885, 7164; in 1886, 5327; in 1887, 6168; in 1888, 6693. The present organization of the army demands at least 40,000 enlisted men, while there is a staff organization for 100,000. The limit of 25,000 was first set in an appropriation bill, and has governed ever since. This small body of troops, necessarily having a sufficient number of officers to command a force four times as large, is not only without proper arms, but it is too small to form even the nucleus of an important modern army, while its service is not tempting to men of keen intelligence, the kind of men who must be depended on in the warfare of the future, when the inspiration of courage and confidence that is derived from the touching of elbows will be lacking. It is true that the service secures men of excellent military capacity, and, as a rule, it is probably also true that the general character of the rank and file of the American army is higher than that of any other army in the world, except the German army, in which service is compulsory, in a country where public education is thorough and universal. It is fair to state that American officers who have visited Germany professionally assert that their own men are superior to the German soldiers. However that may be, it is sufficient to know that the American soldier is an excellent specimen of his kind, and it is also true that the very best of the enlisted men remain in the army and often re-enlist. And yet, notwithstanding the apparent paradox, the service does not prove congenial to young soldiers, and this is shown by the very large number of desertions that take place, concerning which there is a discussion in nearly every annual report of division and departmental commanders.

It is the purpose of this article to explain the method by which recruits are obtained for the army, instructed in the duties of soldiers, assigned to regiments and companies, and to follow this with an explanation of the condition of the enlisted man when he reaches the post at which his company is stationed, and is actually a United States soldier.

At the lower end of Long Island Sound, a few miles above Fort Schuyler, which commands the narrow passage connecting the Sound with the East River, is a group of islands. The largest of these is Hart's, formerly a United States military station, under the jurisdiction of the city of New York; Hunter's is the most northerly bit of land in the new Pelham Bay Park; Glen is a summer resort; Davids Island is named from a previous owner, Mr. Thaddeus Davids. It is about twenty-five miles from the Battery, and one and a half miles from the village of New Rochelle, which is on the main shore opposite. It is owned by the government, and is the eastern depot for the recruiting service. There are three depots—two for the general service, at Davids Island and Columbus Barracks, Ohio; and one for the mounted service at Jefferson Barracks, Missouri. There are a number of rendezvouses from which recruits are sent to the depots, where they are instructed, and from which they are forwarded to permanent commands. A rendezvous is a recruiting office, the place where enlistments are made. It is under the command of a commissioned officer, who has two or three enlisted men under him, who drum up recruits and do guard and police duty at the rendezvous. A sergeant conducts the recruits to the depot. The latter is under the command of a field officer, with a complement of staff and line officers.

The work of recruiting for the infantry and artillery comes within the jurisdiction of the infantry arm of the service. There are twenty-five regiments of infantry, and each year a line officer from each of half the regiments is detailed for this duty, the odd and even numbered regiments alternating in furnishing the yearly quota. The tour of duty being two years, there are always twenty-five infantry officers serving on regular recruiting details, while there are a number of others who are serving on special details, some of which are obtained by the favoritism and by the civilian interference with the military functions of the army, which has already been described in these columns in an article entitled "The Army and the Politicians." The officers are stationed both at the depot and at the rendezvouses. The whole recruiting service is in charge of a superintendent, with head-quarters at New York. Details are furnished from the permanent party at Davids Island for the following rendezvouses: In this city, two offices; in Philadelphia, Baltimore, Albany, Augusta (Georgia), Brooklyn, Boston, Camden (New Jersey), Providence, and Washington there is one in each city. The rendezvouses are not permanent like the depots. They are closed and opened, or transferred from one city to another, according to the exigencies of the service. For example, in 1888 the rendezvouses at Denver, Atlanta, and Richmond were discontinued because they ceased to be productive; and that at Charleston was closed because the army had received a sufficient number of colored recruits.

The depot at Davids Island receives recruits from all the rendezvouses that are nearer to it than to Columbus Barracks. From Portland to the most Southern recruiting station on the Atlantic coast men who enlist in the infantry or artillery concentrate at this place. The island will be recollected by all who were familiar with this vicinity during the war as a hospital for sick and wounded soldiers. Many an old soldier of the war recalls it as the place where he recovered from the wound which he received at the front. It was rented for hospital purposes by the government in 1862, and was thus occupied until the end of 1866. During that period it was covered with wooden structures, some of them very like those that are still to be seen on Hart's Island. For many years it was an uninviting spot; the buildings were dilapidated, the grounds ill kept, the roads bad. Indeed, it is only within two years that any effective effort has been made to add to the attractions of the island; and to Lieutenant-Colonel Frederick Mears, of the Fourth Infantry, who recently finished his tour as commanding officer, is due the credit of putting the post in a condition which makes it worthy of its delightful natural surroundings. Roads have been made, the wharves are excellent, the old officers' quarters have been put in repair, new quarters have been built, new well-ventilated brick barracks add to the comfort of the enlisted men.

Soon after the island was abandoned as a hospital, in February, 1867, Congress passed an act authorizing its purchase for military purposes. The purchase was completed in May of the same year, and in April, 1868, jurisdiction over it was ceded to the United States by the Legislature of New York. At first it was used as a sub-depot for the recruiting service, the main depot being at Governor's Island. At this time, from 1869 to 1878, the recruiting service was not as well organized and managed as it is now, and the men who found their way into the army were of inferior character. In 1878 the general recruiting depot was transferred to Davids Island, and in the next year began the work of making the island habitable. Officers' quarters of the kind familiar to all who have visited army posts, a commissary storehouse, a hospital, and a bakehouse were built. Even to this day, however, the officers' quarters do not reflect credit on the government. Some of them are good, two of them are absurdly small; while there is not an adequate house for the commanding officer, who is lodged in one of the houses of the officers' row which is dignified and enlarged by a wing about large enough for a smoking-room for two.

Since 1886, however, to compensate for its lack of generosity to the officers, the government has been putting up fine brick barracks for the men, one building a year. Two of these barracks are completed, and a third is in process of building. They are one story high, with a central building of two stories, on the lower floor of which is a recreation-room, where the men play cards, checkers, and dominoes, smoke, loaf, and invite their guests. This room is a departure, and thus far it has been found difficult to prevail upon the soldier to use it. He prefers his bedroom. The dormitories are the two one-story wings, each dormitory accommodating forty men. These rooms are very high, and the ventilation, as has been said already, is admirable.

Another building is the mess-hall, which is organized on a new principle. Generally in the army the men mess, as they do everything, in companies. At Davids Island there is what is called the consolidated mess. Between the two completed brick barracks is a brick mess-hall, in which 650 men may be seated at the double line of tables which run transversely down the hall. In the space between the tables are tracks. The kitchen, flagged, and scrubbed with all the vigor that can be inspired by the old sergeant who is in command of the cooks and scullions, is in the rear of the centre of the hall. The cooking is done by steam, and the food is carried into the dining-hall by two double-decked trucks, which run on tracks to a turn-table. Then one truck-load is sent one way down the hall, and the other is sent in the opposite direction. Near the kitchen is the great bakery.

In the dormitories are the lavatories for the men, and there is a bath-house separate. In the head-quarters building is the post library for the enlisted men, one of the largest and best in the army. Upstairs in the same building are the records of the recruiting service, so full and complete that it seems a pity that they should be compelled to encounter the risks of a frame building. These records include the descriptive lists and papers of all men who have served at the depot. In other words, there is at the island the complete military history of every man who has entered the army through this depot. The examining room is in the same building. The parade ground runs from one end of the island to the other, through the centre. It is a very large plot, for the island, containing more than eighty-six acres, and is comparatively long and narrow. At the southwestern corner of the island are woody rocky heights, and on one of them is a great brick reservoir for the water, which is pumped up from a small fresh water pond, the joint product of art and nature. The island will soon be connected with the New Rochelle waterworks. Along the edge of the island that looks across the Sound to the Long Island shore are the old wooden barracks, still occupied by the men who cannot be accommodated in the new brick structures, and for winter drill-rooms. In the gravelled spaces between the old and new barracks the squad drills of the recruits are conducted. Among the trees on the points already mentioned the recruits who are suspected of harboring musical talent practise their ear-splitting discords, and are taught the various trumpet calls which fill the hours at infantry and artillery posts with music. Somewhere, too, on the island drummers and fifers learn the first lessons in rub-a-dub-dub and blowing, but very few civilians have had the courage to search for the spot, lest perchance they should come upon it, and learn too late the fatal power of invincible noise.

This is the home to which the recruit goes for instruction. He finds there a permanent military party, from which are taken the men on duty at the rendezvouses. There are a number of old sergeants, who are serving their second or third enlistments, and who act as instructors of the recruits. These sergeants either ask for the detail on their re-enlistment or enlist at the island for the purpose of remaining there. As a rule, a company officer will keep open a good sergeant's place for him for a month after the expiration of his term of enlistment. If he re-enlists within that time, he continues to wear his chevrons. If he is a first-rate soldier, with the necessary qualifications for giving instruction, he may procure a detail to a recruiting depot. If he does not re-enlist within the month, he may rejoin the service at the depot, with the intention of procuring promotion and serving out his term there. When he once procures the detail, it lasts, as a rule, during his term. In addition to the sergeants, among the permanent party are the extra duty men—the mechanics required at the post, the depot band, cooks, clerks, and messengers. Then there are the dozen or so of commissioned officers. Some of the recruits have served from three to four months. These are ready for assignment. The number of recruits at Davids Island runs from 500 to 800.

The recruit has enrolled his name at the rendezvous. It is not every man who takes it into his head that he would like to be a soldier who is accepted at the rendezvous. Sometimes very few men are needed by the army, or there are enough soldiers of the class usually enlisted at a particular station. Then the recruiting officer is exceedingly careful. Some of the unfortunates are doubtless convinced that the service is altogether too fastidious. There is no dearth of men in the country who are willing to wear the United States uniform. The applications average a larger number than the legal limit of the enlisted strength of the army.

In 1888 there were 24,710 applications for enlistment. Of these 18,017 were rejected. In the last eight years the average number of applications is 26,661; of rejections, 18,946; while, notwithstanding the large number of men offering themselves at the recruiting offices, the army last year lacked 1800 of the legal 25,000. The rejection of nearly 75 per cent. of the men who apply for admission to the rank and file of the army indicates, of course, not only care in the selection of those who are accepted, but also the low character of very many of the applicants. Many men who apply at the rendezvouses are rejected by the officer in command on their appearance. Brutality and dissipation leave unmistakable signs upon the faces of their victims, and the man who bears them does not get as far as the first surgical examination.

The recruit whose appearance satisfies the officer, if men are wanted from the office at which he makes his application, having given his name, birthplace, age, etc., with whatever of his personal history he sees fit to intrust to the keeping of the recruiting officer, is examined by a surgeon. He is then transferred to the depot, and is once more examined, after having been bathed and vaccinated. When he is assigned for permanent duty, he is examined a third time, in the presence of the commanding officer of the depot. The depot examinations are very thorough and minute, and it may be assumed of any enlisted man who receives his uniform and kit that he is a very good specimen of physical manhood.

Having been accepted, the recruit at once begins to learn the duties of a soldier. And first comes the setting-up drill. This consists of light gymnastic exercises without dumb-bells, clubs, or other apparatus, and the recruit often receives part of this instruction before he gets his uniform. There are three drills a day, each an hour in duration, and while they are in progress, the recruits may be seen in every stage of soldierly development. The most advanced have their rifles, while the newest recruits are going through the motions which give them their set-up. These last make up the awkward squad. Those who are in citizens' clothes clearly show that it is generally poverty, inability to get on in the world, that drives men into the army. Their garments are in all stages of dilapidation, but the faces, though sometimes deficient in character and sometimes hardened, are generally intelligent, and the new recruit is almost always intensely interested in his novel tasks. He is often found in the hours between drill off in a corner practising what he has been recently taught. It not infrequently happens at Davids Island that a new recruit displays such aptitude for military duties that he is made a corporal within a few weeks of his enlistment.

In an awkward squad some of the men are in uniforms that have not been refitted by the post tailor; some are in ragged citizens' clothes, the coats with frayed edges, the trousers sprung at the knee, wrinkled at the heel, and not long enough by several inches, the hats greasy and worn at the edges, the shoes broken at the toes, while a few are so sleek and well clad as to suggest that poverty is not always the author of soldiers, although it is safe to say that a very large percentage of the rank and file of the army are men who entered the service that the government might take care of them after they were beaten in the struggle with the world. There are cases, however, of the enlistment of men who wish to hide themselves in the army—men who have committed crimes, or who are running away from creditors, or from tiresome or too many wives.

There was a curious instance at Davids Island which shows how undesirable recruits may slip into the service in spite of the utmost care and vigilance of the recruiting officers. A recruit was discovered in the night in the house of his first sergeant, having broken in. The sergeant's watch was found in his possession. The captain of the company examined the thief, and concluding that he was an old offender, notified the civil authorities, with a view of apprehending him in case he had enlisted for the purpose of escaping the consequences of a crime. The result of the inquiry was the discovery that the recruit was a convict serving a term for homicide. He was, moreover, a dangerous lunatic, having fled from the prison asylum. This is, of course, a very extraordinary circumstance, but detectives occasionally find men among recruits who are attempting to evade the police.

The average recruit, however, is a man who is out of employment, who has abandoned hope, and as a last resort, enters the army for the food and protection which the government gives to its soldiers. It must not be supposed, however, that such men enlist with a view of deserting whenever civil employment is offered them. Very few recruits think of desertion. Most of them intend to serve out their terms; and if they do desert, it is not generally because other employment is offered to them. So far as can be ascertained, most deserters have no prospects of employment when they quit the service.

The recruits at Davids Island are divided into four provisional companies, called companies of instruction. The company numbers from 90 to 160 men, being largest from September to February, another indication that most soldiers enlist to be taken care of. They therefore join the army when employment is most needed and also most difficult

to obtain. Each company has a first sergeant, seven sergeants, and four corporals. It is made up without regard to the relative proficiency of the men, and the colored recruits are mixed in with the whites indiscriminately. In the army the two races are regimented by themselves; but at the recruiting depot blacks and whites occupy the same dormitories, march and drill together, and mess together. This is as it is in the navy, black and white sailors living peaceably in the same fo'castle together. An officer who has been on duty at Davids Island for a year recalls but one difficulty in that time on the race question. Only once has a white man fought with a black man on this fundamental issue. There are in each company recruits who have served one, two, three, and perhaps four months, so that the squads of each are in every stage of instruction.

The gymnastic drill, as has been said, is carried on without the apparatus. Thus far the government has refused to provide a gymnasium, although it is one of the most essential features of military drill and instruction. There is not a foreign service which does not count greatly for the muscular development of its troops on the gymnasium; nor is there a first class militia armory in our own country without apparatus. A gymnasium is one of the dreams of the officers at Davids Island, and it is quite possible that they may soon be successful in obtaining one. There are gymnasiums at a few posts.

After the recruit has been taught the exercises which tend to the development of his muscles, he is advanced to the squad which is drilling in the facings, marchings, wheelings, etc.; and after he has learned this, a rifle is given him, and he is instructed in the manual of arms. At the end of the month he is fitted to do guard duty. The guard at Davids Island consists of five non-commissioned officers and twenty-one men. When a recruit has been under instruction at the depot for three months he is counted as available for assignment to a regiment.

The depot is drawn upon by the service not only for privates and field musicians, which include trumpeters, drummers, and fifers, but for band musicians, who are also prepared for their duty at the post, and for artificers, such as bakers, cooks, clerks, blacksmiths, carpenters, gardeners, plumbers, painters, tailors, teachers, etc. Among the available privates are not only the recruits who have been at the depot for more than three months, but also the re-enlisted men are available after a few days' probationary service at the depot.

The recruit receives his uniform from the government on terms that will be explained hereafter, when the pay of the soldier is discussed. The government has its own tailor shops—the largest of them is in Philadelphia—where the uniforms are made according to certain sizes which are based on carefully prepared statistics. The uniforms are sent on requisition to the depot, and whatever alterations are required to make them fit better are the work of the post tailors. Uniforms are often sent to a post unsewed, simply cut out, so that the work of the post tailors is greatly simplified, while a much better fit is secured. A soldier of the United States army is well or ill dressed according as his company has an efficient or inefficient tailor.

The United States soldiers come from all countries, but about two-thirds of them are native Americans. From 1880 to 1888, both inclusive, the army received 60,435 recruits. Of these 55,805 were white; 4630 were colored; 37,691 were natives; and 22,744 were foreigners. It is the experience of intelligent officers who have served much with troops that while the men of different nationalities do not differ much in their military capacity, certain general propositions are true. The Englishman is most likely to be insubordinate. He has the habit of pretending to have fallen from a superior station. If he is a deserter from the British army, he is still worse. The Irishman must be closely watched. He is one of the best soldiers when he is good, and one of the worst when he is bad. The Germans and Scandinavians are very trustworthy. The New-Englander is intelligent but opinionated to a degree that sometimes leads him to insubordination. If he is able to control his sprightly independence he is likely to become an excellent non-commissioned officer, and may even secure one of the few commissions that are bestowed upon men of the ranks. The Southerner is more likely to be subordinate. The negro troops are proficient in drill, very docile, exceedingly clean, and are good soldiers. They never lose their fondness for the display of the service. The Northern is better than the Southern negro. The native white soldier is the most restless and the most depressed by the monotony of the army post.

When the average recruit finds himself on Davids Island, he is better housed, better fed, and better clothed than he ever was before in his life. Instead of living in a cheap boarding-house, or knocking about from one lodging-house to another, he sleeps in a great apartment and breathes fresh air. He lies on a clean iron bedstead, on which there are a woven wire mattress, another good mattress, clean sheets, blankets, and pillow cases. During the day the bed is always ready for inspection. He has plenty of water for washing, and he is compelled to take a bath at least once a week. Many recruits have not known what it is to be clean until they joined the army.

They are clothed in good and substantial garments, which they must keep brushed and cleaned. When they work, they are provided with overalls and working blouses. It is probable that boot-blacking is a great hardship to many of the men, and it may be that the requirements of white gloves oppresses some recruited souls but it must be admitted that the obligation of cleanliness tends to advance the civilization of the men who are willing to enter the ranks.

The food of the men is abundant and of excellent quality. It is a delight to visit the mess-hall, kitchen, and bakery at Davids Island, which are now under the supervision of Captain Morris C. Foote, of the Ninth Infantry. The ration of the United States soldier is very much more than he can eat, and the excess is sold solely for his benefit. With the money thus obtained luxuries are purchased. An average dinner at the Davids Island mess-hall consists of a soup, roast or boiled meat, a vegetable, a pudding, a pie. Sometimes there is a stew, in which case there is no soup, and then the men have coffee at the three meals of the day. Ordinarily they have it twice a day. They have meat three times a day. The bread furnished them is as good as can be found on any private table or at any restaurant in New York. It is well made and wholesome, and the only objection that the men can make to it is that it is never served to them when it is hot—an objection that will appeal more strongly to a Southern negro cook than to a healthy stomach.

The recruit is well housed, well fed, and well clothed. He works less than the average laborer, very much less, having six hours off duty; but he is restrained of his liberty. He may go to the library, and read the books and papers, but not many soldiers avail themselves of this privilege. As a rule the recruit prefers to pass his hours of rest and recreation in the room provided for that purpose in his barracks, or at the store of the post trader. He is not permitted to sleep during the day unless he has been on guard the previous night, but he may sit in his quarters if he prefers. At the post trader's store he may buy tobacco and other things that please his fancy or satisfy his needs, and he may procure beer and light wines. The sale of spirituous liquors is forbidden, and the amount of the lighter beverages consumed by the men is regulated by the officers. If a soldier should be permitted to get drunk at the post trader's store, the license of the proprietor to sell beer and wine would be cancelled at once.

The canteen system has not been adopted at Davids Island. That system is simply a co-operative store and club of enlisted men. The capital for its establishment is generally loaned by the officers of the post. One of the commissioned officers is detailed to supervise the canteen, and non-commissioned officers form a committee of management. Such articles as are sold in the store of a post trader are kept in the canteen, and are supplied to the men at a little more than their cost. The margin for expenses is very small, for the government supplies the building, and there are no salaries to pay. Besides the store, a recreation-room is provided at the canteen, which gives to it the character of a club. The system has not been adopted at Davids Island because the men, with the exception of the few who make up the permanent party, do not remain at the post for more than three or four months, and unless a strictly cash system was adopted, which is somewhat difficult in dealing with men who receive so little ready money, the canteen would be ruined by bad debts. At least this seems to be the objection in the minds of officers who are interested in the matter, and who regard the system as a success at regular army posts, where a body of troops remain for several years.

The regularity of the recruit's life, and his inability to spend his evenings where and as he pleases, are the hardships he endures. He is up early in the morning; he is almost constantly under orders during the day; he drills three hours; if the weather is pleasant, and he is so far advanced as to be drilling in the manual of arms, he must be at dress parade in the afternoon; his meals are ready on the stroke of the clock, and he must march to them with his company, he must answer to his name at tattoo—nine o'clock; and he must be in bed half an hour later. In addition to the other material comforts which have been mentioned, it will be seen that he has plenty of sleep, plenty of exercise, and plenty of fresh air. It cannot be denied, however, that to the average American citizen the soldier's life is full of terrible and depressing monotony. The recruit who goes to Davids Island cannot get a pass until he has been at the depot three months, except for very pressing reasons. He must remain at his post and learn his soldierly duties, the most important of which is discipline and its necessity. He must be taught that he is subordinate, and that his desires must yield to the requirements of the service which he has entered. Moreover it is essential that the recruit should possess moral as well as physical and mental qualifications, and he must be tested in this respect by his three months' service at the depot. When he is finally sent to his company after his instruction is completed, he will be able to procure passes oftener, but even then he cannot be as free as the citizen who has not joined the military forces of the government. He has surrendered part of his liberty.

His compensation is comparatively large, but a good many men who join the army do not consider it as much as it ought to be. Of course there is grumbling in the ranks; there is grumbling everywhere—at least wherever the English language is spoken. Some of the men do not like their food, many of them complain of the treatment they receive from their officers, and there are as many causes of discontent as there are incidents and details in a soldier's life. Most of the complaints, however, are so absurdly unjust as to be unworthy of a moment's serious consideration. One monumental and overpowering cause of dissatisfaction is the social position of the enlisted man. This is supposed to induce many of the desertions. It is said that civilians look down upon a man who wears the uniform of an enlisted man; that, being in uniform when they are guilty of their social vices, the black sheep of the service give it its reputation. How far this is true would be very difficult to determine. The soldier doubtless demands a better social position than he was entitled to before his enlistment; for he is, in truth, a very much better man. But he is, and must remain, among the laboring classes, and it is very doubtful if respectable civilian laborers look down upon him if he conducts himself decently. If there is really anything in this complaint, it must be due to the feeling of men who are earning their living while retaining their freedom that the soldier has surrendered his independence because he is unable to maintain his place in the struggle for existence and advancement. Of course, the objecting to the marriage of soldiers is a fruitful source of discontent.

So far as money compensation is concerned, it is ample, the soldier being very much better off than the civilian laborer. A private soldier receives $13 a month for two years, $14 for the third year, $15 for the fourth year, and $16 for the fifth year, the increase being paid to him on his discharge. If he is a mechanic or a teacher, he receives what is known as "extra duty pay," which amounts to fifty cents a day, more than doubling his pay. There are some inequalities and injustices arising from the system of "extra duty pay" which should be remedied. A company cook now receives more pay than the first sergeant under whom he serves. Musicians and trumpeters receive the same pay as privates, but farriers and blacksmiths of cavalry receive $15 at the beginning of their terms. The first pay of a corporal is $15, and of a sergeant $17. A first sergeant receives $22; a sergeant-major, $23. The highest pay that can be earned by an enlisted man is $45 a month for the first two years of his enlistment; this is the pay of a hospital steward, who is especially enlisted to perform the duties of an apothecary. A soldier serving his second five years receives $2 a month more than the highest sum paid to his grade for the first term.

In addition, the soldier has his home, his clothes, his food, and his medical attendance furnished to him by the government. If he is ill, his pay goes on, while the civilian laborer under like circumstances loses his time. Any comparison that can be made will show that the pay of the United States soldier is the best which unskilled labor receives in the country, while the advantages of the soldier in quarters, character of food, clothing allowance, and continuity of pay, make him very much better off than a civilian of the same class.

He has a money allowance of $200 for the five years for his clothes, and it is a poor soldier who cannot save $75 of this. He may leave his money with the paymaster, as in a savings-bank, receiving it, on his final discharge, with four per cent. interest. The deposits, however, are forfeited if the soldier deserts. During his service he may attend the post school and receive a primary education, the teacher being an enlisted man receiving extra duty pay. On his honorable discharge he receives the increased pay for the third, fourth, and fifth years of his service, and his travel pay to the place where he enlisted.

If a soldier remains in the service for thirty years he may be retired upon three-quarters of the pay of the grade then held by him. In addition, an allowance of money is given to him for clothing and subsistence. If after twenty years' service a soldier becomes infirm, or if he is discharged for wounds received or sickness brought on in the service, he is cared for in the Soldiers' Home at Washington. For the maintenance of this institution each enlisted man of the army is taxed twelve and a half cents a month.

When the recruit is ready for service with a permanent command, he goes to his company. He does the ordinary routine work of the post. If he is a cavalryman, his life is not so monotonous as that of the infantryman or artilleryman. The garrison work of the last is the most dismal in the army. In the infantry there is sometimes frontier service to be done, but most of the privates of the army pass their time in sleeping, eating, drilling, police and fatigue work, and guard-mounting. It is doubtless this monotony of existence that leads to most of the desertions. This is the contention of Lieutenant McAnaney in the September number of *The Journal of the Military Service Institution*, who adds useless routine and social position as leading causes; but useless routine goes to make up the monotony, as its chief evil is the prevention of the soldier from seeking amusement outside of the post during the hours that he is off duty. There is great relief already felt from the establishment of the field work, which is now pushed with great energy in nearly every department. It seems that what the soldier needs to make him contented is a greater variety of employment. He soon grows tired of company drill, of practising the facings, wheelings, and the manual of arms. He hails any change with delight. The enlisted man greets with joy any order for a transfer. He loves to go from post to post, therein differing very radically from his officers, to whom change means an expenditure of money that many of them can ill afford.

Recruits and old soldiers do not desert. The former are interested in their work, which is novel to them; while the men who have served three years have overcome the temptation to violate their oath to the government. The number of desertions in 1888 from the army were 2436, and the average for five years is 2673. Adjutant-General Drum estimated that less than eighty per cent. of the enlisted strength of the army served out the term or obtained honorable discharges. The other twenty per cent. desert or are dishonorably discharged. The record at Davids Island, however, is very different. For the last five years it has been as follows:

	Average Strength of Garrison.	Per cent. of Desertions.
1886	580	4.55
1887	667	3.40
1888	684	0.77
1889 (9 months)	601	0.67

In estimating the character of the depot, the excellence of this showing consists in the diminishing percentage of desertions, which is doubtless due to the improved material condition of the recruits. Its bearing upon the general question of desertion lies in its vindication of what has already been said, that new recruits do not desert. It is when the soldier reaches his post that the real hardships of the military life are felt. The novelty has worn off, the routine duties have been learned, and the wearying monotony begins. Then for three years the temptation to desert is always present, and it is within this period that desertions are most numerous. After a service of three years the soldier's life has become so familiar, so part of the man's nature, that restlessness has worn off and comparative contentment begins. Besides, the rewards of service are then beginning to be reached, and the end of the term is near, when the man can quit the service not only with honor, but with a sum of money in his possession which will support him until he is able to find civil employment or re-enlists.

There are many men who live in the army, who serve one term after another, and are content with no other life than that of the soldier. Here is the record for 1888, which shows how many old soldiers were serving in the army:

Men serving thirty-five years	6
" " thirty "	14
" " twenty-five "	86
" " twenty "	603
" " fifteen "	1,160
" " ten "	1,710
" " five "	[illegible]
" receiving re-enlisted pay	456
" " pay for third year	4,866
" " " " fourth "	3,236
" " " " fifth "	2,197
Total	[illegible]

Adjutant General Drum, speaking of this subject, said: "An examination of the data ....shows the continual presence in the ranks of an average of 18,000 men with a service of three years and upward, or 72 per cent. of the legal strength of the army. This fact confirms the statement made by me in previous reports, that the larger proportion of deserters were men of less than three years' service."

There are, of course, various suggestions made to prevent desertions, but with that question this article has nothing to do. The American soldier is well cared for and well paid, but he will continue to be tempted to desert after the novelty of his life has worn off, and until it has become a second nature to him. Deserters are not the unintelligent men. They are the restless, quick-witted, and irresponsible rovers who are always looking out for excitement, and the men who enlist for the purpose of securing transportation to the West, with the intention of deserting. On this point the following note to Lieutenant McAnaney's article is interesting:

"The records of the Judge-Advocate's office, Department of the Missouri, show the following of the first one hundred deserters (in dept.) in 1888, where education was classified by the B of S.: 15 are reported as 'poor' or 'ordinary,' 67 as 'fair' or 'average,' 14 as 'good,' and 4 as 'very good' or 'excellent.' What a board of officers would call a 'fair' education might be called 'good' by others."

This should always be borne in mind by citizens who are in the habit of sympathizing too quickly with tales of the hardships of the soldiers: two causes for desertion that are sometimes given by men when they are caught may be safely set down as lies—one is "bad food," and the other is "cruelty of officers." Some companies undoubtedly live better than others, but "bad food" is very rare in the army, and a cruel officer is even rarer. Officers are ambitious to be popular with their men, and they do not risk their standing in the army and their commissions by harsh treatment of them.

oogle

THE "FOREIGN ELEMENT" IN NEW YORK CITY.

IV.—THE SCOTCH.*

BY JOHN L. WILSON.—ILLUSTRATED FROM DRAWINGS BY W. A. ROGERS, AND FROM PHOTOGRAPHS.

AMONG the various nationalities which contribute their quota to the making up of the population of New York city, the most cosmopolitan community probably on the face of the globe, the Scottish nationality ranks among the smallest. It is not strange that it should be so. Scotland has never had a large population. As compared with either of her two nearest neighbors, England and Ireland, with the former especially, Scotland, in point of population, has always been exceedingly small. To-day, with the large increment of Irish to the larger cities, especially in the west, the entire population but slightly exceeds four millions. It has really been wonderful how this small nationality has sent its sons and its daughters in such numbers all over the earth. In every British colony the little kingdom is well represented; and it would be difficult to find a foreign country into which Scotsmen have not forced their way. It is significant also that wherever you find them they are an element of force at or near the front. Macaulay likens the Scotsman, in one of his well-known passages, to a piece of cork. Sink the cork where you may, it will rise to the surface. It is so with the Scot. Plant him where you may, leave him only liberty of action, and he will make his presence felt; he will work his way to the surface of society.

The Scot owes something to nature. There is intrinsic excellence in the race. There is the ring of genuine metal in the material out of which he is made. Whether you regard him as Celt or Saxon, or a qualified compound of both, there is in him superior racial excellence, which time and hard experience, mental, moral, and religious training, have undoubtedly qualified, but have not depreciated. In some of the finer, softer, more amiable, and more attractive aspects of human nature Scotsmen may be found wanting as compared with the men of some other nationalities. But in the various elements which constitute the real worth of the individual man—solidity of character, purpose, energy, resource, determination, endurance, and self-reliance—the typical Scottish man has few if any superiors. He is a debtor to race first of all, afterward to climate, to a niggardly soil, to the Presbyterian Church, and to the parish school. In spite of an inborn stubbornness—an unconquerable unwillingness to be driven, or sold, or played upon, or made use of—he has a faculty of taking advantage of favoring circumstances when they offer; and when he lays hold there is a bull-dog tenacity in his grip. For the use of others, the Scot is not the most adaptable of men. It is to his honor that it is so. For his own purposes, and in pushing his own way, he is adaptable enough. Of the general accuracy of these statements it would not be difficult to multiply proof. In Canada the reins of power have been held by a Scotsman for the best part of two generations. Sir John Macdonald has found but one man worthy to be called a rival, and he has been a countryman of his own. In the older Australian colonies, where they have opportunities similar to those offered in Canada, Scotsmen are more often than otherwise at the summit of power; and they are foremost not so much as politicians, or office-seekers, or self-servers, but as men seeking the welfare and advancement of the colony or community. It is unnecessary, however, to linger in foreign parts seeking examples. We have them in abundance in these United States; and we are far from being without them in the immediate neighborhood, and especially in the city of New York.

WILLIAM WOOD, LATE COMMISSIONER OF COMMON SCHOOLS OF THE CITY OF NEW YORK

In the early colonial times the Scottish settlers and their near kinsmen, the Scotch Irish from Ulster, formed an important element of the general population; and in what may be called the formative period of the republic they did yeomen's service. Than those of Livingstone, Marshall, Wilson, Hamilton, Gordon, Witherspoon, and many others that might be mentioned, there are no worthier names connected with early American history. In later times they have been less conspicuous in the increasing crowds and the multiplying nationalities; but here and there in town and country, in the State Legislatures and in the halls of Congress, in the various professions, as ministers of the gospel, as physicians and surgeons, and as lawyers, in the ranks of literature, as authors and journalists, in trade and commerce, and in the various branches of industry, Scotsmen and the sons of Scotsmen are giving evidence of the abiding qualities of the race. The nationality is well pronounced, distinct, active, and prominently in view. In the community Scotsmen figure as bankers, brokers, ship-owners, merchants in almost all departments, publishers and booksellers, owners of newspapers, editors and reporters, engineers, mechanics, moulders, brass-founders, builders, stone-masons and carpenters, tanners, gardeners, florists, auctioneers, and in numerous other branches of trade and industry.

In the earlier days of the city the Scottish element was even more strongly pronounced than now. There were no more prominent men in the city than the Livingstones, the Barclays, the Earl of Sterling—long a figure in New York city life—the Coldens, the Middletons, the Rutherfords, the McAdams, the Johnstones, the Maxwells, the Tillaries, the Lenoxes, the Turnbulls, the Taylors, the Auchinroles, and later the Auchincloses, the Grahams, the Haddens, the Douglases, the Maitlands, with many others, the old names reappearing generation after generation, worthy sons following worthy sires, maintaining the reputation of the names alike in social and business capacities. Among the clergy of the earlier times we find such names as the Rev. Dr. J. Mason, Rev. James Wilson, Rev. Mr. Monteith, Rev. John Bissett, Rev. J. M. Mason, Rev. Samuel Miller, Rev. Dr. William Smith, Rev. Dr. McClelland, Rev. Dr. McLeod, Rev. A. Stark, Rev. Dr. W. C. Brownlee, Rev. Dr. J. N. McLeod, Rev. John Lillie, and a few others, names highly honored while their owners lived, and destined some of them to lasting celebrity. Dr. John M. Mason, son of a Scotsman, but born in New York, was educated at Columbia College and at the University of Edinburgh. He succeeded his father as minister of the Associate Reformed Church, a Scottish organization, and was minister of that church continuously from 1793 until 1810. He became Provost of Columbia College in 1811, but resigned in 1816. He was called to the Presidency of Dickinson College, Carlisle, Pennsylvania, in 1821. That office he held till 1824, when he resigned, returning to New York, where, in broken health and a mere wreck of his former self, he lived in retirement until his death in December, 1829. Dr. Mason as an ecclesiastic occupied a place in the front rank of the men of his time, and as a preacher he had few superiors. In 1802 he preached the annual sermon before the London Missionary Society, and in the same year in Edinburgh before the Society for Relief of the Destitute. On both occasions it was admitted Dr. Mason reached the very highest standard of pulpit eloquence and power, and the sermons which have been preserved, "Messiah's Throne" and "Living Faith," justify the verdict. Dr. Alexander McLeod, born in the island of Mull, Scotland, came to the United States when young, studied at Union College, Schenectady, and was pastor of the First Reformed Presbyterian Church, New York, from 1801 till his death in 1833. Dr. McLeod was eloquent and powerful in the pulpit, preached to admiring crowds, and enjoyed a wide reputation. As a writer also he won distinction. He was a pioneer of the antislavery movement when antislavery sentiments were far from popular. Among the physicians of those earlier days were Dr. James Tillary, Dr. Hugh McLean, Dr. A. Anderson, Dr. J. B. Stevenson, Dr. J. T. Ferguson, and others, men all of them prominent in their profession. Up till near the middle of the present century the principal builders in

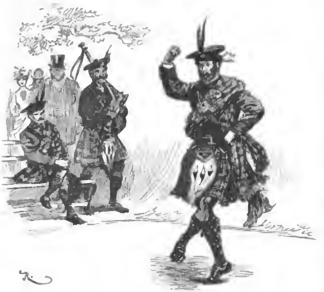
WILLIAM COVERLY, NEW YORK MANAGER OF THE ANCHOR LINE OF STEAMERS.

Scotsmen, and in churches and some of the ansions of our merchant princes their monu- in plentiful abundance. In the earlier days of the city had also their meetings, their places , their clubs, their balls, and their social re- ious kinds. To these, however, reference will e.

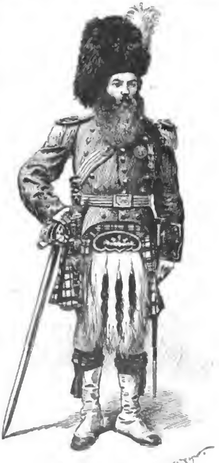
ter times the Scot maintains his character and the midst of us. A visit to Wall Street and streets, or a glance at the city directory, will be show that as bankers the Scotsmen of New old their own. There is the Bank of Montreal, gents of which are both born Scotsmen, Mr. Wal- n and Mr. Alexander Lang There is the bank of J. Kennedy, Todd, & Co., a house which may d as a sort of successor to the house of J S Ken- o., Scottish in its origin, and to a large extent Scot- s present management. There are the banking f John Paton & Co.; Maitland, Phelps, & Co., of r. Robert Gordon, now of London, in the house of Drexel, Morgan, & Co., was long a prominent member, the Canadian Bank of Commerce, with Alexander Laird and William Gray at the head of it, and other houses in which Scotsmen figure as partners or agents. Then there is the Scotch Irish house of J & J, Stuart & Co , a house through which many thousands of dollars have found their way to both Scotland and Ireland. Some of the men named above have become more than representative, they are marked men not only in this community, but in the great world of finance Walter Watson and his partner Mr. Lang are now the New York financial agents of the Canadian Pacific, and the representatives of other important trusts Watson, the son of an Edinburgh banker, was bred to the business in Edinburgh, and spent some years in Canada before he came to New York. Lang is a son of the manse and is a brother of John Marshall Lang, of the Barony parish, Glasgow, the most populous as well as most influential parish in Scotland. John Paton, another son of the manse, was born in Ancrum, Roxburghshire, the original home of the New York Livingstones, where his father was for many years parish minister. In the adjoining parish of Crailing another branch of the Patons have long owned large estates. Mr. Paton was educated and bred to the banking business in his native country, and, like his friend Watson, acquired experience in Canada before settling in New York. As becomes a son of the manse, he has always taken a lively interest in church affairs. He is an elder of the Fifth Avenue Presbyterian Church (Dr. John Hall's). Mr. Robert Gordon is a native of the town of Dumfries. He came to this country when quite young, some thirty odd years ago, formed a connection with the house of Maitland, Phelps, & Co., became an invaluable servant, and was ultimately admitted a partner Mr. Gordon was one of the most popular Scotsmen in the city. A man of fine taste, and a patron alike of art and literature, his company was courted by men of refinement and culture To him the city is largely indebted—he was not alone in the matter—for the statues of Burns and Scott which adorn our Central Park. He was, so long as he remained in the city, a representative Scot—prominent in the St. Andrew's Society, of which he was several times President, prominent in the Caledonian Society, of which he was a liberal patron, and an enthusiast in curling and other out-of-door sports popular with his countrymen. The Gordon medal has done much to make curling popular all over the North.



DANCING THE HIGHLAND FLING.

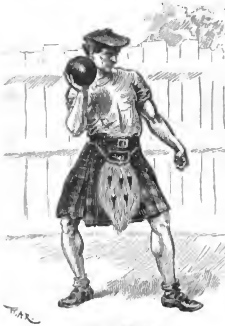
One of the most successful Scotsmen of our time, financially at least, is Mr John S. Kennedy, long and prominently connected with the city. He is a very striking example of Scottish astuteness. Born and educated in Glasgow, he came to this country first some thirty-five years ago, entering one of our down-town banking houses as clerk. It was by-and-by deemed advisable to make him partner, and it was not many years afterward when he was able to strike out for himself. A succession of golden opportunities came to him in iron speculation, first in connection with the St. Paul, Minneapolis, and Manitoba Railroad, and later in connection with the Canadian Pacific, of which he became a director. For some years he was the acknowledged representative of that road in this section of the country. He has now to a large extent retired from business, enjoying somewhat of rest after his gigantic labors But he has made his millions, of which he makes fairly generous use He was never a noisy or demonstrative speculator But you have only to look at his large head, his keen eye, his firm-set mouth, and to observe his impatience of whatever is irrelevant to the matter in hand, to discover that you are in the presence of no ordinary man—of a man full of purpose and energy, a man who sees broadly and clearly, who decides quickly, and whose courage and endurance are always equal to the occasion

It would not be difficult to multiply names taken from almost every department of business and intellectual activity. Time would fail to tell of the Lenoxes and the Irvins and the Lauries and the Sloanes and the Whitewrights and the Morrisons, and the others who have been recently removed, but who have left enduring memorials behind them; and of the Brands and Frazers and Lyalls and Callenders and Boyds, and many others who remain, and who are worthily upholding the good reputation of the Scottish nationality in the midst of us. But there are some names and some institutions which it is necessary to emphasize. On the Lenoxes it is the less necessary to dwell that they have left noble and enduring monuments behind them—monuments which will carry blessings with them to many coming generations Laurie and Sloane and Whitewright and Mor-



COLONEL JOSEPH LAING, OF THE DISBANDED 79TH REGIMENT OF SCOTTISH HIGHLANDERS, N.Y.S.N.G.

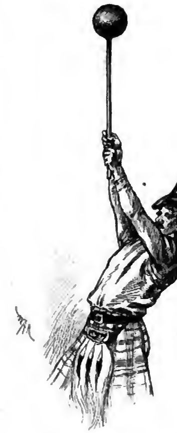
rison will be remembered, among other things, for their bequests to the St. Andrew's Society. But there are living Scotsmen who are building up great industries and great reputations, and there are institutions of which Scotsmen have just reason to be proud.



PUTTING THE STONE.

Pittsburgh is a long way from New York, but for many years past Mr. Andrew Carnegie has been more of a New-Yorker in the matter of residence than he has been a Pittsburgher, and of late years few men have been more prominent in New York society. A native of Dunfermline, Scotland, where he spent his boyhood years, and where he imbibed from his father, a pronounced Chartist, those extreme opinions in regard to politics and religion which he has continued through life so far somewhat ostentatiously to profess, he came to this country when quite young, and had to push his own way. Accident or fortune led him in the direction of telegraphy. Brought into contact with some railroad magnates, he was found useful, and won their confidence. We soon find him drifting into the iron trade. Success was rapid. His works at Pittsburgh are now among the largest in the world. His wealth is enormous; away up in the millions. He is an avowed anti-royalist, a declared friend of popular government, a patron of education, and a liberal benefactor of public institutions. His gifts in educational and scientific directions have been numerous both in this country and in the land of his birth, and they have been princely as well as numerous. He is a disciple of Herbert Spencer, and his hopes for humanity lie in the direction of science. He has from the first been a member of the Nineteenth Century Club. He is in many respects a man of mark. Ability of a superior order must be conceded to him. His great success has not been the result of a mere freak of fortune. Amid all the cares of business he has found time to carry on the work of self-education. He speaks and writes the English language with grace and fluency. Culture must be conceded to a man who is admitted into some of the best circles of British society. He enjoys the friendship of Mr. Gladstone, and he was on intimate terms with the late Mr. Matthew Arnold. He companions with great men, not with illustrious nobodies. His coaching tour from London to Inverness, with Mr. Blaine as one of the party, was characteristic. His books have a certain kind of merit. His account of his tour round the world was respectable. His *Triumphant Democracy*, a peculiar and characteristic volume, has had a wonderful success. Some recent essays in *The North American Review* and elsewhere perhaps reveal the thoughts and sentiments of the man to greater advantage.

Among the institutions of the city which owe their origin to Scottish enterprise prominence must be given to the Anchor Line Steam-ship Co. It is essentially a Scottish establishment. It is now a large institution and represents many interests; but the great Scottish house of Henderson Brothers covers all other names and all other interests, and Glasgow is its head-quarters. The Anchor Line represents a shipping interest which is world-wide, and which includes sailing vessels as well as steam-ships. Vessels are consigned to the Henderson Brothers, New York, from all parts of the globe. Dating from 1856, and beginning with the little steamer *Tempest*, which was lost on her second return voyage to Glasgow, it is not a very old line. But how it has grown! It has a larger fleet of steamers than any other line in the world. Its red ensign, the banner of hope, is to be seen in almost every great port, and wherever it is seen it is regarded with pride if not with jealousy. It owns a great ship-building yard in Glasgow, and it has intimate business relations with another great ship-building yard at Barrow-in-Furness. The soul of the company from the start has been Mr. Thomas Henderson, who still bears upon his shoulders the responsibilities which are inseparable from the management of this almost overgrown institution. Sons and nephews and other young men who have grown up with the concern—some in Glasgow, some in London, some in Liverpool, some in Bristol, some in New York, some in the Mediterranean, and some in the far East—share the work and help to lighten the burden. The elder Hendersons have made frequent visits to this port, and the younger men have come and gone so often that most of them are well known to us. The first local manager, the man whose name is indissolubly associated with the earlier and rougher years of the Anchor Line experience in New York, was Mr. Francis Macdonald, an excellent business man, an amiable and accomplished gentleman, whom to know was to love. Mr. Macdonald had acquired his earlier business experience in Glasgow. After years of faithful service, assisted latterly by Mr. Coverly and some one or other of the younger Hendersons, he succumbed to consumption, a disease which seems to find some natural attraction in gentle but ardent natures. Since Mr. Macdonald's death, Mr. Coverly has had the principal charge. He is a nephew of the elder Hendersons, a Glasgow man by birth and training, with some experience of Canadian life. As a manager, Mr. Coverly is both popular and efficient. He is known as "the handsome Scotsman," and, truth to say, there is no finer-looking specimen of the *genus homo* to be seen on the floor of the Produce Exchange or among the shipping men of New York. Over six feet in height, of erect bearing, fully developed, with the red hair and clear complexion of his race, he would, one can imagine, in the costume of the clans, present the *beau ideal* of the Highland chief. Mr. Coverly, in addition to some local partners, has always at his right hand some member of the Henderson family.



THROWING THE HAMMER.

The Anchor Line has never made speed so much as safety its principal object. Its record is excellent. It was the first steam-ship line which successfully connected the river of Henry Bell with the river of Robert Fulton. It is still the principal line making the connection, although excellent service is rendered by the State Line, managed by the Messrs. Baldwin. It is interesting to bear in mind here that

to say, which looked out on the German Ocean, and where the people were, for the most part, Catholics and Jacobites. The region is far away from any of the great literary centres, but, being destined for the priesthood, young Bennett was not without opportunities for study. It is easy to understand how, in spite of his Scottish blood and Scottish surroundings, he felt himself intellectually, at an early age, out of touch with the great mass of his countrymen. Scottish history, especially since the Reformation period, was the story of the triumph of the enemies of his creed; and in Scottish institutions, as they were or promised to be, he could have little delight. Nor for the clerical life did he discover any special liking. He longed for a larger sphere, for a freer atmosphere, and for unconventional work. In this frame of mind he obtained a copy of Franklin's autobiography, and his thoughts were turned to America. Two years later, in 1819, he landed at Halifax. On his early American experience, which was hard enough, but which was contributing to the making of the man, it is unnecessary to dwell. It was not until May 6, 1835, when the first number of the *Morning Herald* appeared, and was issued from a cellar in Wall Street, that he found his proper sphere and his proper work. The day marks an era in American journalism. How the *Herald* prospered, how from a small sheet it assumed its present size, and how it revolutionized the newspaper press—all these are matters of history. Mr. Bennett was in the habit of saying that the people gave him more credit than he deserved; the *Herald* had grown with the city; it had prospered because the city had prospered. The situation, it is true, sometimes makes the man. It is equally true that the man sometimes makes the situation. More often perhaps there is action and reaction; and there can be no doubt that whatever advantages New York offered to Bennett, he was equal to the situation. A change would no doubt have come over American journalism if Bennett had never appeared upon the scene, but it was reserved for him to precipitate the revolution, and to make it a success. To him, therefore, belongs the praise. His methods are no longer a mystery, and need not be dwelt upon. His radical idea was to make a newspaper. He did not despise the editorial or teaching element—far from it—but news was the first requisite, and the *Herald* must have news, no matter what the cost. This characteristic remains with the paper, although it has long since ceased to be an exclusively *Herald* feature. There was genius in the man. He had a habit of looking at things from an angular stand-point; and no matter whether the people happened to be in humor with him or not, it was always a necessity that they should know what this man had to say. Among the secrets of the elder Bennett's power was his skill in using men. In later times, when he made suggestions and superintended rather than wrote, it gave him great pleasure to have his ideas properly expressed, and when an article pleased him, he never failed to say so. He never allowed liberties on the part of his men, and he took none with them; but he was appreciative, kind, and encouraging in a high degree. It resulted that his men loved him, tried to please him, and served him with their best. It would have been strange, all things considered, if the *Herald* had not become a great property and a great power.

Speaking of newspapers, there are numerous Scotsmen on the daily and weekly press of the city, some of them occupying leading positions. Whitelaw Reid has Scottish blood in his veins, so also has John Russell Young, and many others that might be named. The *Scottish-American Journal*, which claims to represent the nationality in America, is published in this city. That one such newspaper should satisfy the nationality is proof that Scotsmen in America are not greatly given to politics. The only use they seem to have for a national newspaper is to get "news from home." Perhaps it is best that it should be so.

Within the limits of this article it is hardly possible to do full justice to the nationality in the city. It is unavoidable that some names be omitted, and that some features be overlooked. In many departments, business and professional, Scotsmen were relatively more numerous in early times than they are now. They are less visible in the growing crowd; but they are there all the same. As builders, stone masons, and carpenters they are plentiful—so plentiful that to mention names would be invidious. As gardeners and seedsmen and florists they are far away in the majority, and they have won the leading positions. Peter Henderson's name is known over the length and breadth of the land. Young & Elliot's (now William Elliot's Sons) auction sales command attention in Europe and Asia as well as throughout this continent. Wilson, of Astoria, whose magnificent establishment was so long a feature of Fourteenth Street, became a sort of household word. And what name is more
